"It is out of sight," under the hood. All that shows is a small hand lever on dash. You do not have to leave your seat to start your FORD MOTOR when equipped with same.

All that is necessary is to pull the lever. Will POSITIVELY TURN YOUR MOTOR OVER EVERY TIME. With this starter YOU HAVE TWO STARTING DEVICES. YOU DO NOT HAVE TO REMOVE THE CRANK. IT STAYS ON.

FOR THE NEXT 60 DAYS TO THOROUGHLY INTRODUCE OUR STARTER WE WILL MAKE THE ABOVE PRICE.

NO MORE BROKEN ARMS. BACK KICKS ARE DANGEROUS.

DIRECT ON RECEIPT OF PRICE.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

Dixon's Graphite Transmission Grease No. 677

This is as good as insurance on your transmissions and differentials, because it practically cuts out the grinding, wearing friction that soon destroys gears and bearings. More power goes to the wheels. Your car runs faster, easier, more quietly. Your mileage goes up and your repair bills come down. And your pleasure is multiplied as your car responds to the soothing influence of the fine graphite flakes. Have you a copy of "Lubricating the Motor," No. 23?

Information

The Safety of Your Car and Passengers Depends upon Your Brake Lining

If your brake is not lined with J-M Non-Burn, you will not be able to stop your car quickly in tight places, when slipping a few feet more may mean death and destruction. You certainly cannot afford to take chances with linings made of leather, camel's hair, fibre, wood, cast iron, etc., which tests have proved require from 12 to 25 feet to stop a car after brake has been applied.

J-M Non-Burn BRAKE LINING

is made of pure asbestos fibre (a mineral) interwoven with strong brass wires in each strand. It never burns, chars, slips, ravels or fails to grip the drum immediately the brake-lever is applied. Will outlast at least twelve ordinary linings. It affords the greatest braking power of any known mineral. J-M Non-Burn is in universal use by the leading automobile manufacturers.

Sold by most dealers. Always look for the name stamped on the lining. It's your protection.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to ***prevent*** accidents.

"I can't afford to take ***any chances.*** We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of ***Weed Chains*** and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—***Life Insurance*** and ***Accident Insurance Companies*** strongly endorse them and recommend their use. ***Taxicab Companies,*** for their own protection, ***insist*** that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the ***most profitable*** Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

PACKARD TWO-THIRTY-EIGHT

The new model is ready for our patrons. It is the embodiment of Packard quality. You are invited to inspect these attractive features

WORM BEVEL DRIVING GEARS

Unequaled as a silent drive when installed in rear axle transmission. A new departure in mechanical development.

ONE MAN TOP

Can be raised or lowered by one man from a position in the car or on the ground.

ELECTRIC SELF-STARTER

An independent motor unit for cranking only. Spins the engine at one hundred revolutions per minute.

ELECTRIC LIGHTING GENERATOR

Independent dynamo with self-contained regulator, insuring at all times a properly charged battery.

SEPARATE MAGNETO IGNITION

Magneto for starting and running, with battery system in reserve. Greatest possible insurance against electrical trouble.

CENTRALIZED CONTROL

Every switch and operating adjustment on control board just beneath the steering wheel.

LEFT DRIVE

Avoids stepping into the street. Safest in traffic.

LEFT HAND GEAR SHIFT

Adds to the convenience of driving and avoids obstructing the front compartment of the body.

SHORT TURNING RADIUS

Car turns in a circle forty-four feet in diameter.

HYDRAULIC GOVERNOR

Helps to prevent racing or stalling the motor. Steadies the car in rough going.

FORCE FEED OILING

All engine bearings, including cam shaft, floated on a film of oil under pressure. Direct leads to cylinder walls feed oil to piston thrust surface when engine is working hard.

SEVEN BEARING CRANK SHAFT

Two and one-eighth inches in diameter. Held in seven bearings in heavily ribbed crank case. Contributes to smooth running.

DRY PLATE CLUTCH

Practically indestructible. Made of hardened steel discs and asbestos lining. Does not grab nor slip. Fitted with clutch brake of uniform resistance.

TRANSMISSION

Three speeds progressive on rear axle, permitting of the lightest and most flexible chassis.

WINDSHIELD

Packard folding design with rain vision. The most rigid and enduring windshield ever built.

STEERING

Worm and nut mounted on roller bearings. Easy and safe.

RADIATOR SPLASHER

Keeps radiator clean in muddy going. The motor is mud tight. Enclosed wiring, valves and oil passages make clean design.

GASOLINE TANK

Outside of the body on rear of frame. Not necessary to disturb a single passenger when taking on supplies. Tank is sealed tightly, avoiding odor or waste by evaporation.

REAR TIRE CARRIER

Removal of tires from running board permits access to the front compartment from either side.

FRAME

Six inches deep to give maximum service. The bridge builder's factor of safety embodied in every detail of Packard construction.

ACCESSIBILITY

Every important unit of motor, clutch, transmission, brakes and steering, readily accessible for cleaning, oiling and adjustments.

Packard Motor Car Company, Detroit

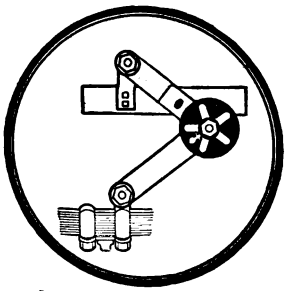
New Automatic Shock Absorbers are the only real improvement since the original Truffault-Hartford

To the great army of American motorists the Truffault-Hartford Shock Absorber needs no introduction. In the efficiency of its spring control it has no equal. It is admittedly the best—now regular equipment on twenty-five leading makes of cars.

The new Automatic Shock Absorber is simply a broader application of the original Truffault-Hartford principle of frictional resistance to excessive spring action. Instead of providing one frictional tension, it supplies three, effecting a riding condition that very closely approximates the ease and comfort of the Pullman railway coach.

Of these three frictional tensions, the first is only slightly effective, serving to eliminate the spring vibration on ordinarily smooth roads, which while hardly noticeable to the occupants of the car, does seriously affect the more delicate mechanism.



A second tension, that is double the amount of the first, comes into play with a change in the roadbed to moderately rough. It meets this new condition to a nicety, absorbing the last vestige of shock but permitting the springs to operate at their full flexibility at the same time.

When a bad road is encountered, and the natural tendency of the springs is to bound and rebound with damaging force, the third tension of the New Automatic becomes effective. It preserves the same softness of spring action that is experienced on moderately smooth roads and eliminates the jar and jolt that invariably accompany sudden contact with a road obstruction.

All tensions set automatically and when once properly adjusted the New Automatic requires no further attention. It is at once the most efficient and economical shock absorber—a bona-fide improvement on the Truffault-Hartford, the most successful in the world.

THE STURDY STUTZ MADE GOOD IN A DAY

Compare the Stutz—Part by Part—with Any Car Made at Any Price

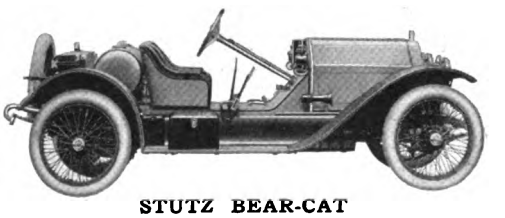
Everybody now insists on full car value for their money—and a *past* instead of a *future* record.

Take Your Time in Making a Selection

No car built has anything on the Stutz for style and beauty, roominess, easy operation, freedom from trouble, low cost mileage, power and convenience.

So don't take snap judgment in buying your next car—give the Stutz the thorough examination it is entitled to receive on account of its **past** and **present** performance.

"My Next Car Will be a Stutz"



Those that know the Stutz—and it's pretty well known everywhere—not only praise it in the highest terms, but you will find a number who will say, "My next car will be a Stutz."

Go to your nearest Stutz dealer—look at the new models—note that they are even better than the previous Stutz cars. Ask him to show you the exclusive Stutz features.

Write for our New Illustrated Catalog No. A—Series E

DEALERS: We have a little desirable territory still open and will make a profitable contract with responsible dealers. Write or wire quick.

Vol. XXXVII New York, U. S. A., Thursday, November 6, 1913 No. 7

MARION FOLLOWS AMERICAN INTO HANDS OF A RECEIVER

Lack of Working Capital and Limited Bank Credits Cause Embarrassments—Assets Exceed Liabilities—Latter $500,000.

Affected by the same influences, lack of working capital and limitation of bank credits, which caused the failure of its near relative, the American Motors Co., the week previous, the Marion Motor Car Co., of Indianapolis, went into the hands of a receiver on Monday last, 3rd inst.

The receivership grew out of proceedings instituted in the State Superior Court by the Kinsey Mfg. Co., of Toledo, O., which was a creditor to the extent of $19,202.65. The receiver appointed, James E. Kepperley, is one of the attorneys for the Marion Motor Car Co., which did not oppose the proceedings. The liabilities of the company, it is stated, will reach $500,000 but its assets, according to reports, will exceed this sum.

The assets and liabilities of the American Motors Co., of which Frank E. Smith, its vice-president, has been named as receiver, have not been made public.

Both factories are being operated and there are those who believe that both companies, of which J. I. Handley is the president, will pull through. It is only three months ago that Handley organized a selling company bearing his name, which was to market the entire production of both American and Marion cars.

Standard Motor Likely to Locate in Iowa.

Instead of locating its plant in Minneapolis, as first was proposed, it now appears a merger of the Minneapolis Motor Co., a builder of motorcycles, and the Colby Motor Co., of Mason City, Ia., will be operated in the latter city, where the Colby factory is immediately available for use.

The Standard company, which was organized some three weeks ago under Delaware laws, with an authorized capital of $6,000,000, has chosen as its president and treasurer C. H. McNider. The other officers are F. E. Kenaston, vice-president; M. J. Scanlon, vice-president; F. E. Stearns, secretary and assistant treasurer. In addition to these men, the directors are F. H. Bowman, P. M. Stearns, S. J. Boal and William M. Colby.

The Standard company will continue the manufacture of both the Colby car and the Minneapolis motorcycle.

Lewis Finds New Name for New Company.

Because the Mitchell-Lewis Motor Co., of which he was president and general manager until February last, objected to the name Lewis Motor Co., which William Mitchell Lewis had selected for his most recent enterprise, he has renamed it the L. P. C. Motor Co., of which he himself is president and general manager. Rene W. Petard is secretary-treasurer and factory manager and E. B. Hand vice-president.

As stated in last week's Motor World, they will build a light "six," of which first deliveries are promised February 1st. For the time being, operations will be carried on in what was formerly a part of the Racine-Sattley carriage and wagon plant in Racine, Wis.

Why Canadian Ford Passed Dividend.

Although its report showed earnings of $1,250,000, most of which was reinvested in real estate and equipment, and though it has a surplus of approximately $1,900,000, the Ford Motor Co. of Canada, at its annual meeting last week, passed its dividend. This action was deemed wise because of the financial stringency existing in a large part of the Dominion. Last year the Ford Canadian company increased its capital from $125,000 to $1,000,000 and declared a 700 per cent. stock dividend, and the two preceding years paid cash dividends of 100 per cent.

CORECEIVER FOR POPE IS SOUGHT BY STOCKHOLDERS

Owners of Large Holdings, with Bank Creditors, Project Selves into Reorganization—Protective Committee is Formed.

Just what lines the reorganization of the Pope Mfg. Co., of Hartford, Conn., will follow has not yet been clearly indicated. The appointment of Col. George Pope, treasurer of the company, as receiver was accepted as meaning that the reorganization will be conducted by the Pope interests, but since that time the larger stockholders and banking creditors have projected themselves into the affair and are endeavoring to have a co-receiver, or co-receivers, appointed to serve with Col. Pope.

The stockholders themselves have formed a protective committee, and when the hearing fixed for November 12th occurs in the Federal Court in Boston they will urge the appointment of additional receivers.

This protective committee is composed of Allan Forbes, president State Street Trust Co.; James L. Putnam, of Putnam, Putnam & Bell, attorneys; Carl Bonny, of Bonny & Moore, Worcester; Daniel W. Gurnet, of Richardson Hill & Co.; George M. Angier, of Angier Chemical Co.; William P. Fowler and Robert M. Currier, of R. M. & C. R. Currier.

It is understood that they are bent on replacing Albert L. Pope as president and general manager of the company, and on making other changes.

On the other hand, the merchandise creditors have formed another and friendlier committee, of which Clarence E. Whitney, of the Whitney Mfg. Co., is chairman. The other members are D. J. Post, Veeder Mfg. Co.; E. J. Lobdell, American Wood Rim Co.; C. A. Earl, Corbin Screw Corporation, and De Witt Page, New Departure Mfg. Co.

GARFORD-KNIGHT STEPS IN; EDWARDS-KNIGHT STEPS OUT

Willys, Having Purchased Edwards License and Other Assets, to Build New Car in Own Factory—Retains Designer Edwards.

Reports that the Edwards Motor Car Co., of New York, purposed removing to the West, which had been afloat for several months, proved not wholly correct, for, instead of removing, the company has been swallowed whole by John N. Willys, president of the Willys-Overland Co., of Toledo. He has acquired the Knight license and the entire stock and equipment of the Edwards company and will produce a Knight-engined car in the Garford plant in Elyria, O., which car will be known as the Garford-Knight. H. J. Edwards, the designer of the car and vice-president and general manager of the company, has been retained and will go to Elyria in the capacity of chief engineer to direct the production of the new Willys car.

The Edwards company was incorporated in July of last year, under the laws of Maine, with a capitalization of $2,000,000, Edwards and C. G. Stoddard, formerly of the Stoddard-Dayton establishment, being the chief parties involved. The car was an impressive, $3,500 creation, but the company made small progress with its cars and even less progress with its Knight-engined trucks, which it aimed to produce in a factory in Louisville, Ky., which it was stated it had acquired. Its absorption by Willys, therefore, will cause comparatively small surprise.

During most of its short life, the Edwards company maintained an office and salesroom in New York in the United States Rubber Co.'s skyscraper, where it occupied most of the fourth floor. This upstairs salesroom, a commodious and magnificently appointed place, caused many tradesmen to shake their heads, for it was in the nature of a bold experiment, and that it did not pan out is about what every one expected. Few persons ever found their way to it.

Rajah Now Goes After Rex Ignition.

Claiming that the Rex Ignition Mfg. Co., of New York City, has been selling porcelain parts to be used in Rajah spark plugs, the Rajah Auto Supply Co., of Bloomfield, N. J., filed suit this week in the United States District Court for the Southern District of New York, sitting in New York City. The Rajah company asks an injunction restraining the Rex company from continuing this practice, which it charges is a violation of the restrictive license under which Rajah plugs are sold. The plugs are manufactured under the David B. Mills patent, No. 825,856, granted July 10, 1906. The Rajah company has secured similar injunctions against other companies.

"Clink of Gold" Plant Again for Sale.

For the fourth time, what last was the plant of the Ohio Falls Motor Co., of New Albany, Ind., will be offered at public sale on Wednesday, November 26th. When it was put on the block several months ago, it was bid in by officers of the embarrassed company, but they failed to consummate the transaction and the court, therefore, has ordered a resale.

The property, which originally was acquired by the more or less famous "clink of gold" stock-jobbing American Automobile Mfg. Co., comprises about six acres of real estate, several brick buildings and considerable equipment. It is subject to encumbrances of about $26,000 and, according to the order of the court, no bid for less than $15,000 cash will be considered.

Willys Acquires Interest in R. & L.

Presaging an enlargement of the business of the R. & L. Co., of New York City, and its taking on of the Willys Utility wagon, John N. Willys has purchased an interest in this Garford distributing corporation; his purchase, however, does not constitute a controlling interest, and both J. T. Ranier and Paul Lineberger will remain, as heretofore, the active principals in the business.

The R. & L. Co. recently erected a service station in The Bronx and has been active in pushing the sale of both Garford cars and trucks in the metropolitan district, and the extension which is contemplated is planned to care for the distribution in the metropolitan territory of Willys's light delivery vehicle.

Waldon and Budlong go to Europe.

S. D. Waldon, vice-president of the Packard Motor Car Co., and M. J. Budlong, manager of the Packard branch in New York, sailed to Europe last week. While they will not close their eyes to automobiles, in the case of Budlong, at least, the jaunt is one of recuperation, his health of late not having been of the best.

Indianapolis Dealers Oppose Local Show.

There will be no local show in Indianapolis next year. This was decided at a meeting of the Indianapolis Automobile Trade Association on Thursday last. Instead of a show, the dealers will hold "open house" during one week of February and have in view the adoption of a uniform style of decoration.

THREE SUITS IN ONE WEEK FALL UPON MANSFIELD TIRE

Total of Trio Amounts to $45,000—Two Grow Out of Tire Building Deal—Third Results from Contract for Crude Rubber.

When a manufacturer has a lawsuit filed against him he generally is supposed to worry. If so, the Mansfield Tire & Rubber Co., of Mansfield, O., may have worried a little this week, when the Automobile Tire Co., of New York City, filed suit against George W. Henne, the Mansfield vice-president, for $10,000.

And if the company worried a little, it doubtless worried some more when the Automobile Tire Co. instituted an action against the Mansfield company itself for another $10,000. And if the company worried a little more at this second suit, it more than doubled its worry when J. H. Rossbach & Bros., of New York City, appeared with a suit for $25,000, making the week's calamities total $45,000.

All three suits were filed in the Supreme Court for New York county. While the Mansfield side of the disputes has not yet meen made a part of the court record, it is stated that the rubber manufacturer has its own story of the disagreements.

The two actions instituted by the Automobile Tire Co. grew out of a contract under which the Mansfield company makes tires for the Automobile Tire Co. The manufacturing concern is in possession of dies belonging to the tire company, and the dispute in question grew out of an alleged failure of the Mansfield company to deliver tires as fast as the Automobile Tire Co. wanted them. Since all its dies were in the Mansfield factory, the plaintiff claims its business was damaged by this failure to deliver. But there is a Mansfield side to the question, and the court must decide the dispute. While the $10,000 suits against Vice-President Henne and the company grow out of the same transaction, they are entirely separate actions.

The Rossbach suit is the outgrowth of a crude rubber contract. The Rossbach concern, which is made up of Jacob, Leopold and Max J. H. Rossbach, is a skin and hide concern but took a little dabble in crude rubber, contracting to deliver a specified quantity per month during 1912 and 1913 to the Mansfield company at 90 cents a pound. Whether a drop in the price of rubber had anything to do with it is not apparent, but following a decline below 90 the Rossbachs claim the Mansfield company repudiated its contract. The damages are estimated at $25,000.

SELLING GASOLENE MAKES GARAGE OF SUPPLY STORE

Buffalo Court Refuses to Permit Supplyman to Operate Without Garage License—Hinges Decision on Sale of Gasolene.

If the opinion of Justice Charles B. Wheeler, of the Supreme Court for Erie county, New York, holds good the question of whether a supply store or garage sells gasolene has much to do with whether it comes within the legal definition of a public garage. Justice Wheeler last week placed a supply store in the garage class, although the only reason for so doing, he said in discussing the question, was that the supply store sells gasolene.

The question came up when Charles R. Fish, who already operates one supply store at Cold Spring, wished to open another in Buffalo, at Massachusetts, Rhode Island and 15th streets; he applied to Commissioner of Public Works Ward and was directed to apply to the Common Council, which body alone has permission to issue garage permits. He refused and asked for a writ of mandamus compelling the commissioner to license his supply store, but the writ of mandamus was refused.

Justice Wheeler points out that the only question in the case is whether or not the proposed building is to be deemed a public garage. It was conceded that the building was to be used for supplying motor vehicles with gasolene and that a certain amount of gasolene was to be stored on the premises. He quoted with the ordinance language these words: "Or otherwise caring for motor vehicles of any kind for profit."

He held that supplying motor vehicles with gasolene is "otherwise caring for them," and added that a manifest purpose of the ordinance is to guard against the danger incident to surrounding property from the storage and sale of gasolene. He said that the section should be construed so as to carry out the general purposes of the chapter, and that with this in mind he had little hesitation in reaching the conclusion that the proposed structure should be deemed a public garage; that the words, "otherwise caring for" motor vehicles, mean something besides "storing, cleaning or repairing" them.

Marmon Made Honorary Member of I.A.E.

Fulfilling promises made at the joint meeting of the Institution of Automobile Engineers of England and the Society of Automobile Engineers aboard the steamer City of Detroit III, June 4-7, President Howard Marmon, of the American organization, has been unanimously elected an honorary member of the British institution. Marmon's election carries with it double honors, as he is the first man to be elected an honorary member of the I. A. E.

Ewing Lists Debts of $590,540; Assets $400.

L. E. Ewing, who organized several automobile enterprises, of which the Findlay Motor Co. was the last one, filed a voluntary petition in bankruptcy in the Federal Court in Cleveland, O., on Thursday last, 30th ult. He places his liabilities at $590,540 and his assets at $400.

Of the debts, $190,000 are due crediters of the Findlay Motor Co. Another large portion of the liabilities are the result of a guaranty and bonds furnished for the New York Mail Co. to the Federal government to insure the transportation of mails in New York City. One of the bonds, for which Ewing and others gave indemnity, amounts to $150,000. There is also due to A. H. Ewing, of Gates Mills, O., $42,500 for money borrowed.

Ewing started out to do big things in the automobile industry and got so far as to merge a Lockport (N. Y.) truck company with his own project in Findlay, but ill luck dogged his footsteps and none of his ventures panned out properly.

Velie Discontinues Retailing in Boston.

The Velie Motor Vehicle Co., of East Moline, Ill., has discontinued its branch in Boston, as the Velie car hereafter will be handled by an agency. The Velie people, however, will maintain an office and wholesale storeroom at 16 Amherst street, Cambridge, which is across the river from Boston.

Wilson Forms Tire Company in Jersey.

With J. C. Wilson as president, the India Rubber Co. has been organized in New Brunswick, N. J., for the purpose of producing tires. The other officers are Charles A. Hunter, vice-president, and W. L. Wild, secretary-treasurer. It is hoped to have the plant in operation by December 1st.

Maxwell Manager Dies Suddenly in Oregon

A. V. Davis, Northwestern manager of the Maxwell Motor Co., of Detroit, died suddenly at his home in Portland, Ore., on Sunday morning last, due to an attack of heart disease. Davis was 31 years old and went to Portland from Detroit less than a year ago.

Oakland Branch for Kalamazoo.

The Oakland Motor Car Co. has opened a branch in Kalamazoo, Mich.; it is in charge of Henry R. Jossman.

PALMER GOOD SPENDER BUT NOT VERY GOOD ON FIGURES

Michigan Financier not Clear as to Where that $1,656,000 Went—Kept Only a Check-Stub System—Then Lost Stubs.

Unless his bank books and check books can be found, the creditors of Victor L. Palmer, the financial genius of the badly busted Michigan Buggy Co., of Kalamazoo, will have a difficult time in discovering what he did with the $1,656,000 which he listed as liabilities when he filed his personal petition in bankruptcy.

This was indicated when Palmer took the stand last week for investigation by the referee in bankruptcy. He testified that he had never kept a cash book showing his personal expenses but had relied on his deposit and check books. He also declared that as he had made it a practice to destroy his canceled checks drawn on local banks and, unless the books could be found, it would be impossible for him to give the details of his financial transactions.

Questioned concerning the whereabouts of the bank books, he stated that they had been in his private desk at the time the Buggy company went into the hands of the receiver, and he supposed they were now in possession of the trustee.

Palmer told the referee that he had three separate bank accounts in Kalamazoo, and that the money was still in the banks.

"Did you not sell some bank shares on July 3 of this year?" he was asked.

"No, sir," was the reply.

From the line of questioning it is apparent that the trustees will make an effort to prove that Palmer sold certain shares to a Kalamazoo man a month prior to the failure of the Michigan Buggy Co.

Palmer stated that he had obtained money from a local bank to send his wife abroad. She has been in ill health for two years, he explained, and left last February. She is still in Europe.

The witness remembered buying some local bank stock at one time during the year, but could not give the exact date. He had paid $5,300 cash for the stock. He was asked if that was not an unusual transaction for him, and one which for that reason would be easily remembered, but he said he was not prepared to state. He explained that he purchased the bonds directly from the president of the bank and was not sure whether or not he received a receipt for the money or whether the bonds were delivered to him at the time.

As a result of the hearing, the Michigan Trust Co., of Grand Rapids, was appointed

Digitized by Google

trustee under bond of $1,000. It was explained that the bond was placed at this small figure because there was little likelihood of securing any part of Palmer's assets, as he had pledged nearly everything he owned with the exception of $103 cash in bank and several shares which he held in the Citizens' State Savings Bank of Plainwell. No appraisers were named, as it was pointed out that there would be practically nothing to appraise.

Palmer will be examined further on November 11th.

State Foreign Corporation Tax Upheld.

State authorities, who have been vainly trying for years to levy taxes on foreign corporations which do business within their confines, were given a solution of the problem this week when the United States Supreme Court upheld the foreign corporation tax law passed by Massachusetts in 1909.

Judges Day, Holmes, McKenna, Lurton, Hughes and Lamar—Van Devanter and Pitney dissenting—classified the tax as a fee exacted for the privilege of doing business in the State and not as a tax on the property of the corporation outside the State. The tax demanded is one-fiftieth of 1 per cent. of the foreign corporation's authorized capital stock, and opposition to it has been on the grounds that it conflicted with the Federal corporation tax law and imposed a burden on interstate commerce. The Supreme Court decision saves to the Bay State an income of $250,000 a year, as well as $1,000,000 which is involved in suits pending for the recovery of taxes paid during the past four years.

Electrical Men to Discuss Car Problems.

Taking up problems not altogether foreign to its members, the American Institute of Electrical Engineers has scheduled its next meeting, which will be held in the Engineering Societies Building, 33 West 39th street, New York City, on Friday evening, November 14th, to include nothing put papers having to do with the electrical equipment of gasolene automobiles and has urgently invited members of the Society of Automobile Engineers to be present and to take part in the discussion. The papers to be presented and discussed at the meeting are as follows: "Advantages of Clutch Type Generators and of Separate Lighting and Starting Units for Motor Cars," by Alexander Churchward; "Dynamo Electric Lighting for Motor Cars," by Alfred E. Waller; "Electrical Equipment for Gasolene Automobiles," by Frank Conrad of the Westinghouse Electric & Mfg. Co. It is expected that the meeting will be largely attended and that it will lead to other meetings along similar lines.

WILLYS-OVERLAND PRESENTS FULL FINANCIAL STATEMENT

Figures Show Prosperous Condition of Willys Properties—Assets Total $32,600,000 — Valuation of $14,000,000 on Goodwill.

Its consolidated balance sheet, as of June 30th last, having become available, amplification of the chief items of the Willys-Overland Co.'s financial operations, previously disclosed, have become possible.

The report, which covers not only the Willys-Overland institution but the several subsidiary companies, places the total assets at $32,602,836.07, of which amount $14,059,999.98 are represented by good-will, etc.

Exclusive of outstanding stock and the surplus the liabilities total $4,494,362.90.

The balance sheet includes the operations of all of the Willys subsidiaries for the complete year ending June 30th, but those applying to the Willys-Overland Co. itself cover only the period from November 18, 1912, (when the Ohio company succeeded the New York corporation), to June 30.

The report in full is as follows:

Assets.

Property Account:		
Goodwill, Patents, Trade Marks, etc.		$14,059,999.98
Real Estate, Buildings, Plant and Equipment as based on appraisals made by the American Appraisal Co., as of June 30, 1912, adjusted in respect of additions and deductions since—		
Real Estate	$321,006.07	
Buildings	2,435,220.81	
Machinery and Equipment	2,104,158.44	
Tools, Dies, Patterns, etc. (as depreciated)	528,218.25	
Furniture and Fixtures	70,002.54	
Automobile Equipment in Service	76,676.78	
Construction Work in Progress	85,725.60	5,621,008.49
Total Property Investment		$19,681,008.47
Investments in and Advances to Affiliated and Allied Companies		4,065,616.62
Current Assets:		
Inventories of Raw and Worked Materials and Supplies and Finished and Partly Finished Cars and Parts on hand or in transit, at cost	$5,186,858.56	
Accounts Receivable (less Reserves)	672,121.97	
Notes Receivable	363,875.55	
Miscellaneous Investments	26,825.00	
Cash in Banks and on hand	2,556,241.24	8,805,922.32
Deferred Charges to Future Operations:		
Expenditures on Development of New Overland Models	$5,227.87	
Prepaid Interest, Insurance, etc.	45,060.79	50,288.66
		$32,602,836.07

Liabilities.

Capital Stock—(Authorized and Issued):		
7% Cumulative Preferred Stock—50,000 Shares of $100.00 each	$5,000,000.00	
Common Stock—200,000 Shares of $100.00 each	20,000,000.00	$25,000,000.00
Capital Stock of Subsidiary Companies Outstanding, including Proportion of Surplus appertaining thereto		37,513.99
Total Capital Obligations		$25,037,513.99
Current Liabilities:		
Notes Payable (Trade Accounts, $2,189,614.70)	$2,457,974.94	
Accounts Payable	1,111,792.33	
Pay Rolls and Salaries Accrued	116,247.21	
Miscellaneous Loans and Advances	77,590.63	
Customers' Deposits	219,257.80	
Taxes and Interest Accrued	85,809.66	
Reserve for Quantity Rebates to Customers	172,417.99	
Reserve for Car Repairs under Guarantee	30,000.00	
Preferred Stock Dividends declared payable July 1, 1913	87,500.00	4,358,590.56
(Common Stock Dividends $1,300,000.00 were declared in July, payable in August, 1913.)		
Reserve for Depreciation and Accruing Renewals:		
Balance at June 30, 1912	$24,570.38	
Amount provided out of Earnings for the year, exclusive of provision for Depreciation of Tools, Dies, Patterns, etc. ($205,000.00) deducted from the Asset	193,155.12	
Less—Book Value of Dismantled Property and Replacement Expenditures written off	81,953.16	135,772.34
Surplus:		
Net Profits from July 1, 1912, to June 30, 1913	$5,653,898.37	
Deduct—Proportion thereof accrued to November 25, 1912, the date of commencement of operations of the new company	1,686,221.80	
Balance, being Net Profits of the new Corporation	$3,967,676.57	
Less—Dividends Paid—		
Preferred, 5¼%	$262,500.00	
Common, 3%	600,000.00	
Dividends paid on Outstanding Preferred Stocks of Affiliated Companies	34,217.39	896,717.39 3,070,959.18
		$32,602,836.07

Income Account.

Net Earnings and Income from Operations of all Companies for the year, after deducting all expenses of the business, including allowances for Corporation Excise Tax and all expenditures for Repairs and Maintenance of the Properties, including an adequate allowance for accruing renewals and depreciation		$5,705,537.46
Add—Other Income:		
Interest on Notes and Accounts Receivable	$151,601.91	
Miscellaneous	25,227.75	176,829.66
Total Earnings and Income from all sources		$5,882,367.12
Deduct—Interest on Floating Debt		228,468.75
Balance—Surplus Net Income for the year ending June 30, 1913		$5,653,898.37
Proportion accrued to November 30, 1912, the date adopted for the purposes of the Accounts as the commencement of Operations of the New Corporation, the Assets being actually acquired as of November 25, 1912		1,686,221.80
Balance, being Net Income of the New Corporation (seven months)		$3,967,676.57

The Week's Incorporations

Jackson, Mich.—Jackson Gas Engine Co., under Michigan laws; authorized capital, $10,000.

Cleveland, O.—Central Wagon & Auto Co., under Ohio laws; authorized capital, $10,000. Corporators—H. D. Squires and Harvey G. Keck.

Cleveland, O.—Automobile Addressing Machine Co., under Ohio laws; authorized capital, $150,000. Corporators—W. K. Stanley, P. C. Stoller and J. W. Curtis.

Milwaukee, Wis.—Fulton Co., under Wisconsin laws; authorized capital, $25,000. Corporators—Frank L. McNamara, Roger Y. Flanders and John H. Hurley.

Rochester, N. Y.—Indian Taxicab Co., under New York laws; authorized capital, $5,000. Corporators—W. S. Lucas, H. F. Lucas and A. B. Lucas, all of Rochester.

Detroit, Mich.—Federal Rim Co., under Michigan laws; authorized capital, $5,000; to manufacture wheels for motor cars. Corporators—A. H. Goss and H. W. Bailey.

Milwaukee, Wis.—Western Motor Supply Co., under Wisconsin laws; authorized capital, $25,000. Corporators—Roland F. Coerper, M. S. Gross and H. H. Karrow.

Cleveland, O.—Baxter-Frick Gear Cutting & Mfg. Co., under Ohio laws; authorized capital, $25,000. Corporators—Archie Baxter, William H. Frick, Vincent A. Taylor.

Detroit, Mich.—Tulite Auto Bulb Co., under Michigan laws; authorized capital, $25,000; to manufacture automobile lamps. Corporators—L. J. Lepper and James W. Richardson.

White Plains, N. Y.—W. L. Plumb Motor Co., under New York laws; authorized capital, $1,000. Corporators—W. L. Plumb, C. B. Plumb and S. Alton Ralph, all of White Plains.

Buffalo, N. Y.—Frontier Taxicab & Touring Co., under New York laws; authorized capital, $5,000. Corporators—Anthony Carnevale, Samuel Geddis and Frank Conover, all of Buffalo.

Worthington, O.—Worthington Garage Co., under Ohio laws; authorized capital, $3,000; to operate a garage. Corporators—George W. Wing, Frank P. Walling and Madeline Wing.

South Bend, Ind.—Bastian-Morley Co., under Indiana laws; authorized capital, $100,000; to manufacture gas, gasolene and electric apparatus. Corporators—James P. Morley, John P. Hayes, J. Morley.

Boston, Ky.—Boston Starter Co., under Kentucky laws; authorized capital, $100,000; to buy and sell automobile supplies and accessories. Corporators—H. W. Batson, George A. Christman, Graddy Cary.

Brooklyn, N. Y.—Utility Garage Co., under New York laws; authorized capital, $6,000. Corporators—Walter H. Rice, 1441 Bedford avenue; Saidie E. Miller and Hattie M. Rice, both of 237 Maple street.

Chicago, Ill.—Chicago Commercial Garage Co., under Illinois laws; authorized capital, $2,500; to rent, sell, buy and store motor cars. Corporators—Roy F. Beach, St. Clair Cousens and Robert C. McCabe.

Hamilton, Ont.—Hamilton Taxicabs & Garage, Ltd., under Canadian laws; authorized capital, $40,000; to manufacture and repair motor vehicles. Corporators—D. M. Sorenson, H. J. Davidson and others.

Wilmington, Del. — Oakbrook Motor Mfg. Co., under Delaware laws; authorized capital, $250,000. Corporators—W. F. Young, Perkiomen, Pa.; A. H. Yocum, Reading, Pa.; T. S. Doherty, Wilmington.

Chicago, Ill.—Private Motor Service Co., under Illinois laws; authorized capital, $10,000; to deal in motor cars, parts and accessories. Corporators — Charles S. Bougher, Walter H. Eckert, Warren B. Buckley.

Chicago, Ill.—Ford Supply Co., under Illinois laws; authorized capital, $10,000; to manufacture and deal in motor car supplies and accessories. Corporators—Harry Okin, Thomas J. Bagley, James S. McClellan.

Bronx, N. Y.—Simmons Auto Supply Co., under New York laws; authorized capital, $5,000. Corporators—John S. Kelly, 2138 Westchester avenue; George W. Lewis, 42 Broadway; George W. Smith, 901 Tremont avenue.

Newark, N. J.—M. A. Mullin Auto & Livery Co., under New Jersey laws; authorized capital, $100,000; to conduct a general livery business. Corporators—L. H. Vassant, W. F. King and J. H. Taylor, all of Newark.

Brooklyn, N. Y.—N. W. Manufacturing Co., under New York laws; authorized capital, $25,000; to manufacture automobile and body cleansers. Corporators—Chas. E. Williamson, Chas. E. Smith and Lucien C. Wallace.

Brooklyn, N. Y.—Pitts Motor Car Repair & Sales Corporation, under New York laws; authorized capital, $24,000. Corporators—Frank G. Pitts, George C. Walbridge and Rodney C. Walbridge, all of Brooklyn.

New York City, N. Y.—Detroiter Motor Sales Co. of New York, under New York laws; authorized capital, $5,000; to conduct general automobile business. Corporators—Chas. Aschenbach, Jos. Marx and Leon Hamburger.

Chicago, Ill.—Automobile & Cycle Trades Association, under Illinois laws; authorized capital, $5,000; to conduct a collection and adjustment agency. Corporators—Livingstone E. Osborne, J. Milton Tait and W. W. Love.

Brooklyn, N. Y.—Meyer's Garage, under New York laws; authorized capital, $1,000; to operate a garage. Corporators—Louis Meyer, 731 Eastern Parkway; James E. Friel, 1663 Union street; Otto Schult, 618 Linden street.

Santa Ana, Cal.—Duplex Distillate Carburetor Co., under California laws; authorized capital, $50,000; to manufacture a patent carburetter handling low-grade oil. Corporators—H. H. Kelly, Jr., J. C. Metzger and others.

Brooklyn, N. Y.—Coney Island Garage Co., under New York laws; authorized capital, $500; to operate a garage. Corporators—Walter J. Kelsey, 237 72nd street; Arthur Fulder and Frederick Meyer, both of 5313 Fifth avenue.

New York, N. Y.—American Motorists' Protective Association, under New York laws; authorized capital, $250,000. Corporators—Henry C. Reed, New York, N. Y.; Harold L. Sharp, Rutherford, N. J.; James Reilly, Newark, N. J.

Toledo, O.—Carl Electric Vehicle Co., under Ohio laws; authorized capital, $300,000; to manufacture electric vehicles. Corporators—L. M. Henders, M. G. McAleenan, B. E. Robertson, David L. Johnson and M. C. Myers.

New York, N. Y.—Detroit Tire & Rubber Co., under New York laws; authorized cap-

Digitized by Google

ital, $2,000. Corporators—Rudolph Henschel, 150 West 141st street; William A. Wellman, 1402 Lexington avenue; Rebecca F. Potter, 109 East 96th street.

New York City, N. Y.—Hirsch & Schwartz, under New York laws; authorized capital, $10,000; to conduct general automobile business. Corporators—Jos. Schwartz, Louis Hirsch and Jacob Schwartz, all of New York City.

Newark, N. J.—Essex Motors Mfg. Co., under New Jersey laws; authorized capital, $100,000; to manufacture motors, machinery, supplies, etc. Corporators—W. H. Simpson, East Orange; M. E. Hudlen, Newark; J. J. Coyle, New York.

New York, N. Y.—Marathon Tire Sales Co., under New York laws; authorized capital, $1,000; to conduct a general tire business. Corporators—Owen Moynihan, Bergenfield, N. J.; Joseph Brewster, 225 East 17th street; Richard M. Farries, Scarsdale.

New York, N. Y.—Weiss & Kronenberg, under New York laws; authorized capital, $10,000; to conduct a general motor vehicle business. Corporators—Charles Weiss, Harry Kronenberg, Mollie Weiss and Bertha Kronenberg, all of 113 West 77th street.

New York, N. Y.—Markell Corporation, under New York laws; authorized capital, $1,000; to operate a motor 'bus line. Corporators—Arthur B. Graham, 412 West End avenue; Archibald E. Stevenson, 128 West 34th street; Mildred J. Pelikan, 13 East 108th street.

Quogue, N. Y.—Dimond-Warren Motor Co., under New York laws; authorized capital, $8,000. Corporators—James R. Dimond, 171 West 71st street, New York; Arthur C. Warren, 517 West 113th street, New York; Thomas Dimond, 139 West 32nd street, New York.

New York, N. Y.—Welding Supply Co., under New York laws; authorized capital, $5,000; to manufacture and deal in motors, vehicles, oxygen-acetylene welding appliances, etc. Corporators—Walter E. McDonnell, Michael J. McDonnell and A. M. Matheson, all of 132 Nassau street.

Recent Losses by Fire.

Green Haven, N. Y.—George Foote; garage destroyed. Loss, $1,000.

Superior, Neb.—Superior Garage; garage and seven cars destroyed. Loss, $15,000.

Pittsburgh, Pa.—A. G. Schnabel & Sons Auto & Wagon Repair Co.; building damaged. Loss, $50,000.

Reading, Pa.—Reigel's Garage, 609 North 3rd street; garage and several cars damaged. Loss not stated.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

E. F. Thompson has been promoted to the post of sales manager of the Motz Tire & Rubber Co., of Akron, Ohio. Previously he was one of the company's department heads.

Benton Fremont, who for the past three years has been an Oakland representative, has been appointed acting manager of the Chevrolet Motor Co.'s branch in New York City. He succeeds Leslie F. Smith, resigned.

W. F. Renolds, formerly with the Lippard-Stewart Motor Car Co., of Buffalo, has been appointed district sales manager of the Selden Truck Sales Co., of Rochester. The latter handles the entire output of Selden trucks.

Will H. Brown, president of the Brown Commercial Car Co., of Indianapolis, has been appointed sales manager of the Cole Motor Car Co.'s branch in that city. The Brown company itself, however, will continue operating as heretofore.

Lee W. Bennett, who has been identified with the New York trade for several years, has acquired an interest in the Syracuse Automobile Supply Co., of Syracuse, N. Y., of which he will become president and general manager. He will assume these duties about November 15th.

F. P. Nehrbas has been appointed factory manager of the Lyons-Atlas Co., of Indianapolis, maker of Lyons-Knight cars. For 11 years, Nehrbas was factory manager for the E. R. Thomas Motor Co., of Buffalo. From August 1st, 1911, until the suspension of the Alco automobile department, he served the American Locomotive Co. in the same capacity.

George H. Matheson, who recently was appointed purchasing agent of the Keeton Motor Co., of Detroit, is not a member of the Matheson automobile family of Wilkes-Barre, Pa., as was at first stated. He was at no time associated with the Matheson car, but instead was connected with the McCord and Hayes manufacturing companies in Detroit.

Invader "Invades" Bay Shore Garage.

Lyndon E. Lee, Walter R. Lee and Edmund W. Lee, who operate in Bay Shore, L. I., as the Bay Shore Automobile Co., are the defendants in a suit filed this week in the Supreme Court for New York county by the Invader Oil Co. The action is for $123.27, the balance of a bill of goods supplied between April 2 and July 2, 1913.

Jeffery Erecting Another Big Addition.

Although the Thomas B. Jeffery Co.'s plant in Kenosha, Wis., already covers 25 acres, work has been started on the erection of an addition which will include 2¼ acres of floor space. The new building will be a steel and concrete structure of standard saw-tooth construction and will be ready for occupancy December 5th.

Little Falls Man Owes Gasolene Bill.

The Indian Refining Co. filed suit this week in the Supreme Court for New York county against John A. Cooney, of Little Falls, N. Y. It is charged that between May 19 and July 29, 1913, the refining company sold him goods to the value of $384.88, on which he paid but $80, leaving a balance of $304.88.

McGraw Takes up Making of Truck Tires.

The McGraw Tire & Rubber Co., of East Palestine, O., is making ready for the marketing of what will be known as the E. C. McGraw truck tire. It constitutes a special department of the business which will be managed by A. Hanschild, former manager of the Pollack Tire & Rubber Co.

Havers Reaches Out for Foreign Trade.

Edgar A. Wilhelmi, the New York exporter, left New York last week, taking with him, among other things, a Havers "six" car. He will visit both Great Britain and the Continent and later will go to India, where several parties are bidding for the Havers agency.

Standard Truck May Change its Base.

The Standard Motor Truck Co., of Cleveland, is negotiating with the board of trade at Warren, O., for its removal to the latter city. A factory site in the latter city already is assured, but the removal of the company hinges on a certain amount of stock subscription.

Wants Yonkers Garage to Pay Note.

A note for $100 given, it is claimed, by the Yonkers (N. Y.) Auto Station, Inc., to the Thomas Howard Co. of Brooklyn, September 12, 1913, is the basis of a suit filed this week in the Supreme Court for New York county by Vandewater & Co.

Another Republic Becomes Chevrolet.

Following similar action in other States, the Republic Motor Co. of New York has been authorized by the Supreme Court to change its name to the Chevrolet Motor Co. of New York. The change becomes effective November 28th.

In the RETAIL WORLD

Eureka Garage is the style of a new business in Eureka, Cal.

T. C. Duren, of Thomasville, Ga., is about to open a repair-shop.

Samuel Lomos, of Danville, Cal., has sold his garage to Harris Bros.

T. B. Ferguson, of Washington, D. C., plans to build a garage on 21st street.

Ideal Garage is the style of a new building being erected in Devil's Lake, S. D.

A. B. Gay, of Randolph, Vt., plans to build a garage; it will stand on Merchants' Row.

J. J. Richards has purchased the Austin Avenue Garage in Waco, Tex. He will operate it.

The Chalmers Motor Co. of Virginia plans to build a new service station in Norfolk, Va.

R. L. Brewster has opened a garage in Des Moines, Ia. It is located at 916 West Walnut street.

Carl Eckman, of Mankato, Minn., has awarded the contract for a new garage; it will cost $6,500.

J. L. Dugan is about to enter the trade in Iowa Falls, Ia. He has secured the Paige-Detroit agency.

The W. & F. Felberty Co., of 7916 Lake street, Cleveland, O., will build a garage; it will cost $6,000.

Dolandson S. Sipos, of Colton, Cal., has opened a garage; it is located in the De-Armand building.

E. Hudelson and P. Yancey have purchased the Galt (Cal.) Garage from T. J. Sawyer and Claud Mood.

C. Barry, of Thief River Falls, Minn., is about to erect a garage and machine shop; the estimated cost is $7,000.

Tri-State Sales Co. is the style of a new entrant to the trade in Dallas, Tex. It will distribute Marathon cars.

Larsen & Lehnen, of Corning, Ia., have dissolved partnership; Walter Larsen is engaged as a salesman in Omaha.

Cecil R. Culler and others plan to establish a wholesale and retail automobile supply business in Orangeburg, S. C.

The J. A. O'Leary Auto Co., of Iowa City, Ia., will build a new garage; a site has been purchased on Linn street.

A new garage is being erected in Rochester, Pa., for Conrad Bros. It will be one-story and of modern construction.

Henry Desmaris, of Holyoke, Mass., is erecting a three-story garage, 35 x 60 feet; it is located at 15-17 Division street.

A. J. Schmidt, of Modesto, Cal., is arranging to enter the trade in Porterville, Cal. He will handle Studebaker cars.

Arthur H. Swank, of Galesburg, Ill., has purchased from Frank Clark the Main Garage; it is located on East Main street.

John Boda and Charles Halberg have taken over a garage business in Sheldahl, Ia. The new style is Sheldahl Auto Co.

The Economy Auto Garage & Supply Co. has been formed in West Reading, Pa. It will locate on Pennsylvania avenue.

R. Carstensen, of Sacramento, Cal., plans to erect a garage; he also operates the Crystal Ice Co. and Snowball's saloon.

Charles D. Fisher, of Hagerstown, Md., has secured permission to erect a garage; he will build on North Mulberry street.

Glen Perdue plans to open a garage in Salisbury, Md. He is remodeling a warehouse on Dock street for that purpose.

B. L. Marks, of San Francisco, has been granted permission to operate a garage; he plans to locate at 4th and Brannan streets.

A new building has been erected in St. Louis for the Barrows & Crawford Motor Co. on Locust street; its cost was $40,000.

Edward P. Joster, of Baltimore, Md., has secured plans for a one-story garage to be erected on Spring street; it will cost $5,000.

The Automobile Training School, of St. Paul, is about to erect a two-story garage; the school is located at 199 West 6th street.

Frank Mead and James Ready are about to open a garage and repair-shop in Franklin, N. H. They will locate on Memorial street.

All interest in the garage firm of Cozad & Wise, of Villisca, Ia., have been acquired by Wise. Cozad retires from the business.

W. T. Wilson, of Omaha, Neb., has sold his Auburn agency to C. O. Wilson and W. F. Hause; the latter will trade as Wilson & Hause.

William Moore, of Oneonta, N. Y., has opened a garage on Windsor avenue; he formerly was connected with the Colburn & Moore Co.

F. & E. Sweraldo, of 252 Central avenue, East Orange, N. J., have been granted authority to build a garage; the estimated cost is $15,000.

The Hike Garage, in Sloan Springs, Ark., has been taken over by W. H. Bailey; he took immediate possession and is operating the business.

A. Ollendorf and Henry Hauman, of Newark, N. J., plan to open a garage at 45 William street; they will remodel a building for their occupancy.

W. H. Shaw, of Sonora, Cal., is remodeling for garage use a building which adjoins his livery stables; he recently entered the trade as a Maxwell dealer.

Ludwig and Jacob Walters have purchased the Mansfield (O.) Garage, located at 66 North Walnut street; Oscar Sigler will continue as manager.

J. H. Daniels & Son will open a garage, repair and accessory business in Eugene, Ore. They have leased space in the Quimby building, on West 8th street.

Edward McCasne and Simon Rersetter have taken over the La Porte Garage in Waterloo, Ia. Paul Clement, the former owner, retires from the business.

H. J. Neverman, of Denver, Ia., has purchased the Nicholas-Clark Garage in Waverly, in the same State; he has removed with his family to the latter town.

The Coryell-White Motor Car Co. has been formed in Pasadena, Cal. The company will handle Paige-Detroit and Howard cars at 161 West Colorado street.

Staples & Kimpton, of Phoenix, Ariz., have taken over Wesley Wood's garage at 235 West Washington street; the name has been changed to Capital City Garage.

R. M. Davis, manager of the Fort Worth (Tex.) Auto Supply Co., has become an automobile dealer; he has secured the Winton representation for several counties.

The Spaulding Auto Co., of Aberdeen, S. D., has been granted permission to build a two-story and basement garage, 50 x 120 feet; it will be of brick and will cost $14,000.

The International Motor Car Co., of Douglas, Ariz., has sold its business at 715 G avenue to J. Scott and others; the style

Digitized by Google

has been changed to International Garage.

Carl Bros., formerly of Houston, Tex., have entered the trade in Waco, in the same State, under the style Washington Garage; they are located at 110 Washington avenue.

W. H. Beidler, of Sacramento, Cal., has taken over the agency of E. G. Anderson; the latter was a sub-dealer under Don Lee, San Francisco, the Cadillac distributer in California.

The Leon T. Shettler Co., of Los Angeles, has taken over the distribution of Apperson cars in Arizona; the company plans a campaign for the establishing of sub-dealers.

G. H. Marvin, of Gastonia, N. C., and J. L. Snyder, of Charlotte, in the same State, have formed the Chase Motor Truck Sales Co. in the latter town; they will handle Chase commercial cars.

H. B. Beattie, formerly with the L. S. Hall Rubber Co. in Philadelphia, Pa., has entered the trade for himself; he has organized as H. B. Beattie & Co. and will handle tires and accessories.

The Cincinnati (O.) Automobile Co. is completing a two-story, fire-proof garage and salesrooms on West Court street, near Race street; the company stocks Pope-Hartford cars and supplies and accessories.

The Reliable Motor Car Co., of Salt Lake City, has purchased the interest of J. Mitchell in the Mitchell-Brown Repairing Co. The latter company will be known as the Brown-Reliable Motor Car Repairing Co.

The Auto Service Co. and the Cabarrus Motor Co., of Concord, N. C., have consolidated; the business will be continued in the Cabarrus location on West Corbin street. J. C. McCanless, M. Lafferty and M. McConnell are the proprietors.

Arthur Helbing, of Beaver Dam, Wis., has sold his interest in the Beaver Dam Overall Co. and has purchased the Stoddard Garage; he will share his quarters with the Beaver Garage Co. and will devote most of his time to the sale of cars.

The Dimond-Warren Motor Co. has been formed in New York City for the purpose of handling the wholesale and retail distribution of S & M cars in the metropolitan district; the company has located at 2002 Broadway. The officers are: President, Thomas Dimond; vice-president and treasurer, J. Renwick Dimond; secretary and manager, Arthur C. Warren. The Dimonds are connected with the Dimond Iron Works. Warren has been connected with the trade for ten years, as a racing driver and later as a salesman for Buick, Stearns, Pope-Hartford and Palmer-Singer cars.

TENTATIVE PROGRAM FOR S. A. E. WINTER MEETING

Benefits from Farm Tractors Included in Topics for Discussion at Professional Sessions—Banquet at the Hotel Plaza.

Following brief announcement of the dates of the annual meeting of the Society of Automobile Engineers, which will be held in Grand Central Palace in New York City during the week of the automobile show in that building, a tentative program now has been adopted and the titles of some of the papers that are to be read made public. The meeting proper, as stated three weeks ago in Motor World, will be inaugurated with a strictly social gathering at the Manhattan Automobile Club on Sunday afternoon, January 4th, at three o'clock. On Monday morning the Standards Committee will meet at the headquarters of the society at 1790 Broadway, and on Tuesday morning the professional sessions will be commenced at Grand Central Palace. Three sessions will be held on Tuesday—morning, afternoon and evening—and none will be held the following day, Wednesday. Two sessions will be held on Thursday—morning and afternoon—and the meeting will be brought to a close with the annual banquet, which is to be served at the Hotel Plaza, Fifth avenue and 59th street.

The whole of the first professional session will be devoted to reports of the various divisions on standardization, as will a good part of the second session. Only one paper has been announced for this session, though it is expected that others will be announced later. The paper is entitled "Storage Batteries" and will be presented by W. H. Conant, manager Detroit division of the Gould Storage Battery Co.

The Tuesday morning session has been styled a Commercial Vehicle Session and will be devoted entirely to subjects pertaining to motor trucks. The papers that will be read are as follows: "Final Drive for Motor Trucks: a—Internal Gear, by V. V. Torbenson; b—Double Reduction Live Axle, by B. B. Bachman; c—Worm Gear, by John Younger; d—Chain, by H. D. Church." "Gasolene Mining Locomotives," by Joseph A. Anglada; "Development of Electric Tractor for Handling Freight Cars Over Tracks Laid in City Streets," by T. V. Buckwalter; "Farm Tractors and What They Have Done to Promote Better Farming Conditions."

The reading of reports at the Thursday morning session will be supplemented by three papers, as follows: "Electric Gear Shifting," by Frank N. Nutt; "Taxicab Service," by L. P. Prossen; "Radiators," by J. W. Cain. At the afternoon session but one paper, entitled, "Knight Motor Cooling Test," and prepared by R. C. Carpenter, has been scheduled.

Inter-State Ordered to Explain Disparity.

Officers of the Inter-State Automobile Co., of Muncie, Ind., have been ordered to appear before the referee in bankruptcy, Henry C. Sheridan, Tuesday next, 11th inst., to give testimony concerning their acts, and also regarding the company's assets and liabilities.

The order was issued on the petition of the Livingston Radiator & Mfg. Co., of New York, whose claim amounts to $7,000, and who assert that the great disparity between the assets and the liabilities before and after the company was adjudged bankrupt requires explanation. The petition also charges that owing to the "alleged or pretended dissension" among the stockholders and officials great loss and waste has been occasioned and an early sale is, therefore, asked for in preference to a continuance of the business.

International Truck Affairs Untangling.

Although the affairs of the International Motor Co., of New York, were rendered somewhat complex last month when minority stockholders opposed a mortgage loan of $1,200,000, the company professes to be within easy reach of an exit from its troubles; the court, to which a minority stockholder applied for an injunction restraining the company from borrowing the additional capital, will probably render a decision Saturday, 8th inst., when the judge, who has been ill, resumes his duties. Officers of the company state that there is every likelihood that the loan will be secured and, also, that on all bank obligations, in fact on all except merchandise debts, maturity will be waived for three years, thus giving the company sufficient resources to render it, as one officer expressed it, "the strongest truck company in the business."

Champion Seeks to Save "Champion."

If Albert Champion, proprietor of the Champion Ignition Co., of Flint, Mich., can help it, the Champion Spark Plug Co., of Toledo, O., will not much longer use the name or term Champion in its title. In an effort to prevent it, the Flint man has brought suit in the Federal court in Ohio charging the Toledo company, which is composed of Robert A., Frank D. and Agnes Stranahan, with infringement of his trade mark. He seeks a restraining order preventing the use of the name Champion and also an accounting of damages since July 5, 1910, when the Toledo company was organized.

NIGHT WORK FOR MOTOR TRUCK.

In all large centers there is more or less trucking done at night—the larger the city the more the night trucking, usually, in proportion. As a rule, however, such work is done more as a matter of necessity than of policy. Milk, for instance, is hauled at night to have it at the depots ready for early morning distribution; coal sometimes is delivered at night to buildings so located that day delivery interferes with traffic and therefore is not permitted; and the loading and unloading of steamers necessitates night trucking.

It would seem, however, that there are many possibilities in night trucking from a purely economic point of view, where conditions are such as to permit the necessary work at the beginning and the end of the trips. It is almost axiomatic that the speed and endurance of the motor truck are often kept in the background by delays caused by traffic blocks and slow-downs, all of which can be avoided by running at night. In other words, more work can be done in a given time than in the day, generally speaking. And it is almost unnecessary to mention the fact that a continuous run from starting-point to terminus is far less wearing on a truck—its motor, transmission system, brakes and tires—than a run during which the car is frequently stopped and started, slowed down and accelerated, to the detriment of the tires and brakes in particular, but of everything else, more or less.

What trucking can be done during the night does not have to be done during the day, so that the streets would be relieved of a certain amount of traffic at a time when relief is most needed. And if the machines are kept standing during the day, they can be cared for under better conditions than if such work were done at night. From an electric vehicle point of view it is an advantage to charge during the day when the central station load is light.

Obviously there are objections to night trucking. Night work is distasteful to many men, and occasionally darkness interferes with operations—though not often. A certain amount of rearrangement of details might have to be effected to suit the new order of things. And there is the possibility that night work might bring about some increase in the wage scale. It would seem, however, that the advantages considerably outweigh the disadvantages, and that there is an opportunity to work out an improvement that has received too little consideration in the past.

WHERE THE CYCLECAR FALLS SHORT.

It being so distinctly apparent that any narrow gauge vehicle which needs must be balanced between two ruts, or else be driven with one or, rather, two wheels in a rut, cannot prove of all-around practicability, in this country, at least, the wonder is that so much energy is being devoted to the invention and exploitation of cyclecars.

Haply not a great deal of real capital has yet been actually invested in their manufacture and it is possible, therefore, that some of those who incline to such investment will find cause for pause in the opinions brought out last week by the discussion of the subject by the Metropolitan Section of the Society of Automobile Engineers. If the discussion serves this purpose, the Society will have rendered the automobile industry an uncommon service.

Brought face to face with stern facts, even the enthusiastic exponents of the cyclecar were for the first time, and more or less reluctantly, forced to acknowledge the limitation of the little vehicle which has been press agented into such undue prominence.

To agree that it is adapted chiefly for city and suburban usage is sufficient to condemn it. It may be true that there are many millions of people living in cities, but it requires inordinate faith and enthusiasm to believe that any very considerable number of those who may purchase cyclecars would restrict them to such use. Its capacity for annihilating distance is too great and human nature is too frail to permit the belief that persons likely to buy cyclecars will confine themselves to streets or macadam roads.

More than this, it has been abundantly demonstrated that no very large part of the American public will purchase or long make use of toylike or otherwise diminutive automobiles, no matter what may be their selling price. It appears to have been overlooked that there has been an almost unending succession of such vehicles produced and exploited and that each in turn created a splutter and then passed out. To slightly change their shape, increase their limitations by narrowing the tread, and call them cyclecars will not, in our opinion, be attended by happier results.

DAVIS IS VICTORIOUS IN GRUELLING DESERT RACE

Ex-Stage Driver Leads Home Eight Survivors Over 574-Mile Course —Bell (Marmon) and Nikrent (Buick) Next.

It is a far cry from stage coach driving to automobile driving, but that experience gained in the one may be good in the other was demonstrated yesterday (Wednesday) when Olin Davis, who at one time was a desert stage driver plying the whip in the shifting sands of Arizona, won the sixth annual Los Angeles to Phoenix, Ariz., road race at the wheel of a Locomobile. Over 574 miles of city streets, mountain roads and desert sands—chiefly sand—Davis piloted his car with a pack of 24 others following after; but none could catch him. He finished the grind in 18 hours 54 minutes, which is at the rate of 31 miles an hour. His time, as compared with the times of the other eight who finished, is as follows

Driver and car.	Time.
Olin Davis, Locomobile	18:54:00
Guy Bell, Marmon	21:45:00
Louis Nikrent, Buick	22:11:00
Jack Rice, Simplex	22:58:00
Ben Buxton, Mercer	23:28:00
Robert Creer, Mitchell	24:03:00
Boyd Ellis, Buick	24:04:00
Rev. E. P. Schenck, Ford	24:30:00

It is obvious that Davis did not have a particularly difficult time in winning, and even though his average speed was comparatively low, judging from other space-annihilating performances, that he "wabbled a bit," to put it mildly, on some of the desert roads must be patent to any who have any experience of Western so-called highways. According to custom, the 25 starters were sent away from Los Angeles soon after sun-up, their order of starting being as follows:

Charles Soules, Cadillac; W. H. Carlson, Simplex; Harry Ham, Cadillac; Olin Davis, Locomobile; Omar Toft, Simplex; L. J. McKone, Cadillac; Barney Oldfield, Simplex; Lowell Smith, Ford; James M. Smith, Buick; Tom Waters, Fiat; Guy Bell, Marmon; E. V. Tracy, National; Frank Verbeck, Fiat; A. T. Dickey, Packard; F. Wallace, Apperson; W. A. Folks, Blue Midget; J. F. Watson, Overland; Henley Ellis, Buick; H. J. Pink, Cole; H. L. Greer, Mitchell; J. C. Rice, Simplex; J. C. Tobin, Apperson; Ben Buxton, Mercer; Rev. E. P. Schenck, Ford; Louis Nikrent, Buick.

As was the case two years ago, the course led southward down the coast to San Diego and then east across the Colorado River to Yuma, which was the night control. Last year the course led from San Diego around the mountains and the Salton Sea. From Yuma the trail led to Phoenix, Ariz., and someone with a penchant for figures has figured that of the 574 miles, 150 were boulevards, 170 mountain roads and 254 mostly the shifting sands of the desert. Between the starting point and the finish line there were 11 checking stations, including the control at Yuma, which is 368 miles from Los Angeles and a fairly long jaunt for a day.

As it was, only four of those who got as far as Yuma checked in before dark and the others all had their lights going. But not all of them survived to finish the first day's run. Of the 25 that started, only 19 reached San Diego, 130 miles away, and but 14 drew into Yuma that night, a fact which is eloquent of the conditions with which the drivers had to grapple.

Although he did not finish the race, Barney Oldfield, from whom great things were expected, provided no small part of the excitement and at one time it was reported that he had been killed. Oldfield lowered the record from Los Angeles to San Diego from 3 hours 7 minutes to 2 hours 41 minutes, thereby raising the hopes of his followers. Later, however, he slipped off the road into the Colorado Desert, where he remained until the driver of the next car towed him back to terra firma and started him on his way. He reached Yuma all right, but early the next day side-swiped a farmer's wagon, stampeded the horse, wrecked his Simplex—and quit. Rice, on the other Simplex, picked him up and brought him in.

Oldfield, however, was not the only one to furnish thrills. Forty miles from the starting point Omar Toft wrecked his Simplex; 60 miles further along the course McKone and his Cadillac came to grief, and both he and his mechanic were carried in on Waters's Fiat, which also had been wrecked after passing San Diego. W. H. Carlson, at the wheel of a Simplex, was the first into Yuma, and 12 minutes later Rice, in another Simplex, rolled in, carrying Oldfield and his mechanic. Charles Soules drove his Cadillac to within 100 miles of the finish line before he was forced out, and Hams, also in a Cadillac, went 20 miles further before he, too, had to quit—wrecked.

Louis Nikrent, who, accompanied by his brother Joseph, won the desert race with a Buick in 1909, was another man of whom great things were expected and, though he started last, he reached Yuma fifth; eventually he finished in third place. Frank Verbeck, who won the July race to Sacramento, finished 11th in time to Yuma, but a succession of troubles in the awful Mammoth Wash Sink and on the sands of the desert eliminated him from the running.

HOLDING THE MIRROR UP TO THE CYCLECAR

Little Vehicle Subjected to Searching Criticism by S. A. E. Members—Deemed by Majority to be Fit Only For Town Service—None Able to Define "Cyclecar" But Nearly All Know What it Should Mean.

"When is a cyclecar?" quite as much as "What is a cyclecar?" was the rather knotty question that served as considerable of a poser for the hundred-odd engineers and others who attended the monthly meeting of the Metropolitan Section of the Society of Automobile Engineers that was held on Thursday last, 30th ult., at the headquarters of the Society in New York City. Regardless of the glibness with which the foreign automobile manufacturer may be able to answer either question, that the American manufacturer is not blessed with or cannot be blamed with having and not disseminating information which will enable him to explain just where the miniature automobile leaves off and the cyclecar commences, or vice versa, was made very plain.

The meeting was devoted entirely to a discussion of the broad topic "Cyclecars," and though the delving was deep—it was the first serious consideration of the subject, in fact—and much of an enlightening nature was brought forth, not one of the hundred-odd engineers and others who attended could suggest a meaning for the word "cyclecar." A. L. McMurtry made the best attempt at it, however, and brought down the house by stating that to the public, at least, a cyclecar appeared to be a "three- or four-wheeled vehicle which sells for $350 and costs $600 to build."

Cyclecar Essentially Town Vehicle.

But after all was said and done, it undoubtedly was the concensus of opinion of those present that a cyclecar is essentially a town vehicle, most useful on paved city streets and limited in its effective or comfortable range to a radius of action of about 50 miles around large cities where unrutted roads are not the rule; that it is not a touring vehicle or one for general all-around use was the overwhelming opinion.

Much was said for the cyclecar and much was said in arraignment of it in the search for a reason for its being. And in this respect McMurtry expressed the sentiments of more than one of those present when he stated in the course of his remarks that the advent of the cyclecar "has afforded questionable promoters a new excuse to organize manufacturing companies to build cyclecars at ridiculously low prices." McMurtry took up probably more time than did any one else in voicing his sentiments for and against the cyclecar, and in the end his sentiment for the motorcycle and against the cyclecar took the form of a graceful tribute to the two-wheeled vehicle, to its overwhelming advantage over the three-tracker or the narrow tread two-tracker and to the seeming foolishness of attempting to convert it into a cyclecar by the not altogether simple expedient of adding two more wheels to it. McMurtry said, in part:

Modern Motorcycle Little Understood.

"The cheapest motor vehicle is the motorcycle. Next to it is the cheap automobile. Most of you are aware of the characteristics of the cheap automobile, yet few really know the modern high-power motorcycle. Of all motor-propelled vehicles, the modern motorcycle is the least understood and the most universally condemned. Almost all the arguments against the modern motorcycle are false because they are based on assumptions rather than on facts.

"The cylinder volume tax in some countries was so heavy that the manufacturers designed cars fitted with small high-speed motors. These small cars in most cases were exact duplicates of the regular product on a much smaller scale. It is a mistaken idea that these cars were designed solely to compete with the inexpensive American car, as some appeared on the highways long before the so-called invasion of the American car.

"Assuming that a two-passenger car containing all the essentials of a motorcycle, thereby avoiding apparently the expensive construction of the automobile, or a miniature car built on a lesser degree of refinement would answer the requirements, manufacturers of such a car have named it a cyclecar. We therefore have two types of a cyclecar—namely, the modified motorcycle and the small automobile. . . .

Pointed Questions that Lack Answers.

"The average automobile engineer has always shown a certain amount of contempt for motorcycles in general. Little do they realize that the motorcycle engineer has brought his product to a high state of refinement, equal to, if not superior to, the best automobile.

"It is peculiar that the earlier types of motorcycles were belt driven, while the modern types are chain driven through clutches, yet the small types of cyclecars are belt driven. If a cyclecar is designed based on motorcycle practice, it should have all the refinement of the motorcycle in regard to both material and workmanship.

"If it is possible to build a cyclecar which embodies almost all the essential elements of the motorcycle, why are not the motorcycle builders making them? Why are so few interested?

"If we take the price of a motorcycle as a basis of comparison, then a motorcycle type of cyclecar should reasonably cost over $500. This is provided, however, that the proposed cyclecar is built with the same sterling quality of workmanship and material which may be found in the modern motorcycle.

Is the Demand for the Cyclecar Real?

"All the proposed American cyclecars are nothing more or less than small automobiles and as such are in a class by themselves in regard to utility, operation and cost of maintenance. The price of the actual American cyclecar is very close to that of the cheap automobile, while the prices of the cyclecars that remain in blueprint form are too low to guarantee either first class construction or their actual existence.

"As the cyclecar is at present of considerable interest it is natural to hear of a great demand for it. Has this demand been analyzed? Is it a question of what is wanted or what can be supplied? Does the question of cost supercede mechanical construction? Does the demand actually exist, or is it a question of many inquiries and few sales?

"Why are the large automobile factories with their wonderful manufacturing facilities not attempting to supply it? Can it be possible that the makers of cheap automobiles are waiting to eliminate their list of full equipment, design a skeleton body and meet the demand for a cyclecar with a cheaper automobile?

"It is not my intention to appear pessi-

GETTING READY FOR WINTER

Cold Days Mean Dollars for the Garageman Who is Prepared—Stock of Anti-Freeze and Winter Wares Should be Ready for the Call.

Now is the golden opportunity for the dealer who is wide awake and fully capable of grappling with his opportunities. Winter will soon be here and, instead of dreading it, the live, energetic chap is going to make it an occasion of profit. What are you going to do about it?

Have you got your anti-freezing solution ordered? Or will you wait, as many do, until after the real need has passed? The time when a man comes to you for it is the time to have the stuff on hand so you can give it to him. The transition from moderately cold weather to extremely cold weather takes place very quickly; watch the calendar and the weather reports and be prepared for the change. The change is coming; there is no uncertainty. It is not a question of stocking goods that may never be called for.

Demands that Cold Weather Causes.

Already there is a demand for gauntlets, lap-robes, rugs, hood-covers, footwarmers, etc. With prices right, the average motorist would rather purchase this equipment from his dealer than from anyone else.

There are carburetters that are particularly adapted for cold weather starting; there are primers that many a customer would buy to aid his electric starter, if he only knew about them. The dealer who suggests these conveniences to his customers is likely to make a friend and a profit at the same time.

This suggests the thought that the way to sell things is to have them for sale. No man who has a picture of a car in his pocket is regarded as a dealer in cars. If you plan seriously to undertake the sale of those accessories which will bring you profits, carry a stock of the staples and at least a sample of the others.

CLEANLINESS AND DIRT AND THEIR RELATION TO BUSINESS

Clean windows; clean floors; clean desks; clean repair shop; clean stockroom. They all go together. Where you see one you are likely to see the other. The man who hates dirt hates it anywhere and teaches others to hate it just as much. Dirt is a foe to good business. It breeds incompetence. It breeds distrust, shiftlessness and failure.

"Show me the garage that is dirty and ill-kept and I'll show you a garage that is not making money," said a keen-eyed traveling salesman.

The clean man cleaves unto clean things. There is no argument in favor of dirt. If you were to analyze why some dealers feel discouraged and hopeless and blue, you would in nine cases out of ten find the answer in that one word "dirt."

Clean up! Brighten up! Stir up! Begin now!

SAMENESS OF WINDOW DISPLAYS; WAYS TO AVOID THE MONOTONY

Now is the time to think of effective window displays. A simple car in the window is not enough. People get tired of seeing the same thing and after a very short time it ceases to attract attention. That means you should plan some way of changing your window display—and plan to keep it constantly changing.

Even the addition of a rug on the floor is a change where the floor has been bare. Add a few potted plants, such as ferns and palms, it creates still more interest. Why not try a new method of window lighting, so that your window will get maximum attention at night?

Husbands and wives are more frequently down town together at night than at any other time. Perhaps if your display is just right it may be the means of centering interest on your particular car. Little things count and such a thing as a particularly attractive display might be just the means of swinging an order your way. It has been known to happen before—and every salesman is aware of sales switched as a result of details seemingly unimportant.

Perhaps it would be a good idea to have your salesroom entirely redecorated. The walls may have grown dirty and dust-covered. Look things over from the eye of a prospective customer and see what effect it would have on you from that angle. Then go and do the needful thing.

Why not plan a Thanksgiving display of special order? Perhaps an arrangement giving a football atmosphere could be worked out. Use your imagination. Study the effects produced by your brother merchants in other lines. Do something!

FAIR WEATHER SALESMEN AND THE RAIN-INSPIRED KIND

At this season each year many salesmen become discouraged. Weather is generally bad. Everything tends to encourage putting off. Tomorrow may be a fine day. "No one wants to talk automobile on a day like this," is the universal sentiment.

But the real salesman delights in such obstacles. It gives him a chance to prove that he is superior to the weather and he realizes that if the majority of salesmen are "lying down" their lapses give him an extra opportunity to show his quality.

He lays his plans even more carefully than in good weather, and he finds his prospects at home—or office—when he calls. He finds that his energy and enthusiasm meet with instant response. It is easier to get undivided attention and, while action is often delayed, his work counts for more.

There is something inspiring about the man who comes along full of business and energy when others are putting off.

AWAKE-NDISING WORLD

3 MEN---3 QUALITIES---3 YEARS

Trio of Youths Who Built up a $50,000 Business by Work, Hustle and Honesty—Free from Debt in Three Years—How They Did it.

In a little less than three years a certain firm of automobile dealers has built a business that is the wonder of their local competitors, and that has yielded them a substantial profit. They went into a territory where they were absolutely unknown and where the sales of the car they represented had been comparatively few and far between.

The members of the firm were—and are—all young men. They realized that they were going into a business that meant work. Not one of them had ever sold automobiles at retail or wholesale before. All of them, however, had driven cars and understood them, and they knew the car they were selling. They were not rich men's sons, but boys who had accumulated some money and were able to borrow enough more to obtain the necessary capital.

Methods, Not Experience, the Secret.

In three years they have paid back all they borrowed. They all draw a comfortable living salary and a division of the profits, if declared, would give each of them a good start in life. But more than that, they have a business the estimated value of which is close to $50,000. And all this has been done without previous experience in the line and during a period when many dealers have been kicking themselves because they ever went into the automobile business.

The secret of their success lies in three words—Work, Honesty, Hustle. They made up their minds that the business was one which required the hardest kind of work to succeed. They all entered it prepared to work—there was no room for loafers. One was assigned to the selling end as his special domain, one looked particularly after the mechanical department and the other exercised a general supervision over everything. In addition, every man of them boosted the other fellow and worked with him.

They were determined to succeed together and they have done so. Too many partnerships split on the division of work. This partnership succeeded on it. The spirit of mutual help and mutual confidence and mutual work did the trtick.

Square with Everyone Every Time.

At the very start they made up their minds that they would demand the highest type of honesty from themselves and would expect it from their customers. If there was an argument with a customer he was given the benefit of the doubt. "We felt many times as if we had been too easy," said a member of the firm, "but now we know that those little cases were small in comparison with the big business we have been working for; we have a sub-dealer organization that believes in us, works for us and trusts us completely. It has been built up by being square with every sub-dealer every time."

When you have done that—"been square with everyone every time"—you need not fear for the future. Dealers like that treatment whether it comes from the factory or from the distributer with whom they do business.

ADVANTAGES OF MAKING THE USED CAR A DEPARTMENT

There is a growing tendency toward specialization in the automobile business that bids fair to help solve many of its problems. The evidences of this tendency are not lacking in either small or large cities. You see it on every hand. Particularly is it noticeable in the methods of handling used cars.

In the small cities it is not at all uncommon to find garages where one of the salesmen devotes his entire time to the used car end of the business. When a customer with a trade-in appears he is promptly turned over to the "used car man" whose practical knowledge of used car values enables him to judge at once the desirability of the sale. In most cases his word is final and very often he has on his list of prospects a customer for every car he is called upon to take in.

In New York City Carl H. Page & Co., which sells Chalmers cars, has gone to greater lengths than this. A separate business has been established for the handling of used cars. It has its own establishment, its own manager, its own salesmen and its own repair and service department. The idea is a logical one and it has proven profitable. The used car salesman has but one subject on his mind—namely, used cars. He is thinking used cars all the time; that is his field and by specialization he becomes an expert in used car values and used car sales, whereas the salesman who attempts to sell new cars as well as used cars naturally gives the new cars the preference in his thoughts and activities. And the used cars become sidetracked waiting for a "better day."

WHY THE FARMER CAN OWN A CAR WHERE CITY MAN CAN'T

It goes without saying that the absence of garaging and kindred charges makes it possible for many people to own cars in the country who could not dream of doing so in the city. Most farmers are their own blacksmiths, so far as all ordinary work is concerned, and a well-equipped blacksmithing outfit, including a man's size forge, is to be found on nearly every good-sized farm. So the farmer gets very handy with tools and manages to keep away from the repair shop except when something of a serious nature happens, which is not often.

"BOAT BODIES" NEW NOTE IN ANNUAL FRENCH SALON

No Radical Tendencies Apparent and "Sixes" Losing Ground—Lubricating Methods and Springs Show Greatest Changes.

Without revealing a very great deal that is startlingly new in design or construction, the 14th French Salon, which was opened in the Grand Palais in the Avenue des Champs Elysees, Paris, on Friday, October 17th, closed its doors on Monday, October 27th; it, however, served to make plain, among other things, that the changes that have been made abroad and that are being made, are no greater than those reflected by American practice; that the new cars are essentially the old cars refined. As was stated in Motor World two weeks ago, American makers were well represented, Ford, Hudson, Cadillac, Packard, Hupmobile, Buick, Case, Overland, and Mitchell cars being prominently displayed.

But if there is not a great deal that is new in mechanical construction, the French builders seem to have struck a brand new note in body building, the most startling feature of which is the appearance of the so-called "boat" body, a type that likely will be looked at askance by the American motoring public, but which appears to have caught on to an unusual degree abroad. In the various types of boat bodies the resemblance to floating conveyances does not stop with the appearance. It is carried deeply into the construction. Such bodies for the most part are built up of a number of "skins" of woodwork to resemble exactly existing types of fast marine runabouts. The theory of such construction is that it reduces weight, while the lines conduce to a reduction of wind resistance. In at least one such body, the seats are removable and the "hull" is fitted with a cockpit coaming in regulation marine style. In another respect, the silhouette of the modern car has changed. Hoods slope more sharply and there is a well-defined tendency to smooth down the sharp corners of radiators, though the V-type does not appear to be increasing.

Whatever else may be said for foreign tendencies in design it is certain that the six-cylinder motor has not gained in popularity in the slightest degree; the year is certainly not a six-cylinder year, as was freely predicted might be the case. If anything, the "six" has retrograded and the small, high-efficiency four-cylinder motor bids fair to very nearly boost it off the boards. In the popular sizes and even in the larger sizes, block casting has come more than ever to the front and for the main part valves are placed all on one side and are neatly enclosed. The most popular size motor would seem to be one with cylinders measuring about 80 mm. x 150 mm., or roughly, 3⅛ x 5⅞ inches, making plain that the trend toward still greater stroke to bore ratios apparently has ceased for the time being at least. In constructional details, few motors depart from the conventional, the general attempt being to obtain compactness, simplicity and clean design—three features which long have been recognizable in American motors.

With regard to essential components, double ignition has almost entirely disappeared, the magneto being deemed sufficient for even the largest sized motors. In lubrication methods there has been a concerted attempt made to increase oil capacity. Some engines now carry as much as 2½ gallons of oil, which is maintained in constant circulation, and in a noteworthy number of cases manufacturers have attempted to facilitate cooling by casting fins on the bottoms of their crankcases. Another suggestive development is that under pans fast are disappearing. Pump and thermo-siphon cooling are about on a par, though the balance gives evidence of swinging in favor of mechanical circulation in the not far distant future.

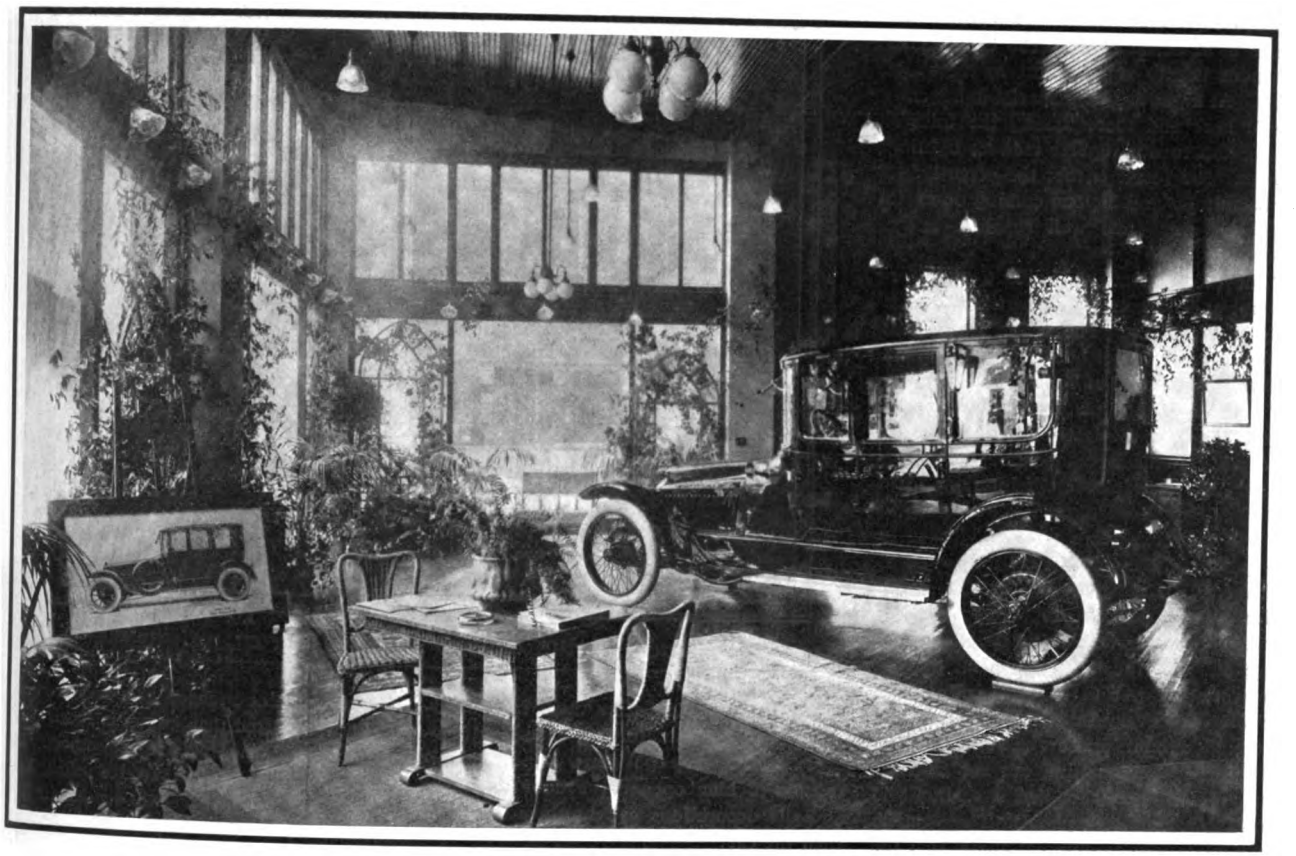
Despite the year or more of American experience from which foreign designers have to draw, they appear to be in no great hurry to embrace electrical equipment to anywhere near the extent it has been embraced in America. In a very few cases, makers are supplying electric lighting and engine starting apparatus as standard equipment, and in a few others they have indicated their intention of supplying it on demand. At any rate, that the movement in favor of such apparatus has been felt abroad is made plain by the fact that a number of foreign manufacturers now make provision on their engines for the mounting of lighting generators at least and some provide, too, for starting motors. Electric lights are fairly common, though the old oil lamp and the not so old acetylene lamp still are much in evidence.

Another feature of the foreign car in the abstract that is worthy of more than passing notice is the great preponderance of the Hele-Shaw clutch on Continental machines. British designers as a rule have not taken very kindly to the Hele-Shaw clutch, but across the Channel there has been a veritable landslide toward it. The general impression seems to be that, weight for weight and size for size, the Hele-Shaw clutch provides for greater flexibility and smoothness than does the cone clutch or the usual type of disk or plate mechanism.

Brakes, as a rule, are considerably larger this year than ever before, and the general increase in size is taken by those in the know to indicate a previous and conspicuous failing that only now has been recognized. There has been no appreciable increase in the number of makers housing both pairs of brakes side by side in the same drums, and there has been no increase whatsoever in the use of front wheel brakes; the practice, in fact, appears to be dying a perfectly natural death for want of sufficient demand on the part of the public.

In spring suspensions there probably has been more change than in any other single constructional detail. The transverse rear spring of the platform type has quite disappeared, though some makers still adhere to the single transverse semi-elliptic member. Likewise, the three-quarter elliptic rear suspension fast is giving way to the simpler semi-elliptic suspension incorporating long, flexible members. In one of the models on exhibition, for instance, the leaves are more than three inches in width, are extremely thin and are 60 inches in length, though this probably is the extreme. The tendency, nevertheless, is toward thinner leaves and more of them. The designers of Clement-Bayard cars have adopted a rather unusual suspension in which the rear members are double cantilevers, one cantilever member being mounted directly above the other. A peculiar action which is claimed effectually to damp out oscillation and provide the maximum of resiliency results.

Contrary to what may be expressed as the general expectation, the worm drive has not made great strides during the past year; some few makers have taken it up in a tentative sort of way and others have dropped it. On the whole, it does not appear to have either advanced or retreated in the general affections of engineers; it has remained practically stationary.



Here's a Toothsome Story from Winnipeg.

An eye for an eye, says the old law, and a tooth for a tooth—but as far as anyone has discovered, there is nothing in the Book about a tooth for a magneto contact. Yet that is almost what a Winnipeg man used. Anyway, this is the yarn: Two of them were out in the country in a car; one of them, incidentally, was a doctor, which may have had something to do with it. The sawbones—who must have been a tusk-yanker, too—was doing something to the magneto when he lost one of the platinum contacts. Promptly seizing his companion, he extracted from one of his teeth a modicum of the super-precious metal, made a magneto contact of it and put it in the machine and drove home. Winnipeg is a long way off!

THE "SPECIAL WEEK" IN AUTOMOBILE SELLING

Detroit Dealer Worked Out a "Sedan Week" Along Lines of Special Sales in Other Trades—Finds Value in the Plan But Declares Thoroughness is Essential—How the Project Was Carried Out.

INSIDE OF BEMB-ROBINSON SALESROOM IN DETROIT SHOWING SETTING FOR "SEDAN WEEK"

When a dry goods merchant has a sale of dress goods or underwear it doesn't suggest anything in particular to some automobile dealers, for they are unable to see any connection between dry goods and cars. As a matter of fact, there isn't much connection between dry goods and cars, but there is a mighty relation between the merchandising methods which lie back of the selling of these two widely differing products.

That it is possible to develop special selling plans in the automobile trade and to have "special weeks" wherein emphasis is effectively laid on some one feature of the dealer's line or business has been demonstrated in more than one way and probably no better than by the enterprising Bemb-Robinson Co., the Hudson dealer in Detroit. This company believes that selling cars is as much a merchandising proposition as is the retailing of dry goods, and in support of its belief recently held a "Sedan week" of which the feature was the Hudson Sedan.

But the company didn't just roll its Sedans into the windows and let it go at that; it went still further—further than many dealers would think of going. And they say it paid. How it was done is best told by Walter Bemb himself.

"The department stores and cloak houses have their fall openings at which time they get special attention and do a lot of extra business," he said. "People go to the stores to see the things they want and buy. If we can get anyone to come to our showroom the battle is half over. Our showroom is our meal ticket because when you have a man in your showroom you get his undivided attention. There are no telephone calls and no people popping in and out to draw his attention from the business in hand. What could we do to get a number of people we regarded as prospective customers into our showroom? That was the problem, and this 'Sedan week' is one way we solved it.

"Last year we had a 'Limousine week.' It was a success. From it we learned a lot of things that helped make 'Sedan week' a greater success.

"How did we go about it? Of course, we had our general scheme thoroughly in mind and this is the way we worked it out: First, we planned our general decorative scheme. You will note that the motif is an Italian garden, vines everywhere, a fountain run by an electric motor in the corner with ferns and other green plants banked up around it till the only visible part of the fountain is the delicate little stream spurting up into the air. Of course, there are

Digitized by Google

plenty of cut flowers, chrysanthemums predominating.

"Now, you will notice that our windows are ornamented with lattice frames and decorated with flowers and vines. The idea is to shut up the windows so that people will come in to see instead of trying to peek through from the outside. We want them here—inside.

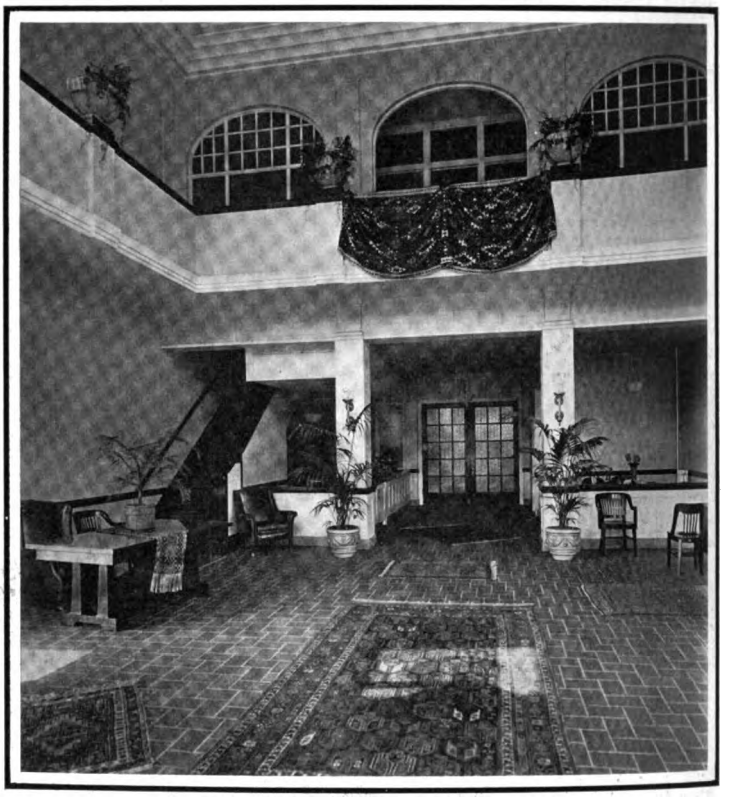
"Our floors do not usually have those Turkish rugs, and that special garden furniture is in harmony with the decorations and adds beauty and comfort to the show room. At night, we have special lights concealed here and there among the foliage, in addition to our regular indirect lighting system. The result is that the place lights up beautifully and anyone coming down to view the cars feels well repaid for the trouble.

"But the decorations, while a very important and necessary part of the plan, are only a part of it. The whole thing is a selling scheme to get before the public and secure the attention of buyers.

"The invitation on special stationery was sent out to a selected list of prospects who we thought would be interested in a closed car. Besides these, invitations were sent generally to Detroit's 'four hundred.'

"The next step was a simple invitation to the public in the Sunday papers to 'come and see.' This same advertisement was run twice in the theater programs.

"Now, here is where many dealers would leave off. But the most important part of our work was yet to be done. On Monday morning every salesman was on hand at the showroom; and every night till 9:30, with our decorations and our car and our men, we were ready for business. But, you know how it is with people. They get so many invitations to different affairs that the response is naturally not large. Yet, if they are overlooked they feel slighted. But that printed invitation was only part of the idea.



"Right away our men got busy on the 'phone calling up prospects they thought would be particularly interested. They not only extended personal invitations over the 'phone but offered to send a Sedan for them and bring them down here and take them home. You see, we had a car just for that purpose. Of course, most of these invitations were accepted, and thus the prospects got a demonstration of the car on the way down—and when they got here were quite prepared to agree that the Hudson Sedan was a beautiful and comfortable car.

"In many cases as many as four people in the family came down—father, mother, daughter and son. Could there be any better way to sell them all then to get them into our showroom at such a time? Could there be any stronger appeal to their vanity than sending after them in a handsome car with a uniformed chauffeur driving? When they got here a porter uniformed in blue opened the door for them and the decorations caught their eye—and then the car!

"Most assuredly it has been a success. Sedan week started Monday, and up to Friday we sold three Sedans. The week has been one continuous downpour of rain—and you know the effect that ordinarily has on salesmen. If we had not had 'Sedan week' it would have been a dead week. Instead, our men have been full of 'pep' and enthusiasm. The whole store emanates success and up-to-date methods. Every man is alive and on his mettle. He dresses with even more care than usual and he has a definiteness of purpose that means business. Why, do you know that pretty nearly all the other dealers in town have been here to see how we were making out? It has been the talk of the town.

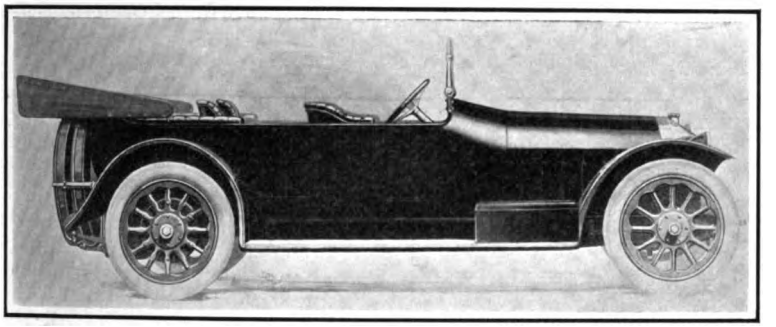
"So far, I said we have made three sales. Those are real orders, deposits paid down and immediate delivery ordered. Besides that, we have gotten very close to some people who will later be buyers. We are sure of that. Every Hudson owner feels pleased and not a few of them have dropped in and suggested that we get in touch with some friend who is a likely prospect. In short, this plan of concentrated selling has worked so well that we will continue it for another week. And we expect to follow it with other schemes that are just as practical later on."

INVITING "ATMOSPHERE" OBTAINED IN A SALESROOM

SOUTH BRANCH OF THE CHICAGO ELECTRIC CAR CO., IN CHICAGO, ILL.

Bright Headlights Challenge to Hawk.

The hawk may have been arguing in the only way he knew for headlight dimmers or he may have been out "on a bat," but when he tried to pull Thomas Lane Ross, of 1524 State street, New Orleans, out of the car in which he was riding last week, Ross spent a strenuous few minutes.



He was riding with Dr. C. A. Bohne on the West End road when the hawk appeared in the cone of light ahead, swooping at the headlights; but his aim was bad. The bird missed the lights, so grabbed at the next object in line, which chanced to be Ross's arm. Ross fought to throw off the bird and the physician increased the car's speed, but it was some distance before the sharp-taloned hawk could be beaten off. Even then the bird made another swoop at the car but missed and quit the battle.

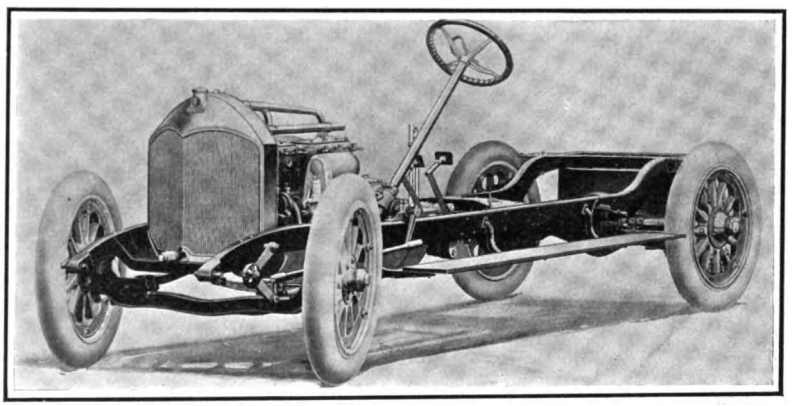
PATHFINDER TAKES TRAIL WITH SIX-CYLINDER MODEL

Unexpected Addition to Line Has Unusual Details—Electric Starting and Lighting and Four-Speed Gearset Direct on Third.

When the Motor Car Mfg. Co., of Indianapolis, Ind., some three or four months ago, made known the fact that its four-cylinder Pathfinder car had measured up so well in the past that it was considered good enough to stand as it was, with some minor improvements, not a word was allowed to escape to indicate that a brand new model was in course of preparation, and so, in the description of the single four-cylinder Pathfinder chassis with its seven bodies, printed in Motor World for July 24, there was no mention of any but that one model. It just has transpired, however, that work has been quietly proceeding on a six-cylinder machine, developed along independent lines and bearing little resemblance to the "four" that heretofore has been the sole chassis of the Pathfinder line. The price of the "six" is $2,750.

PATHFINDER SIX-CYLINDER MODEL WHICH LISTS AT $2,750



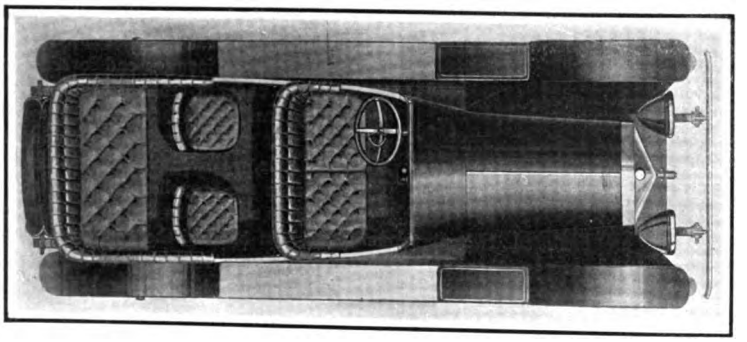
While the new car, which is fitted with a touring body for seven passengers, may be said to resemble the older model in that it is of the flush-sided, straight-line type, and otherwise is quite in keeping with the most recent ideas as to what a modern car should be, it differs outwardly from the "four" in that it has a V-shaped radiator with a pointed hood of polished metal surmounting it and has no side lamps built into the long cowl, which is raked at an easy angle that harmonizes well with the long lines of the body. The machine is distinctly in the big car class, as its carrying capacity and the wheelbase length of 135 inches clearly indicatea; and if further proof is required it is to be found in the fact that the tires are 35 x 5 inches all round.

The motor has its cylinders cast in blocks of three, which construction is in no small degree responsible for the fact that a 39-inch hood is long enough to house the engine. The cylinders are of the L-head design with a bore and stroke of 4⅛ x 5¼ inches, giving a formula rating of 40.9 horsepower, which, of course, is considerably below the brake horsepower because of the long stroke. Intake passages are cored in the castings, so that a simple V-shaped manifold from the carburetter is all that is necessary; this manifold is hot-water-jacketed, affording no opportunity for condensation of fuel when the motor is warmed up. The valve mechanism is on the right side of the motor and the stems and springs are enclosed, two aluminum covers permitting access when necessary. Vent holes in the casing act as breathers, and the arrangement results in the constant lubrication of the valve stems and tappets by a spray of oil from the crankcase. The camshaft is made with its valves integral.

The oiling system includes two plunger pumps driven by special cams on the camshaft, one on each side of the middle camshaft bearing. Oil under pressure is forced to the bearings and timing gears and then drains into the splash compartments which prevent the oil from running to one end of the crankcase on grades. Scoops on the connecting rods serve to splash the oil to the cylinders. A float indicator shows the height of the oil in the reservoir. Water is circulated by a large centrifugal pump entering the cylinder jackets under the valves.

The motor carries the electric lighting and starting apparatus, the starting motor having its shaft in line with the pump shaft. Connection is established through an overrunning clutch and Gray reduction gear. The pump-shaft is connected to the crankshaft by a chain of the "silent" type. The generator, which is a separate unit ,is mounted on top of the starting motor and is driven from the pump shaft by a small chain, also of the "silent" kind.

The power plant is mounted as a unit on a three-point support. The clutch is a multiple disk, running dry, with raybestos facing, and the gearset provides four speeds, the direct drive being on the third with the fourth as an overstep. Control is through a centrally located ball-handled lever. The propeller shaft is enclosed in a heavy torque tube with its forward end forked and trunnioned under a cross frame, the rear end being fast in the housing of the full-floating rear axle. Despite the employment of this tube, a universal joint has been placed between the propeller shaft and the pinion shaft, in addition to the joint at the forward end, just back of the gearcase. The bevel gears give a reduction of 3¾ to 1. Both emergency and service brakes are in drums on the rear wheels and are operated by rods running inside the frame.



PATHFINDER CHASSIS SHOWING NEW V-TYPE RADIATOR

The rear springs of the car are three-quarter elliptics, no less than 54 inches long, and are underslung, the rear end of the frame having a kick-up to clear the axle. The front springs are semi-elliptics and are 39 inches long. Rear springs are shackled at both ends to permit the greatest freedom of movement. The frame, of open-hearth steel, has a maximum depth of 5 inches and has a gradual upward curve at

Digitized by Google

the front, necessitating large forgings for the spring hangers, which also support the adjustable bumper.

The steering wheel, 18 inches in diameter, is on the left side; the gear is a Gemmer. The clutch and brake pedals are adjustable by means of pinching bolts. The starter is thrown into operation by means of a pedal. At the rear of the cowl the instrument board is mounted, and under the cowl is the 18-gallon gasolene tank. The greater part of the weight of the tank is carried by two brackets riveted to the tank in front and secured to the topmost toeboard, while bracing is provided by two rods which pass through heavy tubes which run through the tank from front to rear, near the top, and permit the nuts on the brace rods to be drawn up tight without causing pressure on the tank itself. The rods are much smaller than the tubes, so that there is considerable flexibility in the

SEATING ARRANGEMENT OF PATHFINDER "SIX" SHOWING TAPERED HOOD

mounting. The tank is easily removed after the instrument board has been taken out, which is not a difficult task. A light steel cross members of channel section serves as a support for the board, which carries the gasolene filler, ammeter, eight-day clock, ignition switch operated with a Yale key, light switch and speedometer. The speedometer is driven from the propeller shaft.

In addition to the instruments and other equipment referred to, the new Pathfinder equipment consists of a tool box on the right running board, where it corresponds with the battery box on the opposite side, a special waterproof storage compartment at the rear accessible when the rear cushions are lifted, single-piece built-in windshield that can be folded down over the cowl or placed in the ventilating position, top with side curtains and cover, electric headlights in which two small 4-candlepower lamps near the top take the place of side lamps, electric horn, adjustable foot-rests, folding robe rail, motor-driven tire pump, double tire carrier, an extra rim and a complete tool kit.

FEELING SALEMAN'S BUMPS TO SEE IF HE IS ANY GOOD

Large Sales Company Adopts Phrenology in Selecting its Workers—"Goes the Limit" in Making Sure to Get Good Men.

"Want to hire a salesman?"

"Maybe. Come here till I feel your bumps."

The salesman who wants a job squats down in front of the sales manager, the latter maneuvers over the applicant's skull like Jimmy Valentine "cracking a crib" and casts a weather eye at the aural and nasal appendages of the squatter.

"Take this blank over there and fill it out."

The applicant does as directed, although the questions to him look like "plain darned foolishness." He brings back the blank filled out as directed.

"No, you won't do. Sorry; we have a vacancy, but you don't come up to specifications."

"Why not? What's the matter?" demands the astounded one.

"Well, if you must know, your bump of combativeness indicates a lack of ability to meet customers successfully; your bump of destructiveness is a regular Gibraltar, and where your bump of mirthfulness should be there's nothing but a hole. Your answers to the questions on the blank indicate that you are not up to the standard we require in our salesmen, so we can't use you."

"Thank God!" exclaims the salesman, as he watches the sales manager out of the tail of his eye and sidles toward the door.

Intensified salesmanship? Maybe. Anyhow, one of the largest sales organizations, the American Multigraph Sales Co., in America has gone in for phrenology in its selection of salesmen, and studies the exterior indications of character in choosing its men. Of course, it doesn't necessarily follow that the sales manager is an expert "bump feeler," but the company does require the filling out of a blank and does make a study of phrenologic character indicators.

The outcome of the innovation is as yet undetermined, for it is new with the pioneer in this field. It will be generally conceded that too great care cannot be used in the selection of a sales force, and if the sales organization's methods appear radical or extreme it may be suggested that they are but the development of a determination to employ only the most capable men.

Anyway, if the plan proves popular and is generally adopted, it is up to some salesmen to grade off a few undesirable bumps and fill in a few cranial dales and valleys, even if they have to do it with a tack hammer.

Ford Spoils Pretty Cyclecar Story.

Henry Ford has spoiled another pretty story in which he was made appear the central figure. Like many others, the story was brought from Detroit to New York, where it was put into print.

According to the narrative, Ford drove up to the Hotel Pontchartrain in a cyclecar, and as the astonished crowd rushed out to view it, Ford, so says the story teller, laughingly remarked that he was preparing to build them for $100. Straightway, according to the same narrative, word was passed from banker to banker that no money should be loaned for cyclecar ventures, which are being projected in Detroit at the rate of about 10 a week.

According to James Couzens, and others high up in the Ford company, the story is true except to the extent that Ford has never built a cyclecar, doesn't own one and has never driven up to the Pontchartrain in one. Ford is not worrying about cyclecars; it is not necessary.

Two Honorables Attend Hupp Banquet.

There was real "class" to the second annual banquet of the Hupp Motor Car Co.'s European dealers, which was held during the Paris show. It was of sufficient importance to be attended by the Hon. Myron Herrick, ambassador to France, and Hon. Charles Denby, American consul-general at Vienna, both of whom addressed the assemblage. There were 60 plates at the banquet, which was presided over by J. L. Poole.

To Enlarge Batavia Rubber Plant.

The Batavia Rubber Co. is making ready to erect a two-story addition to its plant in Batavia, N. Y. It will be a two-story and basement structure, 85 x 101 feet, and will cost approximately $35,000.

DOING THE THINGS YOU'RE NOT REQUIRED TO DO

Little Deeds That Are Not Compulsory But That Breed Good Will—Reilly Mixes Election Returns and a Rafferty Man's "Hurroos" with a Discussion of Why One Dealer Garageman Failed.

The drunk who stood behind Reilly let out a wierd and maudlin "Hurro-o-o-o!" He was unusually strong on the "O-o-o-o."

He had begun "Hurro-o-o-ing" earlier in the day when he knew what he was "Hurro-o-o-ing" about, and even when he propped himself up against his neighbors in the crowd which formed in front of the News bulletin screen shortly after the polls closed he had a more or less definite idea as to why he had embarked in the "Hurro-o-o-o" business.

"I'M F'R RAF'R'TY!" HE GURGLED. "RAF'TY'S GOOD MAN!" AND THEN, "HURRO-O-O!"

The Rafferty Man "Hurro-o-s" Again.

But it was now well after 9 o'clock and he was "Hurro-o-o-o-ing" for Hurro-o's sake. "I'm f'r Raf'r'ty!" he gurgled. "Raf'ty's good man." And then, "Hur-o-o!"

"Who's Rafferty?" asked Reilly.

"Raf'ty's—he-sh — he-sh——" Just then the operator flashed another bulletin, whereupon the drunk left off his explanation, for every bulletin by now seemed to be the signal to uncork a fresh "Hurro-o-o-o!"

"Whash it shay?"

"Breckenheimer carries the tenth by four hundred," read Reilly.

"Thatsh tough—washted perfectly good 'Hurro-o-o' on a Dutschman," lamented the Rafferty rooter—and he didn't overcome his grief for several minutes.

The Hurroo boy was still muttering his chagrin at having inadvertently cheered in the wrong place and Reilly was nervously waiting for the next "Hurro-o-o" to hurtle over his shoulder and into his ear when Ben Doyno passed in the narrow lane which the police were keeping open for traffic.

"Oh, Ben!" shouted Reilly.

"Come on, come on! What are you going to do? Hang around here all night?" and Doyno seized Reilly's arm and dragged the little dealer not unwillingly away from the Rafferty man. "I'll tell you what we'll do," declared the supplyman. "The Progressives are running a bulletin across from my store. Let's go up stairs and sit in the window."

Square Dealing that Helped Candidate.

"Armstrong, on the Progressive ticket, was saying his garage business was getting so big he might have to give up trying to sell cars," remarked Reilly, when the two had settled down in comfort with an unobstructed view of the big white sheet on the building across the street.

"He's done well over there."

"Some of my owners garage with him," continued Reilly, "and they certainly speak well of him. His own owners wouldn't buy any other car on a bet. He is winning his election on his business reputation. He's thorough, businesslike and plays straight."

"He undermined the Mackey Garage in short order," asserted Doyno.

"Why shouldn't he?" demanded Reilly. Mackey was a bum garageman and dealer, if ever there was one."

"So?" asked Doyno, with as much interest in the bulletin as in the conversation.

Too Exacting Tactics Lost Trade.

"Quite so," replied Reilly, who seemed capable of talking, reading bulletins and smoking all at the same time. "He lost trade by his tactics and principally because he seemed possessed of a streak of stinginess or too scrupulous exactness. He was perfectly willing to do all that was required of him, but he wouldn't do a darned bit more."

"How's that?" Doyno was still gazing intently out of the window.

"One instance I remember was that of a man who sent his car in to have the radiator fixed," continued Reilly. "Mackey did the job well enough, but when the owner went after the car it was turned out to him not only with dust on the mudguards and generally dirty all over, but with streaky stains on the hood where the water in the radiator had slopped over.

Didn't Clean Car Because not Ordered.

"The owner looked the wagon over and wanted to know if he couldn't have it washed. Mackey said he could. The owner wanted to know why they hadn't cleaned it up a little bit before they let it out of the garage. Mackey said no orders had been given to clean the car and that he didn't want to assume responsibility in doing unspecified labor.

"There were numerous things like that which didn't help him to win a loyal trade; he seemed to be looking for excuses not to do things instead of seeing how much he could do for his customers. Another owner was out one rainy day and when the chauffeur left the car in the garage that day he left one of the rear tires flat. It so happened that the chauffeur suffered an accident that night and no one went near the car for two weeks. The owner had no other driver, so the car stood there.

Digitized by Google

"One day, after two weeks had passed, and it seemed that the driver would be abed a long time, the owner of the car dropped around at the garage to look at his car. He found it on the floor space allotted to it, standing exactly as the chauffeur had left it. The car was still resting on the rim and the tire was in fine condition.

Pleaded, "I Wasn't Supposed to Do It."

"The car owner asked why the garageman hadn't taken the tire off; he asked what they meant by letting a car stand two weeks in that condition. Mackey said the chauffeur generally took care of the tires and such things and that he hadn't received any instructions to take it off. The owner said he would issue instructions that very minute, so Mackey told a man to take it off. The man had a hard time getting it off and, at that, the tire was very nearly ruined.

"The car owner didn't seem enthusiastic over the service he was getting from Mackey, and he moved to Armstrong's garage. Mackey couldn't understand it; he couldn't see why he should be blamed for not doing a thing when he hadn't been told to do it and wasn't supposed to do it. He never suspected that there was such a thing as common sense and that this should have enabled him to do a thing or two even if he didn't have written instructions."

"Don't wonder he lost trade. That doesn't sound much like Armstrong's way of doing business."

Sure Car is "Right" Before it Goes.

"You're quite right it doesn't," asserted Reilly. "Armstrong is as much the opposite as a man can be. Supposing a man takes his car into Armstrong's garage to have a new crankshaft put in. Armstrong has the repair work done and before he gives the job an official O. K. has it cleaned up. There's nothing that makes a car owner feel quite so good as to have his car look spic and span after it has been repaired or overhauled. And what's more, this washing or cleaning isn't necessarily an added expense to the garageman.

"The average repair bill amounts to several dollars and it generally is of such a size that the addition of a dollar or whatever it may be for cleaning isn't noticed when the owner sees the bill. The little time that it takes to clean the car isn't of much consequence if included in the labor charge. And what's more, I don't believe there are many owners who would kick if they found the car had been cleaned even if they did have to pay a little extra for it. Of course, if a man is garaging somewhere else he might object. But many times a little cleaning off of dust would make a great difference in the looks of the car and in the attitude of the owner."

"H—— of a system!" ejaculated Doyno.

"A lot of business men—especially garagemen and dealers—fail to appreciate the value of small details in the retaining of good-will. Good-will is a big business asset, so big that it is sometimes worth hundreds of thousands of dollars, and its retention should constitute a goodly portion of a man's activities.

"Did you ever go into a United Cigar Store and see a sign which said, 'Yes, sir; we have stamps'? And do you suppose there is anything that compels a cigar store to sell stamps? There isn't a cent of profit in them, and there is no reason in the world why they should sell stamps except that it is but one instance of looking for a chance to do customers a favor instead of hunting for reasons not to do things for them. How many times do you get a frosty look when you ask a druggist or a cigar man to sell you a stamp?"

Similar Instances in Other Trades.

"Yes," said Doyno, as he settled back in his chair while the spotlight operator gave his bulletin-writing arm a rest and flashed a few pictures of candidates, "and did you ever take your shoes out to get them fixed and have them come back unshined and dirty? Or did you ever send your clothes out to get them pressed and have them come back with that same old suspender button hanging by that same old thread? It's a little thing, but you certainly notice it. The man who gets my laundry now—and I guess he's about the twentieth I have tried—advertises that he will sew on buttons and make any small repairs free of charge. I certainly appreciate it."

"There are a thousand and one little things a garageman can do for his customers that he literally isn't compelled to do," said Reilly, "but if he develops a habit of looking out for his customers they come to think immensely well of him. Stinginess never got anybody anything, and this 'I wasn't supposed to do it' attitude looks like the outcropping of either an inherent stinginess or mental blindness.

Applies to Individuals in Same Way.

"This applies to everyone—employes as well as employers. I guess you'll find if you look around that the employe who gets ahead isn't the man who does just what he was told and then stops. Any machine can do that much, but it requires intelligence to go a little beyond orders, and the man who puts himself in the machine class generally is so regarded and stays there, whether he be working for a corporation or the public.

"Now Armstrong——"

"Let's get out of here; it's all over," interrupted Doyno as he started out.

"As I said," continued Reilly on their way down the street, "Armstrong's one big—— Good Lord! Look!"

Doyno looked. On the opposite corner Reilly's Rafferty acquaintance was moored to a lamp post. It was on a corner where many cars turned westward off the main street. Every time the headlights of a turning car illuminated the Rafferty man's face it roused him. And every time he was aroused he gave a, by this time, faint and hound-like "Hurro-o-o-o!"

"Merchandiser" to Supplant "Ad. Man."

That what business today calls an "advertising man" will in the future be replaced by a "merchandiser," is the statement made by Tim Thrift, president of the Association of National Advertising Managers; the "merchandiser," he states, will not only handle such matters as are now commonly delegated to the advertising man but will make the writing and placing of copy subordinate to a bigger and more important problem.

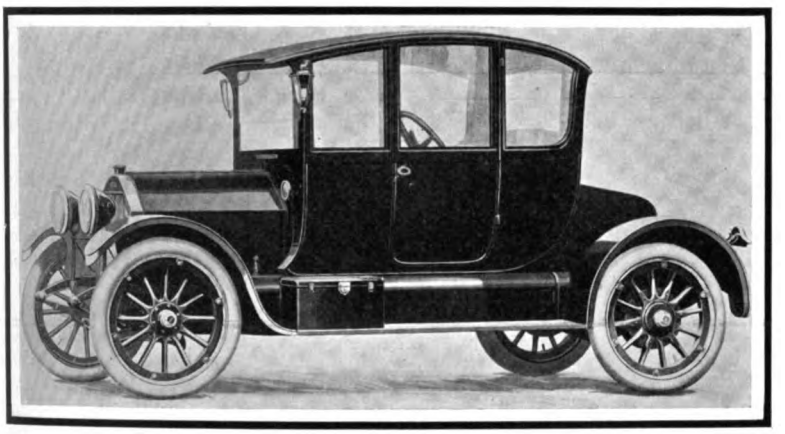
"Modern business methods and competition are gradually forcing the advertising man from his position of importance in the commercial world and developing a higher type of publicist, namely, the 'merchandiser,'" said Thrift.

"The man who to-day buys space and writes subject matter to fill it has had his best day. There will always be advertising writers, but the man who will direct the paid publicity campaigns of big business in the future will be an organizer, an analyist, a psychologist and a distributing expert.

"Writing advertisements and buying space to put them in is a mere detail," declared Thrift. "The great need to-day is for men who, from an advertising standpoint, can pass upon the character of a product, its appearance in the eyes of the public, the requirements of consumers and the best methods of distribution.

"This expert will not conflict with the sales manager. That official has to do with men and methods of dealing directly with the market. These two men will cooperate, each being necessary to the other. The merchandiser will spend much time in the factory or mill, studying the methods of production.

"He will travel through districts where his product is being sold, studying the needs of consumers, their peculiarities, competitive conditions and distribution facilities.



"The merchandiser will be a valuable help to the sales manager in the inauguration of contests and other schemes for 'gingering up' the sales force and stimulating demand for the product."

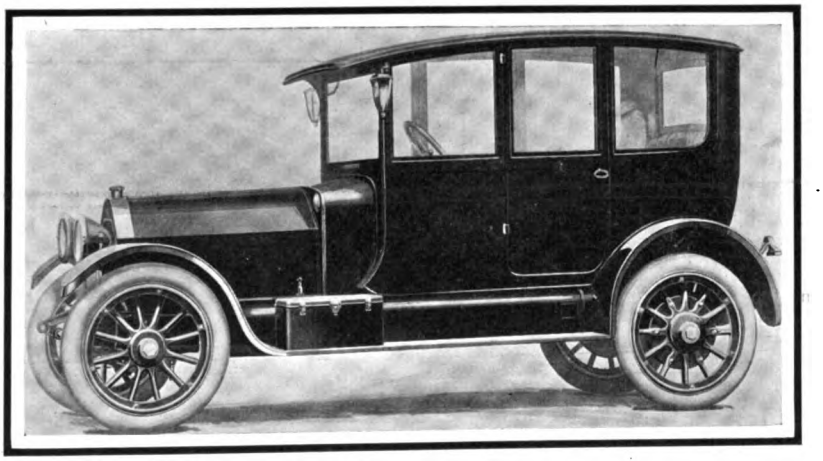
MARION LINE LENGTHENED BY ENCLOSED BODY MODELS

Coupe and Sedan on "Four" and "Six" Chassis Break Succession of Open Bodies for First Time—Effective Seating Plans.

It is some eleven years since the building of Marion cars was commenced, and in all that time the manufacturers contented themselves with turning out machines of the open body types. No enclosed cars were included in the regular series. Now, however, the Marion Motor Car Co., of Indianapolis, has turned its attention to the production of enclosed cars, with the result that two new body types have been added to the Marion line. One is a coupe and the other a sedan; the coupe is mounted either on the four- or six-cylinder chassis, while the sedan is mounted only on the larger chassis.

NEW MARION COUPE MODEL ON FOUR-CYLINDER CHASSIS



The coupe, which seats four passengers, is designed with no little skill, and it is entirely devoid of the top-heavy appearance that is so easily imparted to this type of car by faulty laying out. The exterior is simple in its smoothness, but it is the simplicity that comes of much hard work in "fairing up" the lines, as a naval architect would express it. The seating arrangement is neatly worked out. The wide rear seat accommodates three persons, including the driver, who, however, is seated about six inches further forward than the others, so that his view will be unobstructed, while he is not too far away for sociability. The fourth passenger occupies a folding seat attached to the front panel of the body.

In the sedan the lines of the coupe are carried out on a larger scale, the general effect being much the same—that is to say, the family resemblance is plain. The seating arrangements are planned for five persons. Three sit side by side on the roomy rear seat, while the other two, one being the driver, sit in comfortable stationary chairs forward.

The enclosed models are equipped with complete electric lighting and starting systems, the lights being arranged in the most convenient way for closed cars. All the instruments are conveniently placed in front of the driver, who controls the car from the left side.

As for the mechanical features of the Marion "four" and the later addition to the line, the "six," they doubtless are well known, for they have been described in detail in Motor World under date of August 21. As a memory refresher, however, it may be said that the "four" is very similar to the corresponding car of the preceding series, while the newer "six" is built along lines that have been proved and tried by time and service and are in no wise experimental or freakish. The motor, of the L-head type, has its cylinders cast in two blocks of three each and the crankshaft has three hand-fitted bearings. The appreciation of the Marion people of the advantages of a long motor stroke is indicatetd by the bore and stroke measurements, which are 3¾ and 5¼ inches, respectively. The "formula" rating is 33.75 horsepower, and as this does not recognize the stroke factor it is clear that the horsepower developed is considerably in excess of that figure. Quiet running is greatly assisted by the employment of a "silent" chain for camshaft drive and spiral gears for the magneto and pump.

The elements through which power is transmitted include a nine-plate disk clutch running dry, a three-speed selectively controlled gearset with centrally located shifting lever, and propeller shaft bevel geared to the full floating rear axle. A pecularity is that drive from the axle shafts to the wheels is not through the usual dogs fitting into notches in the hubs, but through flanges formed integral with the shafts and bolted to the wheel hubs. Of particular interest in connection with enclosed bodies, which are expected to afford the utmost luxury in every way, is the fact that the suspension of the Marion cars consists of springs made from English Sheffield steel, three-quarter elliptic in the rear and semi-elliptic in front. The spring bolts are hollow and contain sufficient oil to provide lubrication for months at a time. The wheelbase of the "six" is 124 inches—sufficient for easy riding but not too long for a town car—and the tread is, of course, the usual 5 6inches. The electric starting and lighting system is the Westinghouse. In the matter of equipment the new Marion models are well provided; it is unnecessary to go further than to state that each car carries all the accessories that usually are listed as "complete equipment," besides a good many things that often are missing from cars considered to be well "found."

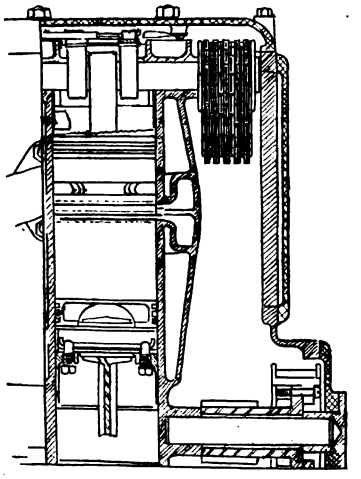
PISTON VALVE MOTOR MADE BY POPPET MOTOR MAKERS

Carter Valve Gear Includes Piston Which Replaces Cylinder Head—Large Port Openings and Unusual Construction.

Whether or not poppet valve motors ever will be displaced, or even cast into the background, by motors with valves of other types is something that time alone can tell; there can be no question ,however, as to the activity and ingenuity of those who believe that there are valves as good as, if not beter than, the poppet. The most recent non-poppet type to be commercialized is the Carter piston valve motor, of which the Model Gas Engine Works, of Peru, Ind., secured control some time ago. A special factory for building this motor is being erected in Pittsburgh, Pa., and meanwhile the Peru factory will manufacture one size, which is shown in the accompanying illustration.



Apart from the valves, the motor is of conventional design. The valves take the form of pistons and are housed in upward extensions of the cylinder bores; the valve pistons are of the same diameter as the working pistons, though somewhat longer. In each valve there is a diaphragm which completely closes it about one-third of the way up, and the top of the valve is crossed by a pair of parallel bars extending crosswise of the cylinder. Just above the diaphragm there is a pin similar to the piston pin, carrying a roller. The walls of the valve are slotted above the pin and through the slots the camshaft passes, extending along all the cylinders and passing through all the valves. The camshaft carries three cams for each valve, one bearing on the roller on the pin and the other two, which are duplicates, on the bars that cross the top of the valve. The cams of course give the valve its reciprocating motion, and they are so designed that the valve is permitted no motion other than that imparted by the cams—that is, it is positively driven in both directions.

It is the lower end of the valve piston that covers and uncovers the ports, which are placed one above the other, intake on top, and extend all around the cylinder except for narrow bridges. The lower part of the piston valve is in the form of a ring connected to the upper part by bridge pieces inside and relieved so that it does not touch the cylinder walls, packing rings of special design being fitted and coming flush with both the edges. In the accompanying illustration the exhaust port is open. As the valve descends the exhaust port is cut off and the intake uncovered, opening into the space between the upper and lower sections of the valve. The total valve travel is half an inch. The power required to operate the valves is said to be practically nothing, for as the valves move

CARTER PISTON VALVE ENGINE

upward to uncover the exhaust ports they are pushed by the pressure within, while the partial vacuum on the intake helps to bring the valves down.

SHOWING CAMSHAFT DRIVE

The cylinders are cast en bloc, and the camshaft is covered by a housing that bolts to the top of the cylinders. The "silent" chain through which the camshaft is driven also is enclosed in a housing at the end of the engine; these chains are employed throughout the engine in place of gears.

It will be noticed that the cylinders have no heads, as cylinder heads usually are understood. The piston valves take the places of heads and the explosion pressure, of course, is borne by the camshaft which, as the illustrations show quite plainly, is made extraordinarily heavy, for a camshaft, and is mounted in bearings that are of unusual length. For the same reason the cams and rollers are heavy and have broad bearing faces.

Ball Bearing Lore in Condensed Form.

When it comes to concentrated and condensed utility, with all the facts at hand and no frills, the latest price list of the J. S. Bretz Co., of 250 West 54th street, New York, is worthy to stand in a high place as an example of what a utilitarian price-list should be. The company imports F. & S. ball bearings, which are made in Germany, and the new list, covering the various types, gives in tabular form about every sort of practical information that could be asked for. The outer diameter, bore, width, number of balls, size of balls, normal load in pounds and running speed of each bearing are given, and while most of the dimensions are in millimeters, there is a reference table of equivalents in inches, to make things easier for Americans.

S. A. E. to Discuss Rim Standards.

To consider further, and to discuss the suggestions of its members, the Pleasure Car Division of the Standards Committee of the Society of Automobile Engineers will meet on Wednesday, Nov. 12th. The meeting will take place at the headquarters of the society, 1,790 Broadway, New York City, and is scheduled for two o'clock in the afternoon.

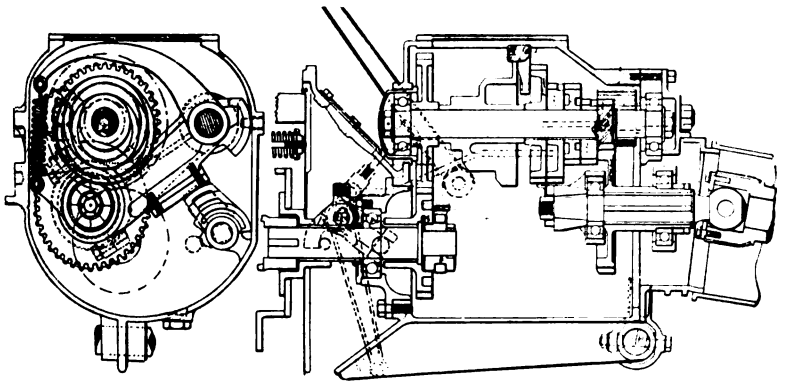
One of the Possible Noise Makers.

A possible cause of noise in an engine lies in the looseness of the studs or of the yokes which hold the valve guides in place in the crankcases. A little looseness might be quite sufficient to start a slight rapping noise and, moreover, there would inevitably be an increase of wear on the moving parts of the valve lifter.

One Cause of Difficult Starting.

A gradually increasing difficulty in starting a motor may result from the leaking of the valves, which not only allows the gas to escape and so reduces compression, but also allows air to leak in and upsets the proportions of the mixture—to say nothing, of course, of reducing the power of the engine.

Sopping up Water with Alcohol.



The strong affinity that alcohol and water have for each other makes alcohol useful where it is desired to dry anything rapidly. If the wet surface is swabbed with alcohol the spirit will take up the water and will itself dry off quickly.

HERE'S A SLIDING GEARSET THAT HAS ECCENTRIC GEARS

Shifting Mechanism that Has Extraordinary Flexibility—Direct Drive on High Without Unmesh-Gears—How it Works.

The idea of a gearset in which changes from one speed to another are made by the usual method of sliding gears on their axes, but in which, nevertheless, the gears always are in mesh, seems contrary to the more or less established order of things. Constant-mesh gears with individual clutches are old friends and most numerous of all are the gears that slide out of mesh before sliding in again, but the Ross Transmission Gear Co., of Detroit, Mich., has developed a system in which a single gear on the tailshaft actually slides from one to another of a cone of gears of graduated sizes, but never is out of mesh except when in neutral, and does not miss a single revolution in the application of power when shifting from lower to higher speeds, or vice versa.

ROSS AUTOMATIC CONTINUOUS MESH SLIDING GEAR IN SECTION

There are three principal elements in the Ross gearset; the primary shaft, driven from the motor, the countershaft carrying the cone of stepped gears and the tail-shaft, which is connected to the propeller shaft through a universal joint. The primary shaft drives the countershaft in the usual way and carries on its slightly extended end one member of a jaw clutch. The countershaft carries three gears for first, second and third speeds, and between the first and second and the second and third are two eccentric gears—that is, gears so mounted that the countershaft passes through them considerably off center. These eccentric gears are so set that the teeth on the edge nearest the shaft are exactly aligned with the teeth of the smallest gear adjoining, while the teeth on the opposite edge of the eccentric gear, which are furthest from the shaft, are exactly aligned with the teeth of the larger gear on the other side. The whole cone is arranged so that it can be run either clutched to its shaft or free on it, the clutch operating automatically.

The tail-shaft carries a single gear called the master gear, and the extended end carries one member of a jaw clutch corresponding with the clutch member on the end of the primary shaft. The most extraordinary thing about the tail-shaft is that it can move in almost any direction—at least, it is capable of vertical movement and also can be moved longitudinally by virtue of an arrangement of splines and a sliding sleeve which carries the gear. The vertical movement is controlled by a cam on the countershaft forward the gear cone, while the sliding movement is effected by means of a hand lever, a connection with the clutch pedal or an electric shifter, the exact means of control, in other words, being optional.

In changing from a low to a higher speed the master gear on the tail-shaft is slid to the left. In the accompanying illustration the master gear is shown engaged with the low-speed gear on the countershaft. Adjoining the low speed gear is the first of the eccentric gears. If the countershaft is turned half a revolution this eccentric gear will come around until the teeth that are in line with the low speed gear teeth will be exactly in line with the meshing teeth of the master gear, which then can be slid from the low speed to the eccentric gear. As the ecentric gear continues to turn with the countershaft it, of course, pushes the master gear away from the countershaft; or, rather, it would do so if permitted to do so. As a matter of fact, the master gear and its shaft are moved, in exact conformity with the movement of the eccentric gear, by the cam on the countershaft, so that the tail-shaft follows the eccentricity of the off-center gear. The next half revolution brings the master gear, riding the eccentric gear, to the level of the second speed gear, at which instant it can be slid off the eccentric gear and into second speed. Exactly the same sequence is followed in going from second to third; the cam is operative only when the master gear is in mesh with the eccentric gears, of course, that being the only time eccentric motion is needed.

When the tail-shaft carrying the master gear is in third speed position the clutch member on its end is exactly in line with the clutch member on the primary shaft. Only a narrow space separates the two. By shifting the master gear a little further to the left—that is, to the left in the illustration, but forward in the actual gearset—the countershaft gears are freed from the countershaft and allowed to run idly upon it, while the primary and tail-shaft clutch members come together and lock, giving direct drive; all the time, however, the master gear remains in mesh with the largest of the countershaft gears. Of course, to change down the same operations are carried through in reverse direction. The changes are made very rapidly.

Neutral position, which is the only position in which the gears are out of mesh, is obtained by sliding the master gear to the right of the position shown in the illustration—that is, back of the lowest speed gear—and a still further movement in the same direction brings the master gear into mesh with the reverse idler, and then engages the clutch, which establishes a driving connection.

Mud that Hinders Proper Cooling.

There is such a thing as overheating a motor when it is driven in the most skilful manner, is in perfect order in every way and the radiator is full of briskly circulating water. The radiator may be coated and plugged up with dirt on the outside. Of course, it doesn't happen very often that a radiator will get so mussed up that it will not radiate properly, but it is possible and has happened, especially after a long run through very muddy roads. The mud helps along overheating effectively, especially when it dries, acting as an excellent insulator of heat.

Marking Side Curtains for Identification.

Picking out the side curtains of a car and getting the right ones in the right places when there isn't much time is often a temper-trying job, and it seems to be the rule that the pesky things act as if they were possessed of evil spirits. The spirits can be exorcized, however, by marking the curtains so that they can be identified on sight. A little white paint can be used to make neat letters or, if one is particular, the lettering can be stenciled on. The edges of the top should, of course, be marked to correspond with the curtains

"PLAY SQUARE," REDFIELD'S ADVICE TO BUSINESS WORLD

Representative of Wilson Administration Reflects Views of Federal Government—Explains "New Ideals in Commerce."

When Woodrow Wilson and his assistants took the wheel of Uncle Sam's 90,000,000-passenger car there was speculation as to whether there would be need for extra shock absorbers and other devices designed to eliminate the bumps from rough roads, but thus far, with a few exceptions—and even they are matters of individual opinion—the old car has traveled along in quite the usual way.

The probable effect on business was one of the questions of debate. For that matter, the question probably will be debated as long as business exists, but the governmental attitude toward business in general has lately been made more plain by a tour of Secretary Redfield of the Department of Commerce and Labor through the West. The secretary's remarks boiled down are "Play square."

"New Ideals in Commerce" was his theme on several occasions, and the thought expressed was that the man or corporation which is to be and remain successful must be honest with its customers.

"There are thoughts abroad in the land that have not always been here," he said. "The time in which the getting of profits was the supreme ideal has been succeeded by a time in which the giving of service is thought to be the true ideal. We have seen, for example, the springing into life of commissions which say to our great public service companies, 'Thus far shalt thou go, and no farther'—which tell them plainly that both their existence and their profit depend upon serving well the public from whom they derive their powers; which tell them, indeed, that this ideal of service goes so far that they must take the lean with the fat, and may not make the ideal of profit a controlling factor in every detail of their respective enterprises.

"Few men will deny the ideals of one time form the practice of the next, and that our whole history, whether on the commercial, the material, or the political side, has been the gradual working out into fact of the ideals of the days before. What, then, are the ideals of today in commerce? For of we can find them, we may with reasonable security say that they will form the practice of our successors in commerce.

"There was an old commercial ideal wrought into law, which law still has a measure of respect from its antiquity, though hardly from its respectability. This ideal was centered in the old law Latin phrase, 'Caveat emptor,' which, being interpreted, is 'Let the buyer look out.' Look at this commercial ideal a little, and see how disreputable it has become. Apply it to food, and straightaway rises up the public conscience in the shape of a pure food law, and says, 'Thou shalt not.' Apply it to patent medicines, and brave publications rise up to denounce those who sell what may deceive or injure.

"There is coming into being a new law of fair trade, which begins rather plainly to say that the seller has grave responsibilities, and that it is his business to watch out lest he deceive the buyer. There is a growing conception of honor in such matters; men will carefully buy of houses the names of which they think are trustworthy guarantees of quality.

"Once the representative of a great manufacturer said to me, 'Any goods that bear our firm name are all right.' But he sold lots of goods on which the firm name was not put. There was an ideal half baked, reminding one of the man who said he had his principles, but didn't always carry them with him. There are lines of business now in which it is honorably recognized that the seller must be supremely careful lest he be condemned.

"Among such take, for example, the exceptional care and skill put into the selection of materials for, and the design and the manufacture of a modern automobile.

"When you look at our entire commercial field, it is surprising to see how far the old doctrine of 'Caveat emptor,' however much it may survive in discussions of law, has fallen into the background of our commercial life, and the seller is beginning to recognize that a large part of the responsibility rests with him. A rising and increasingly definite social consciousness says to manufacturers, 'Thou shalt not deceive, whether by name, or by label or appearance or composition or advertisement. We, the buyers, mean that you at the source shall look out for us.'

"See how far this idea will go naturally into definite practice among yourselves tomorrow. Your wife will buy for your table the product of the manufacturer who she believes recognizes the principle that the seller must take care. You yourself will buy your clothing from the tailor who you believe puts the most honor into his work; who, in short, serves you best. You will deal with the physician who puts the most and not the least of himself into his professional work. The lawyer will hold and control the best practice longest who gives the most in value and service for what he gets; and the man, whether he be physician or lawyer, or minister, in professional life, who does not feel that as a seller of his services it is his privilege to give the most he can, will have short shrift among you.

"One great product has standing among us because, being called 'the best,' it is so esteemed to be. The producer has felt the responsibility on the seller. Advantage is taken by sellers ,both rightly and wrongly, of this thought. Men of broad vision, who grasp the truth, put their conscience into their goods, knowing it pays. Men of narrow vision will try to persuade over the bargain counter that they are serving the consumer by giving him a dollar's worth for 50 cents."

Burnt Nose Dreads the Tire.

It is said that a healthy young bull terrier living on the outskirts of Toledo, O., made himself obnoxious to the drivers of Overland cars undergoing road tests by tearing at full speed at every car that passed and apparently trying to bite chunks out of the rear tires. The performance got on the nerves of the men to such an extent that considerable thought was devoted to means for putting a stop to the nuisance.

Finally a driver tried the experiment of applying brakes sharply when the beast's nose was very close to a tire. The result was that the ample snout of the dog was well scorched by friction with the spinning tire before he could get his own brakes working, and the chasing pastime was nipped in the bud. What the story really says is that the beast recognized an Overland chassis thereafter and took to the woods with his burnt nose in his mind's eye, so to speak; but—well, perhaps that's expecting a little too much from a mere dog.

Cars for Chickens—the Cackling Kind.

Many moneyed men are fond of chickens and many moneyed men have been known to buy limousines for them, but John Bowman, who died last week in Stonington, Ill., leaving a fortune of a half a million dollars, probably holds the record in his line; he was rated as the "most eccentric man in Illinois."

He was a bachelor and fond of his chickens—the cackling kind—and as roosting places for them had five costly cars on his farm; whether the hens fancied the cars as residences has not been ascertained, but they used them, nevertheless. Other noteworthy deeds of Bowman were buying a room full of musical instruments and never uncrating them; buying a nursery and never planting it, and setting half his farm aside for nature to take its course thereon. He was 62 years old and, it seems needless to remark, lived alone.

KEEPING COOLING SYSTEMS FROM GETTING TOO FRIGID

Conditions that Cause Excessive Radiation—Compounds that Can't Congeal and the Ingredients Required to Make Them.

This is the season when one of the hardiest of hardy annuals, one of the good old perennials, blossoms forth—when, in other words, the annual offering of advice is made for the benefit of those who use their cars regardless of the retirement of the mercury in the thermometer tube and who therefore must expose their radiators to the danger of freezing up. Again in other words, now is the time to make a suggestion or two regarding anti-freezing solutions, and perhaps save someone the trouble of hunting up last year's papers to find out what to dope the water with so it won't congeal if it gets frosty.

It may perhaps sound a trifle paradoxical, but it nevertheless is true that the better and more efficient the cooling system the more liable it is to freeze up; the car that stays coolest in hot weather is not unlikely to be the first to freeze up, if it gets a chance, when the weather feels that way. Radiators are made to cast out heat just as fast as possible, and, not having any discretion in the matter, they continue to do so at all times, regardless of the fact that the cooling system may be much too cool.

It is logical and proper, though perhaps unfortunate, that a rapid and efficient cooler will be a rapid and efficient freezer. As long as the motor is running and doing work there is no danger except, perhaps, that of a little over-cooling, which may be remedied by removing the fan belt or, if that be too much, by letting it run slack. But if left standing in ordinary freezing weather the water is sure to congeal in time, and even if the motor is running slowly there is danger if the weather is exceptionally cold, especially if there is a wind blowing directly on the radiator. And motors have been known to stop, for various reasons that are well known, and let things freeze up when the owner was absent and in blissful ignorance of what was happening to his car.

At any rate, an anti-freezing solution can't do any harm, and even if the conditions never happen to be such as to bring about freezing, it is worth something to know that even if the worst should happen the water will remain liquid. Peace of mind is always worth something. Calcium chloride is a familiar substance with which to "dope" the water; the resistance of a calcium chloride solution to freezing depends upon the amount dissolved in the water. Two pounds to a gallon of water will freeze at 18 degrees Fahr.; three pounds to a gallon will freeze just above zero; four pounds to a gallon will freeze at 17 degrees below zero; and five pounds to the gallon at 39 below zero—which is no sort of a temperature for anyone to go automobiling in for pleasure, incidentally. Calcium chloride is made in various grades and the cheaper the quality the more free acid it contains, and the acid sets up electrolytic action between dissimilar metals in the circulating system. Therefore, only the commercially pure stuff should be used, and care should be taken to ask for the right thing.

Glycerin may be and has been used; but it is expensive, it decomposes under heat and sometimes smells unto heaven, and it is sure death to rubber. So it may be counted out, unless nothing better is at hand or unless mixed with alcohol. Denatured alcohol is perhaps the best thing to use, all things considered, for it will not affect either metal or rubber, will not form deposits, as solutions of salts sometimes will, and has no electrotytic effect. A 40 per cent. solution of alcohol—that is, two gallons of alcohol to three of water—will resist a temperature of 25 below zero. Fifteen per cent alcohol in the water will keep it liquid till the mercury marks 11 degrees Fahr.; 20 per cent. will freeze at 5 degrees; 30 per cent. congeals at 9 degrees below zero.

The only trouble with alcohol is that it evaporates, leaving the water behind and so reducing the efficiency and raising the freezing point. The remedy is, of course, to put in more alcohol occasionally, though evaporation may be checked considerably by adding glycerin to the solution. A reasonable quantity will not hurt the rubber or decompose to any extent. It is said that by using a mixture of half glycerin and half alcohol with which to doctor the water there will be a minimum of evaporation and also of deleterious effects. The glycerin will not evaporate, so shrinkage must be made up with water and alcohol. The freezing point of an alcohol-cylcerin-water solution is somewhat higher than that of the alcohol-water mixture—about 11 degrees higher for a 15 per cent solution but only two or three degrees higher for a 40 per cent. solution.

While ice-machine oils have been used as cooling fluids and have given some satisfaction, the trouble is that oil is not nearly as good a conductor of heat as water and therefore is liable to cause overheating unless the system is particularly efficient, and that anything made of rubber is sure to have a short life and a merry one if kept in contact with oil.

ASK $20,000 FOR GASOLENE STANDARD'S DRIVER SPILLED

Peculiar Fatality in Suit in Massachusetts—Fuel Spilled into Basement Explodes When Employe Opens Boiler Door.

What probably is one of the most peculiar accident cases which has occurred in the automobile trade in some time is now in the Superior Court in Northampton, Mass., wherein Timothy C. Leahey, as administrator of the estate of John O'Rourke, asks $20,000 damages from the Standard Oil Co. of New York.

It is alleged that January 27 of this year a Standard Oil wagon went to the Draper Garage, where O'Rourke was employed, and in endeavoring to fill the garage gasolene tank placed the funnel outside the intake pipe, with the result that a large quantity of gasolene ran into the basement and overspread the floor. When the agent discovered the mistake, it is charged that he went into the basement and swept the gasolene with a broom into a covered receptacle in the floor, covering this receptacle after he had cleaned the floor of gasolene.

The fuel remained in this receptacle until March 4, it is claimed, when an overflow of water during the filling of a boiler caused the gasolene to rise from the tank upon the invasion of the water and to again spread itself over the floor. When O'Rourke went into the basement to fire the boiler an explosion occurred as he opened the fire door and he was so severely burned that he died within a few days.

One of the questions brought up by the defense is whether the gasolene could have remained in the receptacle from January 27 to March 4 without evaporating.

Permit Refused; Erects Garage Without It.

There is one way of getting around official red tape, as has been discovered by A. G. Rice, a dealer in Ruby steel garages in Indianapolis; Rice wanted to put up a demonstrating garage on Capitol avenue, but encountered an obstacle when Building Inspector Winterrowd began a discussion of whys and wherefores based upon some ordinance or other which said something about garage walls in the mile fire zone being a foot thick, of stone, brick or concrete. It began to look as if Rice would get his garage permit next spring, but this didn't appeal to him, so he put the garage up without a permit and told the authorities that if they didn't like it they could make him take it down. Thus far the garage is standing.

MAKING A WOODEN CRUTCH FOR A CRIPPLED REAR AXLE

Wreck on the Rock in the Road Followed by Effective Rural Repair Job—Not Ornamental, But It Brought the Car Home.

It wasn't a ploughed field that the car was staggering through; if it had been one, things might have been better. There were indications that at some time in the past wheels had been over the ground, but the tracks were visible only at intervals. There were rocks and holes, stumps and brushwood and an occasional small tree in the narrow and irregular gash that had been cut through the woods, but nothing that looked like an attempt at a road.

"Well," exclaimed the driver, kicking out the clutch and applying the brake with a suddenness that was not altogether necessary. "How much further are we going through this sort of thing? It's three miles since we saw the last thing that resembled an imitation of a road. What's the use?"

His companion stood up and looked around, and sat down again.

"Looks about the same as far as I can see," he announced. "Wouldn't it make you mad, though, if there was a real road just out of eye-shot, and we turned round here?"

"Shucks! That's the sort of dope you've been handing out all along. What if there wasn't a road ahead within 50 miles? There are two sides to everything, son."

"Son" stood up again, took another look and again sat down.

"Here comes a human being," he said. "We'll ask him."

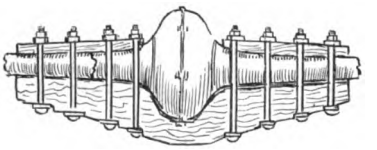
The Human Being approached leisurely, stopped abreast of the little car, curiosity on his face, and remarked, casually:

"Purty rough goin', ain't it?"

"It's got to be called rough because I don't know a word that means rough multiplied by a hundred," replied "Son," grinning. "Where's the main road?"

"You ain't got to go fur to find it," replied the Human Being, gently, resting his axe-head on the ground and leaning on the haft. "You're on the main road now."

"Wha-a-a-t!" ejaculated the two in the car, in horrified unison.



"Anyway, this is all the road there is between here and Stubsborough, which is about three houses an' a store big an' eight miles further on. But if you don't like things a leetle mite rough, which I cal'late you don't, you mightn't like it; it gets a hull lot worse as you go on."

"Back for ours!" said the driver, energetically. "How far is it around to Stubsborough by a—well, a road resembling a real road?"

"Take you raound 'baout 18 mile," said the Human Being. "Guess you'd find it wuth while, though."

"Well, rather!" And the driver snicked in his reverse and commenced the maneuvering necessary to get the car headed the other way. "Much obliged. Give you a ride, if you like, but I guess walkin's faster."

Space in the "road" was scarce and it was much curtailed by big rocks, and bigger ones reared their heads along the margin of the way. The driver backed and filled until he had the machine almost around; another backward sweep and the thing would be done. But alas! for human frailty. He put just a trifle too much energy into the motor for that last reverse. The car overran the distance and the rear axle casing struck the sloping surface of a rock, slid up to the top, slid over the summit, slid down the opposite side, and slid over an abrupt drop of some four or five

EMERGENCY AXLE REPAIR

inches, stopping with a wrenching crash with one wheel clear of the ground and the axle casing propped on the rock.

In anxious silence both men got out and went to the rear end to investigate. And it didn't take much investigating to find that the terrific thump had done real damage. There was a crack in the axle casing close to the differential housing, and it gaped darkly through layers of dust.

"Son" and the driver looked at each other and the Human Being looked at them. Then all three looked at the axle. The Human Being was the first to break the silence.

"Kin you run her that way, boys?" he enquired.

"Run her!" growled "Son." "No, we can't."

"Well, I got a sort of a shop over to my place, an' mebbe I kin help some to git the buggy goin'," he suggested, tentatively.

"Huh!" snorted the driver. "Got a regular repair-shop, and all that?"

"'Taint no automobile repair shop," replied the Human Being, "but I thought likely you might get goin' so's you could get on the smooth road. There ain't no other shop within 30 miles."

He squatted down and looked critically at the fractured axle.

"Any works inside that there pipe?" he inquired.

The two unfortunates saw a glimmer of hope in the attitude of the Human Being, and proceeded without loss of time to elucidate the "works."

"If we could get that there pipe axle stiffened up, you cal'late you might get a ways with it?" he enquired.

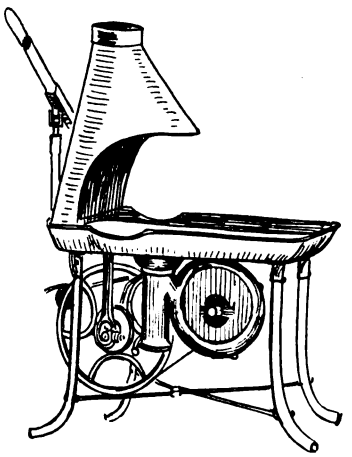
They allowed they might, and the Human Being took matters into his own hands from that point on. With a piece of string and a straight stick cut in the woods he made measurements of the axle casing and then invited the boys to his house, a mile down the "road."

"It's purty nigh sundown," he explained, "an' you'll be wantin' somethin' to eat an' a place to sleep, an' we won't have time for nothin' tonight."

The farmer's hospitality was accepted, and on the following day work was commenced. That is, the farmer did most of the work, for, like most agriculturalists who live in comparative isolation, he had a good tool equipment and knew how to use it to good advantage.

A piece of oak plank 2½ inches thick was marked with the contour of the axle casing and the shape cut out so that the plank could be fitted up to the under part of the axle, extending almost from one spring perch to the other. The plank was so cut as to be about three inches deep under the differential casing, and tapered to about 2½ inches deep at the ends. The upper edge was hollowed to lie snugly against the casing. A number of ½-inch bolts and an equal number of short iron plates, each with two holes through which the bolts would pass, were provided. With this material, a saw, a couple of gouges, a small plane, hammer, wrenches, etc., the party went to the scene of the shipwreck early in the afternoon.

The first thing the Human Being did was to fit the truss to the axle more accurately than he had been able to fit it in the shop. This was readily done with the aid of the saw and the plane and chisels. Having been fitted—incidentally, the car was carefully jacked up to permit the work to be done—the truss was bolted, or rather clipped on with the aid of the ½-inch bolts and the iron plates; a one-inch strip of oak on the top of the axle on each side of the housing saved the metal from possible crushing from the plates.



When it was all done it certainly looked like the devil; everyone said so. And it was a matter of worry to the driver how he ever was going to keep that truss clear of the rocks—if the machine would go at all. However, he managed it, and the car "went." It was something more than 30 miles to a real repair shop; and the car went so well with the funny looking rear axle that the trip was continued for a day and a half more until a place was reached where a new axle casing could be put in.

FORGES THAT FIT INTO GARAGE EQUIPMENT

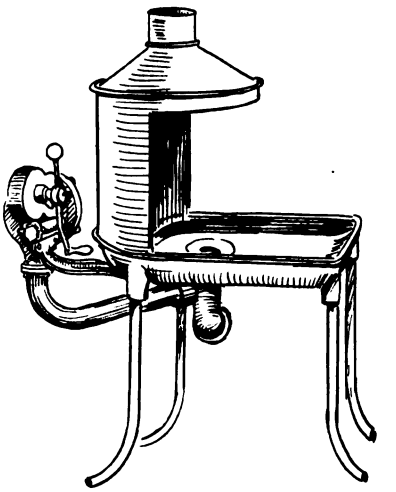
Variety That Obtains in Portable Blacksmith's Fires and the Advantages of Such Appliances for Garage Use—Why they Must Not be Used Within Doors—Foot Power and Hand Power Blowers Contrasted.

Billy Rea, garage proprietor out-of-the-ordinary, whose exploits have been worthy of recounting for the good and sufficient reason that they were exploits of the real business man bent on building business and holding it, was superintending the unloading of a mysterious-appearing packing case from a dray drawn up in front of his garage. It was a very heavy packing case; one could tell it was heavy by the languid manner in which the driver and his helper approached it; their actions made plain that it would require some little time to get it down and into the garage, and so what

SILVER BELT DRIVE BLOWER

was the use of hurrying anyway? But that did not make Rea any the less impatient; he was like a kid with a new toy.

His new toy, viewed from any kid's angle, however, was a rather peculiar one. It was nothing more or less than a small, portable, but none the less heavy, blacksmith's forge—the latest member of the growing list of equipment that made up his "family" of tools, so to speak. After he had made up his mind that he not only wanted the forge but that he really needed it, he could scarcely wait until he got it.



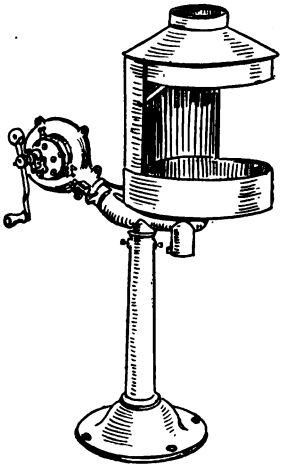
It is true that his garage was not a very large one, but it is equally true that it was the largest garage in the city and consequently it was up to Billy Rea to live up to his reputation for turning out repair work on time—that is what made his garage the largest one in the city. As is the case with many another garage, the times when the need of a forge was felt were not what might be called frequent. Occasionally, one of his patrons would come in off the road with a bent steering knuckle that needed straightening in a hurry or some one else would want some sort of a job done that could not be done without a forge. The blacksmith down street got these jobs; which was all right insofar as it went. But the blacksmith could not always finish the work as quickly as Rea wanted it finished or as quickly as the patron demanded. The solution of the problem, as plain as a pikestaff to any one, required the purchase of a forge of his own. The driver of the dray was unloading it. That's all there is to the story as far as Rea is concerned; he wanted the forge; he bought it; and now he can be certain that work requiring the use of a forge will be finished on time and, incidentally, he saves the blacksmith's charge.

Consider the Forge, How it Blows.

When Rea bought his forge, he bought it from a catalog and he did not have a great deal of trouble picking it out. He had to decide with regard to the size he needed, whether he wanted it with a hood or without one, how the blower was to be operated—he passed up the idea of using compressed air to operate the blower though the shop was fitted with a compressor, and he did not altogether like the idea of operating the blower from his line of shafting, for, he figured, the person using the forge must wait for the metal to heat and during the wait he might as well exercise his muscles blowing the fire—and cost had a little to do with the choice.

In the construction of forges in the concrete, there is considerable variety in detail. Thus, for instance, the draft that makes the coal glow may be induced either by the regulation lever and bellows that helps to give the blacksmith his mighty muscles, or it may be induced by a miniature rotary blower operated by a hand crank. In other styles, the rotary blower may be operated by foot pressure, or by an electric motor or by belting from the power shaft in the shop, if it has one; and in some styles, air that is compressed for other purposes is used to blow the fire by the simple expedient of piping it beneath the fire box. In other details of construction, however, there is not a great deal of variety—fire boxes are much the same in shape and material, supports vary slightly, but not greatly, and the method of confining the fire where it will do the most good and the least harm to combustible property varies somewhat.

It is obvious, of course, that no such appliance should ever be placed within a garage, for even if the owner were able to overcome his own scruples with regard to the fire risk it is extremely doubtful if



CHAMPION MACHINIST'S FORGE

any fire underwriter's inspector would pass the installation, particularly when the requirements covering smoking in garages are so rigidly enforced. There is nothing specific in the rules and regulations of the fire department which prohibit the use of a forge in a garage, though the idea is frowned upon by the Fire Underwriters' Laboratory, which is authority for the statement that one would not be permitted. But there are very few garages where there are not a few feet of open space at the back where a forge could be installed under a light roof to protect it from the elements. The better way to do, of course, is to house the forge in a small metal shelter which could be erected very cheaply and where there could be no possibility of its starting a fire anywhere else except in its own fire box. Incidentally, a great

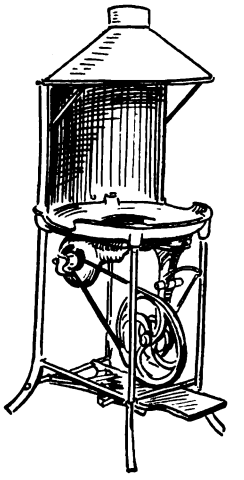
Digitized by Google

many small forges are so light that two men would have little difficulty in lifting them out into the open temporarily. This, in fact, is one of the principal advantages of the small portable forge.

But to get back to the forges themselves. Though much of the poetry that has served

ROYAL GARAGE FORGE

as a halo for the burly smithy was written about his wheezing bellows, that contrivance practically has passed out of existence and given away to the very much smaller and very much more efficient rotary blower; very few modern forges are fitted with bellows. They are more or less unmechanical and occupy more space than a modern forge—hood, blower and all—which counts for a great deal in a garage.



Not Too Little to do Big Work.

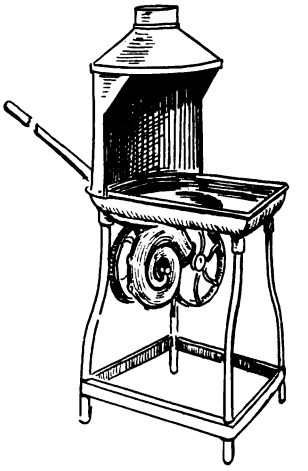
In all of the forges produced by the Silver Mfg. Co., of Salem, O., and the line is quite an extensive one, ranging from the tiny forge suitable for the occasional use of a farmer to the full-sized implement suitable for an exceedingly busy iron worker's shop, a small rotary blower is used and in every case the blower is operated by means of a long hand lever; but so that the lever will work easily, it is swivel mounted and follows the movement of the operator's hand.

The type that is illustrated herewith is mounted on four substantial iron pipe legs firmly braced and attached in such a way that they can be easily removed on occasion. The blower is mounted directly beneath the fireplace, to which it is connected by means of the short, wide pipe shown in the picture. The blower is connected to the lever through the intermediary of a belt running over a large wheel which provides the necessary gearing to operate the blower at comparatively high speed. One distinctive feature of the design is that the fireplace is separated from the hearth, construction which mitigates the danger of breakage from the expansion and contraction of the parts. It is pointed out that the forge will heat iron three inches in diameter to welding temperature. The height of the forge from the floor is 30 inches; the hearth measures 24 x 35½ inches; the fan is 12 inches in diameter, and the weight of the forge complete with the hood shown is 210 pounds.

Blowing Fire with a Whirlwind.

The construction of the Champion forge, which is illustrated herewith and which is produced by the Champion Blower & Forge

BUFFALO FOOT POWER FORGE



Co. of Lancaster, Pa., as only one unit of an extensive line embracing forges of all kinds and descriptions, to say nothing of numerous separate blowers and other iron working tools and appliances, is so simple that it scarcely requires description. In this case, too, the draft is induced by a rotary blower which is driven through a specially developed type of worm gearing which makes for easy operation and high speed. The forge is otherwise distinctive by reason of the fact that it incorporates a special type of heavy nest Tuyere iron which produces a rotary, whirlwind blast which is claimed to heat iron one-third quicker than the usual type of iron, for the reason that it does not blow the air directly through the fire and force a good part of the heat up the chimney. The forge is a handy size for garage use and possesses the advantage that it is extremely simple. The hearth measures 23 x 35 inches; the fan is 10 inches in diameter and the weight of the forge complete is 200 pounds.

The B. F. Sturtevant Co., of Hyde Park, Mass., is another concern that makes forges and blowers in considerable variety, the type that is illustrated being somewhat like the Silver forge in general appearance, though there is an important difference in the manner of operation. Instead of being operated by belt, the Sturtevant forge is operated by gearing, the picture making plain the method of application. The long hand lever is swivelled and the rotary blower is carried directly beneath the fireplace, making possible the use of the shortest connecting pipes. The forge is portable in every sense, and as it weighs but 157 pounds, two men should have no great difficulty in moving it from place to place about a garage, or out of the garage into the "back yard" for use. In the type illustrated the size of the pan is 22 x 33 inches and its height is 32½ inches.

Among a number of other sizes and types of forges, the Sturtevant company produces a miniature one for bench use that is designed to use charcoal, though coal can be used with it on occasion. It has a pan measuring 15 inches in diameter, is but 15 inches in height and weighs 42 pounds complete. Obviously it would be a simple matter to move a forge of this size out of the garage during the time necessary to complete the work in hand.

Special Forge for Garage Work.

Although almost any small forge is suitable for garage use, there are compara-

STURTEVANT LEVER FORGE

tively few manufacturers who have gone to the length of developing one especially for that purpose. The Canedy-Otto Mfg. Co., of Chicago Heights, Ill., is one of them and the appearance of the forge itself, as shown by the accompanying picture, makes plain that simplicity, ruggedness of construction and compactness entered largely into its specifications.

The column and base are hollow and are iron castings, lightness and strength following as a matter of course; the forge.

Digitized by Google

though quite a large one, weighs but 100 pounds, in fact. The piping that leads from the rotary blower serves also as a support for the hearth and the hood. The blower itself is operated through gearing by means of the crank, which may be turned in either direction; the diameter of the fan is 10 inches. The height of the hearth is 30 inches and its diameter is 18 inches, thus providing ample room for the comparatively small work that the average automobile repair shop is called upon to do. As shown by the picture, the forge has but half a hood, though the full hood can be supplied if required. The temperature obtainable is calculated as sufficient to heat 3½-inch iron to welding heat.

The Buffalo forge which is manufactured by the Buffalo Forge Co. of Buffalo, N. Y., differs from any of the others in that the blower is operated by a treadle, thus leaving both the operator's hands free for the work in the fire. From the treadle wheel the drive to the blower is by belt. In other respects, the Buffalo forge does not differ greatly from any of the others, the rotary blower being mounted beneath the fireplace, where it is in the most convenient place for inducing a draft through the fire. The supports are substantial and well braced and the weight of the apparatus complete is 130 pounds. The diameter of the fan is nine inches and of the hearth 25 inches.

Good Reason for Cleaning Motor.

While the man who has a chauffeur to drive his car does not have to think much about such things, the owner-driver has an incentive to keep his engine clean that is of more importance than the mere desire to see things clean. For instance, he is decently dressed and taking a party of friends for a spin, and on cranking the motor after a stop finds it balky. Reaching down to the carburetter in the dark and feeling for the tickler or perhaps for the needle valve, he finds his fingers covered with oil and dirt —or maybe his gloves. Anyway, he has to wipe his hands on something, and at best they are mussed up—which is awkward and unpleasant in case circumstances are such that he wants to look clean. Or it may be that a good pair of gloves is made to look disreputable. Anything of this sort can be avoided by an occasional washing off of the motor with gasolene, and it does not require much labor to keep a motor quite clean.

Canadian Company "Goes Into" Parts.

The National Forging Co., of Chatham, Ont., capitalized at $100,000, is about to acquire what was the plant of the Swift Motor Car Co. It will be utilized for the production of automobile and carriage forgings.

ELECTRIC VEHICLE COSTS COMPILED BY ASSOCIATION

Committee of E. V. A. on Operating Costs Undertakes to Answer Pertinent Questions — Data Averaged from Many Installations.

"How much does it cost to operate an electric commercial vehicle? How much must be written off for depreciation? How much charged up for fire and liability insurance?" All of these questions are vital not only to the owner of a truck or to the prospective owner but to the dealer as well, for upon him the work of propounding them often falls. It is safe to assume that 99 of every 100 prospective users of commercial vehicles want these questions answered first—before they will consider the mechanical perfections of a vehicle or its capabilities or possibilities. Yet they are exceptionally difficult questions to answer. Up to comparatively recently it has been practically impossible for any one to answer them with any degree of accuracy. Now, however, the Electric Vehicle Association of America has stepped into the breach and its committee on operating records has compiled an unusually complete table of data that covers operating costs in a more than ordinarily thorough manner.

Realizing the necessity for accurate data of the kind, the committee that had the work in hand, and that is composed of Wm. P. Kennedy, E. W. Curtis, Jr., H. F. Thompson, S. C. Harris, E. F. Phillips, W. L. Case and C. A. White, delved deeply into the matter and the fruits of their researches are given in the accompanying table. Obviously, the operation of any motor truck must include so very many variables, of which the varying cost of current is only one example, that the figures in the table cannot be used as a standard for any one particular locality or truck. They are, in fact, only a fair average of operation costs and are based on a large range of electric vehicle installations.

Fined for Speeding; Now Seeks Redress.

Ever since John F. Younglove was arrested July 4 in Sioux City, Ia., and fined $25 for exceeding the speed limit with his automobile he has been chafing under what he terms an injustice and has been seeking to discover some way of getting his money back.

He was traveling on Riverside drive on the evening in question when a car owned by the Wyckoff-Cord Automobile Co. and being used by the police department crashed into the rear of his car and damaged it badly. Younglove couldn't see why he should be arrested when he was run into from behind, but he had to pay the $25 which the judge assessed. He even appealed the case, but lost out.

Now he has instituted a suit against the Wyckoff-Cord company for the damage done to his car. He bases his suit on the claim that the company which owned the car is liable.

Taximeter Company Loses, but Wins.

Although the Court of Appeals of the State of New York this week refused to hold up New York City's new taxicab ordinance while the American Taximeter Co. built new meters to conform to the new rates, the taximeter company is not worrying; the ordinance was held up by the taxicab companies pending an appeal, and although the courts refused similar relief to the taximeter company, the latter got its relief under the taxicab injunction. It appealed, however, as a matter of form. The taxicab companies' case is about to be decided by the Appellate Division of the New York Supreme Court.

AVERAGE OPERATING COSTS OF ELECTRIC COMMERCIAL VEHICLES

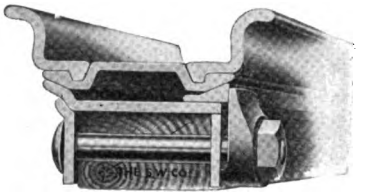
STANWELD MAKERS DEVELOP A BRAND NEW TYPE OF RIM

Radical Construction Which Permits Removal of Tube Without Disturbing Side Flanges—Employs Collapsible Inner Band.

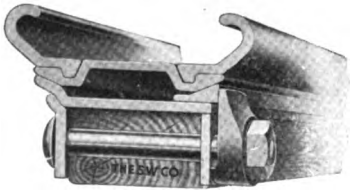
By way of obtaining construction which will permit of the inner tubes of tires being removed or inspected without the necessity for removing the side flanges, as is necessary with the usual type of demountable quick-detachable rims, the Standard Welding Co., of Cleveland, O., just has added to its Stanweld line a new type of rim, which, while combining many of the excellent features of others of its extensive line of rims, is absolutely radical in construction and is like nothing else of its



STANWELD "60" RIM COMPLETE

kind. The new rim is designated by the series number 60 and is furnished with two styles of side flanges, one for regulation clincher or Q. D. tires and the other for straight-side tires; both types of flanges fit the same base.

The principal point of difference between the new rim and its predecessors is that the side flanges and the locking wedge ring are continuous and the inner band is split transversely. The obvious advantage of the construction is that it permits the inner band to be removed without the necessity for disturbing the side flanges, which may be more or less firmly rusted in place. Incidentally, it permits of a quick change of inner tubes being made without removing any part of the casing, though at the same time the casing can be removed, if necessary, without taking either side ring from the tire.

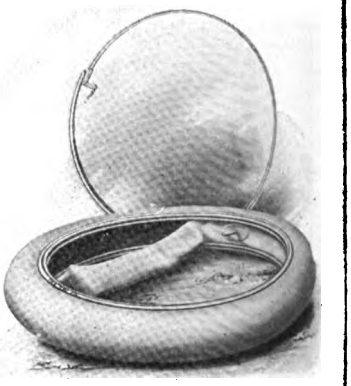


To describe the new No. 60 rim—its full title is "Number-Sixty Stanweld Collapsible Demountable Rim"—in a mechanical way, it consists of five principal parts—the felloe band, which is shrunk permanently on the wheel; the collapsible inner band, which is grooved to hold the endless side rings or flanges; the wedge ring, which centers and holds the inner band on the wheel at its front circumference; and the demounting mechanism, which consists of six clamps operating on bolts that extend through the wooden felloe, and support the felloe band at the rear.

STRAIGHT-SIDE TYPE SECTION

The felloe band is perfectly flat, with the exception of the rear flange, which is beveled at an angle of 25 degrees to expand the inner band when it is tightened on the wheel. The collapsible inner band is grooved at both sides of the top to hold the legs of the side flanges. Its center rises from the grooves to a height equal to the level of the base of the flanges and thus provides a perfectly flat and smooth seat for the tire.

The collapsible inner band is split near the valve stem hole and each end is provided with a portion of a toggle lock that is as efficient as it is unusual. The toggle lock is opened with an ordinary screwdriver and locked by pressure of the foot. Owing to the construction, the greater the breaking strain on the ends of the inner band, the tighter the lock becomes. The side flanges, which it already has been made plain are supplied for either clincher or straight-side tires and fit the same base, are made from flat strips of heavy, cold-rolled steel and, though lighter than the



Q. D. TYPE RIM IN SECTION

usual side rings, have greater strength; the flanges are rolled with lugs to fit the grooves in the rim base.

The wedge ring is exceptionally strong in design and construction and its width and thickness present an effectual bar to its bending or breaking. By way of providing against the possibility of creeping and loosening, the wedge ring is beveled only on the upper surface, the angle being 25 degrees; the construction eliminates the possibility of lateral movement resulting from radial strains, as the flat base of the wedge ring increases its resistance to squeezing pressures and delivers all strains to the bolts in a horizontal line.

The clamping devices used on the No. 60 rim are the same as those used on the No. 45 Stanweld rim, and the clamps are automatic in action. By applying a brace or a wrench, the clamps are lifted away from the wedge ring, at the same time swinging free from the locked position to permit the removal of the rim base. Two or three turns of each nut are all that are required to free the rim for demounting.

Though the new Stanweld rim is only slightly heavier than the ordinary type of clincher rim, its strength is considerably greater and it is claimed to be stronger than many types of demountable rims which exceed it in weight. Recent tests

INNER BAND REMOVED

demonstrated that pressures up to 300 pounds had no effect in bending, flattening or displacing its parts. Manufacturing facilities have been perfected for the production of the new rims in considerable quantities for the present market.

Automobiles with "Regular" Names.

A certain manufacturing concern that makes constant use of a number of cars for testing out the apparatus which it makes has hit upon a novel scheme for designating the cars. Instead of using numbers, which are more or less difficult to remember in connection with particular cars, or model designations, which in this case would be cumbersome and unsatisfactory because the cars all are of the same make, each machine is given a name, for all the world as if it was an animal. This apparatus will be mounted on "Billy," and that one will be tested on "Jack," and so on; and even the official reports are made out using names. The idea works out very well indeed and is said to have numbering systems and the like beaten to a frazzle.

Digitized by Google

HOLDING THE MIRROR UP TO THE CYCLECAR

(Continued from page 15.)

mistic on the subject. However, the cyclecar has afforded questionable promoters a new excuse to organize manufacturing companies to build cyclecars at ridiculously low figures. Automobile engineers should discuss the cyclecar frankly and fearlessly in order that the public will know its limitations with respect to performances, usefulness and price. Enthusiasm for the cyclecar should be limited to that which is supported only by fact."

Hendee Gives Hybrid Cold Shoulder.

Suggesting that it answered one of the questions propounded by McMurtry, R. G. Betts read a letter of George M. Hendee, president of the Hendee Mfg. Co., which makes Indian motorcycles, and is the largest maker of motorcycles in the world, in which Hendee stated that although the subject of cyclecars first had been considered in 1908, and twice since that time, his company had decided to have nothing to do with it. Hendee considers that in its present form the cyclecar is not suited for American roads, and to build it differently would mean the making of a full-fledged automobile in miniature, which, in turn, would mean "throwing down the gauntlet to the most famous light car in the world" and to other terrific competition which the cyclecar could not withstand.

There was much talk of the cyclecar being the connecting link between the automobile and the motorcycle, but Betts pointed out that since the early days of the industry there have been a succession of such so-called connecting links, none of which have endured. The Orient quadricycle, the Orient buckboard, the Pierce motorette, the high-wheeled motor buggy, the original Hupmobile and finally the Brush runabout at $350, each of which possessed cyclecar characteristics and most of them, the Brush particularly, had been designed for the man of small means, and yet none of them remain, despite the fact that some of them gave good service in actual use. The advertising of the Brush, he said, had simply swamped the makers with inquiries, but after two years' strenuous effort and great expense, only about 4,000 cars were sold.

Narrow Tread the Stumbling Block.

Betts stated that in his opinion the tread represents the crux of the whole situation and added that he does not believe that any narrow-tread four-wheeled vehicle which has to be steered to balanced between ruts, or to run with one wheel in a rut, can prove comfortable or ever will prove practical outside of paved cities. He asserted that the narrow-gauge cyclecar is not likely to prove more popular than has the narrow-gauge railway.

Betts further asserted that the cyclecar movement was largely the work of press agentry, and volunteered to give the name and address of a press agent who has issued a circular letter offering to compile a "cyclecar edition" for any publication that desires it.

In discussing the cyclecar from more of an engineering point of view than any of the other speakers, Joseph A. Anglada, a consulting engineer of repute and chairman of the Metropolitan Section, and who has designed a cyclecar for his own use, pointed out that at the last meeting of the International Federation of Motorcycle Clubs, held in December, 1912, it was decided to classify cyclecars according to size; the larger size, he added, include vehicles weighing not more than 784 pounds, having engines in which the piston displacement does not exceed 1,100 cubic centimeters and fitted with tires measuring 2⅜ inches in section; the smaller classification includes vehicles weighing between 330 and 660 pounds, with engines having not more than 750 cubic centimeters piston displacement and fitted with tires measuring 2 3/16 inches in section. All must have a clutch and change gear.

Specifications Prove of Small Value.

In McMurtry's remarks, however, it was made plain that, practically without exception, no American maker of cyclecars has given any intimation of being governed by any of these specifications; that all of them have, in fact, evolved miniature automobiles rather than cyclecars. That this is as it should be, that the cyclecar should be almost literally "an automobile viewed through the large end of a telescope," was the opinion of practically all of those present, the majority favoring construction featuring a four-cylinder water-cooled motor transmitting power through a two-, three- or four-speed gearset, propeller shaft and bevel drive incorporating a regulation differential.

Anglada pointed out that the conventional low-priced automobile of today contains approximately 1,000 detailed parts, not including such things as nuts, bolts, etc., or items of equipment. He believes that this number can be considerably reduced, and that with the simplification of design and the "establishment of new conventions in designs and specifications (considering that the present $500 machine represents present day conventions), will make possible the economical manufacture and sale of small cars in accordance with the new conventions, and these small cars will probably be known as cyclecars.

"The present conventional design of a low-priced American automobile," he added, "comprises a pressed-steel frame, a four- or six-cylinder motor, a friction clutch of the cone, disk or band type, a sliding gear transmission giving two, three or four forward speeds, bevel gear or worm driven rear axle, semi-elliptic front springs, I-beam front axle, three-quarter elliptic, platform or transverse rear spring. The selling price of cars designed along these conventional lines is somewhere in the neighborhood of $1 per pound for a touring car and as low as 50 cents per pound for the later type of small runabouts.

Price and Cost Must be Considered.

"The total weight of the small car and the cyclecar can readily be brought within the European cyclecar definition, although undoubtedly the simpler design of the cyclecar will result in less weight. Assuming, however, equal weight in the initial purchase of materials, there is an important difference in the manufacturing cost of the two cars. The number of patterns is reduced. The number of dies, jigs, special tools, etc., with their attendant cost, is reduced, and with the smaller number of parts in the cyclecar these parts will be simpler and more rugged in construction, with the resulting increase in bearing surface and a corresponding reduction in the cost of maintenance.

"It is quite apparent that a reduction in the number of detail parts of dissimilar design has a direct bearing on the economy of the manufacturing department. In the first place, it lessens the expense of handling different materials and parts and the clerical work attendant upon their receipt and inspection. In the purchase of fewer varieties of raw material and its transit through the various processes of assembling the simpler cyclecar is also less expensive than is the conventional small car, and likewise the expenditures for final testing, locating of faults and adjustments are obviously reduced. Furthermore, simplification of design is of vital importance to the owner. It lessens the amount of attention required to keep the car in first class running condition and lessens the number of replacements.

How the $500 Car Asserted Itself.

"A few years ago when a car to be sold for $500 was first talked about, it was impossible to build a good car to sell at this price, because manufacturers of parts such as axles, transmissions and engines were not prepared to furnish parts suitable for these small cars. Since that time, however, manufacturers have begun to realize that

Digitized by Google

there is a demand for a small car selling in the neighborhood of $500, and some of them are now prepared to furnish from stock the important units entering into the construction of such a car, and for this reason we may reasonably expect that the number of runabouts selling for about $500 will increase."

Anglada added that at present there are no fewer than 38 manufacturers of cyclecars listed, but prophesied that "fully 90 per cent. of them will not be in existence two years hence."

The question of initial cost was another topic that received no small amount of discussion, and though the opinion prevailed that a cyclecar to be successful must be properly designed and constructed of good material and sold for something under $500 withal, no one was able to suggest any logical solution of this palpable problem. To produce a cyclecar, or rather a veritable miniature automobile, to sell for $500 or $600, it was pointed out, is not particularly difficult, though it would entail production in considerable quantities.

Quality an Essential, Says Merkel.

J. F. Merkel, who designed the motorcycle bearing his name, was not present, but in a communication he expressed the belief that there is room for a good cyclecar and that he expected eventually to see such a vehicle in considerable quantities on the roads, though he did not expect that its appearance would have any effect on either the motorcycle or the automobile trade. "But," he added, "quality is essential; quality must be put into a cyclecar to sell for something between $500 and $600; it must be a four-wheel, narrow tread vehicle seating two passengers side by side and carrying a four-cylinder motor of the water-cooled type."

In discussing the initial cost, M. Machol opined that first cost really appeared to be of small moment provided the cost of upkeep was less than that for a small, light automobile; that it was low upkeep cost that first prompted the birth of the cyclecar and that provided a cyclecar could be produced to sell for something between $500 and $600 there should be a market for it if it could be run cheaply. Both Twombly and J. R. Cantley, the latter having had considerable experience with light cars abroad, concurred with Machol in this respect, Twombly pointing out that it was the promise of low upkeep cost that really prompted the development of the cyclecar on the other side of the Atlantic. Others, however, were not inclined to the belief that the purchasing public could be induced to buy a car that is manifestly less than an automobile for more money than will purchase a "certain runabout made in Detroit and selling for $500" merely on the promise of lowered upkeep costs.

Continuing, Twombly switched to the question of vehicle efficiency and very strongly advocated that American designers pay greater attention to the reduction of head resistance as a means to the reduction of upkeep costs by increasing engine efficiency. Abroad, he pointed out, a great deal more attention is paid to the possibilities of the stream-line body than is the case in America, and as a result no small amount of the success attributed to the light car can be traced almost directly to this feature. In the course of his remarks, Cautley made an earnest plea for more efficient motors instead of merely large ones.

Spring Suspension Important Feature.

As was to be expected in the discussion of a narrow tread vehicle which must of necessity seek other paths than those travelled by larger cars—and undoubtedly other bumps—spring suspension formed an important part of the discussion, the majority of those holding, with a great deal of truth, that with the small, light car the springs play a far more important part than they do with larger and heavier cars, and that as a consequence they are susceptible of, or, rather, require, proportionately greater attention. Twombley gave as his opinion that no kind of spring was superior to the long cantilever, which type, he explained, gave the necessary resiliency and a slow period of oscillation without undue rebound. He found that a 36-inch cantilever, with the bearing directly at the center, gave the best all-around results.

The belt drive, attacked by McMurtry with not very great vehemence, was passed over less lightly by P. J. Bailey, of the Consolidated Mfg. Co., of Toledo, O., who, though not present, expressed his opinions in a written communication. He drew attention to the fallacy of expecting good results to follow the elimination of the differential by expecting its place to be taken by slippage in one of the belts. If the belt were loose enough to slip an amount appreciable enough to permit the elimination of the differential, he pointed out, it probably would not be tight enough to drive the vehicle up hill or over heavy roads. "The V-section belt either won't slip at all," he summed it up, "or it will slip too much; the differential cannot be eliminated."

Bailey Declares Cyclecar a Fad.

Bailey is not at all in favor of the cyclecar, which, he said, is nothing more than a passing fad; it has not been the success abroad that generally is believed, and it cannot exist in America because the roads prohibit its use. Those who ride in automobiles, he added, look down on the cyclecar because of its size and motorcyclists hold it in contempt because they can "trim" it on the road. The majority of those who ride want a "real automobile"; and if they cannot afford it they buy a "real motorcycle." One other point Bailey made that was not made by any of the others, was that those who ride in cyclecars are so low that they are in an excellent position to receive the dust and dirt thrown up by both motorcycles and larger automobiles.

A. B. Brown, who was called on by the chairman, stated that he had had no experience with the cyclecar, but he did not see how it could be regarded as an exactly luxurious vehicle. While it might prove of some service in cities, he believed that its narrow tread absolutely prohibited its use in any but the large cities of the country. In fact, he considered it unfair to ask that it be used for touring purposes.

Those Who Believe in the Newcomer.

Chairman Anglada stated that a number of other motorcycle and cyclecar manufacturers had been invited to express their views, but comparatively few of them had accepted the invitation. In addition to Merkel and Bailey, only the American Motor Co., of Brockton, Mass., had replied, the latter indicating that it was preparing to engage in the manufacture of a cyclecar, or miniature automobile. W. S. Frazier & Co., of Aurora, Ill., who were described as motorcycle manufacturers but who are not identified with the industry, also expressed faith in a vehicle of the cyclecar type. Of the cyclecar manufacturers, only the American Cyclecar Co., of Bridgeport, Conn., voiced its views. They were conveyed in a paper prepared by Harry J. Stoops, general manager of the company, whose statements left no doubt of his confidence in the future of the little vehicle, which he firmly believes is a necessary connecting link between the automobile and the motorcycle.

Toward the close of the meeting a resolution was offered defining, at least tentatively, the American idea of a cyclecar, or rather the ideal specifications for such a vehicle. It was explained that the resolution was merely in the nature of what might be termed a straw vote, but it was very vigorously opposed, particularly by the newspaper men present, and finally was withdrawn. Those who opposed it believed that, however tentative, publication of such specifications would be misconstrued or misapplied and cause all manner of trouble. In expressing this belief, David Beecroft also voiced his opinion that, although the cyclecar might not be suitable for touring purposes, there are so many millions of people in cities that they comprised a large and promising market in themselves.

CADILLAC AGAIN AWARDED DEWAR RELIABILITY TROPHY

Coveted Prize Awarded American Car for Second Time in Five Years—Strenuous Tests by R. A. C. That Determined Winner.

Bearing the distinction of being the only make of car in the world to duplicate the achievement, the Cadillac car has again been awarded the Sir Thomas Dewar trophy by the Royal Automobile Club of Great Britain for all around vehicle efficiency and reliability demonstrated in a series of exhaustive tests made under the supervision of that body. It was five years ago that the Cadillac first won the trophy as the direct result of the degree of standardization of its parts. A stock car was dismantled and duplicates for 89 of its parts, selected from stock, used in rebuilding it; only screwdrivers and wrenches were permitted in the rebuilding.

The test just completed, whereby the Cadillac is awarded the trophy for the second time, involved driving over 1,000 miles of give-and-take roads; a careful compilation of fuel and oil used—the fuel consumption figured out at 17.17 miles to the gallon and the oil at less than one pint per 1,000 miles; tabulation of the number of times the electric starter and the electric rear axle gear change was used; the time the lamps were burning, etc. During the test, the speed was maintained practically constant at 19.5 miles an hour. The starter was used 130 times and at the conclusion of the test cranked the engine 1,000 times without falter. All the lamps were continuously lighted for 66 hours 17 minutes, though at the end of the trial the side, rear and speedometer lights continued to burn for 20 hours longer. The two-speed rear axle mechanism was operated 520 times without fail.

Pickens Denied Reinstatement by A. A. A.

William H.—who is "Bill"—Pickens, is still feeling the effects of that race between "Jack" Johnson and Barney Oldfield, which was held on the Sheepshead Bay race track in October, 1910, and he is likely to feel them for some time to come—until January 1st, 1917, to be exact. Pickens, who was Oldfield's manager at the time, was disqualified by the Contest Board of the American Automobile Association for an indefinite period for promoting the meet without the A. A. A. sanction. Subsequently, the disqualification was made for a definite period to expire in January, three years hence. At the last meeting of the Contest Board, Pickens's formal application for reinstatement to good standing was considered, but was denied in the absence of any satisfactory reason for warranting favorable action. At the same time, George J. Greenberg, participant in the Chicago Automobile Club vs. Chicago Athletic Club run on June 12th and 13th, was disqualified and suspended until January 1st, 1915, for "wilful and deliberate violation of the special rules governing the run."

Cuts Tire; Now Proposes Ordinance.

Alderman Churchill of Milwaukee is "sore" on the Milwaukee Electric Railway & Light Co. to the extent of $21, and he has vented his displeasure by backing up a proposed ordinance which would compel the street car company to smooth off all the feather-edge rails, frogs and switches in its system. He claims one of these rails cut into a perfectly good automobile tire and "set him back" $21.

The street car company says it doesn't need any ordinance and that if anyone knows where there are such rails the company will repair them immediately upon notification. Eight months ago the alderman introduced an ordinance along these lines, but it never was reported upon by Commissioner of Public Works Simmons, to whom it was referred. The latter said it was too indefinitely worded and would cause all sorts of trouble in its interpretation and enforcement.

Percy Lambert Killed in Practice.

In the midst of an eventful automobile racing career that had brought him many world's records, Percy Lambert, the British driver who in February last succeeded in driving 103 miles in an hour, was killed on Brooklands track in England on Friday, 31st ult. At the time of the accident that resulted in Lambert's death, he was attempting to travel further in an hour than Chassagne with his 12-cylinder Sunbeam travelled on October 8th; Chassagne made nearly 108 miles an hour. While moving at the rate of 114 miles an hour, one of the tires on Lambert's car collapsed, precipitating the car over the embankment and on top of the driver. He was killed instantly.

Chauffeurs Denied Retrials for "Murder."

New trials have been denied to Frank Hrodek and Laurence Lindbloom, chauffeurs, who were recently convicted in Chicago of murder in running down and killing pedestrians with the cars they were driving; testimony in both cases showed that the chauffeurs had been drinking and were driving recklessly at the time the accidents occurred. Hrodek killed Patrick J. Condon, a retired merchant, and Lindbloom killed Joseph Weiss, a cigar manufacturer. Both men were given long terms in prison.

BOTTA, LOCAL PILOT, WINS BIRMINGHAM OUTLAW RACE

Three of Seven Finish Unsanctioned 100-Mile Event—Two Accidents, One of Which Likely Will Result in Fatality.

For the second time this year, and the third time within two years, C. I. Dunivan, who is apostrophized by the Contest Board of the American Automobile Association as the most persistent promoter of unsanctioned racemeets, has figured in a track racemeet that in all probability will prove fatal for one of the contestants. Dunivan's latest appearance as a promoter was made at Birmingham, Ala., on Wednesday, 29th ult., and as was the case with his previous recemeets, the meet was not sanctioned by the A. A. A. Dunivan himself did not drive. He intended to do so, but as the meet, which consisted of a single 100-mile race, had been advertised as an amateur event, the judges forbid the promoter starting. None of the drivers who took part are known outside of their home circles, the race going to R. F. Botta at the wheel of a "Lyons special"; H. F. Chaflin, in a Buick, was second and Barr, with a Studebaker, was third. Botta's time was 1:58:16. Only three finished of the seven that started.

It became evident almost from the first that accidents would be the order of the day, for in the 11th lap W. R. Lawson, at the wheel of a Studebaker "20," crashed through the fence, sustaining a sprained leg and severe bruisess; his mechanician, Percy Kaplan, escaped with bruises, though he was rendered unconscious. The most serious accident of the day, and the one it is thought likely will result fatally, occurred shortly after Frank Katz, who with a Studebaker had been leading the field, stopped to replenish fuel in the 73rd mile. In the thick dust on the grandstand turn, Katz swept through the fence and the car overturned, injuring the driver severely. Fortunately, Katz had no mechanician in the car with him.

Botta won the race easily, for after leading the field up to the 40th mile, when he relinquished the lead to Katz, he regained it in the 53rd mile and never was headed. Of the seven that started, L. S. Crane, who drove a Pope-Hartford, was forced out in the 80th mile when his car caught fire; engine trouble put out Wm. Odell (National) in the 29th mile; Katz went out in the 74th mile, and Lawson retired in the 11th mile. Chaflin, who was second, covered the distance in 2:09:35 and Barr, who was third, finished in 2:10.

MOTOR TRUCK MAKES MONEY IN COUNTRY MILL SERVICE

Cheaper Than Horses, Despite Hills and Bad Roads—Modern Appendages Help Make Old-Fashioned Business Profitable.

Some 50 or 60 miles north of New York City there is a little village in the hills that is so small no one seems to know just what its population is. It is altogether probable that if one were to get persistently inquisitive as to the number of souls within its borders the person questioned would hold up one hand to tick off the population on his fingers and commence:

"Well, let's see! There's Charley Ketcham, who keeps the store near the station, and his five daughters and two sons; Rob Doxey and his wife and two girls and a boy over at Glenbrook farm; there's Dan Secor, and his wife and three daughters, and generally they have a lot of boarders, but they only come in the summer and they don't count, anyway, do they? Then there's Charley Secor and his wife and two boys, and Vaughan and his wife and son—you know, where you get the honey, at the head of the lane," and so on, till the census is complete. There's a little railroad station that shuts up as tight as a bottle about dark; and two or three hundred yards along the track, where the Moodner River—which is only a brook—makes a sharp turn to the right, only to find itself eternally dammed, there's a red grist-mill with an old-time overshot water wheel that rumbles monotonously all day and only ceases at night to let the water accumulate behind the dam so it can rumble through another day.

It's a typical old-time mill that runs contentedly year in and year out, with one or two men sitting around on sacks of grain waiting for a hopper to run out or a load of stuff to run in or to be sent out. It is surrounded by big, drooping trees; around it numerous chickens pick up a fat living, harried though they are by the miller's almost equally numerous dogs, and white ducks swim in the mill-pond. Quiet and peaceful, and as far removed from the hustle and bustle of modern methods as possible; a page out of a book of quarter of a century ago; one of those places that make one exclaim, involuntarily, "Ye Olde Mill!" and rest one's eyes by looking at it.

That is to say, the mill looks like that kind of a place from the railroad track. To a considerable extent it really is that kind of a place. But if you go a little further and cross the red iron highway bridge that crosses the little river just below the dam the first thing that catches the resting eye is a solid-looking little building of concrete roofed with iron. And on the trunk of the huge tree under which the little house is built is a black-and-white sign that instantly whisks away all the old-time air, and in the glancing of an eye sets the old red mill down in the midst of the rankest modernism. The sign reads

GASOLENE

and the little house contains a store of it, for not only is the mill on the State highway over which automobiles pass in great numbers, but the miller, unencumbered by any particular desire to have his mill run as mills were run in the good old days, has so far ignored the grandfatherly aspect of the establishment as to make use of a motor truck. The smell of gasolene mingles curiously with the dusty odor of the mill; the thudding of the engine drowns out the mild rumble of the overshot water-wheel; and the imprints of big rubber tires obliterate the hoof-marks in front of the mill.

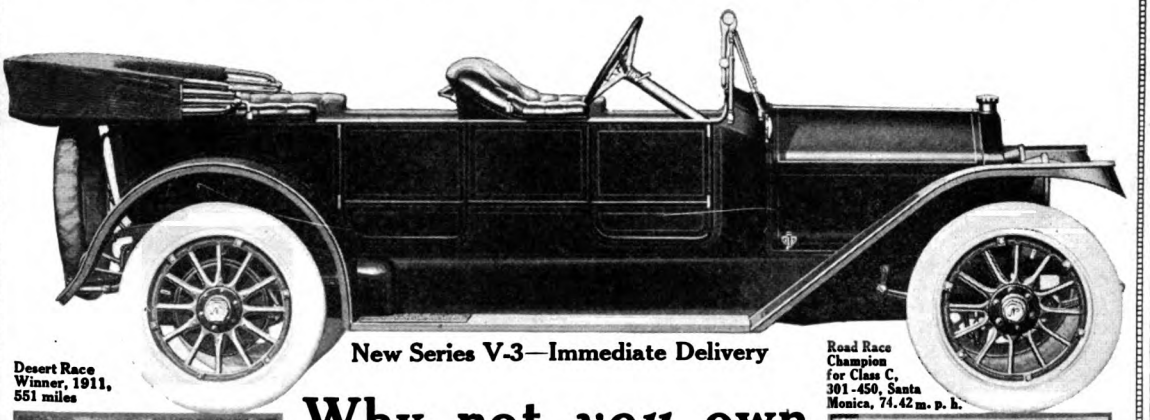
"A motor truck's just as good in the country as anywhere else," asserted the miller, "if you've got work enough for it."

Which is perfectly true. And in this instance there is plenty of work, for the truck carries the burdens that formerly were hauled by from four to six horses. Level roads in that part of the country are merely occasional accidents, occurring when the highway engineers could not conveniently run either up or down a mountain; but not only does the machine run and keep on running to the elimination of horses and to the benefit of the miller's exchequer, but it carries a thousand pounds more than it was intended to carry and does it as a regular thing because the loads happen to come just that way. The makers rated the truck at 3,000 pounds, but the miller consigned the rating to a place where there are no water-wheels and put on 4,000 pounds and isn't sorry—yet.

That the machine stands up under the work it does is a tribute to the way people are building motor trucks in these days. The grades run all the way from long miles of gentle slope to shorter, sharper rises that in a few instances reach over 20 per cent.—and it is safe to assert that one who scoffs at a 20 per cent, grade never had a real good look at one. In the spring when things are softening up the roads in many places are deep with mud, and the truck does miles and miles of low-gear work—and always does it. It's true someone forgot to drain the water jackets one cold night, and they froze up and cracked; but because people live in the country it doesn't follow that they're stupid. They sent for a new pair of cylinders and kept the truck going by plastering cement into the cracks; and so well did the cement do its work that they are holding the new cylinders in case someone should forget again.

The truck is well along in its second year of strenuous service, and has averaged 1,200 miles a month from the beginning. The miller says that it is not unusual for the machine to make a run of 20 miles out and 20 miles back during the forenoon, despite the hills. But there is one thing that very much annoys the miller. The only part of the truck that has given any trouble without strenuous provocation is the big bevel driving gear, which is on the jackshaft, the truck being chain driven. The gear doesn't seem equal to the work that the rest of the track performs so easily, and it lets go every two or three months. So far the miller has put in no less than five new bevels, and he always has a spare one on hand waiting for the inevitable. Constructional peculiarities preclude the use of any gears except those especially made for the truck, and also make it difficult and expensive to put in a complete new jackshaft, though the miller is considering the advisability of taking the bull by the horns and installing a new unit. As to why any owner of a motor truck should put up with such a state of affairs, and why the manufacturer should not at once make the troublesome part good without charge, there is a simple answer. The manufacturer who made that truck manufactures trucks no longer. Besides, the miller exceeded the specified load limit, which has a debilitating effect on guarantees. So things run along as they are, with an occasional sharp jog when the big bevel gets tired of working.

"But does the machine pay for itself in spite of the constant breaking of bevels and the loss of time putting in new ones?"



"Yes," replied the miller, "she's a good paying proposition," and from the way he said it one might gather that he could have added an adjective or two without straining his conscience.

Of the automobiles that pass the miller's place not all of them are from outside parts—not by a great many. About every other farmer in the district seems to own his own car, and the way the machines are chased up and down the hills is something akin to uncanny. There is one man who lives on the top of a hill—a long, steep one—and he can't get away without going down and he can't get home without going up. He says he used to kick a few teeth out of the gears occasionally, until he discovered that a clutch was a sensitive sort of thing and always retaliates when suddenly dropped. The farmers depend upon their cars exactly as they do upon their horses, and it is an everlasting tribute to their mechanical handiness that the garage not a great way from the mill has but little to do.

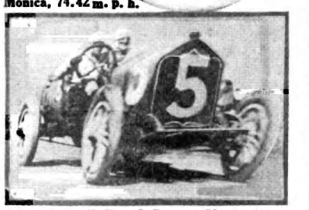
National

WORLD'S CHAMPION

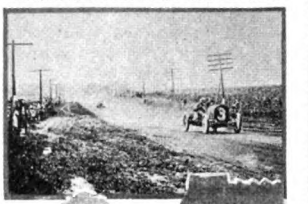
New Series V-3—Immediate Delivery

Desert Race Winner, 1911, 551 miles

Stock Champion, Elgin, 1911, 305.03 miles



Fastest Mile for Stock Cars, average 89.28 miles per hour



International Champion, 500-mile race record holder, 81.72 miles per hour, actual running time

Road Race Champion for Class C, 301-450, Santa Monica, 74.42 m. p. h.

Free-for-All Road Race Champion, 1911, 202.008 mi., av. 74.628 m. p. h.

Why not *you* own the champion?

There can be but *one* leader. It *is* the *National*. Not once, but year after year it remains supreme—unconquered! Records, demonstrations and actual performances prove this.

A ride today in a National will prove to you how this is possible, despite desperate efforts of the costly foreign cars to wrest laurels from America's defender—the *National*.

The *National's* championship quality is bred into its very fibre and strength. Its power is indefatigable and its control marvelously simple. There is a pride in ownership of the one, absolute leader.

Dignified in appearance, quiet in operation, comfortable and luxurious, the *National* is complete in everything from electric self-starter to concealed baggage compartments.

Five models, $2750 to $3400

Thirteen years' experience

Champion on Speedway or Broadway

National Motor Vehicle Co. Dept. 90, *Indianapolis Indiana*

1,063,100. Spring Wheel. Elmer G. Woodlee, Altamont, Tenn. Filed Dec. 3, 1912. Serial No. 734,733. (Wheel with spring-cushioned hub.) 1 claim.

1,063,115. Autotruck Body. James N. Brewster, New York, N. Y. Filed Sept. 10, 1912. Serial No. 719,513. (Truck body construction system.) 2 claims.

1,063,117. Tire of Wheels of Vehicles or the Like. John Cairns, Walsall, England. Filed Apr. 14, 1911. Serial No. 621,101. (Thick tread cushion tire.) 9 claims.

1,063,141. Engine Starter. Gregory John Spohrer, Franklin, Pa., assignor to Wilson Motor Starter Company, Franklin, Pa. Filed May 17, 1911. Serial No. 627,653. (Compressed air starter.) 5 claims.

1,063,161. Spring Wheel. Ozro H. Hinds, Le Mars, Ia. Filed Sept. 6, 1912. Serial No. 718,893. (Wheel with hollow spokes enclosing springs.) 2 claims.

1,061,981. Motor Vehicle Running Gear. Howard G. Carr, Hoopeston, Ill. Filed July 8, 1911. Serial No. 637,513. (Resilient frame construction.) 9 claims.

1,062,011. Vehicle Tire. Charles Francis Jenkins, Washington, D. C. Filed June 27, 1912. Serial No. 706,188. (Wood block tire.) 1 claim.

1,062,128. Gearing. Erick J. Swedlund, Williston, N. D. Filed Mar. 2, 1912. Serial No. 681,116. (Friction drive.) 18 claims.

1,062,132. Explosion Motor. Joseph Vollmer, Berlin, Germany. Filed July 21, 1910. Serial No. 573,116. Motor with two concentric cylindrical slide valves) 3 claims.

1,062,154. Locking Device for Fuel Supply Valves. Albert K. Harnly, Reading, Pa. Filed Nov. 14, 1912. Serial No. 731,278. (Gasolene lock.) 3 claims.

1,062,156. Ignition Magneto. Alexander L. Heizer, Chicago, Ill., assignor to Vesta Accumulator Co., a corporation of Illinois. Filed Mar. 2, 1910. Serial No. 546,811. (Magneto with adjustable poles.) 2 claims.

1,062,197. Bearing for Supporting Radiators in Automobile Frames. Oscar Stegeman, Denver, Colo. Filed Aug. 19, 1909. Serial No. 513,588. (Trunnion for radiator suspension.) 6 claims.

1,062,260. Wheel for Vehicles. Charles Calvin Sill, Seattle, Wash. Filed Aug. 7, 1911. Serial No. 642,680. (Wheel with radial helical springs.) 1 claim.

1,062,308. Internal Combustion Engine. William G. Thummel, St. Louis, Mo. Filed Apr. 10, 1911. Serial No. 619,973. (Air pumping cylinder forcing air into cooling jacket of power cylinder.) 3 claims.

1,062,318. Driving Gear. George C. Berlin, Caldwell, Idaho. Filed Mar. 16, 1911. Serial No. 614,921. (Caterpillar type track tread.) 1 claim.

1,062,320. Shock Absorber. Joseph Boland, Pittsburgh, Pa. Filed July 3, 1912. Serial No. 707,444. (Buffer type shock absorber.) 8 claims.

1,062,345. Indicating and Recording Device. Burton Marker, Chester, Pa. Filed March 19, 1912. Serial No. 684,896. (Automatic recording speedometer.) 1 claim.

1,062,401. Pneumatic-Tire Cover. John Thomas Johnson and Frederick George Mason, Caulfield, Victoria, Australia. Filed July 5, 1912. Serial No. 707,729. (Method of making tire fabric.) 2 claims.

1,062,422. Propeller Means for Self-Propelled Vehicles. William A. Sorg, Minneapolis, Minn. Filed May 27, 1912. Serial No. 699,846. (Automobile driven by separate traction wheel between road wheels.) 16 claims.

1,062,426. Puncture-Closing Compound. William J. Watkins, Fort Worth, Tex., assignor of one-half to Nannie G. Drumm, Fort Worth, Tex., and one-fourth to John A. Wisherd, Stanton, Neb. Filed Nov. 5, 1912. Serial No. 729,617. (Liquid for closing tire leaks.) 2 claims.

1,062,441. Shock-Absorber. Walter H. Cook, New Orleans, La. Filed Nov. 14, 1912. Serial No. 731,355. (Auxiliary spring shock absorber for Ford type springs.) 4 claims.

1,062,452. Motor Vehicle. Edward B. Gallagher, New York, N. Y., assignor to Clover Mfg. Co., New York, N. Y., a corporation of New York. Filed Nov. 20, 1907. Serial No. 402,982. (Removable power plant system.) 33 claims.

1,062,462. Tire-Support. Alexander Harnishfeger, Evansville, Ind., assignor of one-half to Moses A. Strouse, Evansville, Ind. Filed Oct. 11, 1912. Serial No. 725,231. (Carrier for demountable rim and tire.) 6 claims.

1,062,472. Wheel. Samuel Kaye, Columbus, Miss. Filed July 12, 1911. Serial No. 638,143. (Drive through universal joint in hub, permitting steering and driving simultaneously.) 6 claims.

1,062,494. Internal-Combustion Engine. Joseph Munden, Bradenville, Pa. Filed Feb. 13, 1911. Serial No. 608,224. (Valve system including both piston valve and poppets.) 3 claims.

1,062,518. Horn for Motor Cars, Motorcycles and Cycles. Etienne Teste, Paris, France. Filed June 22, 1910. Serial No. 568,297. (Multiple tone horn.) 3 claims.

1,062,519. Vehicle Wheel. William T. Thorp, Litchfield, Ill. Filed Oct. 27, 1911. Serial No. 657,033. (Wheel with springs between inner and outer rims.)

1,062,551. Electro-Mechanical System for the Propulsion of Automobiles. Henri iPeper, Liege, Belgium. Filed Sept. 25, 1906. Serial No. 336,122. (Gasolene-electric driving system.) claims.

1,062,567. Tire-Deflation Indicator. Hermann Jacoby, Eberstadt, near Darmstadt, Germany. Filed Oct. 23, 1911. Serial No. 656,202. (Mechanical means for ringing bell when tire becomes deflated.) 5 claims.

1,063,196. Automobile Tire. William F. Haas, Hartford, Conn. Filed Dec. 29, 1910. Serial No. 599,975. (Tire formed of bands of knitted fabric.)

1,063,219. Spring Wheel. Robert Rutherford, Portland, Ore. Filed July 6, 1911. Serial No. 637,090. (Wheel with spring-cushioned hub.) 1 claim.

1,063,221. Tire. Henry C. Seipp, Pittsburgh, Pa. Filed June 24, 1912. Serial No. 705,481. (Tire with rubber-filled steel channels.) 4 claims.

1,063,2444. Variable-Power Transmitting and Controlling Mechanism. Ludwig Maria Dieterich, Kansas City, Mo. Filed March 18, 1908. Serial No. 421,805. (Transmission by both friction disks and gears.) 5 claims.

1,063,286. Shock-Absorber. Gerald H. Richmond, Buffalo, N. Y. Filed Oct. 20, 1910. Serial No. 588,048. (Pneumatic shock absorber.) 3 claims.

1,063,290. Tire-Protector. John T. Ryan, Vallejo, Cal., assignor to American Tire Armor Co., Phoenix, Ariz., a corporation of Arizona. Filed March 13, 1908, Serial No. 420,905. Renewed Sept. 19, 1911. Serial No. 50,255. (Protecting tread.) 2 claims.

1,063,291. Armored Pneumatic Tire. John T. Ryan, Vallejo, Cal., assignor to American Tire AArmor Co., Phoenix, Ariz., a corporation of Arizona. Filed March 26, 1908, Serial No. 423,292. Renewed Sept. 19, 1911. Serial No. 650,256. (Sectional nonpuncturable tread.) 1 claim.

1,063,307. Traction Engine. Alexander H. Welker, Berlin, Ontario, Canada. Filed Jan. 19, 1911. Serial No. 603,520. (Three-wheeled gasolene tractor.) 2 claims.

1,063,323. Crankshaft. Henry L. Bock, Toledeo, Ohio, assignor to William E. Bock, Toledo, Ohio. Filed April 10, 1911. Serial No. 20,214. (Built-up crankshaft.) 10 claims.

1,063,330. Valve Gear for Explosion Motors. Mark B. Crist, Pittsburgh, Pa., assignor, by mesne assignments, to The Colonial Trust Co., trustee, Pittsburgh, Pa., a corporation of Pennsylvania. Filed July 20, 1909. Serial No. 508,636. (Gas control through inlet valve.) 2 claims.

1,063,359. Spring Rim for Wheels. William A. Langjahr, Plymouth, Wis. Filed Jan. 2, 1913. Serial No. 739,610. (Wheel with springs between inner and outer rims.) 1 claim.

1,063,368. Gas Engine. George E. McElroy, Newark, N. J., assignor to McElroy Engine Co., Newark, N. J., a corporation of New Jersey. Filed Feb. 15, 1912. Serial No. 677,851. (Motor with valve recessed into cylinder wall.) 11 claims.

1,063,417. Process of Making Compound Hollow Metal Bodies. Edward G. Cook, Brooklyn, N. Y., assignor to Brass & Copper Products Co., New York, N. Y. Filed Feb. 14, 1912. Serial No. 677,507. (Electro-deposition for making manifolds and the like.) 8 claims.

1,063,440. Internal-Combustion Engine. William Harper, Jr., New Bloomfield, Pa., assignor, by mesne assignments, of three-tenths to Harper Engineering Co., a corporation of New York, and seven-tenths to Thomas A. Nevins, East Orange, N. J. Filed June 20, 1906, Serial No. 322,566. Renewed Oct. 30, 1912. Serial No. 728,727. (Two-cycle motor with port and passage through piston.) 2 claims.

1,063,455. Sparking Device for Explosive-Engines. William S. Liming, Scranton, Pa. Filed Feb. 20, 1907. Serial No. 358,356. (Wiring and switch system for ignition.) 2 claims.

1,063,459. Shock-Absorber. Daniel F. McCarthy, Moline, Ill. Filed Jan. 20, 1912. Serial No. 672,471. (Friction shock absorber.) 1 claim.

1,063,465. Spring Wheel. Otto J. Olson, Courtenay, N. D. Filed Jan. 19, 1912. Serial No. 672,167. (Wheel with spring cushioned spokes.) 2 claims.

1,063,475. Vapor-Engine. William F. Stone, Woodbury, N. J., assignor, by mesne assignments, to The Engineering & Development Co. of America, Salisbury, Md., a corporation of Maryland. Original application filed Feb. 18, 1911, Serial No. 609,477. Divided and this application filed May 12, 1911, Serial No.: 656,847. Renewed Nov. 1, 1912. Serial No. 729,401. (Two-cycle motor with ported piston.) 2 claims.

1,063,477. Engine Valve Mechanism. Oscar Treier, Brooklyn, N. Y. Original application filed March 23, 1912, Serial No. 685,866. Divided and this application filed AAug. 10, 1912. Serial No. 714,327. (Cylindrical valve.) 2 claims.

1,063,480. Vehicle Wheel Rim. James H. Wagenhorst, Akron, Ohio. Filed Jan. 16, 1912. Serial No. 671,492. (Q. D. rim and fastenings.) 5 claims.

1,063,485. Automobile-Brake. Rollin H. White, Cleveland, Ohio, assignor to The White Co., Cleveland, Ohio, a corporation of Ohio. Filed Oct. 9, 1908. Serial No. 456,856. (External contracting band brake and toggle mechanism.) 1 claim.

1,063,490. Liquid Fuel Oil Feeding Governor for Internal-Combustion Engines. James I. Wood, Denver, Col. Filed April 18, 1911. Serial No. 621,818. (Centrifugally operated fuel regulator.) 3 claims.

1,063,500. Demountable Vehicle Rim. Percy B. Bosworth, Akron, Ohio, assignor to The Firestone Tire & Rubber Co., Akron, Ohio, a corporation of Ohio. Filed July 5, 1911. Serial No. 637,030. (Q. D. rim and fastenings.) 7 claims.

1,063,520. Internal-Combustion Engine. Justus B. Entz, Cleveland, Ohio, assignor to The White Co., Cleveland, Ohio, a corporation of Ohio. Filed June 11, 1910. Serial No. 566,293. (Scavenging engine with moving cylinder head.) 24 claims.

1,063,530. Motor Car Wheel. James A. Glenn, Albany, N. Y. Filed Jan. 9, 1912. Serial No. 670,337. (Wheel with curved spring spokes.) 6 claims.

1,063,531. Rim Construction. James A. Glenn, Albany, N. Y. Filed April 26, 1912. Serial No. 693,411. (Rim for wheel with curved spring spokes.) 2 claims.

1,063,561. Automobile Horn. Louis A. Marcotte, Beverly Cove, Mass. Filed Sept. 6, 1912. Serial No. 718,905. (Horn with bell in place of reed or diaphragm.) 3 claims.

1,063,578. Tire or Tread Therefor. William Robert Morrison, Chicago, Ill. Filed March 2, 1911. Serial No. 611,856. (Tire tread of net-like bands.) 6 claims.

1,063,592. Lubricating Device for Explosive-Engine Piston-Rods. Ralph Ragan, Atlanta, Ga. Filed Dec. 14, 1911. Serial No. 665,726. (Piston-rod gland lubricator.) 7 claims.

Scientific Chassis Construction *Endorsed on Two Continents*

Look Under the Hood of the Car You Buy

THE least understood part of the motor car—the chassis—is discussed in a vigorous openfaced manner in the latest booklet describing Pathfinder Motor Cars.

It throws a new light on the dark region under the floor boards and hood, which really represents 75 per cent. of your car purchase.

It has a value to the inexperienced buyer that will be immediately appreciated. You cannot afford to be ignorant of the vital part of your purchase.

Here's a splendid opportunity to get an educational prospectus on the development of car buying. Just write for our "Guide to Automobile Buying" and standard catalog.

Your name and address on the margin of this page will do.

Three Dollars and Fifty Cents

$3.50 is the price, prepaid to any point in the United States, of the Ellis Gasolene Purifier.

Another way of putting this is to say that it costs $3.50 to get rid of carburetor trouble at once and for all time.

The Ellis Gasolene Purifier

One of the most disgusting things your customers have to stand is the little items for "fixing and adjusting carburetor," items that appear on nearly every bill for maintenance they receive. Sometimes these carburetor items are less than $3.50; sometimes they are more, but what disgusts them is the fact that it seems impossible for a carburetor to be fixed so that it will stay fixed and give no further trouble.

In the course of a year or so your customers are asked to pay many times the cost of an Ellis Gasolene Purifier for carburetor items with no insurance that relief from such trouble will be permanent.

The $3.50, which an Ellis Gasolene Purifier costs, means just this, THAT IT IS THE PRICE OF INSTANT AND PERMANENT RELIEF FROM CARBURETOR TROUBLE. $3.50 is not a premium for insurance against carburetor trouble, it is the total cost of absolute protection against such trouble. The $3.50 is DEFENSE not TRIBUTE, and you have not got a single customer who would not be glad to pay many times $3.50 for half the protection afforded by the Ellis Gasolene Purifier.

Write for full particulars about the device. At the same time our distribution plan and agents discounts will interest you. There is the need for the Ellis Gasolene Purifier, the price is right and the advantages it offers your trade will create a ready sale for them, once shown and explained.

Shoddy Quality

QUALITY

WHAT kind of service can you expect from washers you can pick to pieces with your fingers?

When washers are expected to protect and conserve such expensive and vital parts of a car's make-up as bearings and such parts, there is only one kind of washer to use—BOOTH QUALITY.

BOOTH QUALITY WASHERS are made of the best grades of all-wool felt.

Booth TRADE MARK

Did you ever notice the axles of an automobile bounce up and down going over a rough road? This shock, strain and twisting is borne by the bearings of the axles and transmission.

Hyatt Roller Bearings cushion and absorb shocks, relieving gears and shafts of excessive strain.

The hollow flexible roller of the Hyatt Bearing is responsible for this great saving in wear and tear.

Two books, one about motor car bearings in general for prospective purchasers, the other for automobile owners, will be sent on request

"Hyatt Quiet Bearings"

NEWARK, N.J.

A Word to Automobile Dealers From the Commerce Motor Car Co.

WE believe the time is coming, not far off, when a well organized delivery car department will be recognized by all good dealers as an essential part of their sales organization.

The old warning against putting all your eggs in one basket should be sufficient to carry the day for a delivery car department. But there is a far stronger influence, for dealers who are seeking profits, in the almost untouched market for delivery cars.

The country is **sold** on motor delivery, and if gear driven commercial cars made from pleasure car chasses had actually given service, the use of motor car delivery would today be almost universal.

The car we have to sell, the Commerce Delivery Car, has the unique distinction of giving satisfaction wherever it is used.

It is a 1000 pound delivery wagon selling for $975.00.

It is manufactured to be a commercial car by a company manufacturing nothing but commercial cars.

It is built for delivery work—for business—for hard, every-day, exacting service and for **nothing else.**

It uses friction drive with the result that it has ample power and is **absolutely fool proof.**

(Remember that every car with cone or multiple disc clutch depends finally upon friction for its driving power and that the Commerce friction drive means no clutch to slip and no gears to strip. **It is fool proof.**)

The remarkable service that the Commerce car has given under all working conditions is more than sufficient indication—it is postive proof—that the Commerce car is designed and built right.

We have been building Commerce cars for two years. There are more than 500 Commerce cars in operation. We have watched the performance and have the record of every one.

Today we know that the Commerce car is the simplest, surest, most economical and most efficient delivery car on the market. It has no competition.

No one can question the extent of the market ahead of such a car.

The fact is that the market for a good delivery car —The Commerce Car—is wider than the country itself.

The question of how to sell delivery cars is one with a very simple answer.

Delivery cars **cannot** be successfully sold as a side line by pleasure car salesmen who try to sell both types of cars.

But the simple, concentrated effort of one or two good salesmen, the demonstrator continually in use, means the start of a Commercial Car department which will prove the most **valuable asset** of any automobile agency.

The Commerce Car supplies a demand that is active practically every month of the year. And where a car stands up—as the Commerce **always does**—each sale is an asset, and **not** an obligation demanding extravagant service and maintenance.

We have proved this car—we know it is a delivery car whose market and success are assured.

We are pinning our faith to that knowledge. We are entering on a period of expansion.

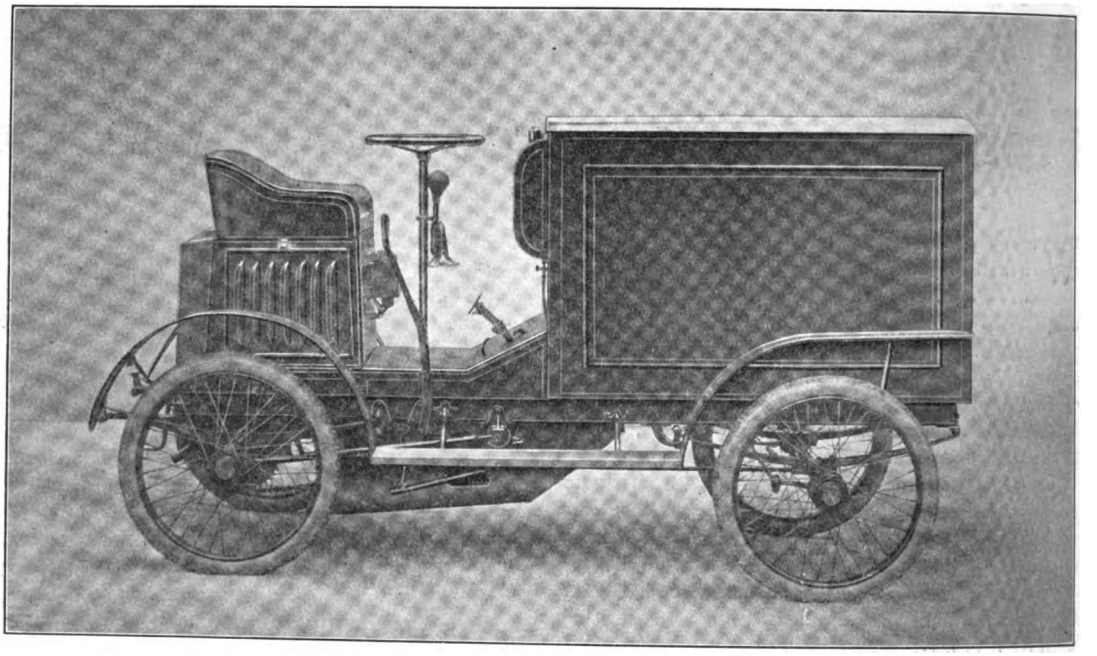
We want dealers—active, interested, progressive dealers who are prepared to seek business along the right lines.

We want business men who are prepared to sell Commerce Cars as actively and determinedly and conscientiously as we build them. We stand back of the Commerce Car and, in the same way, we will stand back of the right sort of dealers.

The Commerce Car plus a dealer's persistence and application means **profits.**

If this has interested you—write to us now—better still, come to Detroit and see the Commerce Car plant and the ideals and plans and character and position and spirit of the men who are making Commerce Cars.

The Commerce Motor Car Company



Administration Dept., 625-629 Penobscot Bldg., Detroit, Mich.

SPECIFICATIONS:

1000 pound capacity, 25% overload, guaranteed.
Equipment, including electric horn, complete.
32 x 3½ Goodyear pneumatic tire or—
34 x 2½ Goodyear Motz truck tire.
Express, full panel, or canopy top.

Clear floor space—64 inches long;
42 inches wide;
52½ inches high.
Gear ratio— 6 to 1 on high;
20 to 1 on low.
Friction drive. Wheel base—102 inches.

THE ONE MAN

Who is by many regarded as the leading genius of the automobile business recently remarked in the presence of a group of automobile men that if properly handled THE MOTOKART should prove the FORD OF THE COMMERCIAL VEHICLE INDUSTRY. Proper handling involves among other considerations the establishment of a country-wide distribution system, the appointment of energetic, hustling agents at every logical point. Our advertising campaign is today bringing in hundreds of possible user inquiries from points where we have not as yet established connections. We want reliable dealers in every county in the United States. If we are not to your knowledge represented in your territory, write us at once for sales proposition.

SPECIFICATIONS

Engine: Two Cylinder, Four Cycle, 3⅝ x 4, Water Cooled.

Wheel Base: 69".

Tread: 44".

Over All Dimensions: Length, 106"; Height, 56"; Width, 52".

Box Dimensions: Length, 51"; Height, 32"; Width, 32".

Friction Drive, Wire Wheels equipped with 26 x 2½ Non-Skid Tires, Pressed Steel Frame, Semi-elliptic Springs, Steel Body.

Capacity: 400 lbs.

Price: $400.00

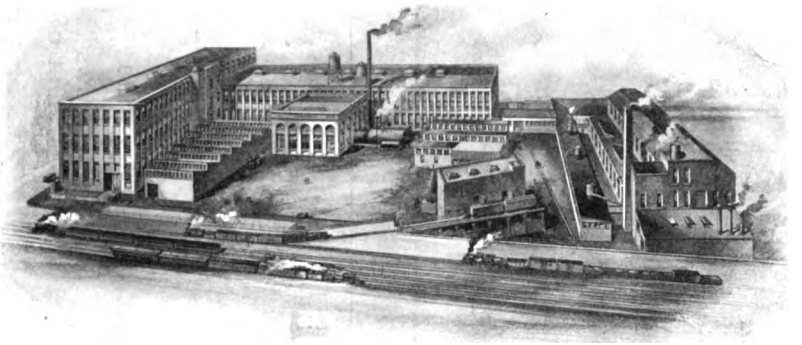
Ordinarily it is Neither Good Business Nor Good Taste to Notice Competitors' Tactics in One's Advertising. But Sometimes it is Necessary.



Rushmore Model C Starter on 38 H. P. Simplex Engine

It has come to our notice that certain makers of starting and lighting equipment, finding themselves unable to compete with the Rushmore System on the basis of engineering performance, have circulated statements to the effect that we are in financial Difficulties and are seeking large loans.

Such statements are either ignorantly or wilfully false in every particular. We do not need more money, and are not seeking it.

Since we began business 22 years ago we have held to the policy of conservative growth and of freedom from entangling alliances or divided control. Our present manufacturing plant, including the additions recently made, is owned by us free and clear. Our live assets today exceed $450,000, unencumbered with notes, mortgages, or bonds of any sort.

For many years we have discounted our bills and paid all obligations promptly when due, and we shall continue to do so. Our present obligations are represented only by current bills amounting to much less than $10,000; and these are being regularly paid as they fall due. Our credit is open to any one who wishes to look us up in the mercantile agencies or elsewhere.

We believe that no manufacturer in our line can present a better showing, or is better equipped to give entire satisfaction to his customers. We believe that none is in a better position to weather the strain of a dull season, or to "deliver the goods" on time when heavy orders come.

We manufacture in the above plant every part of our product, whereas our slanderers are mere assemblers or sales-agents of the great electric "trusts."

MOTOR WORLD'S

"Before Shows" Number

PUBLISHED DECEMBER 18th

Foreknowledge is the knowledge worth while.

Last year, Motor World's first "Before Shows" Number presented to its readers, two weeks before the Show, a most completely illustrated and accurate account of what they would see at the Show.

Its success vindicated our foresight in publishing it. It vindicated our judgment in creating (for it was the first of its kind ever published) what is conceded to be one of the most practical examples of trade journalistic enterprises ever conceived and carried out.

This year, Motor World's "Before Shows" Number will be published December 18th---New York Show January 3d to 10th.

It will be bigger and better than last year. The idea of a Before Shows Issue is too practical---too basic---to be a "one time" success only.

Sell Spark Plugs That Give Real Service

BOSCH PLUGS, in addition to being carefully constructed, in addition to being made from the finest of materials obtainable, have 6 special features which make them the better kind of spark plug—Just the plug your customers want.

$1.00 Each
is the selling price. Shipped from nearby distributors, thus reducing shipping costs.

1 Crescent Electrodes minimize electrical resistance affording the maximum spark, therefore maximum power at all speeds. An easy starting motor is always assured.

2 Undue wear of electrodes prevented, consequently long life is certain at a vital point.

3 Insulator is Steatite, a stone unaffected by intense heat, carbon or oil, and unbreakable by vibration or accident.

4 Massive and an exclusive gastight construction—assures full power at any pressure or any speed. Compression leaks are impossible.

5 BOSCH PLUGS are "excessively" durable; they last as long and serve as well as you expect a "Bosch Quality Product" will.

6 BOSCH PLUGS are as good as Bosch Magnetos, you can have every confidence in them.

Write for "Locating the Spark Plug"

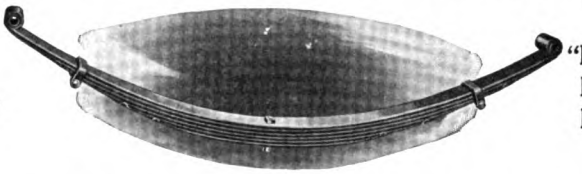
Not One Return In Five Years

Cleveland-Canton Automobile Springs

That, we believe, is a record that has never been equalled in the history of motors and motor parts. Let us tell you why.

For many years the ordinary carbon spring was the best spring obtainable for automobile use.



And a great part of automobile upkeep cost resulted from breakage and settling, of these unreliable springs.

But motor car makers and motor car users demanded springs of greater endurance, of greater flexibility.

And, in Cleveland-Canton Chrome Vanadium Springs we have been able to meet that demand. In five years not ONE of these springs was returned because of breakage or settling.

Cross-Rolled Chrome-Vanadium

"Not a Bump In One of Them"

"Built for Life-Long Endurance"

We use a superior steel—chrome-vanadium. And we roll this steel not only **longitudinally,** but transversely as well.

Then it is heat-treated in oil—not simply flashed or water-chilled, but scientifically tempered. After tempering all the fitting of the parts is done by hand. And this gives a uniformly perfect bearing not possible by any other known method.

So Cleveland-Canton Chrome-Vanadium Springs are not only amazingly durable, but give perfect riding qualities. They absorb shocks, stand jars and jolts that would ruin ordinary springs.

It is certainly to your interest to find out more about them. To those who want to know what **real** spring comfort and economy mean, we will gladly send booklet and proofs. Write today.

First in the Specifications

Continental Motors

The first thing—the really big thing—is the Motor. It stands for five out of seven of the good qualities for which any car or truck is selected:

- ✓ **Power**
- ✓ **Speed**
- ✓ **Endurance**
- ✓ **Economy**
- ✓ **Flexibility**
- **Appearance**
- **Simplicity**

For such an overwhelming reason the motor, ninety-nine times out of a hundred, comes first in the specifications. It really establishes the standing of a motor vehicle.

In more than 60 makes, the Continental Motor—America's Standard—has been chosen to head the list, to make the first appeal. That right has been won by the Continental during 10 years of success—mechanical and financial.

And during 1914, fully forty thousand men will buy motor vehicles largely because they are Continental equipped.

The current of public opinion is running mighty strong.

"Continental Motor" to head a list of specifications is an asset of good-will almost beyond price.

Add this asset to your product and watch the sales jump.

INVADER OIL is the best---***not*** because we say so, or because it is our product, or because we are anxious to sell it, ***but, because the oil itself possesses certain definite concrete chemical tests which prove it to be better than any other.***

¶ With the same range of fire tests, and the same range of viscosities that other oils have, INVADER OIL is lighter in color and lighter in gravity.

¶ ***This simply means that INVADER OIL is freer from carbon than other oils of equal body and consistency, and are therefore better for automobile lubrication.***

The Foreign Trend

The builders of motor cars abroad are constantly introducing new ideas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France, and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.

They expect their cars to be used the year 'round and they know the Jones isn't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, *always*. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street **NEW YORK CITY**

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

A starter that will actually SPIN your motor on the COLDEST day

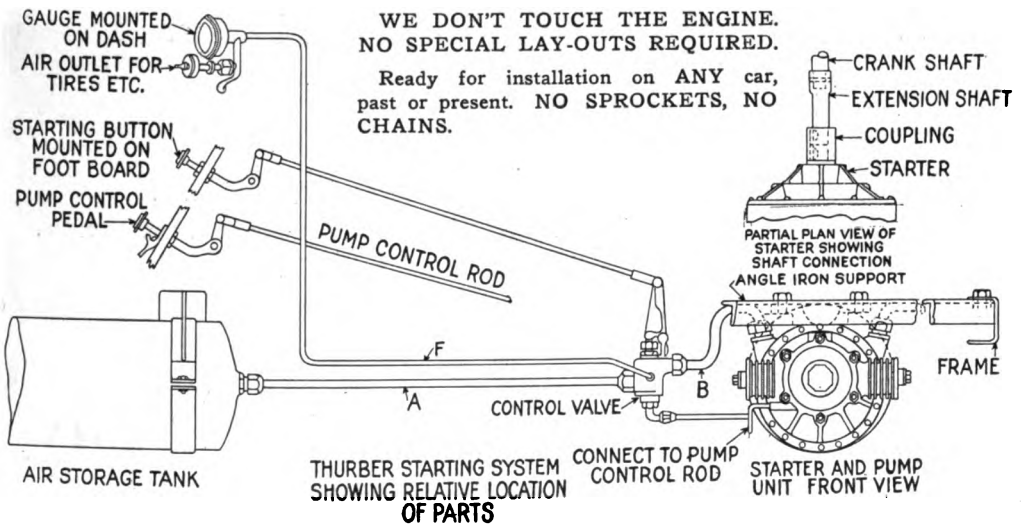
Here is a starter that employs the simplest, most powerful, most easily understood, most positive form of energy known—compressed air. Any dealer or garageman can understand how it works and why it is sure and positive.

The Thurber Rotary Starter will SPIN any gasolene motor—and start it. It is not affected by heat or by cold—by rain or the elements. It is positive in operation. The double-acting valve insures an absolutely air-tight system.

It is a FOOL-PROOF system—it does not require constant "monkeying" to keep it in order. The only attention needed is lubrication of the pump twice a week.

Simple— Powerful—

For reliability and certainty of operation it beats every other system. It can be applied to any car, and requires no special lay-out. It goes OUTSIDE—so it does not require any work on the engine.



Efficient--- Practical---

And this starter is PRACTICALLY EVERLASTING. There is absolutely nothing to wear out.

Thurber Rotary Starter

Consists of three main parts viz: 1—Small rotary (the cranking device) with air pump attached. 2—Air tank. 3—Two pipes and double-acting valve.

The lay-out above shows method of application.

TO START ENGINE—The driver simply presses his foot on the button which operates the patented double action valve and the AIR is delivered to the starter which instantly spins the motor.

MANUFACTURERS—Investigate the Thurber Rotary Starter at once. Get our booklet which tells all about it.

DEALERS—You have seen starters come and go. All kinds. Here is something that is mechanically and practically right. It does the work and we GUARANTEE positive satisfaction or your money back.

ENDURANCE

Trials are the Order of the Day

But erring and unfortunate men in high and low estate are not the only objects of judicial investigation. So impersonal a thing as a ball bearing must be subjected to the most relentless trial in testing laboratories and out on the road to discover any hidden fault or weakness. These courts are above any suspicion of partiality. Before these courts the Gurney Ball Bearing has been repeatedly on trial. The verdict is singularly unanimous.

FIAT JUSTICIA

THE VERDICT

Steel—Uniformly good—none better.
Hardening—Uniform—None soft, none brittle.
Balls—The best obtainable.
Accuracy—Unequaled by any other, American or Foreign.
Concentricity—Unequaled by any other.
Load Capacity—Greater than any other.
Thrust Capacity—Much greater than any other.
Endurance—Greater than any other.

Listening to the Song of a "Sweet-Running" Axle

IN one corner of the final inspection department stands a man with an ear for silence.

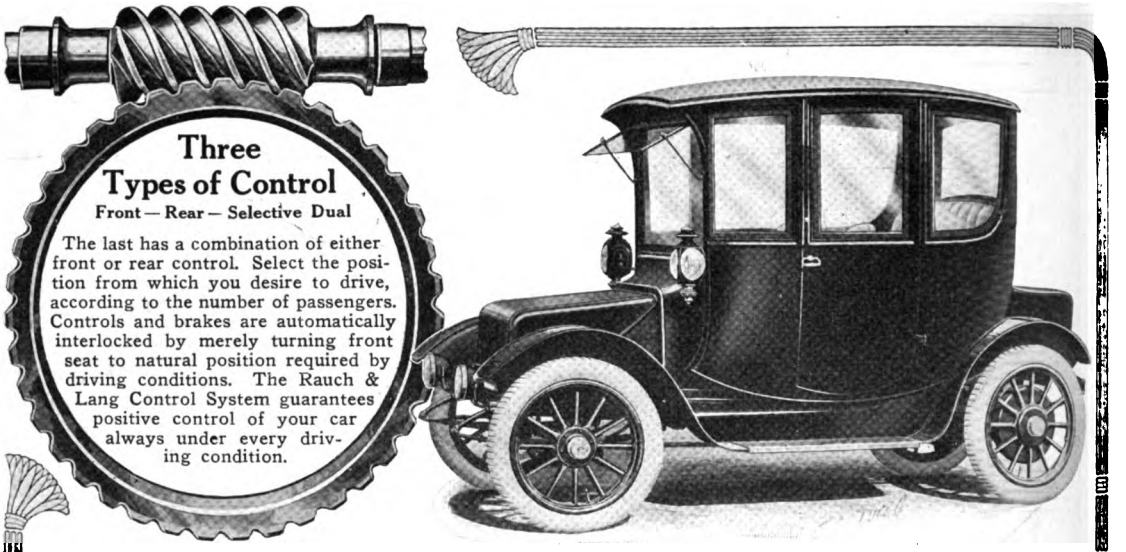
One by one, as the big rear axles come forward, for their diplomas, he listens to their song and grants or rejects their plea.

There is no appeal from his demand for silence. His word is final in the "sweet-running" test of

TIMKEN-DETROIT AXLES

It takes hundreds of parts to make a Timken-Detroit Rear Axle. It takes thousands of separate inspections to be positive that each one of these parts is right—and right means that every moving part must stand up, month after month, year after year, under the gruelling test of actual service.

But no matter how many tests the individual parts may have passed in the course of construction, Timken ideals demand that these parts prove their right to a place in the finished axle—and prove it under the actual running conditions they will meet when the axle goes into the finished car.



So, as each axle sings its song, the final inspector, with his ear to the housing, listens for the slightest discord. And when a Timken-Detroit Axle gets his final O. K. the soft hum of the revolving gear and pinion is barely audible to even a practiced ear.

It is this constant striving toward perfection by men who put their whole hearts in the work, whose one ideal is Timken Quality from rough forging to finished part, that produces axles which give the service we know axles should give.

Society Adopts

The New Rauch & Lang Worm Drive

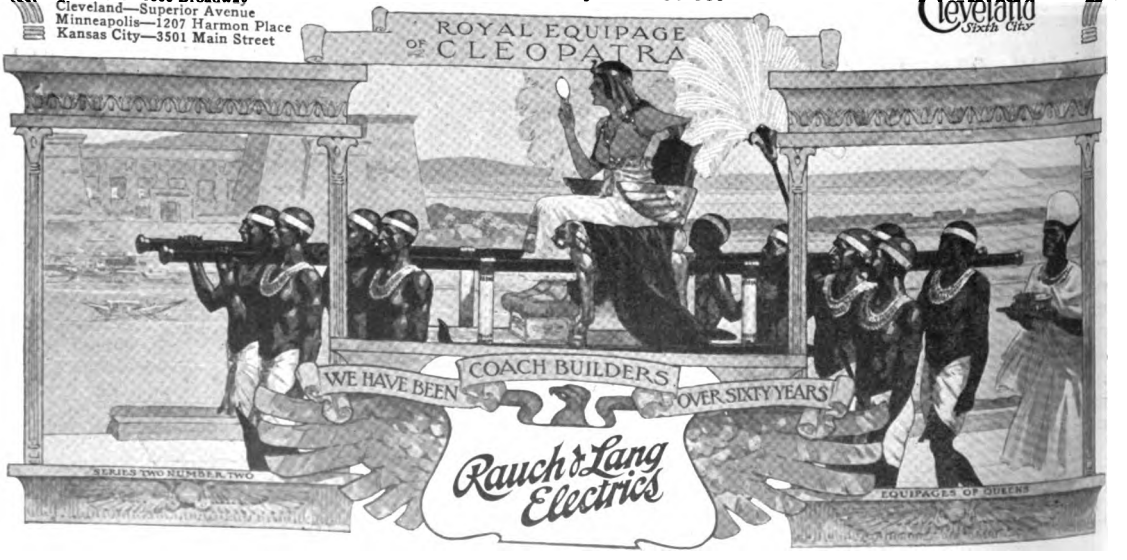
Again has the Rauch & Lang Electric asserted its premiership as Society's chosen car.

The success of the new worm drive has been immediate. This feature means the continued leadership in driving quality—just as the beautiful body lines, rich finish and ultra refinement of every detail have always marked supremacy of Rauch & Lang construction.

Hundreds have already ordered the new car. They are enthusiastic because the Rauch & Lang Straight Type Worm Drive (top mounted) which is superior to all others means a greater-than-ever all-'round efficiency, a silence that is manifest, a power-economy hitherto unknown, and a driving simplicity that appeals to the most timid woman.

The Rauch & Lang is the highest-priced Electric on the market. Its value is readily apparent to those who seek a car of artistic and mechanical perfection.

Any Rauch & Lang agent will gladly demonstrate. Catalog mailed on request.



MAKERS OF COACH HISTORY—For over sixty years Rauch & Lang have been building fine vehicles for a select patronage. In each successive vehicle era they have been accorded the leadership. Strict adherence to lofty art ideals and a wonderful mechanical perfection have won and held the acclaim of people of refinement. (147)

Again Stearns leads the way with a new type—

a body type which embraces so many pleasing variations from traditional design that it has established a new standard. As exemplified in the new four- and six-passenger Stearns-Knight Touring Cars, this new type opens up vast selling opportunities for the dealer who is quick to grasp the possibilities of a new tendency in design.

These new cars, like the famous Toy Tonneau model, first brought out by Stearns in 1907, mark the beginning of a new trend in American motor car design. Distinctive in lines, in upholstery and trimming, and in detail refinements, they offer unusual advantages in appearance and riding comfort. And they have the added advantage of the wonderfully efficient Stearns-Knight chassis construction—an advantage which places them as far in advance mechanically as they are in body design.

CONTINUOUS WEAVE—
The Secret of Strength

EVERY automobile should be equipped with Rebound Straps because of their insurance against broken springs, their assistance to more comfortable riding and the part they play in reducing, not alone tire wear, but the strain on the cars mechanism, incident to rough roadways, as well.

Any rebound strap which is not strong enough to withstand the strain of snubbing the rebound of the heaviest touring car axle is no better than no rebound strap at all.

Gilmer Rebound Straps are now standard equipment on many of the best cars in America. Several of these cars are equipped with exceptionally sturdy rear axles and the Gilmer Rebound Strap is the only one which met the conditions to the entire satisfaction of these manufacturers.

Gilmer Rebound Straps are the strongest made. The straps we recommend for certain cars are capable of withstanding strains or blows several hundred pounds more than is possible under any set of actual conditions.

The strength of Gilmer Rebound Straps comes as a result of the weave employed and the excellence of the material (note continuous fabric) used. Each of our straps is treated with a weather and waterproof dressing thus insuring their strength against the influence of the elements.

Let Your Motor Pump Your Tires

This, Mr. Dealer and Mr. Manufacturer, is the new talking point in selling cars for 1914. Many cars are now evenly matched. Horsepower or wheelbase is little argument. Complete equipment is the clincher. But no car is completely equipped without the

Four Cylinder KELLOGG Tire Pump

The best tire pump made is necessary for proper tire inflation, which tire makers say eliminates most tire repairs. The Kellogg is the standard tire pump, because it is used solely by the makers of better cars. No other can approach it.

Dealers who can offer Kellogg-equipped cars say: "We make the most of our opportunity to talk this standard pump." Less fortunate dealers should not accept "something just as good" or no pump at all. You can have your cars "Kellogg-equipped," or install them yourself.

Every dealer and manufacturer should write for our book—"Air On Tap." There's money in it for you.

Utmost Quality

Proved by the Tire

Mr. Dealer, if your trade wants **the best in tires,** we want to tell you about Marathon.

We build in the **Utmost in Quality.** That's proved by the tire.

We factory-insure 4,000 miles service. And the tire's service to users, proves 4,000 to be the minimum. The average mileage is far above that figure.

Study these reasons:

Sea Island Fabric: We use nothing but Sea Island. That's the finest tire fabric obtainable. It's highest in tensil strength. It's the costliest fabric we can buy, but the cheapest for tire users—it gives utmost service.

Finest Rubber: We use only finest rubber in building Marathon. See the tire and you won't question that fact. We spare no expense to attain highest possible quality.

Hand Built By Experts: Marathon tires are hand built by expert tire men, very slowly. Hurrying is not permitted. This slow, exacting method costs us more—cuts our profit—but it insures **perfect construction.** It insures utmost service to users.

Concentrated Tread: Note how we heap up the tread rubber where the wear comes. That feature avoids waste. And it increases mileage.

Live Steam Single Cure: We single cure Marathon tires, in live steam. That gives unitized construction—makes all parts one. Tread and fabric separation are impossible. The live steam single cure also increases wear resistance.

Insured 4,000 Miles: The above are reasons how we factory-insure Marathon tires for 4,000 miles. And they are reasons why the average service is far above 4,000.

We absolutely guarantee every Marathon to give at least 4,000 miles. Motorists want this 4,000 mile tire. Do you see why you should sell Marathon?

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

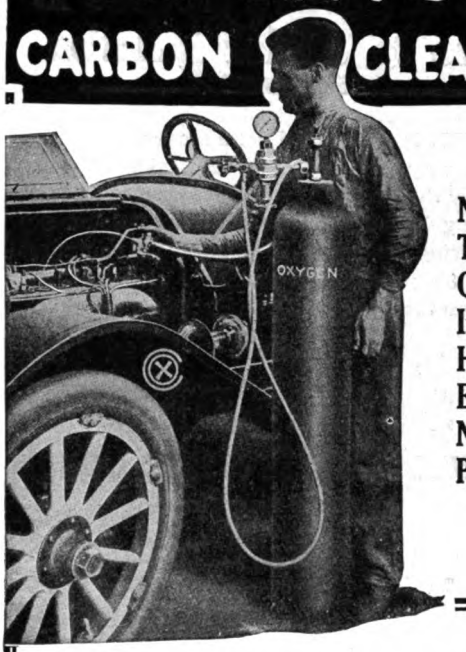
The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.



Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

COX OXYGEN CARBON CLEANER

New
Thorough
Quick
Inexpensive
Harmless
Efficient
Necessary
Profitable

The first really efficient and thorough method of cleaning carbon out of the cylinders is the new Cox Oxygen Carbon Cleaner. It consumes every particle of carbon, even in corners where it could never be scraped out, without the slightest possibility of harming the cylinders.

It takes from 6 to 10 minutes to clean each cylinder, averaging 30 minutes for a four-cylinder motor and 45 minutes for a six. Any workman can do it. Does not require experience or expertness. Absolutely safe to handle.

For Public Garages

The profit possibilities for you in the Cox Oxygen Carbon Cleaner are only limited by the number of your customers. You do the work in one-tenth the time and only a fraction of the cost of any other method. Motorists will pay you well to clean their cars regularly. It is just as necessary as washing the car. This new method will quickly establish the custom of regular cleaning.

For Large Private Garages

For private garages in which more than one or two cars are kept, the Cox Oxygen Cleaner is a good investment. It pays for itself in the greater economy and improved running of the car.

Write Us Today

and we will prove that your profit per cylinder is almost gross—that you can actually pay for the carbon remover several times over inside of a week—this has been done.

Get the information—read the detailed facts—learn still more about the integrity and responsibility back of the house that guarantees every claim made for this—the only REAL carbon cleaner.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

RECEIVER'S SALE
Entire Automobile Plant of
R. C. H. Corporation
Detroit, Michigan

The property of the R-C-H Corporation will be offered at Public Auction on the premises, Detroit, Mich., under order of the United States District Court, on

Tuesday, November 11th, at 10 A.M.

The property will be offered in both parcels and bulk. Conditions of sale may be obtained of the Receiver. The property comprises the following, subject to revision as of day of sale:

Real Estate (16.57 acres and factory buildings)	$201,000.00
Plant Equipment and Machinery	213,889.75
Materials, Supplies and Branch Stocks	313,968.28
Cars	14,530.00
Accounts Receivable	60,634.58
Notes Receivable	3,175.00
	$807,197.61

The plant is equipped for the manufacture of a $900.00 five-passenger touring car; is located in the heart of the industry, with railroad siding, and is ready to resume business, with orders for a large number of cars. The R-C-H car is widely advertised, at an expense of $324,000. The different parcels of the plant are also admirably situated for use as separate units. There are an office building, a foundry, machine-shop, drop-forge plant, and assembly building. The parts business is important, nearly 9,000 cars being in use. The stock of materials is large and well assorted.

For particulars address:

Cut out the Oil Lamp Nuisance

Get rid of those bad-smelling, old-fashioned oil lamps. Every time you want to light your oil lamps you have to get out of your car.

You can light all lamps right from the seat when your car is equipped with

J-M MOBILITE ELECTRIC LAMPS

These lamps cost about one-third as much to install and only one-third as much to operate as standard electrical equipment. They can be easily and quickly installed. Will burn from 300 to 420 hours on six 30 amp. J-M Dry Batteries.

J-M Mobilite Lamps consist of a vulcanized rubber socket fitted with a special Tungsten bulb and a powerful lens and reflector. Used for dash lights, tail lights, speedometer lights and interior car illumination. Also for motor boats, camps, etc.

Price, $3.00 each. Order from our nearest branch if not at your dealer's.

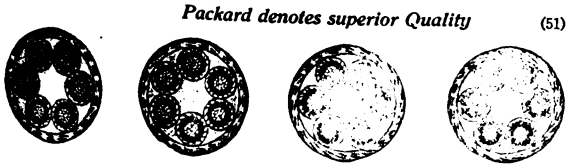
Packard CABLE

PACKARD CABLE goes every other make of cable one better by providing the rubber insulation and braids with a series of flexible enamels, put on by a patented process.

These enamels protect the rubber from the over-vulcanizing effect of heat and the injurious effect of oil, water and dirt to which all cable is subjected.

Demand Packard cable with every starting and lighting system. Don't let the maker save a few cents on each system at the expense of the reputation of your car by substituting cheaper cable. Get the best. Send for sample to test and for our latest price list of 27 kinds of cable for every need.

This Hanger Free To Dealers



A six-color reproduction of the original Packard Girl by Liebscher, 16x20 inches. Makes a handsome decoration for office or garage. Sent free to dealers who write on their own stationery.

Every motorist is a live prospect for a good vulcanizer

What This $2.00 Vul-Kit Will Do

Actually vulcanizes any tube puncture as well as the most elaborate plant could. Burns alcohol—or gasoline may be used for roadside repairs. No experience required to operate it.

SHALER Vulcanizers

Every motorist needs one. While the sale of most accessories is limited by the fact that they are furnished with the car, no car is equipped with a vulcanizer. No accessory has as little competition. The motorist must buy it from his dealer.

There are steam, electric and gasoline heated Shalers for every requirement—the only complete line in the world. Automatic temperature control on every model.

C. A. SHALER CO.

444 Fourth Street, Waupun, Wis.

The coupon will bring you a complimentary copy of our famous book, "Care and Repair of Tires," and dealers' proposition. Send for it today.

C. A. SHALER CO., 444 Fourth Street, Waupun, Wis.

Diamond Vitalized Rubber Tires have made good

The cost of a tire can never be figured until it is worn out—it's the *mileage* the tire delivers that determines the *cost*.

Your time is too valuable and it would be too expensive to attempt to test *every* automobile tire made—so why not sell the tire that has *made good* for thousands of other motorists—the tire that will give your customers the mileage they pay for and have a right to expect.

Diamond Tires

Plain or Squeegee Tread

The first pneumatic tire built in America was a "Diamond"—since then Diamond chemists, engineers, tire-builders and factory experts have labored unceasingly to produce a tire that would deliver the *greatest* mileage at least expense.

Diamond chemists discovered how to produce Vitalized Rubber—pure, young, lusty rubber put through a process that toughens and makes it road-resisting, with no loss of life or elasticity.

The demand this season for More Mileage Vitalized Rubber Diamond Tires has broken all records. It's the tire you want—the tire that makes good for everybody everywhere.

Equip with Diamond Tires

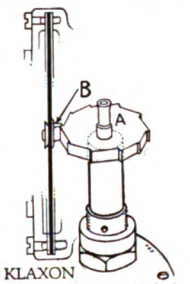
THE KLAXON IS NOT AN "ELECTRIC HORN"

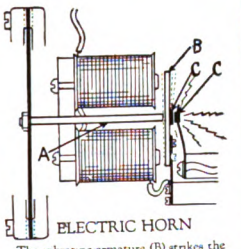
THERE'S a big difference.
Explain it to your customers before they buy a signal, rather than let them find it out afterwards.



The principle of operation is different

The Klaxon is a noise-machine.

Its diaphragm is vibrated by a toothed wheel.



This wheel is rotated by an electric motor;—or, in the case of the Hand Klaxon, by a train of gears that attain high speed under pressure on the push-rod.

Each double vibration means that one tooth of the glass-hard steel wheel slips past the glass-hard steel button on the diaphragm.

KLAXON

The glass-hard toothed wheel (A) strikes the glass-hard button (B) on the diaphragm.

ELECTRIC HORN

The vibrating armature (B) strikes the adjustable rod (A) which is attached to diaphragm, and breaks contact at points (C-C) Unless these points are made of platinum irridium, they soon wear down and the mechanism becomes inoperative

The diaphragm of an "electric horn" is vibrated by a "buzzer"—the same as that used for door-bells, pantries and offices.

Each double vibration means a spark between two points.

Unless these points are made of platinum irridium—the cost of which is prohibitive — they quickly wear off and the buzzer is useless.

The note is different

THE KLAXON NOTE is loud. It is sharp and clean-cut—totally unlike the nasal "buzz" of an electric horn. One Klaxon "tiger" (a short, abrupt note made by lightly touching the Klaxon push-button) is more effective than a dozen "buzzes." Yet it makes less actual noise. Klaxon noise is "concentrated"—not drawn out.

Dealers know that cars equipped with Truffault-Hartford Shock Absorbers are Easy Sellers

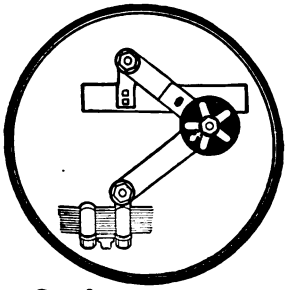
Year by year *Truffault-Hartford equipment* has become a stronger factor in car sales.

Today twenty-seven leading American cars—in the forefront of popularity and topping the list in the volume of their sales—are furnished with Truffault-Hartford Shock Absorbers as *standard equipment.*

These cars enjoy the reputation among dealers of being the easiest riding and easiest selling cars on the market.

Ease of riding now plays a far more important part in the sale of a car than it did a few years ago. Women have become motoring's greatest enthusiasts. Their demand is emphatically for *the easy riding car.*

Hence, the adoption of Truffault-Hartford equipment on the part of twenty-seven car builders was a shrewd move with a telling result. Women now speak of these cars in terms of highest praise.



Dealers looking to their own interests cannot afford to ignore the woman's demand for comfort. It is she who often casts the deciding vote that closes a sale.

Nor can they afford to sell cars that do not include the famous Truffault-Hartford Shock Absorber. Cheaper devices of doubtful efficiency are offered, but the leading car builders have unanimously decided on the

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer and the Best"

Dealers selling cars without Truffault-Hartford equipment have a right to insist upon this valuable sales-help from their manufacturer.

Made in five models, from $60 per set for the New Automatic, to $15 for the smallest model for light cars.

Security? Yes! And More Than That---

Comfort—given by the resiliency of an extra quantity of new, pure, long-lasting rubber.
Economy—given by the increased service of a thicker tread.
These are the vital points of tire service as found in Firestone Non-Skid Tires—a trio of advantages that automobile dealers everywhere are emphasizing with the zeal born of Firestone experience.

The dealer who helps his customers to reach the goal of tire satisfaction by selling Firestone Non-Skids creates a tire constituency that is ever loyal. The car owner who, following the advice of users, insists that his dealer supply him with Firestone Non-Skid, enjoys a reduction of tire troubles and a marked increase in automobile comforts.

YOUR DEALER WILL TELL YOU

that the name "Firestone" stands for tire quality. He will tell you that the ends of security, comfort and economy are served by the use of Non-Skid Tires. The Firestone Non-Skid tread gives longest wear, greater resiliency, added protection against the shocks of bad going.

It presents to the surface of the road numerous edges, angles and hollows that grip the highway and prevent the skidding which was so great a terror to motorists before the days of the Non-Skid.

In thus affording security against tire accidents and insuring longer wear, Firestone Non-Skid Tires are doubly economical. They perform service for the car owner's pocketbook and for his peace of mind.

The high grade of new rubber used in the manufacture of all Firestone Non-Skid Tires prevents the sharp safety edges and angles from chipping—and even after these have worn down, a sturdy tire remains.

For longer wear, increased resiliency, greater security, tire and gasoline economy, tire-heat radiation, the Firestone Non-Skid is ideal, whether in Autumn, Winter, Spring or Summer. For all climates—for rear and front wheels—it is the year-round, complete service tire — with a proved value greatly in excess of its slightly higher cost—the

"Most Miles per Dollar" tire in every sense of the term

AS motor specialists we keep our shop methods right up to the minute. This has been of the greatest advantage to us in the past four or five months as it has enabled us to keep up with our deliveries as promised, with a minimum amount of overtime.

We have, of course, had to enlarge our plant considerably to take care of a growing business, but the point we wish to make is this; that in the time of our hardest rush no customer's work was

slighted in the least, inspection did not lag for a second, limits were not loosened in the slightest degree, and deliveries were maintained with clock-like regularity.

This is the kind of service you can expect in dealing with us. Your orders will be filled on time. The work will be done up to Ergon Standards in every sense of the word and we know your experience with our motors will be just as gratifying to you as that of all our customers.

Send us your requirements and let us figure with you

Figuring It Out

It's a simple thing to figure that so many gallons of lubricating oil at so much a gallon, calls for a check of so many dollars. Easy arithmetic.

BUT—

If so many gallons at so much per gallon costs so much PLUS a repair bill because of using the wrong oil, that makes different figuring.

The engine of your car is a piece of delicate mechanism that demands a lubricant of certain virtue. ANY OLD OIL WON'T DO!

The oil you NEED is the oil that is made for your car;

That oil is

MONOGRAM

The oil that is BEST FOR YOUR ENGINE. It lubricates every second.

The man who has figured this out knows every bolt, bar and rod in your engine—the strength and expected service of these parts.

He knows

MONOGRAM

And as a Mechanical Expert prescribes this oil to the exclusion of every other lubricant.

He has figured it out.

MOTOR WORLD

Vol. XXXVII New York, U. S. A., Thursday, November 13, 1913 No. 8

GASOLENE HAS COME DOWN! HONEST, FELLOWS, IT HAS

Price in New York Drops from 17 to 16 Cents a Gallon After 10 Months at Former Figure—Supply and Demand Logic? Maybe.

Gasolene has dropped!

For so many months the only news of this commodity has been of a bullish nature that the news that the fuel had started downward from the eminence it reached in rapid jumps is gratifying, to say the least; anyway, the price of 17 cents to the garageman, as maintained by the Standard Oil Co. of New York, was cut to 16 cents last week. Correspondingly, the company's price to the individual owner fell from 21 to 20 cents.

Whether gasolene will go lower is a Standard Oil secret, and according to previous information the big corporation will have to consult Old Supply and Demand before anything authentic can be stated. It is only fair to surmise, however, that since the Standard Oil version of past increases was based upon a falling off of the supply, coupled with an increase in the number of cars, the decrease must be attributed to an increase in the supply of "gas" and a falling off in the number of cars. But since there are more cars now than ever before, why—— But the logic's too deep.

Anyway, the story of gasolene dates back to January, 1912, when it jumped from 9 to 10 cents, and it kept on jumping about a cent a month until it got to 16 cents; then it stopped until January 2, 1913, when the trade was given a New Year's gift of another one-cent increase, making the garage price 17 cents. And there the commodity hung until last week.

Whether the hue and cry which were raised when 16 cents was touched had anything to do with the matter is not officially stated, but it is a fact that when the entire garage trade in New York formed an association and began to look for some other fuel or source of fuel the increases stopped for about six months, and since the last one it has been semi-officially stated that the next move would be down and not up.

Philadelphia Also Abandons Truck Show.

Philadelphia also has abandoned its truck week, the Philadelphia Automobile Trade Association having decided to concentrate its annual show in the one week, January 10th to 17th, and to restrict it solely to pleasure cars. The exhibition will be held in a new structure, the nine-story Metropolitan Building recently completed at Broad and Wallace streets. Louis Block, manager of the Ford branch, is chairman of the show committee.

Neracher Now Turns to Electrics.

C. A. Neracher, former chief engineer of the Willys-Overland Co., is one of the principal organizers of the Carl Electric Vehicle Co., of Toledo, which just has been incorporated under the laws of Ohio with an authorized capital of $300,000. It already has acquired the necessary machinery and is negotiating for a vacant factory in Toledo, and so soon as it is secured will immediately begin operations.

Vail to Head Maxwell's Executive Board.

J. A. Vail, for the past eight years general manager of the Fairbanks-Morse Mfg. Co., which produces gas engines in Beloit, Wis., has been elected chairman of the executive board of the $40,000,000 Maxwell Motor Co. He, of course, will come to New York to assume the duties of his new office. Vail succeeds J. C. Brady, son of the late Anthony N. Brady.

Premier Adds Half-Million to Capital.

The Premier Motor Mfg. Co., of Indianapolis, has increased its capital from $1,250,000 to $1,750,000. At a special meeting of the stockholders last week, at which this action was taken, a bond issue of $250,000 was also authorized.

MOSLER TO DOMINATE SPARK PLUG BUSINESS

Court of Appeals Reverses Court Below and Sustains Canfield Basic Patent Owned by New Yorker —Back Royalties Barred —Text of Decision.

Although the Canfield recessed spark plug patent, No. 612,701, was thrown out of court by the United States District Court for the Southern District of New York a year ago and its lack of present-day value expressed in emphatic terms, the United States Circuit Court of Appeals for the Second Circuit this week injected a full measure of life into the patent and handed down an opinion which overturned the decision of the lower tribunal and caused the entire spark plug trade to face an unexpected and perplexing situation.

The patent, owned by A. R. Mosler & Co., of New York City, maker of Spit Fire plugs, is, with its new status, claimed by its owners to cover practically every brand of plug made and marketed to-day; Mosler's attorney, W. A. Redding, is responsible for the statement that there are no less than 300 manufacturers and jobbers in the United States who will soon be called to account and asked to accord substantial recognition to the Canfield invention, the patent having two years yet to run.

Fully as important as the recognition of the patent as covering the recessed electrode principle is the fact that it was declared valid even though ten years elapsed between the date it was granted and the date suit was brought, which lapse was made the most of by the defendant. The court, however, refused to void the patent for lack of prosecution, but as a sort of penalty ruled that a loss of back royalties of any description cannot be collected. The long delay was in no way attributable to

Digitized by Google

Mosler, who instituted suit five months after he acquired the patent, but he loses a handsome fortune by the inaction of its previous owners.

Turning backward to the history of the invention, which was conceived by Frank W. Canfield, a lumberman, and patented October 18, 1898, and which passed through several hands before it reached its present owner, those who have had to do with the matter may marvel at the seeming turn of fate which causes the patent, sold by the Association Patents Co. to Mosler for a merely nominal sum, to become so valuable a property. The Patents company, which was closely connected with the old Association of Licensed Automobile Manufacturers, had purchased the patent but apparently had little regard for its value and let it go for almost a "song," the terms of sale, however, protecting A. L. A. M. members from prosecution for infringement.

The suit was brought against John Lurie, who at the time of infringement traded as the Auto Supply Co. While he was the nominal defendant, the expense, it is understood, was borne by the Rajah Auto Supply Co., of Bloomfield, N. J., and C. A. Mezger, Inc., of New York City, who are the manufacturers of some of the plugs named as infringing.

The principle involved is that of a recess or chamber wherein the electrode or sparking gap is located; the contention of the inventor was that the placing of the spark gap in this recess in the inner end of the plug prevented the accumulation of carbon on the points and thereby eliminated a trouble which had been characteristic of previously constructed electric igniters for internal combustion engines.

His theory was recognized by the court, which said:

"That air at the bottom of a deep, narrow recess would be 'trapped,' so that there would be no circulation at the bottom when there was disturbance in the space into which the recess opened was a fact in physics well known long before there were any gas engines. That circumstance, however, would not defeat this patent, since Canfield, so far as this record discloses, was the first to point out that when a sparking device of this type was so constructed as to secure the presence of such a recess between the two electrodes, the fouling of insulation and the establishment thereby of a path for the electric current other than the one in the course of which there was spark-jump would be avoided.

"None of the various patents and publications introduced in evidence as showing the prior art have anything to say about the desirability of having such a recess between the electrodes. It is contended, however, that some of them show such a recess narrow and deep; that such a recess would necessarily act as the patentee's does because every such recess under the law of physics above referred to would trap the air at its bottom; and since the recess was there in the prior art it makes no difference that the prior inventor who placed it there did not appreciate or announce the useful function it performed."

Priority in the art had much to do with the dismissal of the bill of complaint in the lower court, but the priority was not recognized by the appel-

GERBER GETS ABBOTT PLANT AND BUSINESS FOR $235,000

Detroit Company's Financial Straits Pave the Way to Acquirement by Pittsburgh Man—Old Creditors May Get 20 per Cent.

Instead of securing the plant of the bankrupt Michigan Buggy Co., for which he made several unsuccessful bids, E. F. Gerber, of Pittsburgh, has acquired the Abbott Motor Co., of Detroit, and all its property. Negotiations have been in progress since his last bid for the Michigan assets was rejected, and, although it was known that they were pending, they were supposed to be of a confidential nature that did not permit of publication.

The purchase price, $235,000, has not yet been paid, but that transaction and a few legal formalities are all that remain to consummate the deal. It was rendered more easily possible by the fact that the financial condition of the Abbott company has again taken an acute turn.

In May last, its creditors assumed charge of its affairs and elected their own officers, but two weeks ago they were again called together and it was at that time that Gerber submitted his offer.

It is estimated that with his $235,000 in hand, the creditors of record prior to March 5th last will receive 20 cents on the dollar, and that 100 cents will be paid on all claims accruing after that date.

Gerber, who was one of the heaviest creditors of the Michigan Buggy Co., handled its buggies and motor cars in a considerable portion of the East, and its failure placed him in an uncomfortable plight, both personally and so far as his sub-dealers were concerned.

Denies Lower Duty on Truck Frames.

The Board of United States General Appraisers has overruled a protest by P. C. Kuyper & Co., relating to the classification, under the tariff act of 1909, of shaped steel imported by the Saurer Motor Co. for use in building chassis frames for motor trucks. The parts were undrilled and unriveted and of pressed steel. Duty was assessed at 19/10 cents per pound under paragraph 131, as pressed steel shapes. The claim was that the material was properly dutiable at 4/10 of 1 cent per pound under paragraph 121, as structural shapes of steel, not assembled, or manufactured, or advanced beyond hammering, rolling or casting. The proof offered was to the effect that the shapes were first rolled, then pressed, sheared off and finally hammered to straighten the steel parts. The board held that the shapes are excluded from paragraph 121, as they were not made by the processes named in that paragraph, but were made substantially by pressing and shearing.

Two Receivers for Atlantic Truck.

On the application of Ralph Sanger, a vice-president, the Atlantic Vehicle Co., with offices in New York and a factory in Newark, N. J., was placed in the hands of receivers on Tuesday last, 11th inst. The Federal court in Newark, in which action was taken, appointed A. Perry Osborne, of New York, and Harry L. Davisson, of Orange, N. J., as receivers.

The company was organized about 18 months ago, with a paid up capital of $340,000, to manufacture electric trucks, of which it produced about 50. Its heaviest creditor is the New York Edison Co. Its failure is ascribed to the now common lack of working capital.

Universal and Bremer-Wilson Merged.

The Bremer-Wilson Co., of Chicago, Ill., has been merged with the Universal Mfg. Co., of Racine, Wis., of which Fred G. Bremer has become president. The transaction gives to the Bremer-Wilson people a going factory in which to produce its engine starters, locks, pliers, etc. They already had secured a factory site in Benton Harbor, Mich., and so soon as necessary details are completed the Universal company will remove to that place.

Nine More Stewart Speedometer Branches.

The Stewart-Warner Speedometer Corporation has established nine more branches in, respectively, Philadelphia, Pittsburgh, Atlanta, Kansas City, Cincinnati, St. Louis, Minneapolis, Los Angeles and Portland, bringing the total of such branches up to 17. They are separate and apart from the 53 service stations already established, which number also is to be largely increased.

Goodyear Again Pays 12 per Cent.

Setting at rest rumors which had been afloat in financial circles, the Goodyear Tire & Rubber Co., of Akron, last week declared the regular cash dividend of 12 per cent. on its common stock. During the year, and despite the effects of a fierce strike and a mighty flood, the Goodyear business increased from $26,000,000 to $33,000,000. Its shares are now quoted at about 270.

Carples Sails to Introduce American Top.

James M. Carples sailed from New York last week to introduce the Sharrer one-hand top to the European trade. It is stated that several parties are negotiating for the rights.

WEED'S GRIP TIGHTENED BY MICHIGAN COURT'S OPINION

Perry Grip Enjoined and Weed Patentee Commended — Invention of 1869 Bowled Out in All-Sufficient Language.

Court decision upholding the Parsons patent, No. 723,299, under which Weed chains are made, have become so common as to excite little attention, but in an opinion handed down last week in the United States District Court for the Eastern District of Michigan, Southern Division, Judge Tuttle made pointed comparisons of the Weed grip and the Perry grip, which was claimed to be an infringing device.

The suit was brought by the Weed Chain Tire Grip Co. against Arthur S. Perry and Milton H. Perry, trading as the Perry Chain Grip Co., and against the Union Steel Screen Co., which made the grips for the Perrys, and against the Motor Specialty Co., the Perrys's selling agent. The court held the grip to be an open-and-shut infringement and, referring to the Thomson patent, No. 98,126, granted December 21, 1869, which was cited to prove the prior art, said:

"Thomson lived and produced ideas in an industrial period entirely different and far remote from the efforts of Parsons. It is not necessary for the court to speculate as to the extent to which Thomson might have modified his device had he lived in the period when pneumatic tires and automobiles were in practical use. His device was intended primarily to protect the wheels of the heavy, slow-moving traction engine. It would not be serviceable as a non-skidding attachment to a rapidly moving wheel. Instead of preventing skidding, it would increase it. The fact that it might creep upon the wheel has no bearing upon this case. Creeping is a law of mechanics and not the invention of any man. Parsons conceived a structure in which he could utilize this creeping of the chain fastened upon the tire of a wheel in such a way as to prevent the wheel from skidding, keep the chain from coming off the wheel, and to wear the surface of the wheel so uniformly that the durability of the entire surface of the rubber tire was utilized, and he did all of these things without slowing the tire. No one had previous-done all of these things.

"No better argument can be urged for the inefficiency of the Thomson invention for the use served by the Parsons invention than that none of the many manufacturers are willing to use the Thomson device for the purpose of preventing skidding, while on the other hand, manufacturers have found it so necessary to make skid chains like those shown by Parsons that the courts have been continually called upon to detect the ingenious schemes for infringing the Parsons patent.

The Parsons device met a great need in the way of making the modern rapidly-moving vehicle useful and safe. No earlier device met that need. Parsons's device is novel and useful and he is entitled to the protection of the law."

The Perrys produced Perry, Weeder, Peerless and Emergency grips.

Court Weary of Attacks on Weed Grip.

The United States Circuit Court of Appeals in New York City is apparently weary of listening to arguments about the Weed tire chain; it said as much this week in an opinion affirming the Weed Chain Tire Grip Co.'s victory in the lower court over the E. J. Willis Co., of New York City, which sold grips made by the Whittaker Chain Tread Co., of Boston, maker of Whitaker, Besdam and Empire grips. The court declared that if ever there was a case where everything that could be said had been said this was one and that anything that had been produced by the Whitaker-Willis interests failed to have any bearing on the validity of the patent. The decree was affirmed with costs.

Purchasing Agents' National Association.

The National Association of Purchasing Agents has been brought into being, with H. T. Leeming, of Thomas A. Edison, Inc., as temporary chairman and Elwood B. Hendricks as temporary secretary and treasurer. The organization is designed to include in its membership purchasing agents and buyers for industrial establishments of every nature, and when it is permanently welded, at a meeting which will be held late this month, the formation of sub-associations will be undertaken. Temporarily its headquarters are in Hotel McAlpin, New York.

Sumter to Make High-Tension Magneto.

Having decided to go more largely into the manufacture of magnetos, the Sumter Telephone Mfg. Co., of Sumter, S. C., has dropped "Telephone" from its title. It is preparing to bring out a line of high-tension magnetos to supplement its present instrument of the low-tension type.

Milwaukee at Odds Over Bumpers.

The Garage Equipment Mfg. Co., of Milwaukee, has filed suit in the Federal Court in that city against the Milwaukee Auto Specialty Co. charging infringement of its bumper patents. An injunction and accounting, of course, are sought.

$135,000 HIGHEST BID FOR BANKRUPT R.C.H. PROPERTY

Whole Assets Appraised at $650,000 and Acceptance of Bid to be Opposed—$25,000 Offered for $400,000 Real Estate.

One hundred and thirty-five thousand dollars was the best offer made for the property of the R. C. H. Corporation, in Detroit, at the receiver's sale on Tuesday last, 11th inst. It was tendered by four individuals and covered the plant, real estate, buildings and their contents, the four men concerned being J. F. Hartz, who assumed the R. C. H. presidency when the creditors took charge; Charles P. Sieder, secretary of the creditors' committee, and Harry S. Grant and Charles S. Beardsley, of Detroit.

It is understood, however, that the trustee, the Security Trust Co., will recommend to the court that the bid be not accepted, the assets which they seek having been appraised at $650,000.

Winternitz & Co., of Chicago, in conjunction with others, submitted bids for various parcels which totaled $134,000. Harris Bros., of Chicago, who, like Winternitz & Co., make a business of purchasing bankrupt properties, were represented and expressed a desire to make an offer but maintained that they had not had an opportunity to make an inspection and a real appraisal.

The matter will come before the court for confirmation on Monday, November 17th, at which time it is expected that Harris Bros. will have their data in hand and be able to make an intelligent bid.

Among other offers was one of $25,000 for the real estate, which is conservatively appraised at $400,000.

Van Sicklen Completes Speedometer Co.

N. H. Van Sicklen, who for many years was the owner of Motor Age and who within the past several months has been developing a speedometer under the Purdy patents, has organized the Van Sicklen Co. to market the device. He himself is president, Thomas F. Sheriman vice-president and Charles F. Van Sicklen secretary and treasurer. Operations are being carried on at 58-60 South River street, Aurora, Ill.

The speedometer itself is of radical design. It operates by the drag of an air current produced by a single-bladed fan driven by the usual flexible shaft. The rotary air current acts on a similar single blade on the indicating disk which moves against a light spring. The faster the fan rotates the stronger the air current and the greater the disk movement.

COURT KEEPS SNUFFER ON THOSE NEVEROUT PATENTS

Rose Company Unsuccessful on Appeal from Decision Against its Bracket Patents—Lack of Patentable Invention Upheld.

The legal snuffer which Judge Cross in the United States District Court for the District of New Jersey applied last January to a Neverout lamp-bracket suit brought by the Rose Mfg. Co., of Philadelphia, Pa., was firmly fixed in place last week by the Circuit Court of Appeals for the Third Circuit, the decree of the lower court being affirmed. The defendants, who were charged with infringing four patents, were the E. A. Whitehouse Mfg. Co. and the Le Compte Mfg. Co.

What the lower court did was to declare some of the patents invalid and the others not infringed and to dismiss the bill of complaint. The Rose company endeavored to have its suit reinstated, but the Appellate Court has added an extra padlock to the door.

"The bill of complaint," stated the court, "charged that the defendants were infringing four separate and distinct letters patent—two mechanical patents and two design patents—said patents being: Rosenbluth, No. 883,973, April 7, 1908; Hughes, No. 962,220, June 21, 1901; Rosenbluth design patent No. 41,388, May 16, 1911; Rosenbluth design patent No. 41,389, May 16, 1911.

"The defendants were charged with conjointly embodying the alleged inventions of the several letters patent in the alleged infringing articles manufactured by them. Both of the mechanical patents, No. 883,973 and No. 962,220, relate to brackets arranged to support a lamp in detachable relation to a vehicle body, such as are adapted more especially for use on automobiles, to support and illuminate the number or license placed thereon.

"The design patents, No. 41,388 and No. 41,389, are stated to be for new and original ornamental Designs for Vehicular Number-Plate Supports. The decree of the court below holds that claims 7, 8 and 10, the only ones involved in patent No. 883,973, were not infringed by the defendants; that claims 5 and 6 of patent No. 962,220 are invalid, because of the absence of patentable invention in their subject matter, and that the design letters patent are for mechanical and functional features, and not ornamental and therefore invalid.

"A careful consideration of the patents in suit, of the record before us, and of the elaborate oral and printed arguments submitted by counsel on both sides, satisfies us that there was no error in the decree of the court below, and the clear and convincing opinion of Judge Cross relieves us of the necessity of restating the grounds for that decree. The decree of the court below is therefore affirmed."

U. S. Rubber Again Increases Capital.

For the purpose of "repaying the recent outlays for enlargement of plant and for expenditures on the plantations in Sumatra," the United States Rubber Co., which owns the United States Tire Co., on Thursday last added $9,422,000 to its preferred stock. Each stockholder will be allowed to subscribe for one share of the new stock at par for every 10 shares already held. This procedure is designed to prevent the expense of underwriting the new issue. Despite the opportunity offered stockholders and other investors, the new issue failed to affect the market favorably, as had been expected. On Thursday, when the directors took action, U. S. Rubber preferred sold at 104; the following day it dropped to 100¼.

Republic Possessed of New York Branch.

The Republic Rubber Co., of Youngstown, O., has taken over the Republic Rubber Co. of New York, heretofore owned and managed by New York men. F. G. Hill, secretary and sales manager of the old company, will, however, remain in the same capacity with the new organization, having charge of all tire service. C. W. Hardin, former Eastern manager of the parent company, has been elected vice-president and treasurer of the New York company and will handle its mechanical sales. The old location at 229 West 58th street will be retained.

Uncle Sam Grants Studebaker a Drawback.

A drawback allowance has been granted by the Treasury Department on the exportation of automobiles designated as model 6, manufactured by the Studebaker Corporation, with the use of aluminum parts made from castings manufactured from imported aluminum by the General Aluminum & Brass Castings Co., of Detroit. The drawback also applies to such aluminum parts when exported either separately or in connection with other parts of model 6 automobiles.

Detroit Factory for Graton & Knight.

The Graton & Knight Mfg. Co., the old established leather goods house in Worcester, Mass., has established a branch factory in Detroit. It is in charge of C. F. Urquhart and is located in what was formerly the Wayne Belting Co.'s plant on Second avenue.

CUTTING FORD PRICES IS MADE CONTEMPT OF COURT

Officers of Dayton Concern Try to Explain How They Weren't Doing Wrong—Judge Rebukes Belligerent Lawyers.

After a warm legal battle, Lucien Soward and O. D. Noble, attorney and sales manager, respectively, of the Union Motor Sales Co., of Dayton, O., were adjudged guilty of contempt by Judge Hollister in the Federal court in Cincinnati on Saturday last, 8th inst. Their contempt consisted of violation of an injunction obtained by the Ford Motor Co., of Detroit, in June of last year restraining the Motor Sales company and all connected therewith from cutting the price of Ford cars.

The Dayton concern is one of the cooperative sort which, in return for the purchase of $10 shares, promises automobiles and accessories at cut rates. When the Ford people discovered that they were offering their cars at less than list, they sued for infringement of patents and for $50,000 damages, the court granting a preliminary injunction.

Later, Soward and Noble were discovered pursuing the old practices and were promptly charged with contempt. In their defense they set up that they were acting independently and also alleged that if any contempt had been committed it was due to Ford efforts to trap them.

There were so many angry passages between the attorneys at last Saturday's hearing that Judge Hollister finally called a halt and declared that he would adjourn the court unless they ceased. Explanations and apologies followed, and finally the court found both guilty of contempt.

Allen Given Decree Against Niagra.

Modifying "a patented device to a point where it merely works badly" does not avoid infringement, was the opinion of Judge Hand, of the United States District Court for the Southern District of New York, this week, in holding that the Niagra Auto Cover Co., of New York City, had infringed the Nathan tire cover patent, owned by the Allen Auto Specialty Co., also of New York City. The patent is No. 799,662 and was granted September 19, 1905. It covers a case which protects a tire in its position on the running board of a car. The Niagra device, the court held, had been accomplished virtually by making a Nathan case with a different relation of practically the same parts. Judge Hand held that it made no difference whether the cover was put on "hind side front or the normal way."

The Week's Incorporations

Clintwood, Va.—Clintwood Motor Co., under Virginia laws; authorized capital, $10,000. Corporators—B. D. French and others.

Cincinnati, O.—Warner Auto Top Co., under Ohio laws; authorized capital, $40,000. Corporators—W. W. Warner, W. W. Dill and F. A. Brown.

Seattle, Wash.—Clark Motor Co., under Washington laws; authorized capital, $10,000. Corporators—E. T. Clark, Grace M. Clark and E. L. Skeel.

Detroit, Mich.—Scripp-Booth Cyclecar Co., under Michigan laws; authorized capital, $50,000. Corporators—Wm. E. Scripp, George G. Booth and others.

Chicago, Ill.—Abbott Garage & Machine Co., under Illinois laws; authorized capital, $3,000. Corporators—J. C. Abbott, M. E. Boynton and Harry L. Hudson.

Wapakoneta, O.—Breese Motor Plow Co., under Ohio laws; authorized capital, $100,000. Corporators—Robert A. Breese, G. D. Norris and David Lerbach.

Louisville, Ky.—Flannelly-Clarkson Auto Co., under Kentucky laws; authorized capital, $2,250. Corporators—M. H. Flannelly, E. J. Clarkson and Charles Clarkson.

Cleveland, O.—DeForrest Electric Welding Co., under Ohio laws; authorized capital, $5,000. Corporators—R. J. Lamb, M. M. McLaughlin, C. F. Miser and others.

Houston, Tex.—Sprong-Roberts Auto Co., under Texas laws; authorized capital, $15,000. Corporators—W. H. Sprong, F. S. Roberts and L. Thomas, all of Houston.

Chicago, Ill.—South Chicago Garage, under Illinois laws; authorized capital, $2,500; to operate a garage. Corporators—Fred Poulecke, Fred M. Koch and Adam Poulecke.

Montreal, Can.—Michelin Tire Co., under Canadian laws; authorized capital, $40,000; to manufacture rubber tires. Corporators—A. E. Woodworth, A. B. Wright and others.

Valparaiso, Ind.—Wheeler-Elam Co., under Indiana laws; authorized capital, $10,000; to sell motor cars. Corporators—W. G. Elam, R. W. Elam, R. S. Wheeler and others.

Washington, D. C.—Taximeter Register Co., under Delaware laws; authorized capital, $300,000. Corporators—C. E. Miller, A. R. Serven and G. S. Maxwell, all of Washington.

Philadelphia, Pa.—Albertson Co., under Delaware laws; authorized capital, $25,000; to manufacture and deal in motor cars. Corporators—George H. B. Martin, Camden, N. J., and others.

Windsor, Can.—Parsons Motor Car Co., under Canadian laws; authorized capital, $500,000; to manufacture motor vehicles. Corporators—Thomas G. Ellis, A. J. Denomy and others.

Memphis, Tenn.—Memphis Overland Co., under Tennessee laws; authorized capital, $5,000. Corporators—T. H. Smart, F. D. Graham, Roy Moyston, Earl King and Caruthers Ewing.

Dayton, O.—Public Motor Car Co., under Ohio laws; authorized capital, $10,000; to deal in motor vehicles. Corporators—H. H. Willamson, G. E. Booth, Brice Welsh and M. Kewen.

Wichita, Kan.—Jones Auto Exchange, under Kansas laws; authorized capital, $100,000. Corporators—J. J. and Laura N. Jones, A. J. Coombs, C. P. Reser and F. C. Adams, all of Wichita.

Racine, Wis.—L. P. C. Motor Co., under Wisconsin laws; authorized capital, $250,000; to manufacture motor cars. Corporators—William Mitchell Lewis, Rene M. Petard and Elbert B. Hand.

Toronto, Can.—Gray Pneumatic System, Ltd., under Canadian laws; authorized capital, $500,000; to manufacture accessories for motor cars. Corporators—J. M. Duff, Frank Regan and others.

Brooklyn, N. Y.—Crescent Taxicab Co., under New York laws; authorized capital, $5,000. Corporators—Isaac Stone, 1951 83rd street; John B. Haff and Mary L. Haff, both of 331 13th street.

Chicago, Ill.—C. A. Martin Mfg. Co., under Illinois laws; authorized capital, $2,000; to manufacture and sell motor vehicles. Corporators—C. A. Martin, George T. Glover and William Schulze.

Cleveland, O.—Kemco Electric Mfg. Co., under Ohio laws; authorized capital, $100,000; to manufacture electric specialties. Corporators—W. I. Knight, C. G. Roads, Herbert Mathews and others.

Louisville, Ky.—Auto Tire Brokerage Co., under Kentucky laws; authorized capital, $5,000; to buy and sell motor cars and tires. Corporators—Allen L. McCormick, Charles L. Holden and S. Barry.

Buffalo, N. Y.—F. H. Chace Co., under New York laws; authorized capital, $5,000; to engage in the motor car business. Corporators—Frank H. Chace, Daniel Walker and Henry A. Thayer, all of Buffalo.

Greenville, Ill.—Auto Supply & Sales Co., under Illinois laws; authorized capital, $2,500; to deal in motor cars and operate a garage. Corporators—Edward De Moulin, Elvin W. Miller and Clarence E. Holles.

Cleveland, O.—Cleveland Presto-Ceal Co., under Ohio laws; authorized capital, $10,000; to deal in motor car accessories. Corporators—C. F. Schultz, M. E. Schultz, C. S. Bechberger, F. A. Follier and H. U. Krauss.

Bristol, Conn.—Auto Service Co., under Connecticut laws; authorized capital, $10,000; to conduct a real estate and mechanical business. Corporators—I. E. Pierce, W. H. Arnold, J. H. Hayes and Charles Parker.

Bridgeport, Conn.—New England Auto Supply Co., under Connecticut laws; authorized capital, $10,000; to deal in motor car supplies. Corporators—Andrew B. Hicks, George D. Molones and Daniel A. Stanton.

New York, N. Y.—Charles E. Riess & Co., under New York laws; authorized capital, $50,000; to deal in motor cars, etc. Corporators—Charles E. Riess, George L. Reiss and Byron H. Riess, all of Cumberland Hotel.

New York, N. Y.—Modern Garage Co., under New York laws; authorized capital, $10,000. Corporators—Thomas Black, 2075 Eighth avenue; Henry W. Biggs, 201 West 106th street; Carl S. Flanders, 129 Columbia Heights, Brooklyn.

East Rochester, N. Y.—Housel Mfg. Co., under New York laws; authorized capital $25,000; to deal in motor cars, etc. Corporators—William H. Cole, Pittsford, N. Y.; William E. Housel and Bernice B. Housel, both of 1 Cornell street.

Buffalo, N. Y.—Houk Mfg. Co., under New York laws; authorized capital, $900,000; to manufacture motor cars, etc. Corporators—George W. Houk, The Drexel, Overbrook, Pa.; Edward McMills, 147 North street; Charles H. McCullough, Jr., 68 Irving place.

POPE RECEIVERSHIP UP IN TWO NEIGHBORING STATES

George Pope Alone Sufficient in Connecticut but Co-receiver Named in Massachusetts—Boston Stockholders Insistent.

Efforts of the Massachusetts stockholders' protective committee and the Massachusetts bankers' committee to secure the appointment of co-receivers for the Pope Mfg. Co., of Hartford, Conn., and Westfield, Mass., met with different results in the two States.

While Judge Tuttle, of the Connecticut superior court, considers that at this time the temporary receiver, Colonel George Pope, is sufficient, Judge Aldrich, of the Federal court in Boston, took an opposite view and named Colonel Pope and Charles A. Morse, a Boston banker, co-receivers. Judge Tuttle, who rendered his decision on Friday last, 7th inst., stated that the motion for co-receivers could be renewed on December 5th, when the confirmation of Colonel Pope as permanent receiver will come up.

The Boston stockholders' committee is said to represent 29,044 shares of the 58,000 that are outstanding. The Pope family holdings are 11,000 shares.

In appointing Morse co-receiver, Judge Aldrich, who took action yesterday, 12th inst., stated that he did so without prejudice to the subsequent appointment of a third person.

Each of the Massachusetts committees, through their counsel, went to Hartford prepared to urge the appointment of certain men as co-receivers, the stockholders having selected Frank J. Tyler, one-time manager of the Maxwell branch in Boston, while the bankers, whose claims amount approximately to $800,000, favored Charles M. Morse, also of Boston. There was talk of extravagance in Pope affairs, but while they expressed faith in Col. Pope's integrity, they believed the appointment of co-receivers would serve the best interests of all.

The merchandise creditors' committee, of which Clarence E. Whitney is chairman and whose claims amount to about $300,000, was also represented and stated that if the other interests are to have separate receivers the merchandise creditors likewise would ask for one. Counsel for the merchandise creditors, however, suggested that it would be well to "wait and see how Col. Pope gets along."

Judge Tuttle, who sat as a magistrate, as stated, took this view; he also named Frederick C. Billings and John R. Hills to appraise the Pope property in Connecticut.

Meanwhile, another stockholders' committee has been found and, like the others, is seeking proxies. This committee is made up of Roy T. Barnes, Robert M. Brewster and Frederick F. Small, all of Hartford, Small being one of the stockholders who joined in the original application for the receivership. Unlike the Massachusetts committees, however, this trio is not unfriendly to the Pope interests and there are those who predict that a sharp conflict between the Massachusetts and Connecticut interests will result.

Walpole Figures Run into Millions.

According to the report of the co-receivers of the Walpole Tire & Rubber Co., of Walpole, Mass., of which they took possession on August 2nd, the assets on that date amounted to $3,52,301.58 and the liabilities to $4,539,507.28.

In the assets, however, patents, trade marks and good-will are carried at a valuation of $841,998.05, and in addition there is stock in subsidiary companies to the value of $500,000, and also 50 shares of United States Worsted second preferred and 104 shares of Westinghouse common which were taken in settlement of trade accounts and which are listed at $5,490. Likewise there are contingent assets in the form of notes receivable, discounted or assigned, to the amount of $276,678.67. The Walpole real estate, machinery and equipment is valued at $949,514.37, which with the inventory, $628,295.70, constitute the most tangible assets, although although in addition there are accounts receivable to the value of $232,537.56.

Of the liabilities, $3,252,233.33 is represented by capital stock, $671,933.52 by notes and $173,577.99 by accounts receivable. These latter items figure as current liabilities, but in addition there are contingent liabilities made up of notes receivable to the value of $276,678.67 and offsetting a similar item in the asset column.

Bernard Morgan Encounters a Snag.

Ever since Bernard Morgan, of Newport, R. I., informed his British brethren that he thought he could get jobs in America for a lot of them he has been more or less in the limelight or the courts—mostly in the courts. He has brought some patent infringement suits himself, but the latest in which he figures has resulted in an injunction against him. It was brought in the United States District Court for the District of Rhode Island by Louis Schwab as surviving partner of the firm of Stevens & Co. and alleged that Morgan infringed the Bryant valve spring remover patent, No. 1,008,604, which was granted November 14, 1911.

SOME DETAILS OF MERGER OF SAURER AND MACK COME OUT

Discrepancy of Nearly $600,000 Between Original Appraisals—Mortgage Loan of $1,200,000 Still Rests With Court.

Contrary to expectations, Judge Garretson, who sits in the New York Supreme Court in Brooklyn, has not yet rendered the decision which will permit the International Motor Co. to place the mortgage of $1,200,000 on its property which for several weeks has been blocked by a temporary injunction secured by minority stockholders. Judge Garretson has been ill but, nevertheless, has been considering the case at his home, to which he carried all of the many documents pertaining to the matter.

The number has been increased by the filing of original reports of the appraisals made of the assets of the Mack Bros. Motor Co. and those of the Saurer Motor Co., out of the merger of which grew the International company itself. They include the deposition of W. L. Case, who appraised the two properties for the North American Audit Co., and also the report of Ernst & Ernst. The latter statement showed that the Saurer property had a net worth, exclusive of patents, good-will, and capital stock, of $538,992, whereas the other auditing concern figured the actual net assets at $4,523. Of the discrepancy between the two estimates, $281,875, concerned the question whether the royalties payable under the Otto patents of the Saurer company should be classed as a liability. The case hinges partly on this point, i. e., whether a deferred charge is a liability.

The Ernst & Ernst report showed a deficit of $61,008 under the guaranteed total upon which the merger was based, while the North American statement disclosed a deficit of $595,477.

Judge Garretson is now expected to give a decision before the end of this week.

Haynes Names More District Managers.

The Haynes Automobile Co., Kokomo, Ind., has still further enlarged its staff of district managers by adding to it three more experienced automobile men. They are F. C. Burnett, who will have headquarters in Minneapolis; F. A. Fisher, who will handle Eastern Canada, with offices in Toronto, and J. S. Stark, who will be stationed in Elkhart, Ind. Previously Burnett was general manager of the Peckham Motor Car Co., of Dayton, O.; Fisher was identified with the Stutz car in Canada, and Stark was connected with the Michigan Buggy Co.

In the RETAIL WORLD

The Bockelman Garage has been opened in Beecher, Ill.

Stafford Bros. have purchased the Huber Garage in Courtland, Kan.

The Early Auto Co., of Ida Grove, Ia., has sold its business to Rosenhauer & Eckerman.

W. A. McCollum has entered the trade in Des Moines, Ia., at 208 11th street; he has the Colby agency.

The Olathe Auto Co., of Olathe, Kan., has taken over the Trail Garage: it formerly was operated by Lewis Edwards.

William Radeleff and Orval Marklos have formed a partnership in Springville, Cal. They will operate a repair-shop.

W. R. Poffenbarger, of Bussey, Ia., has sold the Bussey Garage to Ken Verips, formerly of Knoxville, in the same State.

W. T. Keys, of Algona, Ia., has sold the Kossuth Motor Car Co. to Paul Clement, formerly of La Porte City, in the same State.

The Henry Swensgaard Sales Co., of Detroit, has "gone into" cyclecars; it has the Dayton cyclecar agency for Michigan, Ohio and Indiana.

The Onondaga Motor Co. has been formed in Syracuse, N. Y., to distribute Hupmobiles; it is a subsidiary of the Chalmers-Syracuse Co.

W. P. Durst is about to dispose of his garage and agency in Greenwood, S. C. He will establish a Ford agency in Elberton, in the same State.

County Supervisor Olof Pearson, of Swea City, Ia., has disposed of his garage to J. L. Vaux; the latter has leased it to C. G. Dourte, who will operate it.

G. H. Crosby has purchased the interest of his partner in the Crosby & Morse Garage in Pomona, Cal. He has changed the style to Main Street Garage.

A new garage is being erected in Warehouse Point, Conn., on Main street; when completed it will be operated by Ralph Merriman and Dugan Blaney.

J. S. Morrison, of Phoenix, Ariz., has sold his agency to his brother, E. C. Morrison, and F. B. Huffer; J. S. Morrison will conduct a wholesale business only.

Joseph Foreman has purchased the half interest of C. M. Bennett in the Westfield (Ill.) Garage; Bennett will engage in business with his brother, C. E. Bennett.

R. F. Fisher and O. F. Wilson have entered the trade in Columbus, O., as dealers in Dart trucks; they have secured salesrooms in the High-Seventh Garage.

Thurl Young and Otis Winget have opened a garage in Enon, O. It is the first garage in this vicinity, transient and local trade heretofore going to Springfield.

Claude Redwine, formerly of Watsonville, Cal., has purchased the garage of W. A. Platt in Mountain View, in the same State; he assumed immediate possession.

The F. X. Laturbur Co., of Sidney, O., has sold its garage and business to Charles McClure and Walter E. Brookey; the latter will operate as the McClure & Brookey Garage.

C. M. Aurand, of Rockford, Ill., has purchased of Augustus Michell a two-story building which is nearing completion and will open a garage. The building cost Aurand $6,500.

Koons & Burk, operators of the Centaur Garage in Wausau, Wis., have dissolved partnership; C. E. Burk retires from the business, which will be continued by J. A. Koons.

Eugene Avery, formerly connected with the Auto Sales Co. in Lansing, Mich., has taken over the Globe Garage in Kalamazoo; he will remove to the latter city and operate the garage.

Leonard Wikoff, formerly with the Galesburg (Ill.) Machine Works, has entered the trade for himself; he has purchased and is operating the Crane & Kennedy Garage, in Oneida, in the same State.

The garage of the Johnson Auto Co., in Marshalltown, Ia., has been taken over by M. Hurto, of the Hurto & Berggren Machine Shop; the Johnson establishment is located at 8 South 2d street.

The Overland Automobile Co., of Houston, Tex., has changed its name to Sprong-Roberts Automobile Co. F. S. Roberts is president, W. H. Sprong vice-president and L. D. Thomas secretary-treasurer.

The Props-Brooker Motor Co., of Muncie, Ind., has purchased the Muncie Garage, on South Walnut street, and will remove to that location; the company was located on North Mulberry street.

Vautrot Bros., of Durand, Wis., have sold their hardware and implement business to John Weishapple and will devote their energies to their garage and agencies; they handle Ford, Buick and Cadillac cars.

A. C. Velton & Son, formerly of Detroit, contemplate opening a garage in La Crosse, Wis. They have leased and are remodeling a building formerly utilized by the Tomah Mfg. Co. It is located on Superior street.

R. L. Brewster has opened a service and repair station in Des Moines, Ia., at 916 Walnut street; for the past two and one-half years he has been foreman of the service department of the Independent Auto Co.

H. S. Goembel, who operated a garage in Geneseo, Ill., on East Orange street, has sold out to Lyon & Gernant; the latter have moved their business from the Zimmerman Mill building to Goembel's location.

Baker & Hamilton, hardware dealers in San Francisco, have taken up tires; they have been made Savage distributers in Northern California. The company is one of the oldest hardware concerns in San Francisco.

Archie Minck, formerly manager of the Joseph Garage, in Columbus, O., has taken it over and is operating it under the style Champion Garage; he also has a taxicab service. His garage is located at Champion avenue and Oak street.

Charles Franzen and V. R. Eads, who have been employed as mechanics in St. Joseph, Mo., have entered the trade for themselves; they have formed the Franzen-Eads Automobile Co. and have located at 109-11 Felix street.

Huse & Heigenthal, of Burlington, Wis., has been dissolved; J. S. Heigenthal will continue the business, which includes the Ford agency. The territory, however, has been divided, part having been taken by the Agner Auto Co., of Burlington.

Roeske & Sindt, Ford dealers in Davenport, Ia., have dissolved partnership; A. E. Sindt has retired from the business, which will be continued by W. E. Roeske under the style The Ford Garage. The location is at 4th and Ripley streets.

A. E. Kirk has purchased the interest of E. C. Aspey in the Hutchinson (Kan.) Mo-

Digitized by Google

tor Car Co. and is now sole owner; the company handles Hudsons and does an extensive tire business, handling $200,000 worth of tires during the past year.

John L. Galster and Owen McMahon, who operated in Petoskey, Mich., as the Northern Auto Co., have dissolved partnership; McMahon retains the automobile business and Galster assumes ownership of two stores which formerly were the property of the partnership.

The Schaible & Weidman Auto Co., of Yysilanti, Mich., has been dissolved; Emanuel G. Weidman has purchased the interest of his partner, Theodore Schaible, and will continue the business under the style Weidman Auto Co. The concern took possession of a new garage in February.

J. M. Frederick, who is interested in the Frederick Auto Co., of Elkhart, Ia., and who until recently was connected with the Holtzmann Sales Co. in Des Moines, has opened a garage and agency in the latter city; he has secured the location on Walnut street formerly occupied by A. D. Bothne and will distribute Regals in Central Iowa.

The Lucia Motor Co., of Green Bay, Wis., Chalmers distributer, has sold its garage and agency in Oconto, Wis., to Cophus Nelson; Nelson had been connected with the company's repair department in Green Bay for three years. William Lucia, who formerly managed the Oconto branch, has returned to Green Bay, where he will manage the sales work of that establishment.

E. A. Spinner, of Milwaukee, and Peter J. Wolf and William Evans, of Menominee Falls, Wis., have entered the trade in Waukesha; they have the Ford agency for six townships and will locate on South street in Waukesha. Evans and Wolf formerly were connected with the Wittlin Auto Co. in Menominee Falls and Spinner formerly was employed by the Ford state agency in Milwaukee.

Recent Losses by Fire.

Scranton, Pa.—J. F. Peck, Brown avenue; garage damaged. Loss, $3,000.

Goodrich, N. D.—Haas & Engel; garage and machine shop destroyed. Loss not stated.

Racine, Wis.—Racine Metal Stamping Co.; explosion and fire; plant destroyed. Loss, $25,000.

Los Angeles, Cal.—Security Motor Co., 1120 South Main street; building damaged and 12 cars destroyed. Loss, $15,000.

New York, N. Y.—Yorkville Garage, 113 East 77th street, Samuel Kronenburg and Charles Weis, owners; garage damaged. Loss, $5,000.

3,941 HOURS OF LABOR ON McMURTRY'S REPAIR BILL

And McMurtry Wants to Know What the Machinist Was Doing All that Time—Demands Particulars in Healey's Suit.

"Machinists' time, 1,500¼ hours, at 75 cents an hour—$1,125.19."

This is one of a collection of items which Charles W. McMurtry objects to in a bill for $3.761.72 presented to him by Healey & Co., body builders and automobile dealers in New York City; he says it may be all right, and if it is he may be willing to pay it, but in a suit which has been filed against him by Healey & Co. in the Supreme Court for New York county he demands that he be told what the machinist was doing all that time. He has been granted an order for a bill of particulars.

The dispute stands as an excellent example of what Motor World has recommended, which is that the repairman itemize his charges in order that there may be no misunderstanding. McMurtry, who had a Mercedes car overhauled in 1912, states that a total of 3,941 hours of labor that was charged up to him constitutes 437 nine-hour days, which is nearly a year and a half of work days, and even if this does represent several men working at the same time he demands light on the subject.

Other of the items to which exception are taken are such as "Blacksmith's and helper's time, 48½ hours, at $3 an hour—$145.50; superintendent's time, 34 hours, at $2 an hour—$68; machinist's time, 627¼ hours, at 75 cents an hour—$470.44; welding and filling up two levers, $6.75; welding one brass part, $3.37; welding frame, $10.80; and making new manifold, $29.60. McMurtry sets up a counterclaim of $800 and wants to call it even, inasmuch as he paid $959.76 on the original bill, which was $4.721.41.

He turned the car over for repairs in November, 1911, and in June, 1912, received it, he states, with the good news that it was "as good as new." He submits affidavits of repair-shop proprietors who state that automobile parts are well known by individual names and that it ought to be possible for any repair-man to specify on what part labor had been performed and that many repair-shops so itemize their bills.

Minor Business Troubles.

Walter C. and Harry N. Allen, who traded in New York City as the Metallurgique Mitor Co. and who failed last spring, were discharged from bankruptcy this week in the Federal court in New York City; their liabilities were $67,928 and their assets $8,070. Besides handling Metallurgique cars, they also represented the ill-starred Michigan line.

A petition in bankruptcy was filed this week in the Federal Court in New York City against the United Auto Supply Co., of 88 Chambers street; the petitioners and their claims are: Meyer Reader, note, $400; J. H. Faw, goods, $270.83; Julius King Optical Co., $102. It is alleged that the company transferred part of its assets in an attempt to defraud its creditors.

Joseph J. Brunner, a garage owner, of 1446 South Wabash avenue, Chicago, is the object of a petition in bankruptcy filed by Fred Brill, of Chicago, Earl W. Conrad, of Warsaw, Ind., and Edward D. McCullough, of Peoria, Ill. It is alleged that his debts exceed $10,000 and that his assets are not more than $4,000.

R. Frank Bell, who traded in Tuscaloosa, Ala., as the Oak City Garage, has filed a petition in bankruptcy; his assets are valued at $2,300 and his liabilities at $1,907.28.

B. F. Baldon, who operated a garage in Quincy, Ill., at 422-24 Jersey street, has been declared a bankrupt on a petition filed by himself; the liabilities are valued at $2,190.67 and the assets at $3,485.20. The garage has been closed for several weeks and the owner of the building states that he has no knowledge of the whereabouts of Baldon.

The Rapid Motor Transit Co., which started a 'bus service on the North Side in Indianapolis in November, 1911, was thrown into the hands of a receiver last week; the liabilities aggregate about $5,700 and the bills receivable about $1,200. The application was made by James T. Eaglesfield, a stockholder, who states that of the $150,000 capital stock only $35,500 was paid in. The owners favor a winding up of the business. Following the receivership, the court ordered that the fare be raised from five to 10 cents, a move which, if the earnings are any indication, might well have been made long ago. It was anticipated by the owners that service would be terminated upon the naming of the receiver, but the court ordered the 'buses kept running during the recent street car strike.

Stearns Replevins Chalmers Limousine.

An order for the replevin of a 1910 Chalmers limousine has been granted in the Supreme Court for New York county to the F. B. Stearns Co. in a suit against the Auto Owners' Sales Co., of 317 West 59th street; the Stearns company claims possession of the car. The Sales company alleges that the Stearns company sold the car to the Crescent Tire Co., that the latter sold it to another party, and that the car is in the possession of the Sales company on storage

ACCESSIBILITY OF BOLTS AND NUTS.

It goes without saying that manufacturers and designers of automobiles are far more concerned with the problem of producing machines that will run well than with questions concerning repairs and renewals; yet there is a great opportunity for the builder to make things easier for the repairman without greatly increasing his own trouble and expense, by so building as to facilitate getting at parts for repair work.

It has become almost an axiom that actual repair work is less troublesome and time-consuming than the preliminary tearing down and the subsequent putting together; and in the case of the man who does his own repair work and does not have at hand all the conveniences of the repair shop the conditions often are extremely difficult. For instance, there is the common custom of making little recesses for bolt-heads and nuts. The intention doubtless is to keep the projections below the general surface and so produce a clean general appearance; but almost invariably the recesses are so restricted that a wrench is used only with the greatest difficulty, and often a nut that, in a slightly larger space, could be easily removed with an ordinary wrench must be turned with some special appliance. There are not a few live rear axles that have to be entirely dismantled in the event of a shaft breaking or a key shearing off or a differential pinion or gear stripping. Examples might be multiplied almost indefinitely and any repair man can do the multiplying.

Any amateur who has spent hours wrestling with such jobs can give at least a few pointers to many a designer. It is far better to put a nut out in the open, so to speak, when it can be done, than to sink it in a depression, for if it does catch a little dust it is easily cleaned off, and anyway the depression catches more dust, though it does not show so much. As for appearance, in most cases any one who has had mechanical trouble would infinitely prefer the slightly less neat appearance of exposed bolt heads to the struggle with sunken heads. And as for live axle trouble, it is doubtful if anyone who knows would hesitate for an instant before paying the comparatively slight extra cost of a construction that would permit easy access to parts that might break. And it does not by any means follow that accessible parts are more likely to break than those that are buried almost beyond digging out.

Naturally, it is distasteful to makers to look forward to the possibility of repairs having to be made, and even more distasteful to salesmen to broach such a subject to prospects—in fact, the matter is one to be handled with the keenest judgment. But a car that is more than ordinarily accessible in parts most likely to need attention has an advantage that will do its own talking on occasion, while the trouble-making car produces just as strong an impression of an unfavorable kind.

USED CARS THAT ARE RARELY CONSIDERED.

The extent to which officers and department heads are justified in making use of corporation property long has been a moot point and probably will remain one.

So far as the automobile industry is concerned, the point has been sharpened by some of the recent failures which have occurred. A motor car usually represents a handsome valuation, and when many of them are used by officers or employes they quickly run into large sums, how large has been brought home to creditors of some of the recently embarrassed car manufacturers.

In at least one instance, it is stated that nearly 30 cars were in such use. At list prices, they represented nearly $75,000. but even this figure did not represent the true state of affairs, as each year not only had new models been utilized but the cost of upkeep had been charged against each of them, and when at the close of each season they were turned back for overhauling and sale they represented merely greatly depreciated used cars.

While but one instance is cited, the practice is too general for it to stand as an isolated case, and if put into dollars and cents, and covering a period of years, it cannot but represent a sum that, if not staggering, is at least impressive. It is a used car situation that is altogether too rarely considered.

When all goes well, it counts for little; when all goes wrong, it counts for much—so much that car makers who have not felt financial pinch well may pause long enough to count the cost and to discover whether a remedy is possible.

Agricultural Engineers Motor Session.

At the seventh annual convention of the American Society of Agricultural Engineers, which is scheduled to be held in the Great Northern Hotel in Chicago, Ill., December 29-31, a part of the program is to consist of papers and discussion bearing on motor farm apparatus. Tuesday afternoon, December 30th, will be devoted to such subjects and has been designated a "Motor Contest Session." In addition to reports of the committees on rules for motor contests and on a proposed motor contest in the United States, two papers will be read. One is by C. J. Rohrer of the General Electric Co., of Schenectady, N. Y., and is entitled "Small Motor Applications for Farm Work," and the other is entitled "The Five Winnipeg Motor Contests and the Lessons to be Drawn from Them."

Electric Vehicle "Salon" for Boston.

Bostonians are preparing for a brand new kind of an automobile show. It is, to be brief, an "Electric Vehicle Salon" and, as the name implies, it will include only those types of vehicles that can trace their ancestry right away back to old Ben Franklin's famous kite. It is to be held in the grand ball room of the Copley-Plaza hotel in the Back Bay section of the city and will hold the boards, or, rather, the waxed floor, from Monday, 17th inst., until Wednesday, 19th inst.

Already no fewer than 11 electric vehicle dealers have signed up for space, and the Electric Motor Car Club, which has the affair in hand, is confident that others, too, will "come in." The dealers who have been allotted exhibition spaces and the cars they will show are as follows: S. R. Bailey & Co., Bailey; Frank M. Phelps, Baker; W. L. Russell Co., Buffalo; J. W. Emery, Church-Field; Imperial Motor Car Co., Columbus; Anderson Electric Car Co., of Boston, Detroit; D. C. Tiffany Co., Ohio; Peerless Motor Car Co., Rauch & Lang; W. H. Stevens, Standard; J. W. Bowman Co., Waverley; Whitten-Gilmore Co., Woods. A space at the end of the room will be devoted to eight battery makers.

British Makers Report Good Profits.

The balance sheets of automobile manufacturing concerns on the "other side," which are being published following the ending of the fiscal years of the various concerns, serve to afford a good idea of the extent of the business done, from a financial point of view. Among others, the Sunbeam Motor Car Co., with a capital of $600,000, made a net profit of $474,545. Rudge-Whitworth, Ltd., made $102,915, which is $22,580 less than the previous year. The Rover Co., which builds motor cycles and a 12-horsepower car selling for $1,750, shows a net profit of $588,120, which is almost as much as the total earnings of the company for the previous 10 years, and out of which a dividend of 40 per cent. was paid. The Birmingham Small Arms Co., makers of the B. S. A. car and which also produces bicycles and firearms, earned no less than $937,605, which is more than was earned in any previous year except 1911, when the amount reached the large figure of $1,164,090. The earnings of the Singer Co., though but $45,820, were $33,590 in excess of the earnings of the previous year.

Detroit S. A. E. Discusses Electric Shift.

What may be termed "an electric gear shifting evening" constituted the regular November meeting of the Detroit Section of the Society of Automobile Engineers, three papers on the subject being presented. The principal paper of the evening was read by Frank N. Nutt, chief engineer of the Haynes Automobile Co., of Kokomo, Ind., and was entitled "The Application of the Electric Gear Shift on the Haynes Car." The other two papers were presented by W. A. McCarrell, chief engineer of the Vulcan Motor Devices Co., of Philadelphia, Pa., and C. R. Underhill, chief electrical engineer of the Acme Wire Co., of New Haven, Conn., and were entitled, respectively, "A Specific Type of Electric Gear Shifter" and "Electro-Magnets and Their Application to Gear Shifting."

FIRST HONORS FOR NEWKIRK ON EL PASO-PHOENIX COURSE

Simplex Pilot Averages Nearly 33 Miles an Hour and Leads Home Nine Survivors — Ten Cars Wrecked in Trying Contest.

It was over a mighty rough and mighty tough 517-mile course that J. J. Newkirk steered his Simplex car to victory in the El Paso (Tex.) to Phoenix (Ariz.) road race on Wednesday and Thursday last, 5th and 6th inst.; he led in only nine of the 21 who started; the other 12 fell by the wayside—and some of them fell by the way, for on some parts of the course there wasn't any side at all; it was just plain mesa, as they say in the cactus country. But as rough as the course was, Newkirk covered it at the rate of 32.84 miles an hour, finishing the long grind in 17 hours and 10 minutes. Nearly an hour and a half later, J. R. Johnston followed Newkirk home at the wheel of a Stutz, his elapsed time being 18:39. The order of finish and the times of the nine that survived the strenuous going are as follows:

Driver and car.	Time.
J. J. Newkirk, Simplex	17:10
J. R. Johnson, Stutz	18:39
M. L. Naquin, Velie	19:17
P. C. Brena, Brena	19:26
Chas. G. Miller, Mitchell	20:24
C. P. Henry, Cadillac	21:03
Oliver Creech, Buick	22:12
T. W. Smith, Buick	23:05
Charles Corbett, Cadillac	——

Though Newkirk deserves no small amount of credit for winning the race, quite as remarkable in a different sort of a way was the performance of Johnston and his Stutz. The car he drove was the one that was wrecked in practice a few days prior to the start; Jack Forest was practicing with it at the time and he was killed when the car overturned. Despite the handicap, however, the car was practically rebuilt and was late at the starting line.

Just what some of the drivers had to put up with in the long grind is well exemplified by the experience of Naquin, who rolled into third place with a Velie after troubles that would have put most other drivers out for good and all. Naquin reached Bisbee in good time—in fact, between El Paso and that place he made the best time of them all. But 11 miles outside of Bisbee the car skidded into a great boulder and smashed a rear wheel. Nothing daunted, Naquin walked back to Bisbee, secured a new wheel, footed it back to the car, but the wheel in place and drove to Phoenix in time to get third money.

Just as the sun was peeping over the horizon, Oliver Creech, at the wheel of a Buick "40," started the procession to Phoenix, and at 10 minute intervals the other 20 starters were sent along after him, the order of start being as follows:

Oliver Creech, Buick; J. R. Johnston, Stutz; John Hutchins, Buick; Tony Workman, Chalmers; J. K. Van Harlingen, Buick; M. L. Naquin, Velie; M. L. Miller, Buick; J. J. Newkirk, Simplex; William Adolph, Chalmers; Edward Steffels, Mercer; Chas. G. Miller, Mitchell; R. H. Clark, Brena; Chas. Corbett, Cadillac; Pete Thompson, Thomas; Chas. Switzer, Buick; G. D. Evans, Ford; J. H. Jack, Reo; Abe Aguilar, Hupmobile; C. P. Henry, Cadillac; A. C. Fallis, Studebaker; H. N. Reno, Chadwick.

Neither H. N. Reno (Chadwick) nor J. H. Jack (Reo) got very far away from the starting line; both of them quit before the others had reached Lordsberg, the first sizable town on the route. At Lordsberg, W. J. Rand (Chalmers) was wrecked and quit almost immediately afterward; Aquilar (Hupmobile) and Switzer (Buick) followed suit. The rest of the starters got to Douglas, where W. L. Miller (Buick) withdrew because of the terrible roads. At Rodeo, New Mexico, Tony Workman (Chalmers) slewed his car into a ditch, leaving only 14 of the original 21 starters to continue on to Bisbee, the night control.

It was not until Tucson was reached that the list of starters was further thinned, Hutchins, who was wrecked at Florence, quitting at that place. Nick Depeder (Mercer), too, quit at Tucson. Pete Thompson, at the wheel of a Thomas, was wrecked just after leaving Tucson, and the same fate overtook Fallis and his Studebaker. Of the others Corbett (Cadillac) arrived at Tucson very late and, though his time was not taken either there or at the finish, he covered the whole 517 miles.

New York Dealers' Contest Postponed.

Because of the time necessary to formulate a new set of rules to govern the contest, the reliability run, which was to have been started by the Motor Dealers' Contest Association of New York City starting November 12 and ending November 14, has been postponed until December 3, 4 and 5. Under the new rules, which were drawn up by David Beecroft, George Robertson and Emanuel Lascaris, even the accessories on a car are taken into consideration and penalties charged for derangements at the conclusion of the run or for work done on them during the run; the clock will be the only accessory that can be tampered with without penalization. The run itself is to be styled "500 Miles New York Reliability Run" and will take the motorists over Long Island roads the first day, into Westchester and Connecticut the second day and to Poughkeepsie, N. Y., and return the third day. At the end of each day's run the cars will be garaged under watchful eyes in New York. The entry list is in charge of Geo. H. Robertson of the Auto Supply Co., Broadway and 59th street, New York.

Investigate a Justice of the Peace.

Justices of the peace have been known to give automobile owners a bad half hour, but the case is reversed in Melrose Park, a suburb of Chicago, where Justice of the Peace Charles S. Bell is the man "who should worry" and, according to latest accounts, is having far from a pleasant time. He is the object of charges brought in the Cook County court by several automobile owners who have taken exception to the "judge's" way of doling out the law.

He has entered a denial to the numerous charges, one of which is that he discriminated between those who were wealthy and those who drove lower-powered and less costly cars and often "fixed it" so the rich man got off easier than the poor man. As an instance of his integrity, he testified that one Gregory asked him to fix a bail bond that could be forfeited, so the defendant would not have to return to court, but this suggestion met with a flat refusal.

Mrs. T. C. Wawter is one of the witnesses against him. She claims that her husband was haled before "his honor" and that, like a dutiful wife, she attempted to follow into court and attend the hearing. She claims that while so attempting she was pushed off the court house steps by one of Justice Bell's satellites and was humiliated and injured by her treatment.

Constable Henry Pine and Elmer Osenbaugh, the officers complained of, have been held for the grand jury in $500 bonds. A claim that there is a conspiracy against Justice Bell is being investigated.

Now Wants "Cowcatchers" on Cars.

Detroit having passed an ordinance requiring the use of fenders or "cowcatchers" on trucks, what was to have been expected has occurred. At least one of the truck manufacturers has petitioned the city council to require the use of similar devices on pleasure cars. The man who made this move is Frederick K. Parke, vice-president and general manager of the Universal Truck Co., who, in his petition, asserts that more than two-thirds of the automobile accidents are caused by pleasure cars.

Quaker City Economy Run Abandoned.

The Quaker City Motor Club's proposed economy contest, which was to have been started from Philadelphia, Pa., on Friday last, 7th inst., and continued through the next day, has been called off. Lack of enteries is given as the reason.

WIDE MERCHA In the MOTO

GETTING CASH FOR REPAIRS

Dealer-Garageman Finds Motor World's Suggestion Valuable — Some Trouble Breaking from Old System But Change Helped Business.

A dealer and garageman who states rather proudly that he is a regular reader and student of Motor World gives this publication credit for a suggestion which has revolutionized the financial end of his repair business.

"The article in question was one which suggested that the time to get the money for a repair job was when the job was completed and delivered to a customer. It stated that the largest part of most repair jobs was labor and as labor was always cash it ought to be easy to get it. That put a new idea in my head. It gave me the courage to put into force a plan to get the cash. And I get it.

"I started by putting up a sign in the repair department that read, 'All Repair Jobs Cash. No work will be allowed out of the shop until paid for. There are no exceptions to this rule.'

Most of the "Kickers" Won Over.

"Naturally I had some kicks. Many people had been doing business with me for some time and had always enjoyed credit. They felt as if they ought to be excepted. But a few minutes' talk with them quickly showed them the justice of my position.

"One of the most striking examples of how the plan works is the case of a young business man who has dealt with me for a matter of three years. He has always been slow pay. He paid his bills, but he took his own sweet time about it. He brought his car in for about $50 worth of work and left it without noticing the sign. When he came after his car the man in charge would not release it until his check was forthcoming. He was mad. He did not think that was the way to treat a regular customer. His attention was called to the sign which had been put some weeks before and which bore a date—and he wilted and passed his check across without any further conversation. He has since told me that it jarred him a whole lot, but he paid and has paid cash ever since. I really think he has a whole lot more respect for us.

"Has the plan hurt our business? Not a particle. In fact, the effect has been just the opposite. We ourselves have grown more businesslike. It has absolutely done away with bad debts; for the same rule applies to supplies and we lose no time collecting, making out statements, etc. We guarantee all our work. If it does not turn out satisfactory we want it brought back so we can fix it right."

Incidentally, this dealer admitted that his "kicky" customers had decreased almost to the vanishing point. If there was any question about a charge it was settled then and there, leaving nothing to rankle in the customer's mind.

HAD THE WILL, FOUND THE WAY TO MAKE A TRUCK SALE RECORD

The sale of seven 1,500-pound trucks in two days by one man shows what concentration and intelligent effort will do in a season when some are complaining of quietness.

Omer Thomas of Kokomo, Ind., made this record in the sale of Buick trucks.

For three weeks after he decided to take on the truck line he wrote every prospect in the vicinity a letter once a week and sent them some kind of literature about Buick trucks. The last piece was a catalog that gave full information.

The final letter to the prospect told just what hour Mr. Thomas would be glad to demonstrate the truck and how long. The acceptance of this suggestion by the merchant addressed indicated the livest kind of interest. Demonstrations were made on schedule time exactly as agreed. How the plan worked is indicated by the results.

One truck was sold to a feed merchant, three to grocers, one to a stove manufacturer and two were purchased by a transfer company.

DEAD STORAGE AND THE OPPORTUNITIES IT AFFORDS

"Dead storage" at a regular rate is a profitable end of the garage business. Many garages depend almost entirely upon this end of the business to meet their overhead during the winter months. Certainly it is not to be sneezed at. And the garage that makes a specialty of it and places its customers' cars on jacks that take all the weight off the tires; that covers the touring car with canvas or at least goes to the trouble of carefully covering the seats so there will be no heavy accumulation of dust when the season opens; and that shows in the many other ways that they are really interested in proper storage of the cars not only can charge a little more but will have pleased customers as well.

Very few owners are equipped to take proper care of their cars in winter—and a warm, clean garage that is properly looked after makes a strong appeal to them.

Beforehand Planning Means Efficiency.

"The detailed planning of each and every operation before work is put in the shop," is one of the secrets of factory efficiency. It saves many costly experiments and useless expenses. It is the basis of scientific business effort of any and all kinds. It applies to salesmanship. It applies to office work. It applies to work in the garage and repair shop. It is worth thinking over—worth acting on.

Someone—it doesn't matter who—said "One good idea put into effect is worth a million that have no outlet in acts."

AWAKE-N DISING WORLD

MAKE MAILS DO DOUBLE DUTY

The Two-Cent Stamp Might Just as Well Help Boost for the Sender's Business—Suggestion for Circular on Coming Winter Weather.

Use the mails for something more than the carrying of your bills, statements and correspondence. The average letter or statement could easily take along a circular with it—and it does not lessen the effect of the statement or bill or letter one iota.

Suppose you wish to push cold weather supplies—why not get out a circular about them? Make it short and to the point. Print it on first-class paper and on both sides. Have it set up neatly and simply. A heading of one or two words could lead interestingly into the subject and then, after a concise introduction it would be good business to quote articles and prices.

For example, here is a concrete suggestion:

COLD WEATHER SUPPLIES FOR MOTORISTS

Half the enjoyment of winter driving is in being prepared for it. Your car requires a little bit different care in the weather that is coming. Anti-freezing solutions, hood-covers, and oil and grease designed expressly for perfect lubrication on the coldest day all contribute to the pleasurable use of your car in cold weather.

If you don't know exactly what you ought to use, ask us. If you do know "what's what" for winter driving, drive right in and let us prove that we have it.

An ounce of prevention is worth a pound of cure—and this applies particularly to the care of your motor and running gear in cold weather.

Wideawake Motor Co.

This side of the folder has suggested to the motorist possible needs; now let the other side tell him what you can do for him. It might contain this:

COMFORTS FOR COLD MOTORS.

Anti-Freezing Solution:

Let us fill your radiator with our special solution, guaranteed in the coldest weather. Takes only a few moments to drive in and get filled up.....Per gal 0.00

Hood Covers.

Sizes for all motors. We make these to order. Leave your measurements and the cover will be ready within a few days. Your motor will run better—and you will thank us a thousand times for suggesting one. Prices range from $00 to $000, according to size and quality.

Non-Freezing Oils.

Oil that lubricates freely in warm weather may not be satisfactory on frigid days. Don't take chances. Get our recommendations.

Cold Weather Greases.

Dope that flows all right in July and August won't do the work in December. You need something lighter and more flexible. Our experience is at your service. Talk it over with us.

The list could be made shorter or longer. This is only a suggested circular. You may have better ideas. But at least do something to swing the trade your way and sell more goods.

NO MAN IS EVER TOO BUSY TO READ THINGS THAT HELP HIM

That he who runs may read is an almost worn-out adage and to give it a new twist and prolong its use it may be modified to say that so far as business efficiency is concerned "he who reads will run the fastest." Motor World has frequently emphasized this point, and now Printers' Ink aims a shaft at the man who is "too busy to read."

"He is a familiar type—the fussy, fretful man who imagines that he is about the busiest fellow in town," it says. "He often dumps in the waste-basket, unopened, copies of business or technical magazines that contain valuable articles bearing directly on his problems. He fondly believes that he is too busy practising to bother with what others are 'preaching.'

"The trouble with this type of man is that he has not learned that the real executive is the man who so plans his work as to leave a reasonable amount of time for reading and planning.

"There are shoals and breakers ahead when the accumulation of new ideas ceases.

"The man who declares he has no time to read is unconsciously advertising his small caliber, his slavery to detail, his arrested development."

PLACING THE SERVICE MANAGER WHERE HE CATCHES THE EYE

A firm of Western automobile dealers who are conspicuous for their leadership in merchandising methods have added to their service department a "service manager." His desk is placed near the door and he is the first person one meets on coming into their place of business.

The customer who wants any kind of service goes right to this man and does not at any part of the transaction come into contact with the mechanics.

"Instead of meeting a mechanic, our customers meet a well dressed, well informed diplomat. We place him near the door to emphasize the fact that we consider service one of the foremost points of our business. Incidentally, this plan brings customers straight to the man who can take care of them and relieves our salesmen entirely from details of this sort."

It is a good idea and one that is sure to be adopted by many other dealers.

CALIFORNIA CARBURETTER HANDLES THREE-CENT FUEL

Also Distillate, Kerosene and Gasolene —Has no Automatic Valves and Only Three Moving Parts— Bowden Wire Control.

They are particularly strong for heavy liquid fuels out in California, for the proximity of big oil-fields and the low prices at which low-grade hydrocarbons can be purchased act as stimulants to those who have ideas as to carburetter design and ability in their construction. It is quite in the natural order of things, therefore, that California should be the home of a carburetter that is credited with the ability to properly vaporize and convert into an economical fuel such things as oil toppings, having a Beaume test of 41.6 and costing 3 cents per gallon in small lots; No. 1 distillate, which can be bought for 6½ cents per gallon; No. 2 and No. 3 distillate, which are heavier and cheaper grades; kerosene; kerosene and distillate mixtures; gasolene and kerosene mixtures; and just plain gasolene. A motor that developed 84.1 horsepower at 1,800 revolutions per minute burning gasolene developed 81.9 horsepower on distillate, 75.3 horsepower on kerosene and 76.4 horsepower on oil toppings, the speed in all the tests being the same.

The carburetter is styled the Master carburetter and is manufactured by the Master Carburetter Co., of 922 So. Los Angeles street, Los Angeles, Cal.; the company was incorporated in April last, has a factory at Los Angeles, and will later establish factories in the East and in Europe, according to present plans. Two types of carburetter are made—one for gasolene and the other for heavier fuels; the two are identical, however, the only difference being that in the heavy fuel carburetter it is necessary to make use of heated air exclusively, and therefore a large air heater or hood for the engine exhaust pipe is a conspicuous feature. The gasolene model has a much smaller hot air attachment. An adjustable shutter in the hot-air hood of the heavy fuel carburetter permits the admission of cold air to regulate the heat.

Both oil and air are positively regulated in the Master carburetter. The oil is fed in the mixing chamber through a series of minute holes in the fuel distributer, which extends entirely across the passage, and these holes are successively uncovered by the rotary throttle which at the same time opens the air passage; there is no butterfly throttle. When the throttle is fully open there is a very free passage and a minimum of friction. The throttle is operated by a Bowden wire control. Clogging of the fine openings in the fuel distributer is prevented by a wire mesh screen in the float chamber; the mesh is of such size that any particles that pass through the screen can also pass through the holes in the distributer. There is a sediment cup under the float chamber, from which foreign matter can be drained in the usual way.

COMPONENTS OF MASTER CARBURETTER WHICH HANDLES HEAVY FUELS

There are but three moving parts—the rotary throttle, the air damper and the float action. The simplicity of the carburetter is such that anyone, it is stated, can take it apart and put it together again without difficulty and without danger of having a pile of parts left over. There are no springs or automatic valves. All parts are interchangeable.

With reference to the lowest grade of fuel used by the Master carburetter—oil toppings—it may be said that it is the first product of crude oil distillation. Distillation of the oil toppings produces gasolene and the three distillates, Nos. 1, 2, and 3. It is clear, therefore, that the toppings contains much volatile matter, and experience has indicated that it makes a good fuel provided it can be handled in the carburetter.

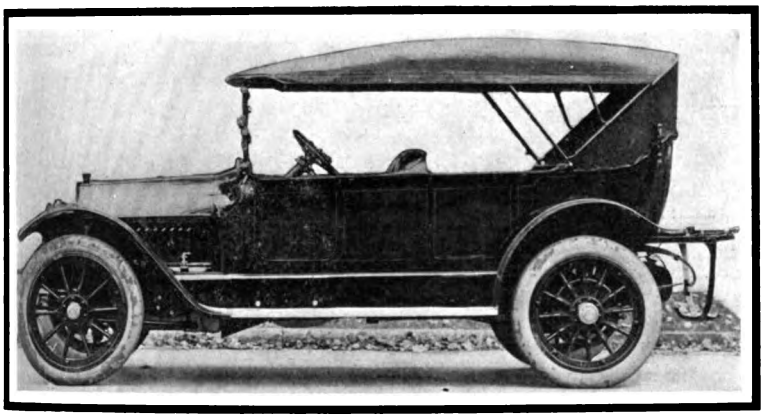
CARRYING SERVICE TO THE OWNER ONE DEALER'S PLAN

Ohio Man Carries Stock of Ford Parts in His Demonstrator—Also Labels His Demonstrator so Everyone Will Know It.

Giving service to the owner when he comes after it is one thing; carrying service to him before he has asked for it is something different. But it is not impracticable, according to Ira M. Crowther, of Willoughby, O., a dealer in Ford cars. Crowther has evolved a plan whereby he makes of himself and his demonstrating car a sort of traveling service station for the owners in his territory, and he describes his scheme in the Ford Times for the benefit of other dealers. Crowther proposes that each Ford dealer carry in his demonstrating machine about $50 or $60 worth of small parts and sell them to Ford owners right from the machine.

"He suggests," says the publication, "that each agent distinguish his demonstrator from other machines by placing a winged pyramid sign on the lower half of its windshield.

"The following list of small parts, totaling approximately $65 in value, can be carried in a box under the rear seat:



"Differential gear, 24 teeth; differential pinion, 12 teeth; diameter of bushing, ⅝ inch; D/S pinion, spindle, stationary cone, inside; spindle adjusting cone, right thread; spindle adjusting cone, left thread; spindle oiler, outer race, small; front hub, inner race, large; front hub outer ball retainer; front hub inner ball retainer; front hub large ball, ½ inch; front hub small ball, ⅜ inch; rear hub key for tapered axle; cylinder head outlet hose, 3¼ x 2 inside; spark plug wire, cylinder No. 1, 15½ inches long; spark plug wire, cylinder No. 2, 12½ inches long; spark plug wire, cylinder No. 3, 8 inches long; spark plug wire, cylinder No. 4, 8¾ inches long; commutator wire with loom; cylinder head bolt L socket wrench; starting crank ratchet pin; carburetter Kingston; vibrator with plat point; vibrator spring with plat point; vibrator bridge with plat point; rear axle shaft, tapered; cylinder head outlet hose clip; piston ring; connecting rod; spark plugs; hub caps; crank shaft rear bearing cap; crank shaft front bearing cap; crank shaft center bearing cap; exhaust and inlet valves; push rod; breather pipe, brass, 1¼ inches long; commutator only; commutator brush assembly; front spring, specify color; front spring perch bushing; radiator outlet connecting hose, 1¾ x 2¾; radiator outlet connecting hose clip; fan belt.

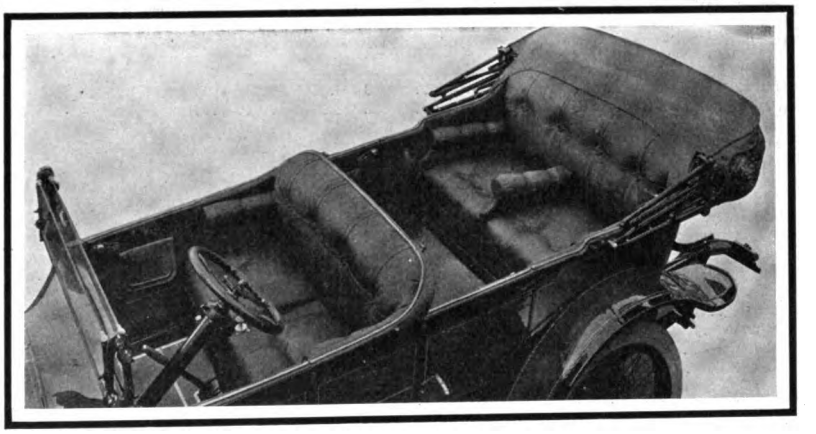
TWO IMPROVED BODY TYPES FOR STEARNS-KNIGHT CARS

Straight, Unbroken Top Lines and Untufted Upholstery Features of Latest Designs—Extra Seats that Fold Out of Way.

Building a good chassis with a powerful, smooth-running and reliable motor is not all there is to automobile manufacturing in these days, and none there be that appreciate the fact more thoroughly than does the F. B. Stearns Co., of Cleveland, O. The slight changes made in the Stearns-Knight chasses were described in Motor World for July 31, as were the principal features of the standard body types. Since then, however, the body question has been given much more than the usual amount of consideration, and as the direct result of the visit of one of the Stearns officials to European plants and to the plant of the body-builder, Van den Plas in particular, two new Stearns-Knight bodies now have been brought forth. The new bodies are mounted on the four- and six-cylinder chasses, and are touring bodies carrying four and six passengers, respectively; either body can be mounted on either chassis.

NEW BODY ON STEARNS-KNIGHT CHASSIS SHOWING "ONE-MAN" TOP



So far as outward appearances are concerned, the two bodies differ only in such matters as length, the lines being the same throughout. The attractiveness of the new designs is in their simplicity and the cleanness of the lines. The top line of the body is unbroken by projecting upholstery. The cowl is low and the body top line is little, if any, higher than the top of the motor hood, which is straight on the six-cylinder car and slightly tapered on the four. The doors are flush, of course, and there is not a single feature of the car that is individually conspicuous—a result that is not so easily obtained as many persons imagine.

Inside the body there are several innovations that have been introduced not merely because they are innovations, but because they enhance comfort, or convenience, or something equally tangible. The seats, which are rather low, have backs that are sufficiently high for comfort but which project less than usual above the top line of the body. While the upholstery is carried up over the edge of the seat-back in the usual way, the fact that it is perfectly smooth helps to give the effect of an unbrroken top line. This matter of upholstery has been given an unusual treatment in the new Stearns bodies. It is of smooth, dull-finished leather and there is an absence of the usual buttons and tufting. The monotony of perfectly plain, smooth surfaces is broken, however, by narrow bands of the same dull leather crossing the seats and backs laterally, two bands to each surface. To the lateral bands are attached other bands of the same material extending in the opposite direction, the effect being that of crossed bands with little squares of leather and buttons at the intersecting points.

Even more unusual is the treatment given the arm rests. The usual type of arm rest is replaced by a soft, large leather roll of the type not infrequently seen on large leather arm chairs. The rear seat, which accommodates two passengers, is divided in the middle and the partition is topped by one of the roll cushions, in addition to those at the outer sides of the seats. The arm rests are well below the top line of the body, and at a comfortable height for easy position.

The four-passenger body, of course, has no auxiliary seats; but in the six-passenger body there are two which, when not in use, fold down flat into the front corner of the tonneau. The seat and its support are, of course, at right angles and are rigidly built together; the back is hinged to the seat. When the seat is to be folded away the back is turned down and the seat is tipped forward. The support section drops into a recess in the floor, which it exactly fills so as to form a level surface, while the seat fits a recess in the back of the front seat and is covered by a leather flap. The seats are easily folded and unfolded and are unusually substantial.

Each of the new models is equipped with a top that can be raised and lowered easily by one man, the top swinging overhead, without dragging on any part of the body, and attaching by special ball-and-socket fasteners to the top of the windshield. The side curtains are rolled when not in use and hung across the top from the bows, where they are easily and quickly reached when wanted. Besides the top, the usual fittings are included, of course, such as robe and foot rails, receptacles for odds and ends, and other conveniences.

INTERIOR OF BODY SHOWING CUSHIONS AND ARM RESTS

Ford Drops Speedometers and $6.

Temporarily, at least, the Ford Motor Co. has eliminated speedometers from the equipment of its car. Because of the fact, it is making an allowance of $6 on each car shipped without one.

NEW YORK MOTOR BUSES HAVE PROSPEROUS YEAR

Annual Report Shows $130,351 Profit Applied to Corporate Deficit—'Buses Increased by 24—Passengers by 2½ Millions.

How much it costs to operate a big 'bus company is made plain in the annual report of the Fifth Avenue Coach Co., owned and controlled by the New York Transportation Co., which about a year ago disposed of its taxicab business, lock, stock and barrel, to the Yellow Taxicab Co. and which now centers its whole activities on the only 'bus line in New York City; the report just has been filed with the Public Service Commission for the First District and is for the year ending June 30, 1913. The figures are particularly interesting, as the number of 'buses has been greatly increased, nearly all of those now in use being of the most modern types.

According to the report, the net profit for the year amounted to $130,351.67, which is an increase of $63,163.02 over the previous year. The amount has been applied to decrease the corporate deficit, which now stands at $286,057.23 instead of $416,997.82, which was the case last year. During the year the number of 'buses in use was increased from 81 to 105 by the addition of 24 vehicles, an increase in the total revenue from operation resulting as a matter of course.

During the year 8,884,534 passengers were carried at 10 cents each, the number representing an increase of 2,545,462 over those carried the previous year. Figuring the income from passengers at the rate of 40.97 cents per 'bus mile, the total amount of fares increased by $254,546.20, to $888,453.40; the total revenue from operation amounted to $935,668.33, which is $260,221.31 more than it was last year. As against these figures, the operating expenses amounted to $716,520.71, or an increase of $162,605.32. Included in the operating expenses are the salaries and wages paid 115 conductors, 133 drivers and 189 others, making a total of 437 who received $354,288.25, an increase of $115,981.97 over 1912.

The statement of the condition of the company reveals that the total floating capital, represented by bills and accounts receivable, materials and supplies is $275,991.01, an increase over 1912 of $92,597.36.

The 105 'buses are appraised at $538,43[illegible] which with shop and material equipm[illegible] office furniture and fixtures, real estate, ganization, and other assets, brin[illegible] the t[illegible] assets up to $899,512.20, which is an [illegible]th crease of $74,938.28. The largest si[illegible] amount in the liabilities statement is $4[illegible] 130.41, which is due associated compa[illegible] for working advances and represents a [illegible] crease of $15,337.40 for the same amount 1912.

The reserve for injuries and damages life and property has been put at $142,941 an increase over 1912 of $48,005.60. In respect, it is pointed out that charges damages and injuries are made monthly the basis of 2.7 cents per 'bus mile for juries to persons and 3 cents for damage property. Up to June 30, 1912, there w[illegible] 45 claims and suits for damages; of 85 t[illegible] were brought during the year, 83 were d[illegible] posed of and at June of this year 47 w[illegible] pending. Another interesting feature of t[illegible] report is the amount that has been charg[illegible] off for depreciation of rolling stock—$[illegible] 959.97, or a decrease of $16,565.28. The d[illegible] preciation is charged off monthly at the ra[illegible] of 1/36th of the total cost.

The figures of the statement are given i[illegible] detail in the subjoined table.

Assets.	1913	Year's Increase or (D) Decrease
Cash	$190,487.04	$55,605.56
Bills receivable	539.75	.....
Accounts receivable	6,970.75	2,441.48
Materials and supplies	77,993.47	34,550.32
Total floating capital	$275,991.01	$92,597.36
Motor 'buses	$538,434.49	$122,747.82
Shop and miscellaneous equipment	33,678.96	6,653.04
Office furniture and fixtures	3,541.94	3,170.04
Organization	25,105.27	.....
Real estate ($69,025.41, less mortgage, $20,000)	(f) 49,025.41	.....
Shops and carhouses (garage)	42,307.05	.....

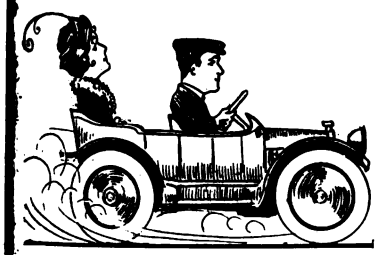
VER-DEMONSTRATING AS A LOSS TO THE DEALER

ore than One or Two Demonstrations Unnecessary and Serve to Increase Expenses—Reilly Explains to Sales Manager Why a Haughty Lady Became Angry—Says She Wanted "Free Livery Service."

"Sailing, sailing——" hummed Reilly. o to it, old top! Kid her along; she likes he added with emphasis, as he looked t the window at a touring car which was ssing.



"Kid whom? What do you mean?" in- ired the Sales Manager, who felt that hen Reilly began his enigmatical conver- tion the only way to secure the key to the nation was to ask questions.

Someone Writes Letter About Reilly.

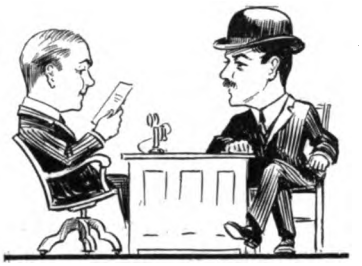
"Kid whom?" Reilly repeated the ques- on. "Mrs. Everett Mannerman Smith," id he, answering his own inquiry.

"Friend of yours?"

"She tried to make me think so once— nd I did think so for awhile," explained eilly, "but she thinks she is on my black list now and she won't even so much as look this way when she goes by."

"SHE WON'T EVEN LOOK THIS WAY WHEN SHE GOES BY," SAID REILLY

"What did the poor girl do?" sympa- thized the Sales Manager. Then he began fumbling in his pocket and exclaimed, "Mannerman! Everett! Smith! Let's see —Here it is! She wrote us a letter about you last week. I've been going to show it to you. Oh! What I know about you!" he taunted as he unfolded a letter and smiled as he scrutinized its contents.



"It's all true; it's all true," replied Reil- ly. "Anything Mrs. Evergreen Smythe says about me is strictly O. K."

"Then you plead guilty?"

"Absolutely."

"Read the letter."

Reilly smiled cynically as he ran through the manuscript handed him by the Sales Manager. It was on a very refined sample of private correspondence paper which bore a monogram embossed in what looked like real gold; maybe it was. The hand-

"AG-G-H! SHE WANTS FREE LIVERY SERVICE, NOT A DEMONSTRATION"

writing was neat, and every line started with exactness at the same distance from the left-hand side of the sheet. For looks it couldn't be beaten. As to contents, it was intended by Mrs. Smith to put a crimp in the hide of that man Reilly that would bring him to a proper realization of the position of Mrs. Everett Mannerman Smith.

Whether she had already picked out a man to succeed to the Reilly business she did not state, but Reilly gathered from the tone of her letter that since he was such an unfit specimen of dealer he must necessarily be short-lived in that community.

"Well?" demanded the Sales Manager when Reilly handed the letter back, still smiling.

"I suppose you'll have to get a new dealer," solemnly answered Reilly.

"Why wouldn't you give her a demonstration?" asked the Sales Manager, referring to the complaint made by the writer of the letter.

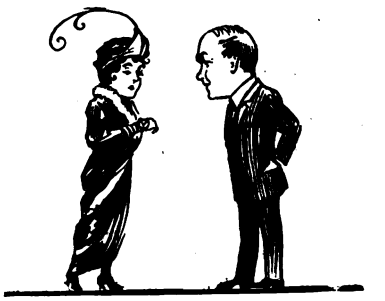
Free Livery Service Not Demonstration.

"Ag-g-h-h!" grunted the dealer. "She doesn't want a demonstration; she wants free livery service."

"Did you give her a demonstration?"

For answer Reilly walked over to the prospect filing cabinet and returned with a card which was dedicated to the woman in question. The Sales Manager looked it over.

"Three demonstrations! The old crab! And she said you wouldn't give her a demonstration!"



"She's quite right," asserted Reilly, "but she apparently forgot to state that the demonstration to which she referred was her fourth. And at that, she got more than ordinary prospects get, but there is a limit to everything."

"What happened, anyway?"

"Oh, it all comes back to whether a dealer wants to sink all the profits of his business in demonstrating," replied Reilly. "Once upon a time I didn't regard demonstrating in that light, but I don't do as much of it as I used to, and I'm doing more now than I hope to be doing in the future.

The Attempt to Sell Mrs. Smith a Car.

"When we dug up the Smiths as prospects we learned that the car we sold would have to be passed upon by Mrs. Smith, wherefore we devoted our time to that side of the household. We had no difficulty with the deal and thought we were progressing quite well with the esteemed lady. It finally

"SHE LOOKED AT HER WATCH AND SAID SHE WOULD HAVE TO HURRY"

came to a time when we thought it advisable to give her a demonstration and she got a fine young ride around town in the car.

"Then she dropped in one day to ask some question or other about the deal and while here dropped the hint that she was on her way to keep an engagement downtown. Suddenly she looked at her watch and remarked that she would have to hurry or she would be late. What could we do? The only businesslike and gentlemanly thing to do was to volunteer to take her down there in the demonstrator to be sure she would get there on time.

"She seemed very grateful for that trip and we thought she would come across all right with an order, but a few days after that she called up and asked us point blank if we would care to take her downtown while she did a few errands. Throughout

Digitized by Google

all these trips she managed to ask intelligent questions about the car, and while we didn't like the idea of running a free livery for her benefit, we gave her the third ride.

"And now comes the trouble. One day about a week later she called up and asked for another ride. She seemed to think that as long as she was a prospective customer we were compelled to trundle her all over town for nothing. I didn't seem to warm up to her request, and I finally asked her if there was some particular point about the car on which she was not yet satisfied. If so, I said we would gladly endeavor to clear things up; she got real nasty about it then and tried to impress upon me the fact that she has three names and that the fact that the last one is Smith doesn't deduct any from her dignity.

Declined to Carry Her Any More.

"I finally had to tell her the truth about it, which was that we believed we had demonstrated fully the excellence of our car and could not afford to do more. I told her we believed she was satisfied with the car and that we had a model on the floor at that minute that we could let her have and that if she required a chauffeur she could engage one of our men until she could get one of her own. About that time she sat down and wrote that letter, I suppose."

"And you've lost a sale," commented the Sales Manager.

"I hope so," replied Reilly. "The truth is, we have had just about enough experience with her not to want her for an owner. She would cause more trouble, demand more free service, take longer to pay her bills and be a bigger knocker for our line than any we have thus far encountered. Anyway, I won't cart any dame like that all over town all winter and then take the chance that she will change her mind. Too many demonstrations are somewhat on the line of the old saying that familiarity breeds contempt. A prospect may be enthusiastic about a car after one or two demonstrations, but if you undertake to give him many more than that he is likely to lose his enthusiasm, no matter how good your car is."

Unlimited Demonstrations Bad Leak.

"I suspected the lady had a grouch," said the Sales Manager, as he cast an eye over the neat monogram.

"This unlimited demonstrating is one of the leaks of a dealer's business," asserted Reilly. "And it's a leak that is not suspected or discovered by many dealers. It never occurs to them to figure out what demonstrating costs. Unless a man is keeping pretty good tabs on his business he isn't likely to have this information, but

"ONE DAY SHE CALLED UP AND ASKED FOR ANOTHER RIDE"

you would be surprised to know what a nice little expense demonstrating can be."

"Probably you're right."

"I guess I ought to know. Demonstrating is only another way of cutting prices, Jim, and I will not cut prices." Reilly picked up the little iron dog on top of his desk and set him down with a bang. "You may believe that the only way to cut a price is to throw off part of the price, and you're right; but there are more ways than one of throwing off part of the price: Some dealers, who endeavor to make themselves believe they aren't cutting prices, will throw in a few accessories to make the sale or will give something else. But it's all price-cutting.

One Showing Ought to Be Sufficient.

"When you have given a man one demonstration at this day and age of the automobile world you have shown him enough as a general rule to permit him to know whether or not he wants your car. It isn't as it was in the early days when a prospect might require three or four rides so he could be sure it wasn't luck that kept the car running on the first demonstration. Any car will run to-day—provided it is worthy of being called a car—and more than one demonstration isn't a necessity."

"Don't you ever give more than one?"

"Sometimes I do," admitted Reilly, "but the times are getting fewer every year. I don't do it if I can avoid it and make a sale, and I don't do it unless I have some grounds for thinking it will do some good. The increasing dependability of cars is reducing the necessity for demonstrating to a point where any extra rides you dole out are nothing more or less than a reduction in price. You take the man's money give him a car, but along with it you him several miles of service that gained you nothing and have cost money.

"It doesn't follow necessarily that o demonstrating will put a man out of b ness, but it is a leak that it is well to s just as it is well to stop any leak. N that Mrs. Smith is sore on me she has Hadden on the string. He is the man w whom she went by just after you came He's had her out a number of times alre and if she undertakes to have her own w he likely will have her out some mo He's strong for the women, anyway; tha always been one of his failings.

"OVER-DEMONSTRATING IS PRICE-CUTTING AND I WON'T CUT PRICES!"

Applying the Rule to Coats and Shoes.

"Why, hang it, Jim! Would you ex pect a shoe dealer to demonstrate the pa of shoes you intended buying; or woul you expect to wear a suit of clothes tw or three times to see if you liked them, o a hat to see if it suited? You wouldn't ex pect it; you've been educated not to expect it, and I think it's up to us dealers to educate the public not to expect too much demonstrating. It is all right to give a man one demonstration of reasonable length but I maintain that that's enough. Some day when the glamor is entirely worn o this business maybe we won't do any at all."

"I hope—— Thank you." Reilly had reached into his desk and extracted a somewhat depleted box of cigars.

"Some day, perhaps," continued the Sales Manager, "you will be able to cut out demonstrating, but now——"

Sales Manager Wouldn't Demonstrate.

"Where'd you get that?" asked Reilly, as he watched the skill with which the Sales Manager snipped the end from the cigar the dealer had donated.

"That's just a little thing I bought the other day." The Sales Manager dangled it before Reilly's eyes. "Want to buy it?"

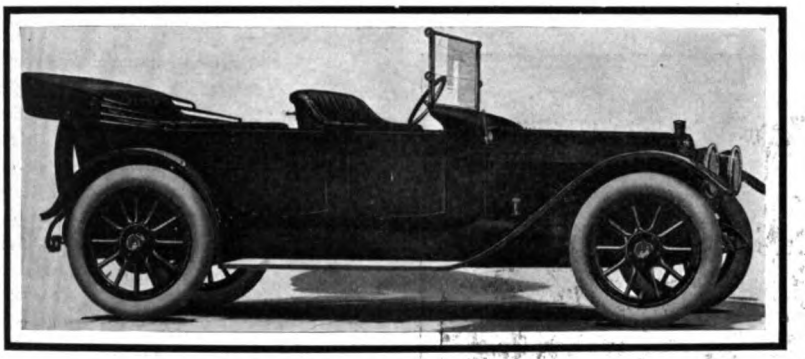
"Let's see how it works."

"Nope; we don't demonstrate." And the Sales Manager put it back in his vest pocket.

"Keep it, then!"

"All right, Mrs. Evergreen Smith," smiled the Sales Manager as he broke his non-demonstration rule.

Automobile Ideas for Carriages.



Carriage builders are not satisfied with making horse-drawn vehicles look like automobiles by the use of automobile type bodies, tops and so on, but are installing "complete electric lighting systems," including even the tail light, which goes on the vehicle, not the horse.

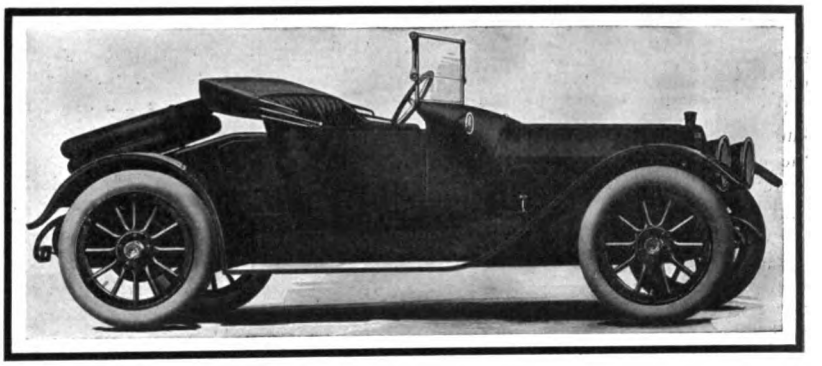
MORE POWER IN "FOURS" AND A NEW VELIE "SIX"

Older Models Improved by Larger Motors and Electric Starters—Standard Practice in New "Six" Which Sells for $2,350.

More power for its two four-cylinder models; a brand new "six" to supplement them; sundry slight alterations in mechanical construction, including a new method of attaching the Gray & Davis electric cranking system on the larger of the "fours"; specification of electric lighting and engine starting equipment on all three models; and a general improvement in body lines and fittings—these things constitute the principal changes that have been inaugurated by the Velie Motor Vehicle Co., of Moline, Ill., in its line of cars for the forthcoming season. Though the changes may be viewed as more or less extensive, judging by the slight alterations that have been made by other manufacturers, the prices remain practically unaltered. The "six," which is new all the way through, of course, lists at $2,350 with either roadster, four- or five-passenger body. The larger "four" with the same bodies lists at $2,000 and the smaller "four," which appears only as a five-passenger touring car, sells for $1,500 with complete equipment.

NEW VELIE "SIX" TOURING MODEL WHICH SELLS FOR $2,350

The changes that have been made in the motor sizes of the two four-cylinder models really are the most important alterations in the line, temporarily overlooking the new "six." In the six-cylinder car, by the way, the Velie company has departed from past practice in that it has adopted for this one model a motor which bears the Continental name plate; both the four-cylinder motors are Velie products. The smaller of the two "fours" which has been designated 5-A, instead of 4-32, by way of indicating its increased horsepower, has a block-cast motor in which the cylinders measure 4 x 5½ inches, the bore being one-quarter of an inch larger than it has been in the past. In the larger four-cylinder model, now styled 4-45, the cylinders are cast in pairs and the bore has been increased one-eighth inch to 5¼ inches; the stroke remains the same and is 4⅝ inches. The "six" has its cylinders cast in threes and the dimensions are 3¾ x 5¾ inches.



All three motors are of the L-head type and all are the same in their equipment, which includes Gray & Davis electric lighting and engine starting apparatus, Bosch dual ignition and Stromberg carburetter.

In a number of instances, chassis details also are the same. Thus, for instance, all three cars have the distinctive Velie dry disk clutch, floating rear axle, and three-quarter elliptic rear springs with the lower members underhung and left drive with center control.

The adoption of the Gray & Davis electrical system for the smaller of the two four-cylinder models has necessitated quite a little change, though the essential Velie features still remain. In the first place, the motor differs from the larger "four" in that its cylinders are in a block, which already has been made plain, and that cooling is by thermo-siphonic action. In the larger "four," the Gray & Davis starter previously was connected through a ring gear on the periphery of the flywheel, and this is the construction that has been adopted for the smaller model. In the larger one, however, this construction has been abandoned and the cranking motor drives through spur gearing to a longitudinal shaft that runs to the forward end of the engine, whence the drive is transmitted through "silent" chain and an overrunning clutch to the crankshaft. The generator portion of the system is mounted upon the forward end of the cranking motor and drives by "silent" chain from the longitudinal shaft through which the starting motor operates. The chain is enclosed and is adequately lubricated by splash from the crankcase.

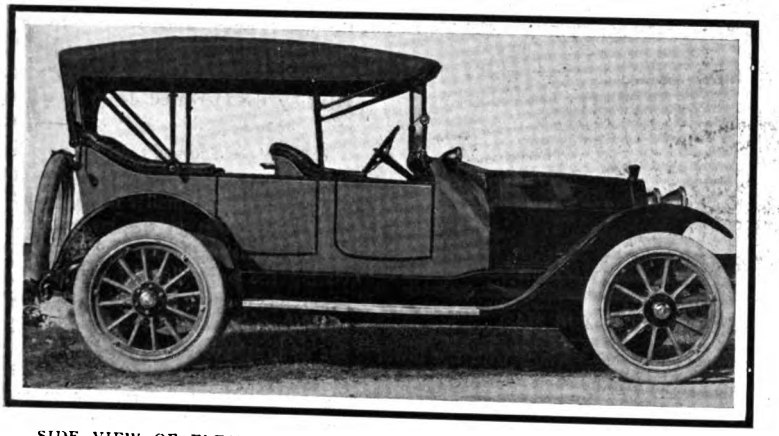
Practically the only other change that has been made in the smaller four-cylinder model concerns the fuel supply system. Instead of feeding directly to the carburetter from the main tank under the front seats, the fuel is pumped by pressure to an auxiliary half-gallon tank located under the engine hood. The change has been necessitated by the increased depth of the upholstery that is used.

Though the camshaft drive in both four-cylinder models is by "silent" chain, the arrangement in the smaller motor is quite different from that in the larger one. The drive is a triangular one and, by way of obviating the possibility of whipping in the chain, chain shoes are fitted, this ensuring quiet operation and freedom from the danger of breakage due to stretch. To permit of necessary adjustment of the chain, the magneto sprocket is carried in an eccentric bushing which makes alteration of the chain tension possible without the necessity for disturbing the magneto mounting. The motor suspension also is slightly different. The forward end of the motor is hung to the center of a cross frame member. At the rear the motor is supported on a tube which extends through the motor supports and is flexibly connected to the side frame members.

ROADSTER BODY ON VELIE "SIX" CHASSIS SHOWING LUGGAGE COMPARTMENTS

Changes in the larger "four" include the removal of the fuel tank from its former position under the front seat to a new loca-

Digitized by Google



tion adjacent to the rear axle and the incorporation of an easily cleanable fuel strainer under the engine hood. Changes in the motor are considerably more extensive and, as a matter of fact, amount virtually to a reconstruction.

Instead of being mounted at the side of the motor and driven by a longitudinal shaft, the water pump now is at the front and is at one end of a worm-driven transverse shaft with the magneto at the opposite end of the same shaft. The arrangement is such that the pump now comes on the valve side, thus facilitating the pumping of cold water first to that part of the water jackets that surrounds the valve ports. Otherwise the motor has not been changed greatly and incorporates a number of unusual features, prominent among which is the arrangement of the carburetter and the manifolds.

Reversing the usual practice, the carburetter is mounted on the opposite side of the cylinders to the intake manifold and therefore is unusually accessible. The intake manifold passes over the tops of the cylinders and is so arranged that the float chamber of the carburetter comes nearly on a level with the cylinder heads. The hot air intake from the exhaust pipe passes around the rear end of the cylinders. Another interesting feature of construction is the method of attaching water headers and manifolds. Instead of being fastened to the cylinders by means of the usual bolts and nuts, a special type of screwed coupling is used. The coupling comprises a split wedge ring which seats against the flared end of the manifold and is held in place by threaded gaskets which screw down to the cylinder castings. The arrangement provides for a gas-tight joint which is self-seating, while at the same time the joints are quite easily broken and are interchangeable.

From the motor, power is transmitted through a dry plate disk clutch and a four-speed selective gearset in which third speed is the direct drive. Motor and gearset are mounted in a sub-frame which is a channel section filled with ash. Propeller shaft drive incorporating two Spicer universals transmits the power to a Timken rear axle of the type in which the new adjustable cam-plate for the internal brake is used. Two adjustments for the brake thus are provided, one at the differential at the cross rod and the other on the outside of the brake drum. Torque is taken by a substantially trussed torque arm with ball and socket connections that are carried in spring cups.

In the new six-cylinder model, the construction is practically identical with that of the larger "four" even to the method of mounting and driving the Gray & Davis electric lighting and starting system. The motor, of course, is different, though it differs not a bit from the usual and familiar Continental design.

SIDE VIEW OF ELECTRICALLY LIGHTED AND STARTED VELIE "FOUR"

Bodies, as may be seen by the pictures, exemplify all that is modern in design and construction, straight lines, clean running boards and slightly crowned fenders being among their more important features. In the roadster model, which may be mounted on either the four- or six-cylinder chassis, the sloping rear "deck" is divided into two compartments with doors on either side; each part of the compartment is large enough to accommodate two full-sized suit cases each, so there is no lack of room for luggage. The bodies on the larger of the two "fours" and the "six" are interchangeable and may be applied to either chassis; the difference in length is in the hood of the "six."

Equipment is complete and in the roadster models is supplemented by a Tanner gasolene tank gauge. Windshields are properly built into place and the top holder is of an improved type in which a spring ratchet device operates to tighten the folds instead of loosening them when the car passes over rough roads with the usual vibration.

Cooperative Truck Service on New Lines.

In their endeavors to help owners of motor trucks to obtain the best possible results from their machines, manufacturers and agents are leaving mighty few stones unturned in searching out service plans that will increase and maintain the efficiency of their trucks. Success in this quest rebounds to the credit of the machine and its makers, as well as helping along the owner, and so there is a double incentive for the latest plan of the Federal Motor Truck Co., of Detroit.

Briefly, the idea is to establish a sort of cooperative working agreement between the various Federal branch houses and service stations, so that any Federal truck will be taken care of by any Federal station, regardless of who happened to sell that particular truck or where it might be owned. At a recent meeting of Federal dealers in New York a start was made by establishing a cooperative chain from New York to Baltimore, dealers in New York, Boston, Providence, Hartford, Bridgeport, Newark, Philadelphia, Wilmington and Baltimore having joined hands and arranged to look after each others' cars when occasion required. Incidentally, the Federal idea is to sell trucks on the basis of guaranteed operating cost; in fact, the New York company will maintain and operate a truck for a given cost and guarantee service, providing another machine if for any reason there is a lay-off, making repairs and doing everything necessary to maintain an uninterrupted service.

Studebaker Electrically Equipped Truck.

Fully alive to the possibilities of electric lighting and engine starting in the commercial vehicle field as well as in the field of pleasure cars, the Studebaker Corporation, of Detroit, Mich., is preparing to place on the market a new 1,500-pound capacity gasolene propelled delivery wagon incorporating these two features; the car is to be equipped with either panel or express body and will sell for $1,150. The new delivery wagon is built upon a special chassis differing considerably from the company's pleasure car chassis, though the Studebaker "four" motor is to be used for power. It will have a governor, however, to mitigate the evils of over-speeding. The springs are heavy and the frame is substantial. A full-floating Timken axle is another feature of the car, which is to have 34 x 4½-inch pneumatic tires. The steering wheel is placed at the left side with the control levers in the center.

REPAIR-SHOP—THE MAGNET OF GARAGE TRADE

Up-to-date Mechanical Department Regarded by New Rochelle Garageman as His Biggest Business Getter—Every Car Owner Comes There Some Day—Business Methods That Make for Efficiency.

Two Englishmen fought in Australia. One "winged" the other with his gun and got away before the other could unlimber for action.

Said the "winged" man: "The best way to get him is to go back to London and wait for him in front of Nelson's monument in Trafalgar Square; every Englishman passes there at some time." The "winged" man went back, waited six months and "got his man."

The Garageman's Nelson's Monument.

National advertisers are told that an electric sign at Broadway and 42d street is at some time seen by nearly every one in America—which may be true. But the point is that a means of advertising which at some time gets to everybody is extremely valuable.

In building a garage business the garageman very likely would like to find some way of getting in touch with every car owner in his vicinity; he would like to find something which corresponds to Nelson's monument.

It perhaps may not apply to all garages, but so far as an establishment of his size is concerned and so far as the size of the community is concerned, G. O. Reynolds, of New Rochelle, N. Y., believes he has found a "Nelson's monument." It is his repair-shop.

He regards his repair-shop as the peg on which all his business hangs; he considers it the means of providing him with an increased future business. Why? Because, no matter how good the car may be and no matter how much of a home-made mechanic the owner may be, some day he is almost certain to have to go to a good repair-shop; wherefore, the garageman with a good repair-shop has only to wait for the motorist—and some day he will "get him."

But the garageman who contemplates taking Reynold's advice would do well to remember that the "Nelson's monument" is not "a" repair-shop but "a good" repair shop. A poor repair-shop does not enter into the consideration.

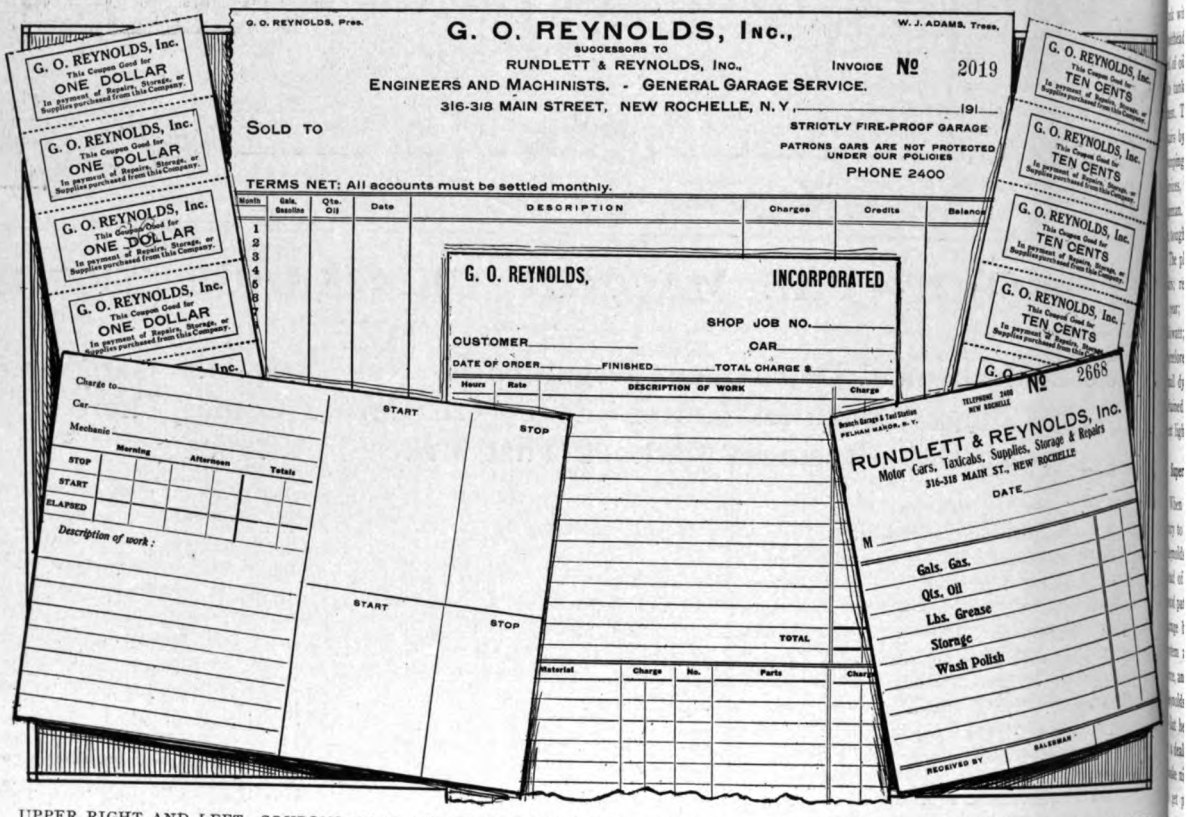
Neither is it to be inferred that "getting" the motorist means "getting the hooks into him"; what it means from the Reynolds viewpoint is a means of contact whereby the garageman is enabled to show the car owner the excellences of the garage and thereby possibly make him a patron.

Reynolds, who operates as G. O. Reynolds, Inc., in this little city, which has 30,000 inhabitants, and wherein was laid the scenes of "Forty-five Minutes from Broadway," typifies the garageman who is going to be among the "fittest" when the weeding-out process is ended. A thorough mechanical man himself, he is likewise a business man—this latter being what so many garagemen are not.

Love of Luxury Made Him Garageman.

He is a graduate of a technical school and has been on the way to his present position since 1906. At that time he had a position in New York City and bought an automobile, but repairs and supplies cost so much that it was a question of giving up the car or making more money. Reynolds was real fond of that car and disliked parting with it, so he began selling supplies near his home in Pelham to pay for his luxury. Then he rigged up a little shop to do as much of his repair work as he could and finally began doing a little for other people. It wasn't long before his little garage and supply business began to grow and the possession of that car again had its influence. He had to give up the garage and supplies or the job in New York, and if he gave up the former he couldn't keep the car, so he threw up the job and entered the garage business in earnest.

He had a partner then, and in 1908 opened a branch in New Rochelle, mostly to sell supplies. Later he bought out his partner and concentrated the whole business in New Rochelle, where his principles have caused his business to reach its present proportions. Now he has a three-story concrete garage which is so fireproof that he held a clambake on the floor several months ago to demonstrate the safety of the building, as was told in Motor World at the time.



Lathe of Extraordinary Capabilities.

His "Nelson's monument"—or repair-shop—occupies practically the entire second floor and is operated under modern efficiency methods. A sample of the plan followed is shown in a lathe which takes the place of several ordinary lathes. It can take a 36-inch wheel, will take a piece 13 feet between centers, has 15 speed changes and can turn 124 threads to the inch. The one lathe does everything.

Welding used to be a problem and was a class of work that had to be sent outside, but since this offered an opportunity for the car owner to get acquainted with some other shop a complete welding outfit was installed. Reynolds himself can do a job of oxy-acetylene welding that might well be the pride of any shop. So well known is the shop that a moving picture company sent in a cast steel piece last week to have a section welded on, indicating that the shop is known outside automobile circles. The garage has a power elevator, turntable, supply department, paint and finishing de-

partment, complete shop equipment, storage space for fifty or more cars, toilet and wash rooms, and above all some sane and efficient systems of shop and business management that mean much.

Daily Approach Manufacturing Stage.

"We are running toward the manufacturing end of the business every day," said Reynolds. "We are approaching a point where we can put up a complete car in our shop. Even now there aren't many things we can't do. We can build a wood wheel, finish it and have it on a car in 12 hours. We can do all kinds of welding, we can finish a car completely and we aim to do everything else the car owner can ask."

Having things right is a fetish; the system employed is not red tape but is intelligent and efficient. A first rule in the repair shop is that the foreman is the man who gives orders. A sign on the wall states that it makes no difference if Reynolds is in the shop; the foreman will continue to give orders. This fixes responsibility and gives progress an orderly course.

When a job comes in an estimate is made on it. This is written on an order card which provides spaces for the required items and which is illustrated herewith. When the estimate is accepted by the owner the estimate card goes to the shop foreman and automatically becomes an order. "But," said Reynolds, "since we had to have the card, why not make it an envelope?" and an envelope it is.

This envelope follows the job through the shop. The cards for the time spent on the car by the workmen are tucked into the envelope. Separate bills for supplies of any description are inserted and all the data connected with the job is stowed away in that envelope. When the job is done the bill is itemized from the data and sent to the owner. Until the bill is paid this envelope furnishes an original record of every tap of work done on the car and anyone in the office can figure up the bill at any time.

Efficiency of Special Billing Device.

That applies to special jobs of repair work. In the case of bills for regular patrons Reynolds had a special billing machine made. This has stop keys for various positions and is made to fit a large 10 x 18-inch book. If a car owner buys ten gallons of gasolene the book is opened to his page and the item typewritten in duplicate. The bills are totalled monthly and the perforated sheets torn out. Reynolds does not have a high regard for loose-leaf affairs and therefore uses the perforated leaf volume.

Coupon Book Checkmates Price-Cutting.

If a car is taken in by a transient for a wash and polish, a card on which is printed "Wash and Polish" is tied to the vehicle. "We used to write the words every time," said Reynolds. "Now all we have to do is to tie on the card. If the car belongs to a regular customer who wants his car washed only occasionally we tie a plain green tag on the front end on those nights when he wants it cleaned."

Men who want discounts encounter a clever scheme. They are asked to buy for $45 a coupon book good for $50 worth of work. This contains 10-cent and dollar tickets. Reynolds estimates that if he can get the money in advance he will very nearly break even on the discount question.

There are 21 names on the payroll, and every name means value received for the money, but not through driving of men. On

the second floor is a four-compartment oil tank with a track and hand chain hoist overhead. One workman can take a barrel of oil up to the elevator, lift it up over the tank and empty it into any compartment. The oil then runs to faucets downstairs by gravity. This saves the labor of pumping and, like many other labor-saving devices, was economically built by the garageman. It cost $21, where the same outfit bought would have cost $150.

The place is filled with penny-saving affairs; reusing the boiler water saves $200 a year; current for power costs 4 cents a kilowatt; current for lights costs 12 cents; therefore the shop shaft is hitched to a small dynamo and current for lighting is obtained at considerably less than the 12-cent lighting rate.

Supervised Building of Third Story.

When it was necessary to add a third story to the building, several months ago, Reynolds supervised the job himself. Instead of buying a flight of iron stairs, a wood pattern was sent to a foundry and the garage built its own stairs. The elevator system also was installed by the garage force, and the things that can't be done by Reynolds and his men are few.

But he is more than a garageman; he is a dealer in cars, although he doesn't lie awake nights wondering where he is going to get prospects. He is primarily a garageman and doesn't pretend to do more car selling than his garage business will stand. But at that, his car sales bear a humorous complexion. He has two salesmen, but they don't sell as many new cars as they thought they would when they began. One day one of them complained to Reynolds, "Casey has a car that he wants to sell; he doesn't seem to want to buy one of our new ones."

"If you can get the old one at a right price, buy it," responded Reynolds.

Makes Money on Used Cars.

"The salesman bought it," laughed Reynolds, "and now I guess they spend as much time hunting for used-car bargains as they do for new car prospects. I found that the used car traders in New York were picking up some fine bargains up here, so we decided to get a few ourselves. We can buy a used car, fix it up in good shape, sell it and make more money proportionately than we can on a new car. The investment is less and the profit is nearly as much as on new cars. There's a 1910 car that cost us $125; we did about $75 worth of work on it and we ought to get $400 easily for it. If we do we double our money.

"Also, there is this desirable feature of selling used cars: We don't have to give service. We sell a car and that ends the transaction. We sell about 50 cars a year and half of them are used cars that we have fixed up."

With Reynolds there is no used car problem; when it is the sale of a new car he fights shy of a bad trade, but if he can buy the used car at a good figure he would rather do that than make a poor trade. A contract form is used that will fit nearly any sale.

Tire Advice Given Customers.

Customers are given wise advice in regard to demaged tires. "We found," explained Reynolds, "that when we repaired a shoe and it blew out again and was sent to the tire company for adjustment they would say our treatment of it caused the trouble, so now we just send the shoes direct to the tire company's branch and avoid all trouble. We limit our repairing largely to inner tubes, although we have equipment for all kinds of work and can do anything.

Reynolds's business associate is W. J. Adams, who is treasurer of the company and who attends to much of the business end of the concern, thus permitting Reynolds to attend to the planning and the larger affairs of the business.

Bloomington Garagemen to Unite.

Garage proprietors in Bloomington, Ill., which has a population of 25,000, are not unlike the garagemen in other towns, in that they have grievances the remedying of which, they are convinced, will do much to increase profits and better their business; and they are not unlike their business brethren in other cities in that they have decided to form an association for mutual betterment.

One of the chief objects of the movement is the slow-pay customer, but a published description of the proposed organization reveals that the garagemen have discovered an unusually complete list of undesirable features of their trade. "The slow pay patron who keeps the garage collectors calling upon him month after month and who finally pays under threat of a suit, and who retaliates for the favor of long extended credit, by transferring his patronage elsewhere, will be placed upon a list, a copy of which will be furnished each member," says a statement of the organization's aims and objects.

"It is also desired to protect the members against various impositions which only the cooperation of all of the repair-shops can bring about. One of these is the individual who drives his car into a garage, pays no storage, borrows tools, frequently failing to return them and sometimes carrying them off and who sponges in many other ways from the shop and without paying anything for the accommodation given him.

"There is another individual who arouses the indignation of the repair-man, and, while enjoying the courtesy and hospitality of the proprietor, will take advantage of a tip heard in the garage that some patron is about to buy some supplies, by filling the order for them, and taking about one-half of the legitimate profit of the dealer, who has rent, light and heat to pay.

"Another individual who arouses the ire of the proprietor is the curbstone repair artist, who is constantly seeking the light work in the way of adjustments which can be given attention at private garages.

"It is this class of work which is most profitable to the garages, and yet they are forced to lose much of it. These and other evils which harrass the proprietors and which have been steadily growing of late years, may be remedied wholly or in part by the organization proposed. It is also hoped to put an end to cut-throat competition in various wares which legitimately belong to the garages and enable the proprietors to make some money. With warfare and ill feeling among the dealers, few can keep their receipts above their expenses and it is a daily battle to make ends meet."

First of the 1914 Calendars Appears.

As usual, first in the field with a calendar for 1914 is the National-Acme Mfg. Co., of Cleveland, builders of automatic machinery for making screws and other things that have to be turned, threaded, tapped, milled, and otherwise machined, and makers of automatic machine products. The calendar, which is sightly, to say the least, takes the form of a large envelope with two cut-outs in its face, through which the monthly calendar and a picture, which latter shows various National-Acme machines and their products, are visible. On the backs of the changeable sheets there is information of interest to users of automatic machines and their products, and order blanks which will produce still more information if turned in.

Painter Who Believes in Signs.

It is true economy, sometimes, to make things serve double purposes rather than have them stand idle part of the time. Animated by this thought, an ingenious repair-shop proprietor who goes so far as to paint the bodies of the cars he mends, made a sort of canopy for cars in process of being varnished by suspending over the car a big canvas sign that was not on duty. The sign not only kept ordinary descending dust off the fresh varnish, but also the dust and dirt dislodged from the ceiling by overhead vibration.

MOSLER TO DOMINATE SPARK PLUG BUSINESS

(Continued from page 6.)

late court, which held that a man, to patent anything, had to intend to patent it; the mere fact that his drawings show a thing does not mean that he has patented it. Prior plugs showed what Canfield patented, but the specifications did not state that the patents covered these details.

"With a deliverance of the Circuit Court of Appeals for the Seventh Circuit we fully concur," said the court. "It reads as follows: 'A patent for a mechanical combination is not anticipated by a drawing in a prior patent which incidentally shows a similar arrangement which is not essential to the first invention, and was not designed, adapted, or used to perform the function which it performs in the second invention, and where the first patent contains no suggestion of the way in which the result sought is accomplished by the second inventor.'

"Gas-Machine" Proportions Accidental.

"The prior publication especially relied upon is known as 'Die Gas-machine.' All that there is in it which is at all relevant is the following figure and description: . . . There is nothing in this description which calls for any recess at all. . . . There is nothing to show that the proportions of the drawing are other than accidental; the draughtsman would have correctly depicted 'Die Gas-machine' of the prior art if he had proportioned the parts differently, showing a recess whose depth was no greater than its width.

"The next reference to the prior art is a patent to Sansevain (U. S. No. 461,802). . . . The specification is elastic; it provides that the spaces around the posts shall be large enough to leave spaces around the posts, thus preventing contact. Such spaces might be very much larger than Fig. 4 shows and still fit into the combination of the patent. So too the thickness of the lower plate is the draughtsman's accidental selection. The specifications state merely that it is a lower plate or disk between the porcelain and a shoulder in the tube. It might just as well have been shown in the drawing as one-fourth the thickness indicated in Figure 4 and would then be all that the patent calls for.

Sainsevain Device Not Anticipation.

"Here are recesses with insulation at the bottom of them: as drawn they are much deeper than wide, but their proportions are apparently an accidental conception of the draughtsman. . . . But if its thickness were reduced, the depth of the recesses would also be reduced, and with an enlargement of the clearance spaces, the recess of Canfield would entirely disappear from the Sainsevain drawing, while the drawing would still remain a perfectly accurate picture of the description which Sainsevain gave of his invention.

"To predicate anticipation on such accidental resemblances found in drawings only would be to extend the doctrine of the Consolidated Bunging case too far.

"In Canfield's patent, however, the proportions of the recess constitute the gist of the invention. It will not be necessary to discuss in detail the other similar references to patents of the prior art. We do not find any of them in which the specifications and claims call for a recess between electrodes which enter a sparking chamber, the proportions of which recess are made a feature of the patented structure, and which will, in fact, function as does that of the Canfield patent.

Rules That Patent Taught the Art.

"It is next contended that the patent in suit taught the art nothing of value, because it did not indicate what insulating material should be used. Porcelain was well known in this art as an insulator, it was used in prior devices and is used today. Naturally it would be the material which one skilled in the art would select if he were to build a spark plug according to the instructions of the patent. Respondent's expert testifies that when made in large masses porcelain is neither electrically nor mechanically strong enough to meet the strains to which a spark plug is exposed. The patent states as we have seen that a recess for a quarter-inch diameter electrode works satisfactorily by being half-inch diameter by one and a quarter inches deep. Assuming this to be the diameter of recess shown in the drawings of the patent and using it as a scale, the witness figured out that the size of the insulators of the patent would be some 3 to 4 inches in diameter and further testified that efforts to produce porcelain insulators of that size which would stand up to their work proved a failure.

Porcelain Material Natural to Use.

"We find this evidence unpersuasive. If such large masses of porcelain did not work, the natural thing to do would be to reduce their size. The specifications do not require a slavish adherence to the proportions shown in the drawings. . . .

"If a quarter-inch electrode requires a half-inch recess, an eight-inch electrode would presumably be accommodated by a quarter-inch recess, which would reduce all other proportions by half. Moreover the patent is not restricted to two recesses, one around each electrode. The claim includes 'a recess around the electrode or electrodes.' The very 'Gasmachine' so much relied on (assuming that its casings were imperforate) shows a recess surrounding one electrode (which electrode is embedded in porcelain of apparently the small dimensions of that in the modern spark plug) while the other electrode is seated on the metal casing.

"The teaching of the patent is that there shall be a recess of proportions to trap air between the two electrodes. It seems to us that a skilled mechanic familiar with the prior art as shown in this record would have had no difficulty in securing such recess and at the same time using a porcelain insulator of a size small enough to be stable."

Holds First Claim Clearly Infringed.

Other claims than the first were not declared infringed by the court, but the one claim allowed is sufficient for the purposes of the complaining corporation.

"As to infringement," said the court, "we do not understand that there is any real contention as to infringement of the first claim. . . . All the spark plugs of defendant which are complained of have the specific recess of Canfield. It is asserted that some of them nevertheless get foul, which to us seems immaterial. Much of the briefs is devoted to a discussion as to the meaning of the second claim. It is unnecessary to consider it, since infringement of the first claim is sufficient to entitle complainant to whatever relief it may be entitled to.

Touching Upon the Point of Laches.

"It is further contended that relief should be denied the complainant because of the laches of his predecessors in title; he was prompt enough himself, but of course is affected by any laches of prior owners. The patent was granted October 18, 1898. Canfield died March 12, 1899, and the patent was held by his administrator till March 13, 1901, when it was transferred to patentee's brother, Charles J. Canfield. He assigned it December 3, 1903, to E. D. Wheeler, who on March 12, 1906, assigned to Association Patents Co., a corporation not engaged in the business of manufacturing or selling engines or spark plugs. The corporation assigned the patent to complainant March 25, 1909. Suit was begun in September, 1909.

Why Mosler Gets No Back Damages.

"Infringement began in 1901 and was continuous thereafter by various manufacturers. One company sold 50,000 of one type between 1901 and 1904 and, though no specific figures are given of sales of other infringing types, there is evidence that such were sold in large quantities on the open market and were well known to the automobile trade. There is no direct evidence that any of the successive holders of the patent prior to complainant knew of these infringing sales, none of them was examined, some were dead. There have been cases where all relief has been refused to patent owners who were negligent about enforcing their rights for a long period of time. Richardson v. Osbourne, 82 F. R. 95, affirmed by this court 93 F. R. 826. These cases have been such as presented 'unusual conditions or extraordinary circumstances'; usually with knowledge of infringement the owner of the patent has stood by and, without objection or warning, has allowed the infringer to invest his money in a plant for manufacturing infringing devices."

Having decided to grant an injunction under the first claim of the patent, the court ruled that because of the lapse of time between the issuance of the patent and the bringing of the suit no damages for past infringement should be allowed. Commenting upon this situation, it said:

"Under the principle enunciated in Menendez v Holt, 128 U. S. 523, we find nothing in the case which would call for a denial of injunctive relief, postponed perhaps for some short period, such as thirty days, so as to give defendant opportunity to arrange its business accordingly.

Easy to Have Learned Infringements.

"As to any claim for profits and damages, however, the case is peculiar. As we have seen, there is no direct proof that any of the successive owners actually knew of infringement. It is argued that they could not have known of open and notorious infringement, because they were none of them in the business of making and selling engines or spark plugs. In that respect the case is peculiar.

"Usually patents are held by persons whose business is of a sort that the patent pertains to; here the owners were not engaged in any such business. The patentee was a lumberman; his administrator was a trust company; his brother was a lumberman; Wheeler was a mechanical engineer; the Association Patents Co. was a mere holding company. None of these successive holders made any use of the patent, except that the patentee made two or three spark plugs for use in his own power pleasure boat. None of them manufactured any of these spark plugs, nor did they procure any to be manufactured, nor did they sell any, nor did they, so far as appears, make the slightest effort to induce any one engaged in the automobile industry to make such plugs on some basis of royalty.

Patent Little Valued by Past Owners.

"During this long period the successive owners treated this patent as if it were of no importance whatsoever, of no use to any one. Apparently they made no effort even to ascertain if there were any infringements of it, or to caution or warn anybody against infringement. The infringement was not an act done in a corner; had the owner taken the trouble to send a competent man to the warerooms of a few dealers in automobile supplies (of this sort) or to any of the periodical automobile shows, where manufacturers send their devices and point out their claimed advantages, there can be little doubt that infringement would have been discovered years ago. An advertisement in some of the trade papers to the effect that the owners of this patent would prosecute infringers, might have warned the trade that this patent was not, by its owners, regarded as a thing of no account, in which they took no interest. It might well be that had some such announcement have been made, infringing manufacturers would long ago have modified their devices so as to avoid infringement as they could easily do by making the depth of the recess less and its width greater, thus avoiding the specific proportions which constitute the essential part of the patentee's claim.

Too Late Now for Past Royalties.

"Where owners have remained thus supine for many years, shutting their eyes to what was going on in the art to which the patent belonged, and thus leading defendants and others to suppose that they intended to make no claim that their patent dominated a portion of that art, it seems to us inequitable that they should come at this late day and insist on being granted an accounting for damages and profits during their long period of inaction.

"The decree is reversed with half costs of this appeal and cause remanded with instructions to decree in favor of complainant on the first claim with an injunction but without any accounting for profits or damages, and one-half costs to complainant."

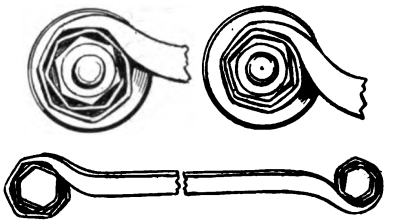
TRUCKS AND PLEASURE CARS UNDER ATLANTA SHOW ROOF

26 Makers of Vehicles Display Their Wares Under Billowy Blue Bunting "Sky"—Accessories and Sousa's Band, Too.

Under a "sky" of billowy bunting of a shade which the ladies style "electric" blue, but which mere man halts at describing at all, the Atlanta (Ga.) Automobile Dealers' Association opened its annual exhibition in the Auditorium on Saturday night last, 8th inst., and if you take it from the dealers themselves it is "some show," to use a slangy but none the less expressive phrase. Certainly, it is bigger than any show Atlanta ever had before, and, if anything, the decorations are just a wee mite more pretentious.

Beneath the blue "sky" there are streamers and more streamers of creamy white bunting so draped that the part of the building that keeps out the rain isn't visible at all. Still lower down—that is, under the streamers—there is a single great gasolier, though no great dependence is placed upon it for light; it is more in the nature of a decoration than anything else, for the real light that shines on the 26 makes of pleasure cars, the six makes of commercial vehicles and liberal sprinkling of accessory dealers comes from strings of brilliant Tungstens hung from the ceiling, though none knows just how the hanging has been done.



The weather on the opening night was not of the particular brand that seduces home lovers away from their hearthstones; it rained. But in spite of the rain and the chill in the air, a great crowd of first nighters turned out to look at the cars and to hear Sousa and his band. Only they didn't hear Sousa at all. They heard the great pipe organ that fills up one end of the auditorium, instead, though those who went back on Tuesday night heard Sousa and they may hear him every night this week until the doors close on Saturday night, if they choose. The complete list of exhibitors and the wares they show is as follows:

Pleasure and commercial vehicles: Atlanta Auto Sales Co., Henderson; Stewart Motor Truck Co., Stewart commercials; Carl W. Fort & Co., Marmon; Maxwell Motor Sales Co., Maxwell; J. W. Goldsmith, Jr., Hudson; Steinhauer & Wight, Cadillac; John M. Smith, Pierce-Arrow, Chalmers, Hupmobile; Van Winkle Truck Co., Van Winkle commercials; International Harvester Co., International commercials; Standard Auto Co., Paige-Detroit pleasure cars and Selden commercials; Bower & Houser, Oldsmobile and Regal; Ford Motor Co., Ford; Bussey & Steel Co., Premier; Johnson Motor Co., Stevens-Duryea, Lyons-Knight, and Chase commercial cars; W. H. McIntyre Co., Imp cyclecar; Mitchell Sales Co., Mitchell; Cole Motor Car Co., Cole; J. I. Case T. M. Co., Case; Velie Motor Vehicle Go., Velie; K. T. McKinistry, Ohio electrics; Buick Motor Co., Buick; Oakland Sales Co., Oakland and Krit; W. C. Mahoney, Cartercar.

Accessories: R. N. Reed, lubricants; Johnson-Gewinner Co., supplies; Howe Rubber Co., Howe tubes and casings; Chas. E. Miller, supplies; Atlanta Automobile Top and Trimming Co., tops and materials.

Here's a Flexible End Ratchet Wrench.

Adapting the pipe wrench principle in a brand new way, a French accessory maker has succeeded in producing an exceedingly

"LE POIGNE" RATCHET WRENCH

unusual type of wrench which has a number of more than ordinarily interesting characteristics; the wrench itself is illustrated herewith and it is styled "La Cle Poigne." The most unusual part of the wrench is that instead of having solid ends like an ordinary spanner, it has very flexible ends and these ends wrap themselves around the nut and grip it with a grip that is unbreakable. Just how the wrench looks before it is applied and after pressure is put upon it, is shown by the pictures. Several advantages are claimed for the construction, not the least important of which is that it is impossible for the wrench to injure a nut, no matter how many times it may be used upon it. The wrench is made in the several sizes that correspond to the sizes of ordinary wrenches and is double ended. The end of the wrench which wraps around the nut is spring steel and as it releases instantly pressure is removed from the end of the wrench, the operation is in effect the same as that of a ratchet wrench.

Emergency "Gas" Supply for Foot-Stool.

Probably there are few persons ingenious enough to imagine that gasolene may make a very good foot-stool for the tonneau of a car—that is, provided the gasolene is in a stout tin with a tight cap. And if it is in a tight, strong tin, there is small likelihood that the driver will have to trudge a couple of miles because his tank had run dry.

DISAGREE WITH THE BOSS? YES, BUT DON'T FIGHT HIM

In Last Analysis Man Who Pays the Salary Should Have Things His Way—One Man's Method of Having "His" Way.

Do you always agree with your boss? You do? Does he think any the better of you for it?

"But," you say, "he's the boss; shouldn't I do as he says?"

Certainly you should; but that doesn't imply that you should always agree with him. And more important still, it doesn't mean that you should always be fighting against the things he wants. In the last analysis you should do pretty nearly what he wants if you are going to take his money. But "handling the boss" is a little science by itself.

It is almost axiomatic that too many bosses resent the presentation of suggestions, and with this type of superior, men have cleverly evolved ways of slipping in their own ideas in such a manner that when the boss finally wakes up to them they appear to him as a great discovery of his own. The boss who welcomes and honestly accepts or rejects suggestions is one of the bright spots in the business world, whereas others have to be "handled." But even at that, if the man who pays the salary wants it done "this way" and is sure of it, that should be final.

"The last advertising manager I had was a stickler to argue. He would go to the mat over the least thing, and to get anything done my way meant a long, hard fight," says a contributor to Printer's Ink. "After a time I got tired of this continual warring. I was paying the bills, and regardless of opinions was entitled to say how my money was to be spent. Understand, I don't mean to say I want men without opinions, but I do expect my advertising manager to submit to my judgment. That was a thing this one wouldn't do, and so the inevitable happened—we parted.

"As his successor I appointed a young fellow who had started with me as a bundle wrapper, and had risen to assistant advertising manager. He had never been a great success as a salesman, evidently lacking some essential, but he was naturally adapted to advertising, and since taking charge, is getting wonderful results. I often notice the way this man handles me. He once told a friend of mine that he believed it just as important to study the market where he sold his services—the boss—as it was the market where he sold

Digitized by Google

his product. And he carried out his plan by studying me.

"When I give this young fellow some idea and tell him to work up a page ad. he doesn't begin to argue about better ways to do it, but goes ahead and does it. When he shows me the copy I generally notice that what I thought was a great idea is buried somewhere in the ad. with his own evolution played up in the scare lines and illustrations.

"But he gets it in somewhere, and of course I am satisfied, as I can generally see where his ideas are an improvement over mine. On the other hand, if he were to combat my idea and try to prove to me how much better his were, as his predecessor used to do, naturally I would have to maintain my position and a useless and energy-wasting argument would result."

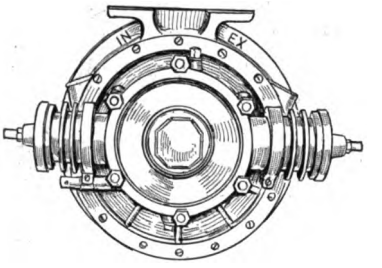
What the Car Owner Couldn't Understand.

It seems hard to believe that the man who first made the now famous remark to the effect that consistency is a jewel knew nothing about automobiles, for there seems to be more downright, hard-headed—— But here's the yarn, which speaks for itself very well.

Three scribes who had nothing to do but write things about automobiles were busy doing so one fine day when in walked a car owner who had acquired that title only a month previous. Now, it happened that one of the scribes had spent long, weary months in an automobile factory; another had owned, operated and more or less desiccated several machines, while the third had spent a day explaining the how and why of the car to its owner, showing him how to distinguish the rear axle from the gearcase, etc. And the proud proprietor, dropping in to ask for further enlightenment, took a chair with the remark:

"Gee, but it seems funny for you fellows to be sitting here all day and writing about automobiles! I suppose you don't see as much of the insides of cars as us fellows who have machines, do you? I don't see how you do it."

Verily, consistency is a jewel.



Why Electric Signals Should be Cleaned.

Although electric signalling devices are supposed to be watertight, not all of them are as tight as might be and, in consequence, it often is possible to improve their tone considerably by removing the diaphragm and smoothing the rust off the rotor with a fine file. A small quantity of vaseline applied before the diaphragm is replaced will postpone the formation of more rust. Incidentally, horns which do not operate freely consume considerably more current than they would normally consume.

UNIT POWER PLANT SYSTEM IN COMPRESSED AIR STARTER

Thurber Rotary Starter Now Has Air Pump and Air Motor Mounted Together—Gas Engine Practice in Pump Construction.

Because electricity is the most conspicuous form of energy for replacing hand cranking, it does not by any means follow that it is the only form of energy that is valuable for this purpose, or that it is the only power that has received thought and study. Compressed air, for instance, not only is available, but its use has been developed scientifically and practically, as was clearly set forth in the July 24 and July 31 issues of Motor World, in which various

THURBER COMPRESSOR-MOTOR

types of compressed air starters were illustrated and described. Among them was the Thurber starter, manufactured by the Thurber Rotary Starter Co., of Detroit, a device which has not a little to recommend it.

Since the publication of the articles referred to, however, the Thurber starter has been considerably improved and not a little simplified. Briefly, the apparatus consists of a rotary motor of the vane type, the construction being analogous to that of the sliding vane water pump, though necessarily the motor is more accurately and carefully built. The motor is placed at the forward end of the crankshaft, connection being made through a planetary gearing enclosed in an extension of the motor casing. A power-driven air pump, charging a high-pressure air receiver, supplies the necessary air, which is delivered to the motor through heavy piping and controlled by a foot-operated valve.

While in the latest type of starter the rotary motor is practically unchanged, a new pump has been designed and a new driving system evolved. The old pump was a four-cylinder machine driven by chain from the engine, and was located wherever it could best be put, without reference to the position of the starting motor. Now, however, the pump is of the opposed type, having two cylinders, and is mounted as a unit with the rotary motor; the pump forms the front part of the combination. The functions of the pump and the motor are controlled by clutches. The motor clutch is automatic; when the air is turned on by pressure on the foot valve the clutch automatically takes hold and the engine shaft is placed in driving connection with the starter; when the engine starts the clutch automatically is disengaged. The pump clutch, however, is engaged by pressure on a pedal when the air gauge on the dashboard shows that the pressure, which normally is about 250 pounds to the square inch, is getting low. It is stated that ordinarily five minutes pumping during the day is sufficient to keep up the supply, and that the system does not leak, but will hold air almost indefinitely.

The pump is designed along gas-engine lines and is particularly well provided with bearing areas; the makers state that it is so quiet in operation that it cannot be heard running, no matter how high the pressure. The starter is unusual in that it will turn an engine over at exceptionally high speed. The makers state that a 40-horsepower engine can be "spun" at 400 revolutions per minute, which is fast enough to start a motor under any conditions under which starting is possible at all. For use when the tank is empty, or for starting when the starter is inoperative for any reason, the hand crank can be applied by removing a cap at the front of the unit.

Vaughan "Six" Makes its Appearance.

The long expected Vaughan "Six" at last has appeared; it has been on private exhibition all week at the Hotel Astor, New York. The car is the product of the Vaughan Car Co., of Kingston, N. Y., which was incorporated early this year with a capital of $1,350,000, and of which A. B. Cordner is president, Orlando F. Weber vice-president, H. W. Johns treasurer, E. S. Partridge secretary and Chester Griswold engineer. The car is an appealing, large one with a wheelbase of 138 inches and a block-cast motor with a bore and stroke of 3¼ x 5½ inches. The touring body is of the pronounced stream-line type with tapered hood and narrow radiator; the smoothness of the lines is enhanced by the absence of side lamps. Springs are long and unusually flexible, those in the rear being of the ¾-elliptic type. Gasolene feed is by pressure, the tank being in the rear.

Willys Adds 1,640 Dealers During Year.

According to official figures made public by President Willys, the number of Willys-Overland dealers increased during the present year 64 per cent.—from 1,843 to 2,843. In 1911 the number was 1,514.

LLUSIONS DEVELOPED BY PAINTS OF DIFFERENT HUES

Why Some Colors Make Cars Appear Larger and Other Colors Smaller Than They Are—Paint Compounding Secrets.

Probably there are not a great many persons who realize that the color a car is painted has a direct effect in influencing the apparent size of the vehicle; that bright reds, for instance, make a car appear really larger than it is; and that the less flashy dark blues and greens and blacks have the effect of slightly reducing the size of the car to the eye. But that this is true is the disclosure of a paint expert who has made a study of colors both as regards their effect on the eye and their construction, or rather compounding, and their manner of finish. His instructions, too, for the choice of colors for wearability, are worthy of consideration.

Practically all of the greys, he says, are neutral in their effect upon the surface—that is to say, they exert no increasing or diminishing effect upon the surface to which they are applied. They are neither cold nor hot in respect to their effect upon the senses, as seasons come and go; they are virtually all-the-year-round colors. They show dirt and surface blemishes less than most other colors, and if applied skilfully they wear well. All of the greys are comparatively easy to apply. Their wearing strength comes from the white lead in their composition. These grey pigments, moreover, in the matter of cost compare favorably with the cheapest of the other colors.

Reds, and notably the light reds, have the effect of increasing the actual size of the car to which they are applied. They have a warm effect in winter and a correspondingly hot effect in summer. While such flaming reds as English vermilion wear durably when given exceptionally good care, the rank and file of these fiery reds fade and lose their original brilliancy after a little time.

Greens and blacks have a diminishing effect upon the surface, but require perfection in surfacing methods, as they show surface defects more freely than other colors. They are, nevertheless, durable colors if kept secure under a strong body of varnish. All of the dark, fine greens, of which there is a noble array, are colors of elegance and refinement.

The brown pigments, of which at the present time there are numerous very beautiful shades, are neutral colors in respect to the seasons. They are durable under conditions which would upset not a few other pigments, do not show surface defects readily, are easy to produce on the surface, have strong covering power, show dirt and road service to the minimum extent, and stand up well under cleaning and renovating processes.

There are many splendid aristocratic lake pigments, which fashion has decreed to be popular for this and, perhaps, succeeding seasons, which are durable under good care, but which the car owner who elects to paint his car is quite certain to have trouble in handling. They are colors which require as perfect grounds as is possible. They are absolutely negative in their effect upon the dimensions of the car, and for brilliancy of color, without being in the slightest degree sensational, are unsurpassed.

Although the blues are meeting with such general favor, they are not, for the most part, colors easy of application. The light blues are less befogged and discolored under varnish, gases, and atmospheric impurities than the darker shades, but all are subject to effects which ordinarily do not disturb most of the other staple pigments. At the same time the blues, almost without exception, are to be accounted durable colors, and when kept well protected under varnish will wear on and on, and have a show of the aristocracy to the end. Surfaces of dark blue appear perceptibly smaller than they really are, while the lighter shades of the color exert a neutral effect.

The yellow family of pigments is not so much in evidence on the motor vehicle as formerly, being hard colors to bring out to a finish. They show surface defects plainly, but if maintained in good shape during surface will wear durably.

White lead, a pigment known throughout successive generations as a wonderfully-enduring substance, forms the basis of yellow. Colors compounded from the old-time Dutch-process white lead are certain to result in good pigment. For this reason greys and yellows, and all the blended pigments between these two, are entitled to the distinction of being raw-hide wearing mediums. They require plenty of time to dry—that is assured; and if denied this, they create surface disorders not easily remedied.

The greys and yellows and their intermediate colors reflect the light and heat better than dark colors, and, consequently, if brought up right, fade less. The dark colors invariably absorb more heat than light ones. They also appear to lower the height of the vehicle to which they are applied.

As a matter of information helpful to the car owner in choosing a color for his car it may be stated that the basis of the green pigments is potash, sulphur, chromic acid, copper, arsenic, and verdigris, combined and varied in methods of manufacture to produce incomparably beautiful effects. Possibly, however, many of the popular greens of the present day contain only a limited percentage of the above ingredients. White, yellow, prussian blue, chrome green, golden ochre, burnt umber, and black all contribute more or less to the composition of automobile greens.

Going back into the realms of chemistry, the base of the blues—ultramarine blue being the grandfather of the family—is silica, alumina, soda, sulphur, and sulphur oxides. Methods of manufacture are too intricate for the lay mind fully to comprehend them, but of this the car owner may be assured—that the various shades of color derived from the above ingredients, and compounded, in some instances, with white lead, are permanent, and endowed with excellent color-retaining and wearing properties.

Foreign Revival of an Old Idea.

The rather old idea of having rigid connection between the motor and the live rear axle casing of a car has been revived abroad in a light tractor recently brought out. The motor and gearset are built on the unit plan, and from the rear of the gearcase to the axle casing extends a steel tube of very large diameter, in which the propeller shaft runs. Thus there is no possibility of any of the working parts, whether in the motor or the transmission system, getting out of alignment unless it is through some abnormal strain such as might be caused by a collision or other accident. The tractor is known as the "Simplicia" and is said to operate successfully. The same construction was employed in an American car a good many years ago; incidentally, the machine, which was built near Boston, had three cylinders and make-and-break ignition and had a life that was neither long nor merry.

Too Heavy for the Turntable.

The strength of a given appliance depends largely upon the point of view of the user. For instance, if a man buys an automobile turntable and uses it, as the maker intended it should be used, for pleasure cars, there is reason to feel confident that nothing will break or give trouble within a reasonable time, at least. But from the point of view of the driver of a great, big motor truck the turntable is a rather flimsy thing. At least, these are approximately the sentiments of a garage owner who installed a very fine table only to have it practically wrecked by the passage over it of a six-ton motor truck, which imposed a far greater strain than the little merry-go-round could stand. The moral is perfectly obvious.

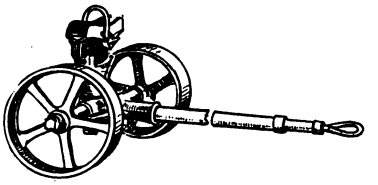
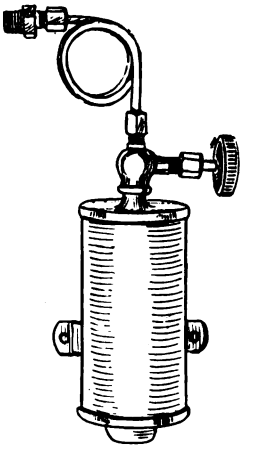
RECENT DEVELOPMENTS in ACCESSORIES

"Ambulance" for Injured Automobiles.



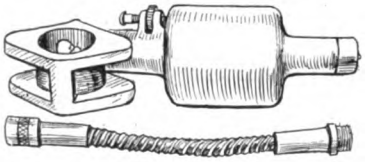
When an automobile loses a wheel, or has one or more wheels put out of the running through accident or internal derangement, it is about as helpless a thing as there is on the road. Under most circumstances a car so crippled is rather difficult to assist, and for this reason various devices are made to temporarily replace wheels that won't roll or that are not there. The Weaver Mfg. Co., of Springfield, Ill., has carried its ideas further than most people in this direction, and has brought out an "ambulance" that seems capable of valuable service under almost any of the conditions that render a car temporarily useless.

As the accompanying illustration makes clear, the "ambulance" consists of a pair of wheels, which are mounted on a steel axle 1¼ inches in diameter, with a long tongue. On the axle is mounted a saddle upon which the axle or other part of the disabled car may be clamped. For use under the front axle, where there is but little variation in construction in different cars, there is a screw clamp, while for attachment at points where the clamp cannot be used provision is made for the use of a rope for binding. The saddle is of heavy malleable iron and the tongue of steel tubing and telescopes so that its length can be adjusted to suit the conditions. A key running through holes provides a simple and secure fastening.



The "ambulance" can be put under a front or rear axle if both wheels are gone or disabled. The tongue can be carried forward and attached to the towing vehicle, or it can be secured to some part of the disabled car itself, if necessary, the telescoping tongue facilitating this arrangement. One man can take the device and without assistance get it under a car and bring it into the shop with less loss of time than two men could do it without such efficacious apparatus. The tires are broad—3 inches—and the whole thing weighs 100 pounds.

Pierce Develops New Motor Controller.



Working along lines that are similar, in some respects, to those followed in developing its speed controller, the Pierce Speed Controller Co., of Anderson, Ind., has evolved a motor controller embodying several features that are out of the usual and that are of distinct utility. The speed controller, which was described in detail in Motor World when it first made its appearance, has for its object the direct control of the speed of the car, and consists of a motor governor operated through a flexible shaft geared to one of the road wheels. The motor controller, however, is designed

WEAVER AUTOMOBILE AMBULANCE

IDEAL DASH PRIMER

PIERCE MOTOR CONTROLLER

to limit the maximum motor speed without reference to car speed, and therefore is driven, also by flexible shaft, from some rotating motor part, which may be the crankshaft, a camshaft, or the pump shaft; or it may be run from some part of the gearset.

While the centrifugal principle of operation adopted for the speed controller is adhered to in the governor, the latter is constructed to run in a horizontal position, the controller being vertical. The device acts on the throttle and is fitted with an adjusting device that permits setting for any desired number of revolutions and which can be sealed with a wire seal to prevent tampering. The application of the governor does not require any special provision in the construction of the motor. It can be applied to any motor at any time and can be removal even more easily, so that in case repairs are required, or for any other reason the removal of the governor should be desired, it can be effected without in any way interfering with the operation of the motor. The speed controller, incidentally, has undergone no changes during the past year, indicating that its design and construction have been found thoroughly satisfactory.

Develops Simple Manifold Priming Device.

One of the effects of the motor starter and other labor saving devices that now abound on automobiles has been to make people dissatisfied with the old method of lifting the hood, opening the petcocks and squirting in gasolene with an oil can when the motor has to be primed. So the accessory manufacturers have come out with variout easy-to-use primers, one of the most recently devised being that of the Ideal Brass Works, of Indianapolis, Ind. The accompanying illustration shows all there is to the primer—a little tank, 6 inches high to attach to the dashboard, a needle-valve, 26 inches of copper tubing and a threaded connection for the intake manifold. To prime the motor all that is necessary is to open the needle valve slightly and crank. After cranking the valve is closed. The whole outfit weighs but a pound and the price is $2.50, finished in nickel, polished brass or gun metal. It has the advantage that, as it injects gasolene into the manifold, all the cylinders are primed at once, and the priming may be regulated.

Cars Exported by the Bushel!

Automobiles by the bushel! It unquestionably sounds funny, but that is the way the French government, which means the French customs officials, make public export figures. For instance, during the first nine months of the current year 182,000 bushels of motor cars were exported from France. From which it is evident that automobiles are represented as being dealt in by the bushel.

DIVERSITY IN RECEPTACLES FOR OILY WASTE

anger That Lies in Oil-Soaked Rags and How it May be Averted—Meaning of "Spontaneous Combustion" Made Plain—Properly Constructed Cans with Which the Garage Proprietor can Protect Himself.

What do you do with your oily waste?

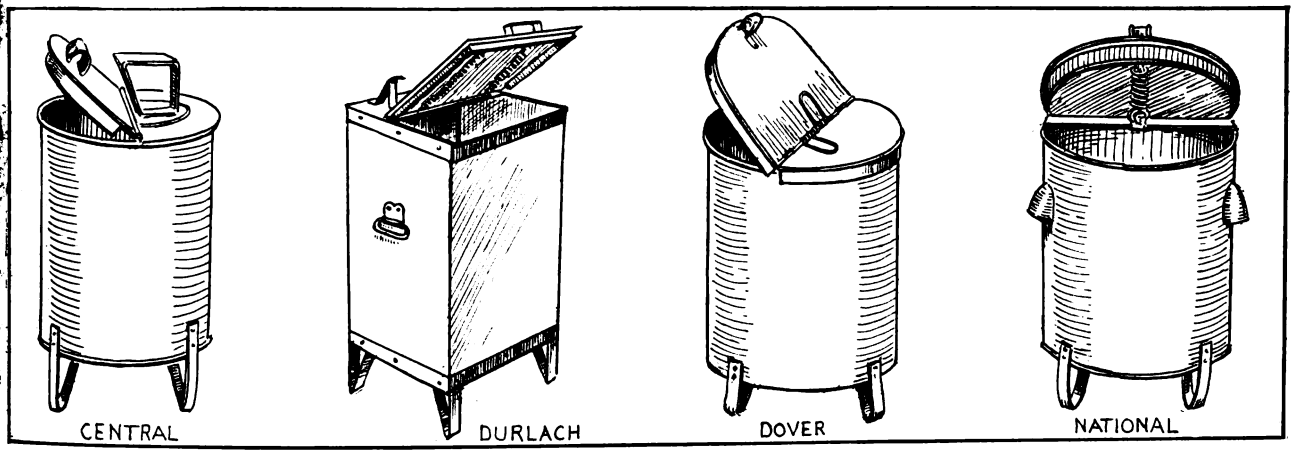
Don't drop it on the floor. Don't pitch it into a corner. Don't chuck it into an open container of any kind. Never keep it in an empty soap box, or any other kind of a box. It is more dangerous than gunpowder, for it will "go off" without the slightest provocation, without intimation and without conscience; gunpowder won't; it needs at least a kindling spark, a start in life, so to speak. Besides, you can keep gunpowder in 'most any kind of a container and it will be safe, provided the man who rocks the boat is not near with a lighted cigar.

But you cannot keep oily waste in any old kind of a container—that is, with any degree of safety or peace of mind. In the first place, it is just plain pestiferous; it is likely to burst into flame at any instant of the day or night; it cannot be trusted alone. There was a garage proprietor—note the "was"—who thought he could trust his oily waste all alone because it was in a sheet iron can. But the can had no cover and waste "went off," which is to say, it became ignited through that curious action which chemists and others style spontaneous combustion, and not very long afterward nothing of the garage remained but the memory of it and a cloud of heavy, black smoke.

Spontaneous combustion, in the words of those who explain it, is a "phenomenon that occasionally manifests itself in mineral and organic substances. The term refers to the smoldering or inflaming of a substance apparently without the intervention of any external heat. Generally it is due to a process of slow oxidation which ultimately results in the evolution of sufficient heat to raise the substance to the temperature of ignition." Which explains, quite nicely, the reason why oily waste will, if left alone, begin first to smolder and finally to break into flame.

The second reason why you cannot store oily waste in any old kind of a container—maybe it ought to be the first reason—is the fire department will not permit any old kind of a container or no container at all. The fire department knows all about the perversity of oily waste and consequently it has laid down inviolable rules governing the disposition of such dangerous material. The rules of the Bureau of Combustibles of the Fire Department of the City of New York as set forth in section 28 of Part X, and covering "Waste Cans," are as follows:

What the Fire Department Says.



"Self-closing metal cans set firmly on four-inch legs shall be kept on all floors for the purpose of holding all inflammable waste material."

The conditions are easy to comply with, and though it would seem that a can is a can the world over and that not a very great deal of variety in construction is possible, such is not the case, in part, at least. A can may be a can, but it also may be a can of any number of different kinds, and it probably would surprise the average person to know of the variety that exists in such palpably plebian articles of commerce and convenience.

The conditions say nothing whatever about the use of solder in the construction of a can, though it is obvious that if the joints were soldered and the waste became ignited the heat would "open the seams" in short order. Hence, no approved types of cans have soldered joints. Rivets take the place of solder. Similarly, there is nothing in the regulations which prescribes the method by which the can must be made self-closing. But springs are such an obvious solution of the problem that no one has seen fit to search further; there has been no need to do so, in fact.

The Dover Stamping & Mfg. Co., of Cambridge, Mass., which produces Dover specialties, including gasolene cans of every kind and description, to say nothing of a complete assortment of funnels, measures and other such things, also produces oily waste cans quite as a matter of course; one of them is illustrated herewith with a number of others of different makes, the group serving to convey some idea of the variety in construction that obtains.

The Dover can is not unlike other cans, insofar as the can part of it is concerned. It is strongly made of galvanized sheet iron and is supported the regulation four inches

FOUR DIFFERENT TYPES OF SELF-CLOSING OILY WASTE CANS SUITABLE FOR GARAGE USE

Digitized by Google

from the floor by means of strap legs which are securely riveted in place. The cover is tight fitting and overlaps the edges of the can; it is spring closed, the arrangement of the spring and its method of attachment being best made plain by the picture.

Round Cans and Cans with Corners.

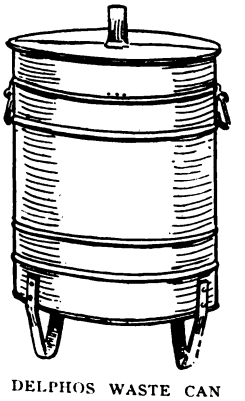
A word with reference to the necessity for supporting such cans at least four inches from the floor: Fire within the can might quite easily raise the temperature of the bottom high enough to ignite the floor, provided it were a wooden one, if the can rested directly on the floor. The air space acts as sufficient insulation to eliminate the possibility of anything of the kind.

Oily waste cans generally are round, the reason being that such construction is simple and because it is simple it is comparatively cheap. I. Durlach, of 199 Wooster street, New York City, however, produces both round and rectangular cans, both of which types are illustrated herewith. In one respect the round can has an advantage over the square one in that it is impossible to place the round one in a corner made by two walls and have its sides touch the walls closely enough to raise the danger of fire. The sides of the round can would touch the wall, of course, but the line of contact scarcely would be sufficient to represent a very great hazard. Hence, where a square can is used and the walls are of some inflammable material, care must be taken to see that it does not touch them. Where the walls are of concrete or some other noninflammable material, the square can, which will have greater capacity for the floor space occupied than will the round one, can be used without danger of fire. It is always advisable, however, to make certain that any kind of a can, square or round, has plenty of "breathing space" on all sides of it.

Automatically Closing Covers.

The Durlach square can and the round one do not differ materially in construction —except as regards their shape, of course. In both cases, the material is heavy galvanized sheet iron and both cans are made in a variety of sizes ranging from 16 inches square by 24 high to 20 inches square and 36 inches high for the one and from 15 x 24 inches to 20 x 24 inches for the other. The method of ensuring the closure of the can is the same in both and is dependent upon a heavy coil spring in one and on two springs in the other. To obviate the possibility of the cans being left open, the tops are fitted with stops which prevent the lid being lifted beyond a certain point, the lids therefore always being under the influence of the springs.

In the illustration of the Central oily waste can, which is produced by the Central Stamping Co., of 172 Fulton street, New York City, the stop that prevents the lid being lifted more than a certain distance is shown quite clearly; the stop, by the way, serves, too, as a convenient handle for moving the can about from place to place. The can itself, like the others, is made of heavy



DURLACH ROUND TYPE

galvanized sheet iron in a variety of sizes, the smallest measuring 10½ inches in diameter and 15½ inches in height and the largest measuring 17 inches in diameter and 28 inches in height.

Cans that Have Handy Handles.

Not all oily waste cans are fitted with handles, for most of them are light and are

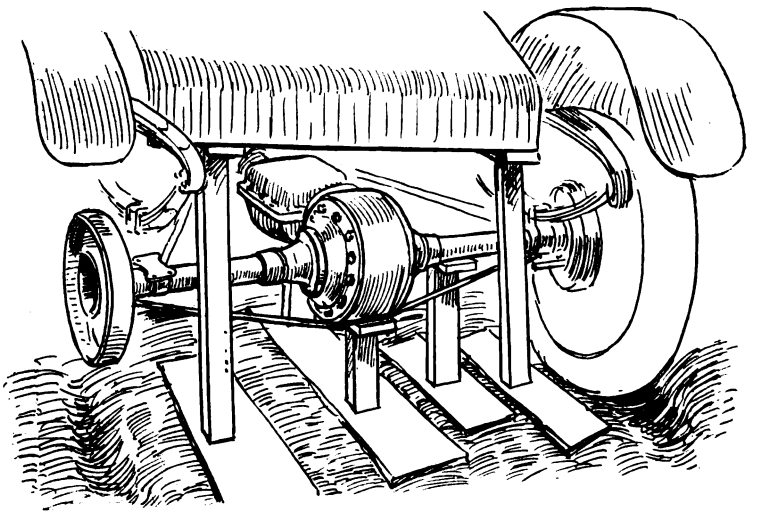
DELPHOS WASTE CAN

easily moved about. Nevertheless, it is conceivable that in case of a brisk fire within one of them handles would be mighty handy things to have. All the cans produced by The National Enameling & Stamping Co., of 374 Broadway, are equipped with handles, as is made plain by the accompanying illustration. The picture also shows quite clearly the method of attaching the coil spring that slams the lid down every time some one attempts to leave it open intentionally, or, as more often is the case, unintentionally. The lid, as is shown by the illustration, is arranged to fit snugly and the can rests on the regulation four-inch strap iron legs. Several sizes are made, the smallest measuring 11¼ x 15 inches and the largest 24 x 36 inches.

Delphos oily waste cans, which are manufactured by the Delphos Mfg. Co., of the Ohio city for which the company is named, do not differ materially from any of the others and, like them, are produced in several styles ranging from a small bench can measuring 12 x 15 inches to a full-sized garage can measuring 15 x 20 inches. In this respect, it is worthy of passing note that waste cans seldom are made in very large sizes. It is generally conceded to be better practice to equip a garage with several small cans of the aggregate capacity of a single large one. Obviously, the larger the can the larger will be any fire that starts, and it is infinitely easier to move a hot small can than a hot large one.

The Delphos can is made of 26-gauge galvanized iron sheets seamed together and having bales rolled into the material to increase the strength. By way of enhancing appearance, they are belted top and bottom with broad bands of enamel, and they stand on substantial strap iron legs of the usual type. The cover is held closed by a spring and handles are provided.

Determining Proper Battery Capacity.



To those who would convert existing lighting systems from oil or acetylene gas to electricity, the biggest part of the problem as often as not is the determination of the proper size battery to instal. The first consideration, of course, is to determine the voltage and, in this connection, a six-volt system undoubtedly is the best for the purpose because the battery then will be comparatively light and the extreme care in wiring that is necessary with much higher voltages will not be required. The next step is to determine the amount of current the battery will be required to deliver, and this can be done very easily by multiplying the total candlepower of the bulbs by the constant 1.25 and dividing the result by the voltage. Thus, if two 21-candlepower head lamps, two 4-candlepower side lamps and a 2-candlepower tail lamp are to be supplied, the total candlepower, multiplied by 1.25 and divided by 6 will equal 10 2/3—the number of amperes current required to light all the lamps at the same time. Obviously, it is not always necessary to have all lamps lighted at the same time, and this should be borne in mind when figuring the capacity of the battery. The formula is correct only for Tungsten lamps. Carbon lamps should not be considered, for they take about three times as much current as Tungstens.

JACKING UP THE REAR END LOOKED SIMPLE BUT WASN'T

Preliminary Tribulations of a Fledgling Car Owner—Replacing an Axle Shaft Easier Than the Process of Making Ready.

Joes had a new car. That is to say, it was new to Jones. In the abstract it was a second-hand car, but as Jones never had owned an automobile of any kind before, it was new to him. In fact, it was painfully new. Every time the motor failed to start after a reasonable number of turns of the crank Jones's heart sank, for he was all at sea. Fortunatealy, the machine was in good condition, and did not develop any

BLOCKING UP FOR REMOVAL OF BROKEN AXLE SHAFT

real troubles—at first. It only scared Jones half to death. Confidence came with familiarity, however, and Jones soon became bold enough to defy the Jinx and curse the car when it acted a little bit contrary.

One sad, sad day Jones, with the pride of ownership upon him, invited Smith and Smith's family out from the city to his suburban home to spend Sunday, and explore the surrounding country in the car.

"No use your paying train fare for the whole distance," said Jones. "I'll meet you at a half-way point—say Brownsville—and take you the rest of the way in my car."

So Smith and his tribe left the train at Brownsville and admired the scenery for half an hour, at the end of which time a 'phone message to Jones's house brought out the distressing fact that the car was stuck somehow, somewhere; and so all the Smiths got on the next train and trooped up to the Jones house. The car was standing on the lawn. To be strictly correct, the car was in the lawn, for it had rained hard the day before and the ground, naturally soft, was made softer, and when Jones in a rash moment attempted to turn around on the grass the wheels went in almost to the hubs. The machine was surrounded by an interesting anl instructive litter of planks, poles and other appliances pressed into service as means for extracting the machine from the mire.

"Why yes," said Jones. "She's stuck in the ground, but I guess I could get her out if I could get any power in the wheels. I can't drive the wheels."

Investigation developed the fact that while trying to pull out of the lawn on low gear Jones had heard something snap, and thereafter the rear wheels took no active part in the proceedings. Smith had been through the mill that grinds out trouble, and, borrowing Jones's third worst suit of clothes—Jones was wearing his fourth worst—sallied forth to do what could be done. The car had a semi-floating rear axle with the three-speed selective gearset mounted as a unit with the axle casing, and there were two universal joints, one at the rear of the clutch and the other just forward of the gearbox.

"Something's busted in the gearbox," mourned Jones. But examination revealed nothing visibly or feelably wrong in the gearbox, and the transmission system up to that point was intact. Jones said he had tried to hoist the wheels out of the mud—but he hadn't thought of giving the jack something to stand on, so that he had good grounds for his complaint that the jack went down before the car went up. A plank under the jack provided a footing and one wheel—it happened to be the left—was jacked up, the axle blocked while the jack was given another "bite" and the wheel lifted clear of the boggy turf.

"Let's see if this will tell us anything," said Smith. Laying hold upon the wheel, he gave it a tentative shake, and it wobbled. Another and more vigorous shake, and the wheel came away in his hands and plopped down into the rut whence it has been jacked, with a splash that would have spoiled Jones's third worst suit if it hadn't already been spoiled. The driving shaft was broken off short just where it entered the hub, and an oil-blackened and partly rusted area showed that a crack had existed for a considerable time, leaving about half of the shaft area to carry the load. Naturally the crack was waiting only for a favorable opportunity to extend through the rest of the shaft, and the strain of the low gear pulling against the mud was quite sufficient.

Had the inner end of the driving shaft been squared and merely slipped into a square hole in the differential gear the ensuing job would have been easy, for the repair would have consisted of pulling out the broken shaft and pushing in a new one. But the shaft was keyed in the differential as well as the hub of the wheel. So there was nothing for it but to take down the axle. The first thing to do was to jack up the rear end properly, and this proved to be an undertaking of unexpected complication, from Jones's point of view.

"Well," said Jones, "we've got the axle jacked up. I suppose the next thing is to take out these bolts," indicating the bolts holding the left side of the axle casing in place.

"Observe," said Smith, "that the weight of the car is on the springs, the springs rest on the axle and the axle on the jack. Now, if you take the bolts out there won't be anything——"

"I get you," interrupted Jones. "What do you have to do?"

"Take the weight of the car off the axle by blocking up the body. Put blocks under the rear end of the frame, and your axle will have only its own weight to carry."

This was done by jacking up the axle till the body was quite high and then putting blocks under the rear frame corners so that when the jack was let down the weight came on the blocks. Jones, wrench in hand, made for the middle of the axle again, but once more Smith held him up.

"If you take out those bolts now several things will happen. Your left spring still is bolted to the axle and the brake rods are connected. There is nothing to support the middle of the axle, so that if you disconnect it the weight of the gearcase will pull it down and the springs will hold up the ends and you'll have a grand mess."

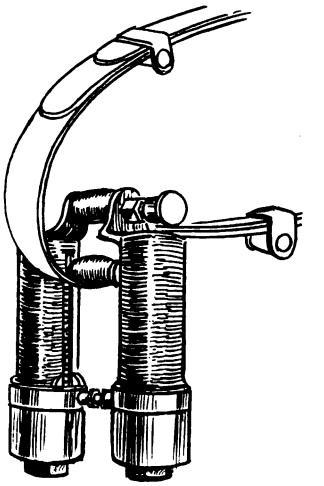
"Gee! It sounds easy enough to talk about jacking up the rear end," sighed Jones. "But it's some job."

The upshot of it was that everything that

Digitized by Google

was connected to the left side of the axle casing was disconnected — the spring, which was cast loose by taking the four bolts off the clips; the emergency and service brake rods, which were held by pins passing through yokes and prevented from slipping out by split-pins, and the radius rod, which was fastened in the same way but by a much heavier pin. Then a block was placed under the right side of the axle, close to the differential housing, and another under the gearcase. This left the left arm of the casing entirely free, carrying nothing but its own weight. The outer end of the truss-rod passed through a hole in the brake drum, inside of which it was held by a nut which, removed, left everything clear.

The reason for blocking the axle to the right of the differential housing instead of directly under the housing was that the housing and the two arms through which the driving shafts ran were three parts connected together by through bolts, so that taking off the left casing would necessarily result in loosening up the whole axle casing structure. Thus it was necessary to provide individual support for each part. Once this was done it remained only to take out the bolts—a sufficiently "mean" job, taking into consideration the tight split-pins and the difficulty of getting the wrench into the recesses in which the nuts were half buried.



The casing removed and slipped off over the broken shaft, the shaft itself had to be removed, and this necessitated the removal of the left half of the differential, carrying with it the big bevel driving gear. The shaft was held in the differential by a nut on the inside and prevented from turning by two small keys which came out when the nut was slackened and the shaft gently driven back. The old nut and the old keys answered for the new shaft, which was put in, the differential casing re-assembled, the axle casing slipped back in place, bolted up and connected up to the spring, radius rod and brake rods, the truss-rod nut screwed on and finally, the wheel slipped over the tapered and keyed projecting shaft end and pulled home with the nut, which was protected by the usual split-pin. The last job was the screwing on of the brass hub-cap, after putting in a good supply of fresh grease.

This was not quite the last job, either, for the car was still in the lawn. But by the time the work was done—and it took considerably longer than it takes to tell of it—the ground was dry and comparatively hard; a couple of planks under the rear wheels made a track, and the machine, once more able to help itself, was easily pulled onto the little road that led to the little garage. It is more than likely that the owner will "keep off the grass" hereafter. He's an optimist, in his way, though, and after all the unpleasantness of the matter was over he sensibly took a cheerful view of the situation.

"Well," he remarked, as he locked the garage door, "it's all-fired lucky that shaft didn't break when we were chasing along the road 15 or 20 miles away from home and the garage at about 40 miles an hour." And it was.

Sager's Newest Shock Absorber.

It is a long, long time since J. H. Sager & Co., of Rochester, N. Y., began making shock absorbers of the auxiliary spring type, and therefore they have had not a little experience in that branch of the accessories business. For this, if for no other

LATEST J. H. S. SHOCK ABSORBER

reason, it is quite reasonable to believe that they know whereof they speak when they say that their latest product in this line, the J.H.S. shock absorber, is by far the best they have devised, not only in efficiency but in durability.

The accompanying illustration shows clearly the outward appearance of the appliance in the form in which it is used for three-quarter elliptic springs. For full elliptics, half elliptics and platform springs the same double unit design is employed, springs of Ford cars and for some types of but the brackets and lugs are arranged to suit the different conditions. For the half elliptic springs single unit types are built with suitable brackets for attachment.

The fundamental idea of the device is that it must be sufficiently sensitive to take up vibrations that are too rapid to be absorbed by the car springs proper. With this end in view there is employed a combination of coiled springs with cylinders and pistons. There are no small, delicate parts that are liable to get out of order; it is said that cars have been run for some 10,000 miles without affecting the efficiency of the shock absorbers.

When Imposter "Sticks" Dealer.

If an imposter named Jones represents himself as a millionaire named Smith, succeeds in convincing a dealer that he is Smith, obtains a car on credit and sells the car to an innocent purchaser named Brown, who is "stuck"—the dealer or Brown? The dealer, so the Appellate Division of the Supreme Court of New York held last week, must stand the loss.

In the case in question, one Gwynne represented himself as Baldwin J. Gwynne, of Columbus, O., and sold to a man whose name may be White a quantity of jewelry. White paid by check. When Gwynne went to Jules S. Bache & Co., bankers, in New York City, to get the check cashed, White identified Gwynne as Baldwin J. Gwynne, the man named in the check. Subsequently the bankers identified Gwynne to some jewelers as Baldwin J. Gwynne, and since this latter was well rated in Dun's and Bradstreet's the jewelers sold him $838 worth of jewelry on credit, which jewelry Gwynne sold to Dennis C. McQuade for cash.

A lower court directed judgment for the jewelers as against McQuade, but the Appellate Division directed a reversal on the grounds that title to the jewelry passed from the jewellers to Gwynne and therefore became legally vested in McQuade. It was held that the offense did not constitute larceny.

Finds Used Car Buyer in Rogues' Gallery.

When "George Lambert" failed to pay the first monthly instalment on a used car he bought from Mrs. George H. Barrett, of New York City, she asked the police what she had better do; they asked her as a preliminary move to look over the faces in the rogues' gallery, and she was somewhat surprised when she recognized the picture of a white-haired, soldierly-appearing man as that of the one to whom she sold the car. He had paid a cash deposit of $100.

His manner was straightforward and trustworthy, but that did not prevent his being held in $3,500 bail after the police located him in a hotel. He is said to have served a total of 11½ years in penal institutions under the names of Dr. Camp, Dr Eggelston and Dr. Lewis, in Baltimore, Philadelphia and New York.

Electric wiring that is carried through holes or otherwise exposed to chafing can be protected by short lengths of rubber tubing held in place with rubber cement

HEEL DISHING DISCUSSED IN SALESMAN'S LANGUAGE

hy Wheels Are Made Dish Shaped and the Effect of the Construction in Increasing Strength—Axle Cambering Made Plain.

"If you stand at the front of the car," id the salesman, as he led the prospect ound from an inspection of the motor and aced him facing the radiator, "you will otice that the wheels are dished. That's —"

"What do you mean by that?" interrupted e prospect, as he fished in his waistcoat ocket for a cigar.

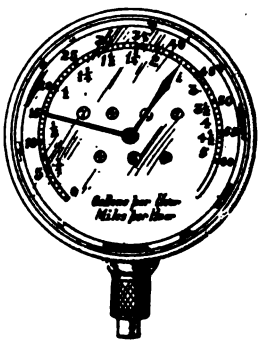
"Dished? Why, dish-shaped," elucidated e salesman, illustrating with a cupped and. "If you laid one of the wheels flat s edges would stick up, same as the edges f a dish."

"What's the idea," interrupted the pros-ect, "to give the car a classy appearance?"

"Not exactly," patiently explained the alesman, "though I've got to admit that t does make the car look a little better. No, hat's not why the wheels are dished. They re dish shaped because they are stronger hat way than they are when they are flat.

"When the wheels are made, the spokes re trimmed so that they are a little bit onger than they should be to have them lie lat when the felloe band is put on. The esult is that when the wheel is finished, the outer ends of the spokes project outwards from the hub, giving the wheel the shape of a dish—hence the term. The spokes are made that way so that they will stand a tremendous side thrust without buckling. Suppose you were driving along and your car skidded—bang!—up against a curb. See the point? The dished wheel is so formed that it resists just such shocks as those and therefore it minimizes breakage.

"The angle of the out-spreading spokes generally is balanced by cambering or slightly inclining the axle spindle from the vertical. This gives the lower spokes a very nearly vertical position in relation to the ground and, of course, it accentuates the dishing because it removes the tops of the wheels further from each other than they ordinarily would be removed. Incidentally, the cambered axle permits the wheels to resist side strains in an elastic manner while at the same time it places the weight of the car directly on the ends of the spokes."



"But whether the wheels are dished or not," continued the salesman, getting warmed up to his work, "it is advisable, and I believe it is generally conceded to be good practice, for the front axle to be slightly cambered for the turning point of the tire on the road then is placed directly in line with the steering pivot and the result is that the car steers easily."

"Thanks," replied the prospect. "You're the first man I ever saw who could explain that little thing to me. There's something else that has been bothering me and——"

But the had moved out of eavesdropping range.

Develops Engine Efficiency Indicator.

By way of affording the driver of a car a definite means of ascertaining at all times the efficiency of his engine, a British engineer has perfected a device that is no less ingenious than it should prove useful to anyone who would reduce fuel consumption figures to the minimum. The device, which is virtually an efficiency meter, is shown by the accompanying illustration which makes plain its external appearance; just how the indicator operates has not been divulged

FUEL CONSUMPTION METER

by the inventor, though a record of what the instrument does is none the less interesting.

The efficiency indicator, as it is styled, is combined with an ordinary speedometer, as is shown by the picture. The dial, in addition to carrying the speed per miles calibration, carries figures which indicate the number of gallons of fuel used per hour. In the illustration, for instance, a speed of 15 miles an hour is indicated and the other hand shows that the engine is using fuel at the rate of 2½ gallons per hour, the two indications being taken while a car was driven up a steep hill. Obviously on level road, with the throttle open only a narrow slit, the consumption must drop, and once the normal consumption for various speeds and grades has been ascertained by the driver a glance at the indicator will suffice to make plain whether or not the engine is operating at its proper efficiency. Needless to add, each instrument must be calibrated for the engine in the car to which it is fitted, though once the adjustment is made the setting will not require to be changed for an indefinite period.

DANGER SIGNAL THAT HOLDS UP TRAIN OF "CUSS WORDS"

Miniature Railroad Semaphore in Stockroom Tells Male Employes Women Are Present—Can't Swear Until They Leave.

"Stop cussin', the block's agin yuh!"

"Whaddye mean, the block's agin me?" demanded the new employe in the stockroom of the Louis Geyler Co., at 2519 Michigan avenue, Chicago.

"The block! Yuh boob! Can't yuh see it?" demanded the older employe as he pointed to a little red lamp on the wall, which also disclosed a "danger" sign.

"What the —— is that thing?"

"Sh-h-h-h!" cautioned the older employe, who proceeded to explain.

The whole scheme is but another indication of the progress which is being made by women's rights, and whereas it has been commonly supposed that when she got her rights she would have to mix with men, as men are the scheme, proves to the contrary. For when a woman goes among the Geyler company's men in that room where Hudson parts are stocked, the men have to quit "cussin'" until she has gone. When they get the "clear" sign they can "cut loose" again.

"Time and again calls come from the stockroom for a stenographer," said Geyler. "Gliding into the 'department behind the bars,' the young lady would prepare to make a typewritten copy of the work assigned to her only to be interrupted by repairmen, chauffeurs and testers, who with careless masculine talk often caused the young lady considerable embarrassment.

"'What shall we do to be saved from our own embarrassment?' asked one of the drivers. 'Woman has rights that even rough-speaking men much observe.'

"The mechanical superintendent thought over the situation and the red-light semaphore is the result. The moment a woman enters the stock department the semaphore is displayed. When she leaves the arm falls back to 'clear.'

"'We have a large force of employes,' remarked one of the stenographers, 'and they are just as good fellows as one will meet in any automobile concern. But sometimes the shopmen forget women are around. The semaphore is all right.'"

Stove Polish for Hot Exhaust Pipes.

The old-fashioned home variety of stove polish is excellent for finishing exhaust pipes from which ordinary paint soon is burned and which always present a more or less unsightly appearance.

1,063,538. Internal-Combustion Engine. William Harper, Jr., New Bloomfield, Pa., assignor, by mesne assignments, of three-tenths to Harper Engineering Co., a corporation of New York, and seven-tenths to Thomas A. Nevins, East Orange, N. J. Original application filed June 10, 1907, Serial No. 378,147. Divided and this application filed Dec. 6, 1907, Serial No. 405,301. Renewed Oct. 30, 1912. Serial No. 728,725. (Means for generating steam to mix with gas fuel.) 2 claims.

1,063,594. Resilient Vehicle-Wheel. William M. Reese, Los Angeles, Cal. Filed Nov. 13, 1911. Serial No. 660,157. (Wheel with pneumatic cushions between inner and outer rims.) 4 claims.

1,063,15. Piston-Cooling Device for Internal-Combustion Engines. Karl Steinbecker, Charlottenburg, Germany, assignor to General Electric Co., a corporation of New York. Filed Sept. 7, 1911. Serial No. 648,012. (Piston cooling system with telescopic water pipe joints.) 6 claims.

1,063,638. Internal-Combustion Engine. Asa F. Batchelder, Schenectady, N. Y., assignor to General Electric Co., a corporation of New York. Filed Sept. 28, 1910. Serial No. 584,176. (Two-cycle motor with two-diameter piston and cylinder.) 7 claims.

1,063,641. Shock-Absorber. Karl V. Bennis, Los Alamitos, Cal. Filed July 8, 1912. Serial No. 708,381. (Auxiliary spring shock absorber.) 7 claims.

1,063,647. Automobile Heating Apparatus. Leo A. Brigel, Cheviot, Ohio. Filed Oct. 2, 1909. Serial No. 520,660. (Means for heating a circulating liquid by exhaust gases.) 4 claims.

1,063,648. Demountable Rim for Vehicle Wheels. John W. Broderick, Newark, N. J. Filed Jan. 12, 1910. Serial No. 537,617. (Rim bolted to felloe through lugs.) 3 claims.

1,063,705. Sheet-Metal Cage for Roller-Bearings. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Co., Harrison, N. J., a corporation of New Jersey. Filed Jan. 2, 1912. Serial No. 668,833. (Hyatt Roller bearing cage.) 1 claim.

1,063,709. Vase for Vehicles. John E. Marsden, Philadelphia, Pa. Filed Aug. 14, 1912. Serial No. 714,964. (Flower vase and bracket.) 8 claims.

1,063,721. Tightener. Charles B. Nelson, Lindsborg, Kan. Filed March 23, 1912. Serial No. 685,792. (Means for tightening anti-skid chains.) 1 claim.

1,063,771. Wheel. Summers Brown, London, England. Filed Jan. 12, 1912. Serial No. 670,781. (Wheel with telescoping spring-cushioned spokes.) 10 claims.

1,063,784. Spring Wheel. Sam R. Dwiggins and Lawrence E. Kelley, Leonard, Tex. Filed June 15, 1912. Serial No. 703,968. (Wheel with springs between tire and rim.) 3 claims.

1,063,798. Motor Plow. Fred B. Houdek, Cuba, Kan. Filed May 4, 1912. Serial No. 695,181. (Frame for motor plow.) 1 claim.

1,063,820. Distributer for Internal-Combustion Engines. Eugene Louis Leon Menage, Paris, France. Filed June 13, 1912. Serial No. 703,445. (Rotary disk valve in cylinder head.) 4 claims.

1,063,881. Vehicle Wheel. Frank Holdman, St. Johns, Ore. Filed April 22, 1911. Serial No. 622,840. (Wheel with spring cushioned hub.) 1 claim.

1,063,888. Tire. Victor Lindholm, Hoquiam, Wash. Filed March 30, 1912. Serial No. 687,488. (Tire of disks of resilient material.) 2 claims.

1,063,892. Vehicle Wheel. Tony Poss, Aurora, Ill. Filed April 8, 1912. Serial No. 689,295. (Wood wheel construction.) 6 claims.

1,063,901. Gas-Engine Starter. Elwood C. Allison, Brooklyn, N. Y. Filed Aug. 2, 1912. Serial No. 712,957. (Ignition starter with compressed air reservoir.) 2 claims.

1,063,943. Spring Suspension. John Henry Ptacek-Bird, Chicago, Ill. Filed Nov. 16, 1911. Serial No. 660,661. (Suring-and-lever suspension system.) 3 claims.

1,063,952. Headlight. Charles C. Bruff, Coalport, England. Filed Sept. 20, 1912. Serial No. 721,365. (Headlights moving with steering gear.) 3 claims.

1,063,963. Indicator. Thomas George Fortune and William Lotridge, New York, N. Y. Filed Jan. 12, 1911. Serial No. 602,147. (Rear signal to indicate intended direction of car.) 3 claims.

1,063,967. Harvester. John E. Gilson, Port Washington, Wis., assignor to Gilson Mfg. Co., Port Washington, Wis. Filed Sept. 24, 1909. Serial No. 519,337. (Agricultural tractor.) 6 claims.

1,063,972. Vehicle-Tire. John C. Hollings, Boston, Mass., assignor to Flora S. Alden, Boston, Mass. Filed May 8, 1912. Serial No. 695,873. (Tire of woven wire fabric.) 4 claims.

1,063,998. Clutch. Alfred B. Morse, South Easton, Mass. Filed Feb. 21, 1912. Serial No. 679,150. (Multiple disk clutch.) 2 claims.

1,064,012. Change-Speed Gearing. Henry A. Ryther, Montague, Mass., assignor to Millers Falls Company, Millers Falls, Mass., a corporation of Massachusetts. Filed July 1, 1912. Serial No. 706,863. (Individual clutch bevel gear transmission.) 6 claims.

1,064,019. Shock-Absorber. George E. Shippey, Pittsfield, Mass. Filed May 13, 1912. Serial No. 697,034. (Double-arm friction shock absorber.) 7 claims.

1,064,035. Tire-Making Machine. Thomas J. Whalen, New Brunswick, N. J., assignor, by mesne assignments, to Harry M. Marble, Newark, N. J. Filed Oct. 6, 1910, Serial No. 585,623. Renewed Oct. 26, 1912. Serial No. 727,968. (Construction of tire-forming machine.) 2 claims.

1,064,043. Wind-Shield. Edward J. Beseman, Los Angeles, Cal. Filed April 25, 1912. Serial No. 693,216. (Windshield with dust deflector.) 4 claims.

1,064,045. Agricultural Implement. Henry H. Boenker, St. Charles, Mo. Original application filed Dec. 8, 1910, Serial No. 596,303. Divided and this application filed March 7, 1911. Serial No. 612,847. (Motor agricultural implement.) 11 claims.

1,064,047. Clutch-Drive for Motor-Wheels. Lewis Brandenburg, Portland, Ind. Filed Sept. 5, 1911. Serial No. 647,607. (Sprockets on statitonary axle driving wheels through dog clutches.) 2 claims.

1,064,055. Gas-Engine Starter. Charles H. Cuno, Meriden, Conn. Filed April 5, 1912. Serial No. 688,586. (Distributer for ignition starter.) 9 claims.

1,064,086. Method of Producing a Fuel Vapor. Alexander T. Porter and Herbert E. Rider, New York, N. Y., assignors to Oil Utilities Co., a corporation of New York. Filed April 17, 1912. Serial No. 691,269. (Carburetter in which fuel is vaporized by partial combustion.) 9 claims.

1,064,089. Motor-Vehicle. William Pearce Rayner, Philadelphia, Pa. Filed June 23, 1910. Serial No. 568,540. (Gasolene-electric driving system.) 9 claims.

1,064,095. Engine. Louis Schwitzer, Indianapolis, Ind., assignor, by mesne assignments, to Lyons Atlas Co., Indianapolis, Ind., a corporation of Indiana. Filed April 17, 1911. Serial No. 621,652. (Lubrication system.) 17 claims.

1,064,097. Cushion Tire. Michel J. Selzer, Akron, Ohio. Filed June 10, 1912. Serial No. 702,789. (Solid rubber tire with ventilating openings.) 1 claim.

1,064,100. Tire Protector. Clifton A. Smith, New Orleans, La. Filed Jan. 15, 1912. Serial No. 671,184. (Longitudinal and transverse strips interwoven to form a tread.) 1 claim.

1,064,119. Vehicle Tire. William E. Anderson, St. Louis, Mo. iFled Oct. 14, 1911. Serial No. 654,650. (Armored tread pneumatic tire of square cross-section.) 4 claims.

1,064,129. Resilient Wheel. William L. Chrysler, Eugene, Ore., assignor, by direct and mesne assignments, to Portland Automobile Wheel Co., Portland, Ore., a corporation of Oregon. Filed June 8, 1911. Serial No. 632,034. (Wheel with ... cushion around hub.) 4 claims.

1,064,132. Starting Mechanism for Internal-Combustion Engines. Arthur R. Curtis, Denver, ... Filed Oct. 12, 1908. Serial No. 457,236. (... starter.) 4 claims.

1,064,150. Priming Device for Explosive Engines. Peter McDaniel and William F. Kernolle, Frankfort, Ind.; said McDaniel assignor to Benjamin F. ... Frontfort, Ind. Filed Apr. 24, 1912. Serial No. ... 958. (Dashboard priming tank and valve.) 1 claim.

1,064,156. Wheel. John Erhardt Muhlfeld, Baltimore, Md. Filed Sept. 23, 1910. Serial No. 583,... (Wheel with pneumatic cushion surrounding hub.) ... claims.

1,064,161. Spring. John J. Newkirk, Chihuahua, Mexico. Filed Jan. 14, 1911. Serial No. 602,... (Semi-elliptic spring with one end short and ... and the other long and flexible.) 1 claim.

1,064,189. Vehicle Wheel. Michele Berardi, Philadelphia, Pa., and Michele Guglielmo de Simone, New York N. Y.; said de Simone assignor of ... third of his interest to said Bernardini. Filed Jan. 17, 1912. Serial No. 704,193. (Wheel with pneumatic tire around hub.) 3 claims.

1,064,190. Electric Air-Heater. Lester A. ... Cambridge, Mass., assignor to Joseph C. Kent, ... tee, Cambridge, Mass. Filed Dec. 14, 1912. Serial No. 736,662. (Electric heater for fuel pipe ... carburetter.) 1 claim.

1,064,199. Speed-Changing Device. James W. ... gar, McLaughlin, S. D. Filed March 9, 1912. Serial No. 682,637. (Drive through spur and bevel ... and dog clutches.) 5 claims.

1,064,213. Supporting Means for Transmission Mechanism. Reinhoid Herman, Crafton, Pa. Filed Jan. 9, 1911. Serial No. 601,754. (Suspension ... motor and transmission system.) 23 claims.

1,064,214. Shock Absorbing Device. Reinhold Herman, Crafton, Pa. Filed April 25, 1911. Serial No. 623,287. (Pneumatic shock absorber.) 2 claims.

1,064,215. Cushioning Apparatus for Vehicle Frames. Reinhold Herman, Crafton, Pa. Filed June 21, 1908, Serial No. 411,880. Renewed Dec. 10, 1911. Serial No. 736,045. (Spring suspension system.) ... claims.

1,064,257. Resilient Wheel. Adolph Rosenthal, Alexandria, La., assignor of 25-100ths to John N. ... Cramer, Harrington township, Bergen county, N. J., and one-half to Joseph M. Goldberg, Alexandria, La. Filed July 31, 1912. Serial No. 712,381. (Spring-cushioned hub.) 1 claim.

1,064,259. Motor Vehicle. Paul Synnestvedt, Pittsburgh, Pa. Filed March 12, 1907. Serial No. 361,938. Renewed Oct. 24, 1912. Serial No. 727,... (Single-motor electric vehicle drive.) 24 claims.

1,064,300. Piston Packing-Ring. Willis G. Dodd, San Francisco, Cal. Filed Sept. 3, 1912. Serial No. 718,339. (Piston ring with stepped joint.) 3 claims.

1,064,259. Demountable Rim. John D. Kennedy, New Kensington, Pa. Filed Feb. 3, 1912. Serial No. 675,308. (Demountable rim for solid tires.) ... claim.

1,064,353. Resilient Wheel. William Lupton, Los ... Cal. Filed Nov. 14, 1911. Serial No. 660,... (Wheel with curved spring spokes.) 1 claim.

1,064,365. Speed-Changing Mechanism. George D. ... Munsing, New York, N. Y. Original application ... filed May 17, 1911, Serial No. 627,864. Divided and ... this application filed July 27, 1912. Serial No. 7... 898. (Sliding gear system with three shafts.) ... claims.

1,064,368. Means for Charging the Cylinders of an Internal-Combustion Engine with Explosive Gas. Owen W. Nacker, Flint, Mich., assignor of one-half to Alanson P. Brush, Detroit, Mich. Filed June 19, 1912. Serial No. 704,474. (Priming device.) 4 claims.

1,064,562. Fluid Power-Transmission Apparatus. Frank H. Summeril, Denver, Colo., assignor of one-half to Horatio N. Norton, Mount Vernon, N. Y. Filed May 21, 1910. Serial No. 562,790. (Hydraulic transmission system.) 24 claims.

Service

Now go on and smile—with some it may be a sad smile. All because this word service is the most universally used and abused word in automobile selling. Our ambition is not merely the sale of a National but the pride in keeping it sold to a satisfied customer.

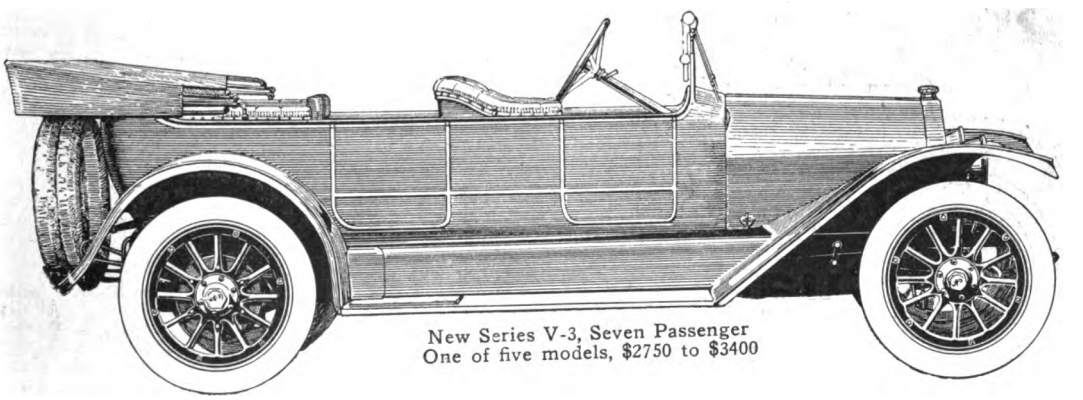
THERE is no generally accepted standard by which you can judge service. Experience is the only way to find out, and sometimes this is too unfortunate and too costly. Everybody promises service; every dealer offers service as an inducement; every manufacturer boasts of his service. This word is becoming a joke—and a disastrous joke.

AS a matter of fact, every dealer and every manufacturer can not give the same degree of good service. Yet, when a man looks along auto row for a car, he gets equal promises of service from every dealer. Even if the dealer means well, he won't give good service to his customer if the factory the dealer represents does not give him good service. As a result the public has grown skeptical—and it is the manufacturer's own fault. Service-promises mean much or nothing, depending upon who makes the promise.

Stock Champion. Fastest Stock Car Mile.

National

International 500-Mile Record Holder



The National Motor Vehicle Co., Indianapolis, Indiana, offers you the following service guarantee. We believe no other company can give you better, and we know we can give you all we promise. Ours is a prosperous concern, and therefore in a better position to be liberal.

1. Service starts with the National car and is not a mere after-apology. We put service into your car when it is built so that it requires a minimum attention in your hands.

2. A company of 14 years' success, of enviable reputation and stability as well as ability is your guarantee that our promises will be fulfilled.

3. Liberal attitude toward dealers in supplying parts with dispatch and cheerfulness and in guaranteeing to private owners that every National dealer's service will be satisfactory.

4. Our policy is to keep our good name and our cars' good reputation above reproach. Satisfied and service-fied customers is our successful ambition.

New Series V-3, Seven Passenger
One of five models, $2750 to $3400

Westinghouse Elec. & Mfg. Co.	East Pittsburgh, Pa.

Count Them

and if you are at all familiar with the various Electric Lighting and Starting Systems you will readily note that there are but THREE MANUFACTURERS whose names do not appear in this list.

A Total of 37 Manufacturers of Whom 34 Recommend the Use of GLBA Batteries or 91.9%

and Agents for cars not equipped with GLBA Batteries are INSISTING that their manufacturers SHALL ADOPT them instead of those which are IMITATIONS of the GLBA.

This overwhelming preference for GLBA Storage Batteries is not due to price consideration, as THEY ARE NOT SOLD ON PRICE.

The actual performance, superior quality, long life, enormous manufacturing facilities, and our unequalled service organization are the features that prompt the FAR-SEEING MANUFACTURERS to pin their faith to the GLBA.

When you buy a car, remember that the starting and lighting system is a vital part of the car equipment.

YOU WANT THE BEST. If you insist on a system made by any firm in the above list, you get an Battery with it—if you ACCEPT one of the other 3, remember that you ARE NOT getting a system whose elements are of the best—and ONLY from a combination of the best can be secured that perfect, harmonious operation which insures the utmost efficiency and satisfaction.

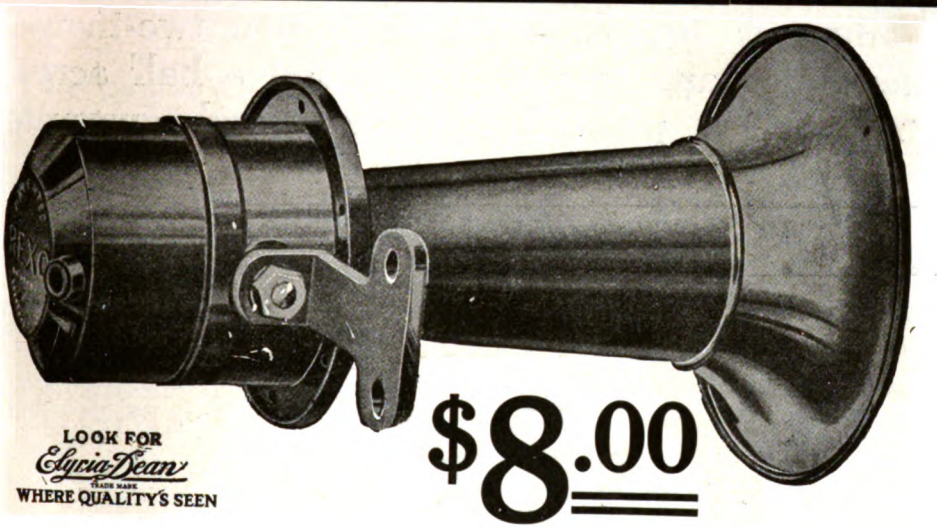
TUTO HORN

$15.00

LOOK FOR
Elyria-Dean
TRADE MARK
WHERE QUALITY'S SEEN

Elyria-Dean Warning Signals, Best From Your Own Standpoint



Goods which have quality and which are priced right possess two of the greatest selling advantages in any retail selling field

Here are the things that insure the quality of Rexo and Tuto Signals:

The correctness of the Elyria-Dean principle is beyond controversy. Your customers never argue about mechanics of a horn, and even if they did, Elyria-Dean Signals have more points in their favor than any other; you have the word of an old established and responsible concern, a concern whose electrical products are known the world over for their lasting qualities.

Digitized by Google

REXO HORN

In workmanship and material Elyria-Dean Warning Signals are equal to the highest priced and their finish as good as can be made.

The Elyria-Dean Line of Automobile Warning Signals consists of the Tuto, a two tone signal for large cars, whose bulk and speed make necessary, upon occasion, a warning device which will at once roar out a penetrating and positive demand for the right of way, while upon the majority of occasions its lower, coaxing signal is amply adequate. The sounds are governed by a light or a hard push upon the control button.

And the Rexo, which has a sound almost as loud and equally as penetrating as the Tuto, although the Rexo is smaller and corresponds with the size of a smaller car.

With either the Tuto or the Rexo the warning sound jumps to its maximum volume immediately, no waiting until the mechanism has speeded up.

Price of the Tuto is $15.00, of the Rexo $8.00. Search the open market over and you will not find the same quality and price on two horns so well adapted to motoring needs in size and sound.

The Elyria-Dean proposition to Dealers is liberal, in fact it will make equally as strong an appeal to you as do Elyria-Dean Signals at their prices to your customers. Write us.

MESHES ITSELF
UNMESHES ITSELF

Rushmore Starter out of action

The SNAPPY Start is the EASY Start

JUST PRESS A BUTTON

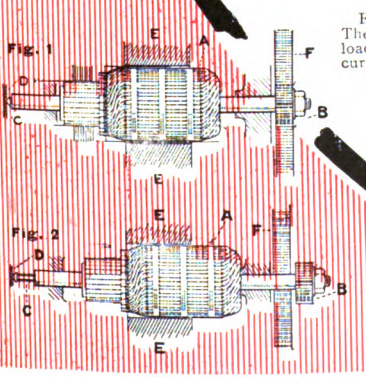
If air didn't get hot when quickly compressed, all the electric starters on earth couldn't make an ice-cold engine pick up its cycle.

The gasoline of today doesn't evaporate fast enough to mention at 30 degrees F. and below. You could run ice-cold liquid gasoline through an engine all day without getting a single "kick," if the air stayed cold.

It's the heat of compression—nothing else—that warms up a cold engine in winter so that the raw gasoline reaching the cylinders evaporates and ignites. The quicker the spin, the less heat escapes to the cylinder walls and the more heat is available to evaporate the gasoline.

With 85 lbs. compression the rise in temperature, with no loss to the cylinder walls, would be nearly 400 degrees.

That is the main reason why an electric starter, to be satisfactory in cold weather, ***must start the engine with a rush*** A sluggish start permits leakage and loss of heat, and compels a slow process of "warming up" in place of the almost instantaneous start possible with quick compression.



The RUSHMORE STARTER

has an efficiency ratio ***from battery to flywheel*** of 72 to 75%. This is about 50% higher than the efficiency usually obtained, counting the loss in intermediate gears with other starters.

The higher efficiency of the Rushmore is a true measure of the higher speed at which it spins the engine for equal current used.

Fig. 1. The Starter in action. Pressing the switch button causes the poles E E to attract the armature A to the left, thus engaging the pinion with the flywheel gear.

Fig. 2. After the engine starts. The increase in speed, when the load is removed, kills the battery current for an instant, allowing the spring C to slip the pinion B out of mesh.

The Rushmore Starter is of slow speed design and runs normally at 1000 to 1200 r.p.m. It is electrically much more efficient than a high speed starter would be, and there is no loss in intermediate gears; hence a very small motor develops ample power. By an ingeniously simple use of armature end play a pinion keyed fast on the armature shaft is made to mesh and unmesh automatically with the flywheel gear at the right instants. The operator simply presses a button; the Starter does all the rest.

THE Detroit ELECTRIC

Why the Electric, and Why the Detroit?

It is an axiom in the motor car business that a dealer is often known by the car he handles.

In this advanced stage of the motor car business, it is further recognized that a live dealer cannot afford to overlook the electric.

So, not only does a dealer need to handle an electric.

He must handle a leader among electrics.

The Detroit Electric is just such a leader. It is being built and sold in greater numbers than any other. It is produced by the largest concern building electrics. AND NOT ONLY THE LARGEST BUT THE STRONGEST FINANCIALLY.

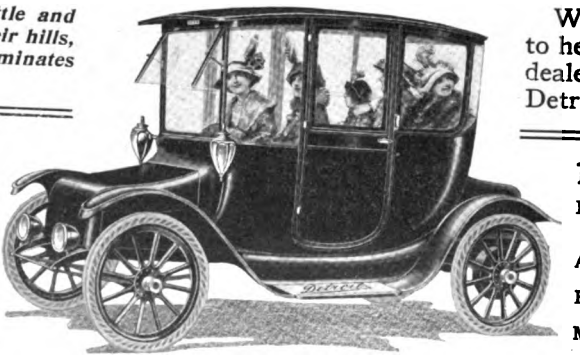
Consider for a moment the significance of such factors as these:

80 per cent. of the Detroit Electrics in service are owned by those who drive no other cars.

In Kansas City, Seattle and other cities noted for their hills, the Detroit Electric dominates its field.

The Detroit Electric leads in Chicago, the world's greatest market for electrics.

More advanced features are found in the Detroit Electric than in any other.



Sales of the Detroit Electric are approximately 100 per cent. greater than for any other electric.

Simplicity of mechanism and economy in operation are developed to the greatest possible degree in the Detroit Electric. It possesses beauty in finish and luxury in appointments that mark the highest expression in body building. Its reliability and sturdiness is every day being demonstrated.

At this time there is a limited amount of open territory which we will allot to live, responsible dealers—men who appreciate the future before the electric.

It means a lot to a dealer to make a connection with such a concern as the builders of the Detroit Electric. It means a lot to a dealer to handle the leader among electrics.

We are always glad to hear from automobile dealers interested in the Detroit Electric.

CORBIN-BROWN SPEEDOMETER
"The Speedometer of Absolute Accuracy"

In competition with practically all other makes and at a higher price, the Corbin-Brown Speedometer has been selected by the Hendee Manufacturing Co., of Springfield, Mass., manufacturers of the Indian Motocycle, as part of their 1914 equipment.

This unprecedented order is all the more significant because of the generally appreciated high manufacturing standard maintained by the Hendee Manufacturing Co.

The Corbin-Brown Speedometer was selected only after the most exhaustive tests for accuracy and dependability.

Contributing factors were the reputation of the manufacturers and the fair guarantee given with every Corbin-Brown—a guarantee not based on mileage but on a full year's service.

You cannot possibly realize the amount of severe shock and strain that is concentrated on the bearings of your car and transmitted through the bearings to all the operating parts. This occurs even when you are traveling over city pavements.
Hyatt Roller Bearings cushion and, in a great measure, absorb these shocks, hence relieve the gears and shafts of this strain.
This is due to the Flexible Roller, an exclusive Hyatt feature.

Two books, one about motor car bearings in general for prospective purchasers, the other for automobile owners, will be sent on request

Oldsmobile 1914

Established 1880 Incorporated 1899

THE dealer who sells the Oldsmobile is dealing in known values, and enjoys the prestige of leadership, together with the liberal profits that are always accorded a leader.

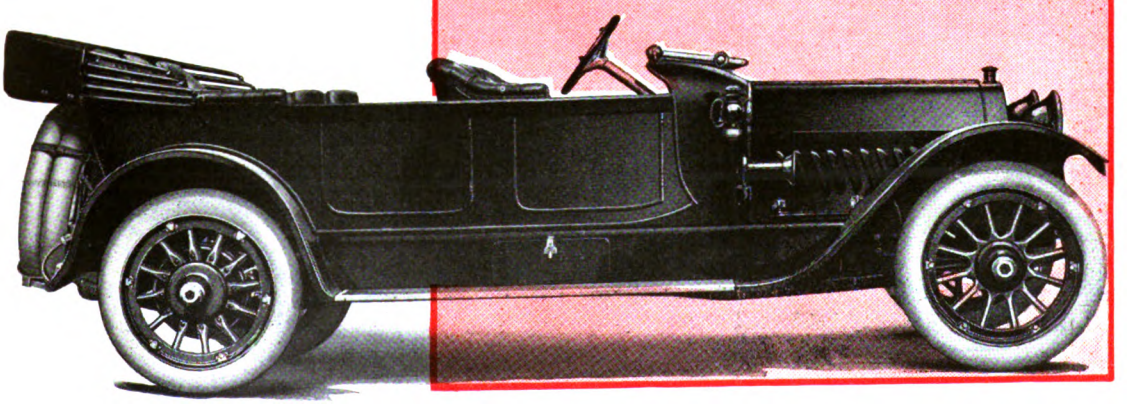
There is no question of Oldsmobile superiority. Everywhere it is recognized, and the dealer who sells it need never argue the point.

Wherever automobile men meet, the new Oldsmobile Model 54 commands their admiring comment, and it is frequently noted as remarkable that such a perfect car can be built and sold for such a price.

Combination Four or Five-Passenger Phaeton, Touring Body Type, $2975

Seven-Passenger Touring Body, $175 Extra

Limousine $4300



Our increased production for the season of 1914 permits us to allot territory to a few extra dealers.

Never in the history of this company have we been so well equipped to meet the demands of our dealers by prompt shipment of cars as ordered. We urge you to write us at once, if you are prepared to sell in your territory a car of the high standards of quality, material and design found in the Oldsmobile.

OLDS MOTOR WORKS, Lansing, Mich.

Equipment 1914 Oldsmobile Model 54

Combination electric and oil side and tail lamps, special Oldsmobile design. Special design Oldsmobile electric head lamps. Special design three-way adjustable ventilating windshield. Top, boot, and patent adjustable side curtains. 60 miles speedometer. Adjustable stem setting and winding Waltham clock. Rear tire irons, capacity for two tires. Demountable rims, one extra. Imported horse-hair tonneau mat. Motor-driven air pump. Famous Delco starting, lighting and ignition system. Electric light in tonneau. Extension electric trouble lamp. Tools, jack. Patented bow separating top holders. Adjustable auxiliary seats in seven-passenger. (Extra, at additional cost, wire wheels; special Oldsmobile touring trunks.) Motor, 50 horsepower, six cylinders, unit power plant, three-point suspension. Bore 4¼, stroke 5¼. Extreme length of four and five-passenger models, 16 feet. Extreme length of seven-passenger, 17 feet. Spring, front, semi-elliptic. Spring, rear, ¾-elliptic, underslung. Tires, 36 x 5, both front and rear. Gabriel snubbers. Klaxon horn.

FIRST ADVERTISEMENT

We have to offer a motor car selling franchise of extraordinary value to 50 efficient, successful automobile dealers in as many cities.

These fifty men should be representative of the front rank of American automobile distributors, able business men; successful and aggressive, first quality men for a first quality connection.

The possibilities are wonderfully interesting.

Have you ever asked yourself this question: "When will the real automobile that I have been waiting for come along?"

The car that will stand out from the mass so sharply, so distinctively, that even a man who knows motor cars will quickly say at first sight

"HERE'S A REAL AUTOMOBILE"

Gentlemen, we have A REAL AUTOMOBILE.

If it passed you on the street today you would turn, watch it disappear and ask

"What car is that?"

If it stopped in front of your door, stripped of every identifying mark, you might properly say

"Here's a new foreign car--Isn't it a stunner?"

We have built a motor car in America that is not like any other car built in America.

We have put into it something which we do not believe has been put into any other American car.

That means something because there are scores of splendid American cars, wonderful cars, from every standpoint of mechanical excellence.

We have made a six-cylinder automobile that we believe is as near 100 per cent efficient mechanically as any type of motor driven vehicle thus far produced.

This motor car does three great things which in our mind typify mechanical efficiency:

Digitized by Google

Digitized by Google

IT RIDES SMOOTHLY

IT STANDS UP

IT FUNCTIONS ECONOMICALLY

That is the alpha and omega of motor car construction.

We could write pages about our motor, transmission, axles, electric starter and the other essentials of construction,--THEY ARE ALL THERE; nothing is missing.

It is a joy to sit at the wheel of this car. The more you know of silent, easy, powerful motor car action, the more pleased you would be with the easy starting, and stopping, and perfect running of this car.

More speed than the sane motorist needs except in emergencies,--power to take any hill or grade that a car may be asked to climb.

THE NEXT GREAT STEP FORWARD

IN AUTOMOBILE CONSTRUCTION AND

DEVELOPMENT IS NOW ANNOUNCED:

THE APPEAL TO THE EYE

Having an efficient car of the highest class "under the bonnet," we have made a great stride forward in the appeal to the eye.

We now ask you to concentrate on this important, vitally important, feature. We have made a car that has that distinctive quality which instantly evokes admiration and favor--STYLE--

This new car is the smartest, best looking, "best dressed" car, if we may say it, that is to be bought in America--and the price is $2750. We have produced a car with individuality,--a car that a man or woman of good taste will instinctively approve and prefer,--a car that may be put in a show window with the definite assurance that it has that "appeal to the eye" which is so powerful in its possibilities to attract the purchaser who wants style.

We are prepared to show the car to the fifty men, we will take them over smooth roads and rough--they can sit at the wheel and put the car through its paces in their own way, and then we will talk business.

The planning, development and construction of this car was all done silently,--like the car itself. There has been no publicity. Now we are ready.

If you are in the Automobile business "for keeps," in the right way and in the right city, let us hear from you. We can show you something so decidedly interesting, so replete with possibilities of profit and prestige, that you will be glad that this advertisement attracted your attention and that you followed it up with a letter, wire, or call.

Lippard-Stewart

The Delivery Car

Lippard-Stewart Worm Drive Delivery Cars

SILENT AND POWERFUL

The Lippard-Stewart is the first delivery car to afford purchasers the advantages of worm drive. Now the way is opened up for the use of solid tires on a live axle with absolute reliability. These new specifications are steps ahead toward furnishing truck owners still greater economy and operating efficiency. They make this car, with a reputation already established for satisfactory operation, even better adapted to many requirements. The original light delivery car of high quality, at a price within reach of the average business man's resources, the Lippard-Stewart now keeps up its record of meeting the demand of users and the trade through modern worm drive.

Why Worm Drive Suits Truck Service

To use the greatest amount of motor power in actual driving energy is one of the big problems of truck design. Wasted power means wasted gasoline. Wasted power means excessive wear. Worm drive corrects waste and wear. Increased ability is obtained. Silence in operation is a characteristic. The smoothest possible application of power minimizes driving strains. Worm drive offers the best method of securing a gear reduction through which the 30 H.P. motor levels the steepest hills. It is the last word in efficiency of all types of final drive.

The David Brown worm and gear—the type made famous by its success on London omnibuses—are used in the Lippard-Stewart rear axle of Timken manufacture. The mechanism is the latest refinement of precise machine work. The foremost English and American engineers are responsible for its design. Lippard-Stewart worm drive has the endorsement of these experts, is backed up by the most rigid factory tests, and has made good in actual service.

The Tire Question---Its Solution

Tire specifications depend upon operating conditions; solid tires may suit a given case better than pneumatic, or vice versa. The new Lippard-Stewart rear system permits of tire equipment of either type. In the past the use of solid tires has been limited to the now obsolete dead axle construction. Now the Lippard-Stewart worm-driven axle lifts the ban on live axles. It is especially built for solid tires—rugged—will not loosen up under jolts and jars. Solid tires can be attached with the assurance that the mechanism will be properly protected from the effects of road travel. The new axle makes interruptions of service less frequent—the car's capacity for work is increased accordingly.

A Chance for the Dealer

The Lippard-Stewart line also includes a worm driven truck, 1½ tons capacity. With these two models, the requirements of most truck users can be supplied. We want to hear from the man who can grasp the big possibilities offered by the sale of the Lippard-Stewart. Our proposition for unassigned territory is a money-maker; write for it—right now.

SPECIAL FEATURES: 30 H.P. Continental motor; Eisemann magneto; cone clutch; Brown-Lipe selective transmission; Timken *bevel drive* (5 to 1 ratio), or *worm driv* (6 to 1 ratio) rear axle; Timken front axle; 35 x 4½ in. Pneumatic tires (*or 34 x 3 1-2 in. front and 34 x 4 in. rear solid tires with worm drive axle only*); sturdy frame; radiator at dash; left hand drive.

Chassis price $1650 (bevel drive) f. o. b. Buffalo. Worm drive, $100 extra above prices of bevel drive models. Bodies to suit a variety of purposes.

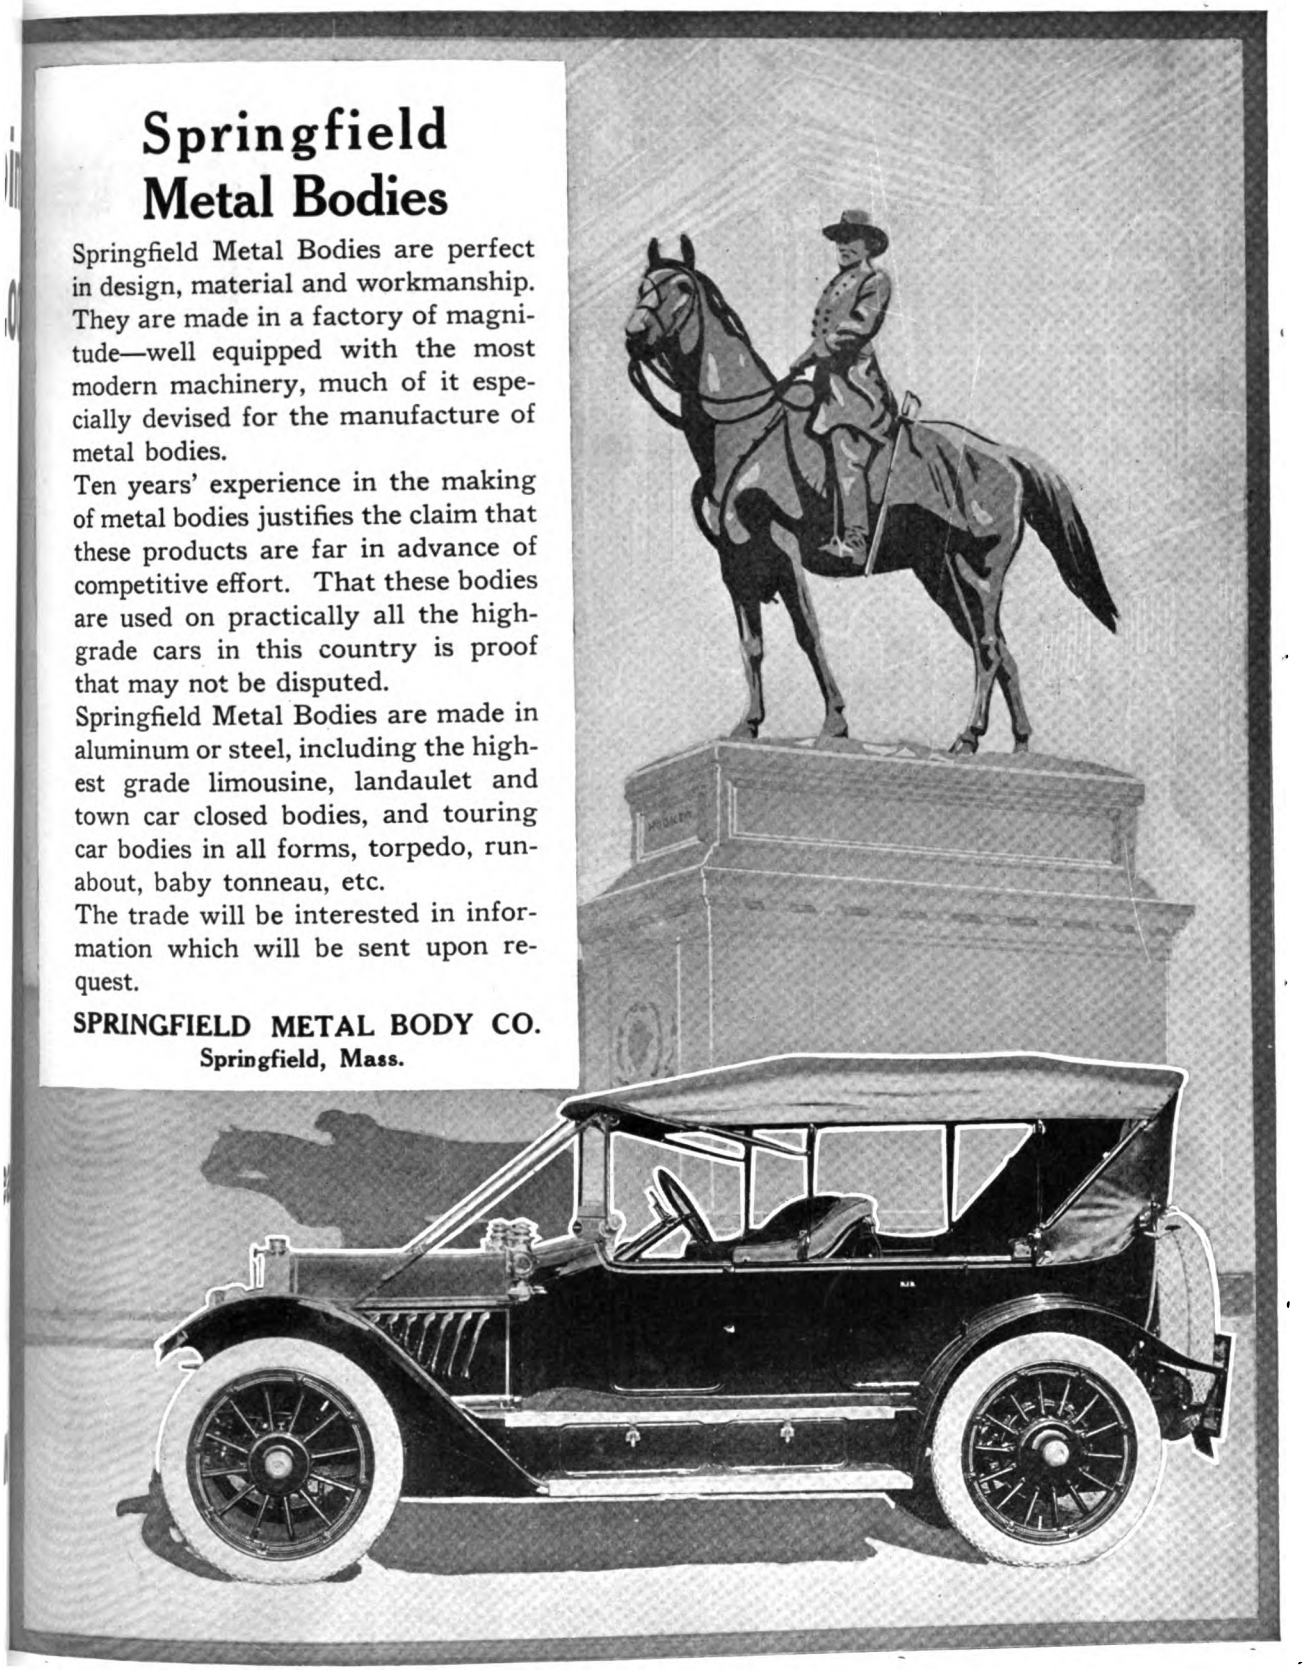
Springfield Metal Bodies



Springfield Metal Bodies are perfect in design, material and workmanship. They are made in a factory of magnitude—well equipped with the most modern machinery, much of it especially devised for the manufacture of metal bodies.

Ten years' experience in the making of metal bodies justifies the claim that these products are far in advance of competitive effort. That these bodies are used on practically all the high-grade cars in this country is proof that may not be disputed.

Springfield Metal Bodies are made in aluminum or steel, including the highest grade limousine, landaulet and town car closed bodies, and touring car bodies in all forms, torpedo, runabout, baby tonneau, etc.

The trade will be interested in information which will be sent upon request.

Where Bearings Are Read Like Books

STRETCHED across one end of a room in the laboratory is a curtain. Suddenly the lights go out and and on this background appears a picture. To the casual observer it is a puzzle—to the trained eye of the metallurgist it is an open book from which he reads, as easily as you read here, the structure of the steel from which is made the cups, cones and rollers of the

TIMKEN
TAPERED ROLLER BEARINGS

Thousands of dollars and years of ceaseless experimenting have been spent in determining the best steel for each part and the proper way in which to carbonize and heat-treat those parts to resist wear.

Experience has proved that if the steel maker lives up to Timken specifications, our carbonizing and heat-treating formulas will bring out the wear-resisting qualities we know bearing parts should have.

So the first big broblem is to *know* that the structure of the steel is *right*.

As the X-ray enables the physician to see beneath the flesh and muscles of the human body, so the microscope and the camera lay bare to the eye of the metallurgist the structure of a Timken Bearing.

Nothing must be taken for granted. If the structure of the raw steel is not up to the Timken specification the microscope and the camera tell the story before a machine can touch it. If the carbonizing and heat-treating do not properly change the structure of the finished parts the microscope flashes the danger signal before the bearings can leave the factory.

It was rightness of principles that first brought fame to the Timken Roller Bearing.

We have never been able to improve those principles. But what we have done, and are doing every month and year, is to make the Timken a better bearing in steel—in heat-treatment—in accuracy.

Added to this is the watchful care of the metallurgists who take nothing for granted—who judge solely by results.

The whole interesting story of the Timken Bearing is told in the Timken Primer No. T-1. Sent free post-paid. Ask for it today.

THE TIMKEN ROLLER BEARING CO.
Canton, Ohio, U. S. A.

Every Timken Bearing, large or small, is of just one Timken Quality, through and through

A 1914 Car That Meets All the Demands of Dealers and Owners

This year, more than ever before, does the Chalmers fully meet the ideals of both dealer and public of what a motor car should be. It contains every feature that motor fashion demands. Dealers have only to show the wonderful New Chalmers "Six" and its sale is assured.

This car more than meets the expectations of the experienced motorist and all prospective buyers who are looking for big value. A big, powerful and beautiful motor car, driven by a master motor—a car equipped with every comfort and luxury that the most critical motorists could ask.

This Year Chalmers Cars Are Easier to Sell than Ever Before

In every way—quality, construction and price—the Chalmers measures up to the careful buyer's standard of value. Never before has such a car as this new Chalmers "Six" been offered for less than $3,000. Yet this splendid car sells for $2,175.

We have on our books at this time more orders for this new "Six" than we have ever had for any other Chalmers model, for never before has a car achieved such a name for itself as has the new Chalmers "Six" in the short time since its announcement.

It Took Two Years of Hard Work to Produce the Master "Six"

The 1914 Chalmers "Six" is a new car—**new from the ground up.** It has a different design from any other car; it has a new motor—a smooth-running, powerful motor—that delights the heart of any one traveling behind it.

It has taken two years of hard work to produce this great new "Six." We have drawn from the experience of the whole world in building the new "Six"; and we have tested every feature through many months and thousands of miles of the roughest usage.

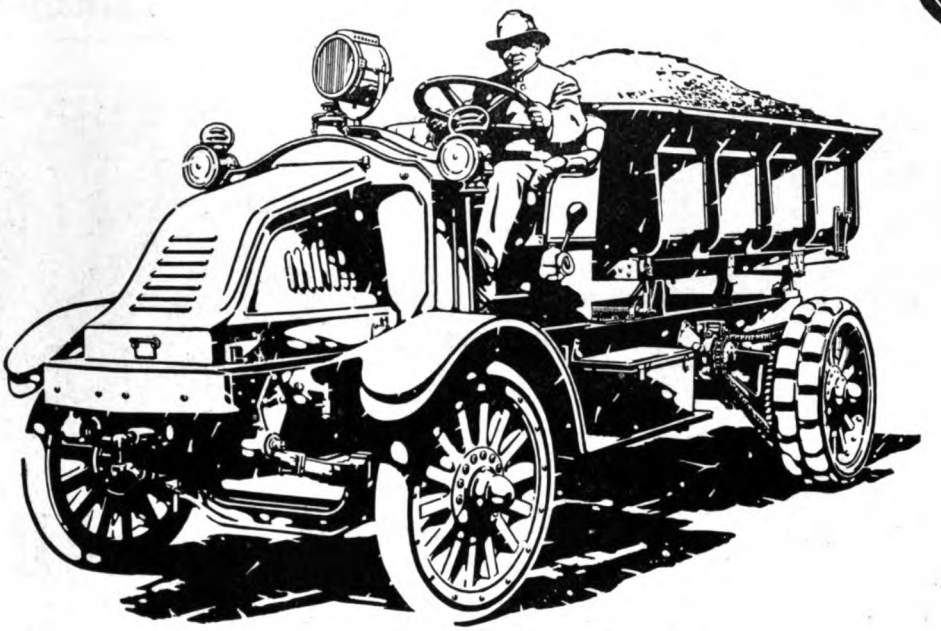
The new Chalmers "Six" is ahead, in its powerful, vibrationless motor, its non-jerking cork insert clutch, its quietness and wonderful flexibility, its streamline bodies and in its electric lights and electric starter.

The Chalmers-Entz starter—built complete in the Chalmers shops—is a marvel of simplicity. One move of a switch and the motor starts. And this starter absolutely prevents any stalling of the motor. It is one of the things that is making the "Six" sell itself—one of the many things that will make 1914 a most profitable year for the dealers that sell Chalmers cars.

Features That Compel Sales

We believe that the new Chalmers "Six" has features that every wise motorist today demands—qualities that are only made possible by the following:

Non-Stallable Motor
Left Side Drive—Right Hand Control
Six Cylinders—all moving parts enclosed
Valves of Chalmers Tungsten Steel
Electric Starter—Silent Entz System
Clean Running Boards—Tires carried in rear
Gasoline Tank—leak-proof, rear suspension
Wide Doors—Fitting Flush—no moldings
Streamline Body—Tapering Bonnet—Molded Oval Fenders
Four Forward Speed Transmission
Eleven Foot Wheel Base—All Bodies Interchangeable
Electric Driving Lights—high and low power
Big Tires 36 in. x 4½ in.—Underslung Springs
Continental Demountable Rims
Concealed Electric Vibrator Horn
Chalmers Silk Mohair Top—Quick-Acting Storm Curtains
Genuine Rain-Vision Wind Shield—Warner Speedometer



Roadster	$2175

Sturdiness and Power

There's a sturdy truck—there's a Kelly! The Kelly is not a pleasure car—except that it brings pleasure to its owner in the saving of money and the betterment of service, but first and most important of all, it is a TRUCK unhampered by the traditions of pleasure car practice in engineering and in manufacture.

"The sturdy Kelly"—that best expresses it—willing, competent, trustworthy and always doing a little more and a little better than was expected of it.

Sturdy Kellys make bigger days and restful nights because they run on schedule.

"BOWER SAVES POWER"

The More Speed the More Waste

The unique construction of Bower Roller Bearings enables them almost to defy friction. The load is borne evenly along the whole length of the bearing. The radial thrust is sustained by a flange, not by the roller itself. Finally, the rollers, because they are always parallel to the raceway, can be made of maximum diameter. Consequently, their speed of rotation is less, ensuring long life.

Bower Bearings never need adjustment.

EVERY MOTORIST should have this BOOK & CHART.

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

"As Sure as the Whirl of the World."

Write for Your Copy Today

and inform yourself regarding the care and operation of the modern Electric Starting, Lighting and Ignition Systems.

The information given in this handbook and on the operation chart which accompanies it will give you practical aid in the proper operation of all automobile electric systems.

Explans in detail functions of the various parts, how to locate and remedy troubles of all kinds. It is the best written book on the subject so far produced.

The large operation chart which it contains is alone worth the price.

Regular price 50 cents.

Will be sent to you for 10 cents in stamps if you use this coupon.

This Book Covers the Following Subjects

Electric Starting and Lighting Systems
The Generator
The Storage Battery
The Motor
The Controls
The Wiring
The Circuit Breaker
The Governor
The Ammeter
The Switches

The Electric Auto-Lite Co.

The Pioneers and Makers of the 6-Volt Electric System

The Self-Starter Series is Ready—and Right

¶ The first thousand of the new Detroiter self-starter series is now going through the factory. It was long awaited by over 600 Detroiter dealers, and withheld in spite of tremendous pressure from every selling center, until the starting device, right in every detail, was perfected. The announcement now made is a document of the greatest importance to every dealer in automobiles.

The Detroiter-Remy Starter $125 Extra

The cleanest piece of workmanship ever brought out in this line. On or off in fifteen minutes. Adds less than forty pounds weight. Preserves perfect balance. Spins motor 175 R. P. M. Operates positively at first pressure of foot pedal. Has no parts to stick or collect grit. Oiled from engine lubricating system. Entirely out of way. Automatically ensures easy starting in coldest weather. And can be added, with perfect installation, to any of the thousands of Detroiters already in use.

Detroiter $900

¶ This announcement marks another sure step in the progress of one of the most successful firms in the industry. It opens a new opportunity to salesmen. It is worth immediate attention on your part—YOU who are reading this advertisement—if your territory is not already closed.

¶ There are several medium price cars competing for this trade. They are all good cars. Yet, in two seasons, the Detroiter has outclassed them. It has established the industry's record for percentage of growth.

¶ *Is not this the kind of firm to be identified with?*

¶ There have been vital reasons: THE DETROITER IS A CAR THAT APPEALS TO DEALERS. It has good points, possessed by no other car of its class, that arm its salesmen with ready arguments. Any man who knows anything at all about automobiles can see the Detroiter's distinction at a glance. The full-floating axle, platform spring, long stroke motor, and other big features have been the admiration of every dealer who ever examined the Detroiter. And what a man respects and admires he can't help but sell.

¶ *Is not this such a car as you have been looking for?*

¶ But perhaps the most remarkable thing about the Detroiter's sales is that while many medium price cars draw their purchasers from men who start out to look over the cheap cars and decide they will go just a little higher—the Detroiter forces men to buy who start out to look over the high-price cars and find they can get all the good features in the Detroiter at several hundred dollars less.

¶ *Is it not such a high-grade proposition you want?*

¶ Well, this is it.

¶ And now comes the Detroiter-Remy Starter and the new fall series—a bigger motor among other refinements, and A BIGGER DISCOUNT TO REPAY THE DEALER FOR HIS EFFORTS.

¶ There is still a chance for more dealers to profit.

¶ Get our proposition without delay.

American Axles

Supply the Most Efficient Type of the Silent Worm Drive: The Lanchester-Daimler

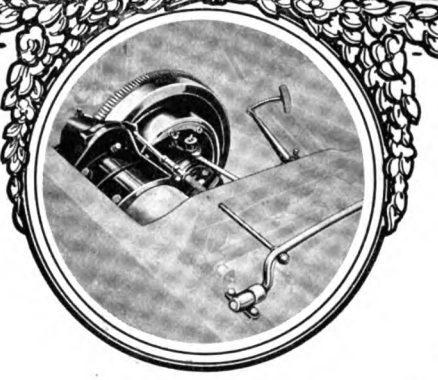
The above statement is not offered as an argument; it is simply the consensus of leading automobile engineers on both sides of the Atlantic.

While America discussed the worm drive, England tested it. While Americans theorized as to whether its acknowledged advantages could be extended to electric and gasoline pleasure cars, foreign motorists were already enjoying its wonderful efficiency.

For more than two years we have regularly mounted the Lanchester-Daimler—the accepted leader among worm drives—in a full floating *American* Axle fitted throughout with the finest of foreign ball bearings.

We count ourselves fortunate in holding the sole American rights as axle manufacturers to the use of this drive.

Automobile manufacturers who have adopted our axles are equally fortunate; they offer in this worm drive a known quality, together with a mounting that represents the highest ideals of American manufacturing.



The adjusting and full-floating features of *American* Axles are fully covered by our own patents and by shop rights from other patentees.

THE AMERICAN BALL-BEARING COMPANY, Cleveland, Ohio

GRAY & DAVIS

Simple **Reliable**

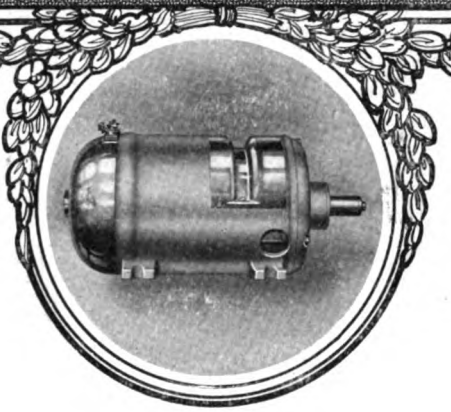
AUTOMOBILES easiest to sell are those equipped with a starting-lighting system of national reputation plus known efficiency.

Take two cars, for instance, both the same price, both have the same finish and are identical in power, etc.

One is equipped with the famous starting-lighting system.

The other carries merely "an electric system."

Which will sell the quickest?



You know the answer.

Write for Instruction Book

GRAY & DAVIS, Inc., Boston, Mass.

SHELDON
AXLES AND SPRINGS

606 WORM DRIVE PARTS

VS.

1866 DOUBLE REDUCTION PARTS

A CHAIN is no stronger than its weakest link. Every nut, cotter, washer, head pin casting, forging, chain link and rivet is a necessary unit of the assembly it composes. The failure of one of those units may mean the wreck of your truck, and perhaps the damage of property and loss of life.

Only one-third the number of parts required for a Worm Drive that are required for a two-step reduction of the chain driven type. This is convincing proof that, all things being equal, the single reduction Worm Drive has a three-to-one chance of giving better service than a two-step reduction with three times as many parts.

But all things are not equal. The Worm Drive is a single reduction, transmitting the power direct from the motor to the rear wheels. It is the only drive in which it is possible to secure this result.

The Worm Drive conserves power because it is a single reduction. Every moving power transmitting unit works in oil, reducing friction to a minimum.

Sheldon Worm Drive is non-adjustable. The Worm carrier is machined exactly true by specially constructed machines.

If the carrier is not true, the Worm can not be assembled. Once assembled the Worm and Worm Wheel can be removed and replaced without disturbing their alignment. No adjustment to tamper with.

It is not necessary to provide adjustment for wear. The slight wear of the imported Worm and Worm Wheel only adds to its efficiency.

Of course, the Worm and Worm Wheel wear out, but not during the life of one truck. The experience of the largest user of Worm Drives has proven this.

COX OXYGEN CARBON CLEANER

Cold Weather Increases Carbon Deposits

Winter Driving Facilitated

Cold weather calls for thin engine oils. Thin oils frequently cause imperfect or over-lubrication—and it is over-lubrication with incomplete combustion, that produces carbon deposits in cylinders.

Carbon deposits cause a lot of trouble which is hard to trace. You can rarely tell, without dismantling your engine, when it is carbon that is responsible for engine faults. Thus it is decidedly important that cylinders should be cleaned of carbon at regular intervals—to assure maximum of efficiency with minimum of trouble.

And the **most complete and thorough**, while **least expensive** method for doing this is by use of a

COX OXYGEN CARBON REMOVER

No taking down engine! No half-finished scraping of cylinders and pistons! No tieing up the car for a day or more!

The work is done quickly—within from 6 to 10 minutes per cylinder. It is done **completely**. The oxygen removes the carbon to the smallest detail and from every nook and corner—**even to the pores of the metal.**

Taxicab, Motor Truck and Large Private Owners will find this a means of not only saving money but also of easily and constantly keeping the cylinders of their cars in excellent condition. For them, one Cox Oxygen Carbon Remover will pay for itself many times over.

GARAGE OWNERS can make it pay a handsome dividend—while doing the work for their customers in much less time and far better results. Owners can afford and will have you clean their engine cylinders frequently when they know it costs little, takes only a short time and will do the work right. The Cox Oxygen Carbon Remover has paid for itself twice over in one week—and can do the same for you.

We Manufacture Patterns

We don't "make" patterns—we MANUFACTURE them—

There's a difference and the difference means that we not only work to CUT THE FOUNDRY COSTS of our customers but to reduce pattern costs. In a word we are not trying to "feather our nest" off one job, but building up a steady, reliable trade that "sticks." Proof of the fact lies in the erection of our new factory—one of the most completely equipped and most modern in the country. "At your service" really means what it should here.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to ***prevent*** accidents.

"I can't afford to take ***any chances.*** We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of ***Weed Chains*** and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—***Life Insurance*** and ***Accident Insurance Companies*** strongly endorse them and recommend their use. ***Taxicat Companies,*** for their own protection, ***insist*** that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the ***most profitable*** Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

One of Those Wrapped Tread Repairs That Outlast the Tire

The wrapped tread blow-out repair is the best for the motorist because it is stronger than any other and does not make an unsightly section on the tire.

It is the best type of repair for you to make because it is simple, and requires only about half as much material as the old sectional method. Anybody in your garage can make good wrapped tread repairs without a lot of experience, and **you can guarantee the job.**

SHALER Vulcanizers

are the only vulcanizers that use the wrapped tread method successfully because

1. They are the only vulcanizers that heat the tire from the inside and outside simultaneously.

2. They are the only vulcanizers which have a temperature control that is automatic.

Shaler Vulcanizers heat with steam or electricity. One of their biggest advantages is that you can start with a small equipment and increase it to keep up with your requirements. Shaler Vulcanizers will do every practicable kind of tire repairing.

Garage Managers:

Don't fail to write at once for a complimentary copy of the Shaler book, "Common Sense About Tire Repairs." It tells what you want to know about tire repairing and how to start a vulcanizing department. A postal will bring it by return mail.

Take a common office or pantry "buzzer"

—put a case around it, attach a sounding board and a projector and you have an "electric horn."

When the car maker or car agent refers to the signal in the equipment as "electric horn," nine times out of ten that signal is of just this construction.

This "buzzer" or "vibrator" horn is the cheapest electrically operated signal possible to make. Its note is a nasal, droning buzz—often even less powerful than the old bulb-horn.

The diaphragm producing the note is vibrated by an electric spark between two points. Unless these are made of platinum iridium, the cost of which is prohibitive, they soon wear down and the horn won't sound.

We know. We have tested buzzer horns—all kinds of buzzer horns. Before the Klaxon was invented, we considered manufacturing buzzer horns. We to-day own the patent of the best buzzer horn we have ever seen.

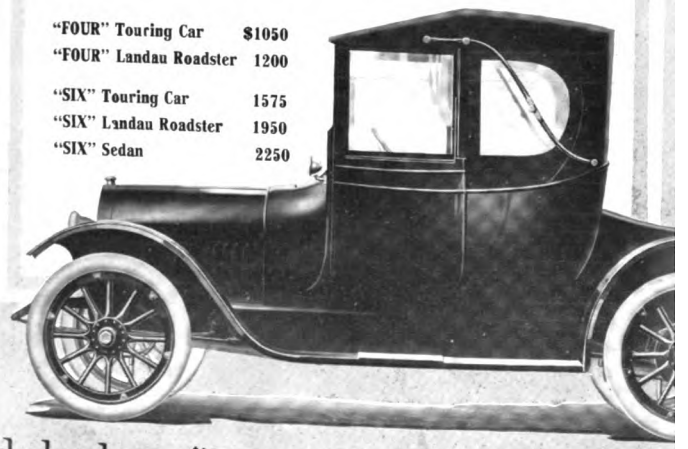
Studebaker

THE automobile dealer over whose door appears the name "Studebaker" shares the confidence that name has inspired for 60 years in the buyer's mind.

He has his introduction; the way to the buyer's action is shortened and smoothed.



And after the sale is made, he retains and strengthens his customer's confidence by the completeness and promptness of the service he renders when asked.

Such a factor is worth a great deal in the automobile business; and the far-seeing dealer is realizing it.

A Trade Paper Giving the World's Motor News

Vol. XXXVII
No. 9

New York, November 20, 1913

Ten cents a copy
Two dollars a year

A New and Remarkable Demountable Rim

60 is its first name—Stanweld its last. It is truly a remarkable rim—the first demountable rim to have endless side-flanges that need not be removed from the casing to make tire-repairs.

Think what that means! The elimination of the most objectionable feature of tire-trouble. And both side-flanges are endless—no rough edges or points to chafe or cut the casing.

Others have said, "It is impossible to design a satisfactory demountable rim with endless side-flanges that need not be removed from the casing when making tire-repairs." Yet we've done it—witness the Number Sixty.

The Number Sixty is a light rim—exceptionally light.

It is a strong rim—remarkably strong.

It is a simple rim—decidedly simple.

It is a safe rim—absolutely safe.

And it is an easy rim to operate—so much easier to operate than any other demountable rim that we expect it to supplant all other types.

The Sixty is made in clincher and straight-side styles.

STANWELD RIMS

Freezing of tires to side-rings means nothing to owners of Stanweld Number Sixty Rims—because side-rings don't have to be removed from the casing until you're ready to throw it in the discard.

The Number Sixty demounts same as the Number Forty—the surest, quickest demounting mechanism ever devised.

Then to remove the tube, all you have to do is lift the toggle-lock with a screw-driver, and pull out the inner band.

The toggle lock secures the inner band so firmly that dirt and moisture can't enter the tire-chamber. It makes the inner band practically endless, so rigidly does it hold the ends.

And outside strains and pressures can't open the toggle-lock. In fact, the greater the breaking-strain, the tighter becomes the lock.

It surely will be to your advantage to see and inspect this remarkable new rim before ordering or specifying any other type.

We're prepared to take care of the demands of the trade—manufacturers, jobbers, dealers and repairmen.

Better get prices and full information—now.

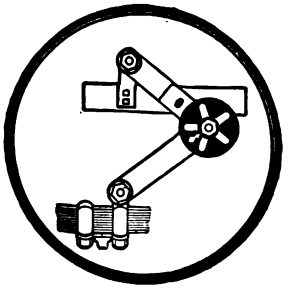
Maximum Motoring Comfort Realized in the Perfection of New Automatic Truffault-Hartford Shock Absorber



Rough and uneven roads are no longer a barrier to the enjoyment of motoring. It is now possible to ride in stately ease over the poorest roads and still have absolute immunity from jolt, jar and vibration.

This ideal condition is attained through the final perfection of the New Automatic Truffault-Hartford Shock Absorber.

While it includes the same basic constructive principle of the famous Truffault-Hartford, the New Automatic has the additional advantage of supplying three separate frictional tensions instead of one single tension, these three tensions varying in degree according to the character of the road surface over which the car is passing.

As a result of this ingenious three-degree-tension principle the restraint placed on the car springs is never in excess of what is actually necessary—only increasing when the road condition is such that greater resistance is demanded.

The first tension of the New Automatic lasts as long as the good road lasts. Without affecting the flexibility of the spring, it serves to absorb the slight, but noticeable spring oscillation there generated.

Immediately upon a change from a good road to one moderately rough, the second tension is brought into play, doubling the restraint and checking any tendency toward excessive spring action.

The third and strongest tension is reserved for extremely bad roads and those occasions on which forceful contact with some road inequality invites the spring to violent action.

A comfort approximating luxury—exemption from spring breakage and deranged mechanism—assured increase in tire mileage—these are some of the things you enjoy by equipping your car with the

New Automatic

Truffault-Hartford
SHOCK ABSORBER

You can learn more about this device from your dealer, at any of our branches, or by sending for our catalogue. It is adapted to all cars of heavier build and is adjustable to any type of spring. Self-regulating and self-adjusting — needs no attention after attachment. Price $60 per set of four. Other Truffault-Hartfords $50, $40, $25, $15.

Ball Bearings

QUALITY

In *Quality* They Lead the World

EXPERTS quickly discriminate between the external features of a motor car and those features that are not observed by a casual inspection. R. I. V. Ball Bearings in a car immediately convince the expert that it is a Quality Car.

Real value has put R. I. V. in a class by themselves and has resulted in a steadily increased output year by year and a continuance of Superior Quality.

There is an advertising value in cars equipped with R. I. V. Ball Bearings.

WHY

MONOGRAM OIL

Is *Always* Best For *Your* Engine

Pennsylvania CRUDE oil sells in bulk for approximately six cents per gallon.

In the production of our automobile oil—MONOGRAM—only 4½ gallons of it, or 4½ per cent, is obtained from every lot of 100 gallons of Pennsylvania crude.

Therefore it takes over 21 gallons of Pennsylvania crude to make 1 gallon of MONOGRAM.

If there were no by-products, it would COST one dollar and twenty-six cents, plus the cost of refining, to produce one gallon of MONOGRAM OIL.

This 4½ per cent, is the very marrow of the crude with all its remarkable wearing and lubricating qualities and the other 95½ per cent, can only be used for such by-products as gasolene, kerosene, ordinary engine and machine oils, and black oils.

This is one reason why MONOGRAM OIL has been continually successful under that one brand name from the very start of the automobile industry.

Remember this when unscrupulous dealers try to hand you oil that costs them 15 cents a gallon (or less) as a "just as good" substitute for MONOGRAM at the SAME price for which MONOGRAM can be purchased.

WISCONSIN DEALER SECURES VERDICT FOR SIX RED CENTS

Proving that Sales to Married Women Are Not Always What They Seem—One Hubby Who Dared Say "No."

Who is the boss of the household when it comes to buying a car?

Oh, she is, is she? Sometimes she is and sometimes she isn't.

Following up the wife as a means of pushing over a sale is recognized as good practice in many dealership establishments, but if Friend Wife says she'll take the car, signs the order and goes home happy, don't figure up the profit until you get the money.

Theoretically, the woman has a right to sign the order, but in the opinion of a judge in Fond du Lac, Wis., the order is worth about six cents; maybe he decided this way in self-defense and because he is a mere man, but, anyway, what he says goes so far as Mrs. Ernest A. Emigh, of Oakfield, Wis., is concerned.

In introducing this feminine character it may be said that she was on the prospect list of J. W. Meiklejohn, the Ford dealer in Waupun. Meiklejohn had demonstrated his cars to Mr. Emigh and the latter, while he thought it a good little car, wasn't ready to sign an order then. In Act II, Scene I, Mrs. Emigh is seen taking a demonstration without her husband and just as the curtain drops she affixes her name to an order blank and directs the dealer to "bring the car out to the house," which is exactly what the dealer did.

In the next act Meikeljohn is seen "bringing the car out to the house," and at the end of the same scene he is discovered taking it back again. Emigh said his wife had no business signing the contract and that he wouldn't take the car under any circumstances.

The dealer maintained that Emigh, by his actions prior to the sale, had ratified Mrs. Emigh's actions and that the contract was good. When the matter got into court the judge suggested that since no property passed, Meikeljohn be given a verdict of six cents instead of the full purchase price which he asked. Summed up, the verdict amounts to, "You're right, all right, old top, but unfortunately we can't do much for you."

Last act, last scene—Meikeljohn discovered in the act of ringing up six cents on the cash register.

Colby-Minneapolis Merger Falls Through.

After having gone so far as to elect officers of the Standard Motor Co., of Minneapolis, which was to have taken over the Minneapolis (Minn.) Motor Co., maker of motorcycles, and the Colby Motor Co., maker of Colby cars, the merger has fallen through.

It would appear that the parties most interested could not agree as to whether the plant of the amalgamated companies should be established in Minneapolis or Mason City, Ia., and accordingly negotiations were abandoned and each company will go its separate way. What will become of the Standard Motor Co., which was incorporated under the laws of Delaware with an authorized capital of $6,000,000, has not yet become apparent.

Kleiber to Make Trucks in 'Frisco.

After having handled the Gramm line for several years, the Kleiber Co., of San Francisco, has consummated arrangements to manufacture trucks on its own account in its home city. It is planned to build 100 of them during the 1914 season, all of which will utilize Continental engines. The Kleiber Co. has been in business for 17 years, handling horse-drawn vehicles before taking on the motor-propelled sort. Its officers are Paul Kleiber, president; W. M. Remensperger, vice-president; Ed Kleiber, second vice-president; P. E. Rathjens, treasurer; Otto Tum Suden, secretary.

ROLLS-ROYCE SAYS GARFORD COPIED MOTOR MOUNTING

English Car Builder Sues for Infringement of Hinged Suspension Patent—Asks for Accounting and $10,000 Damages.

Claiming that the mounting of the unit power plant in the Garford pleasure car is almost a copy of the mounting of the same unit in the Rolls-Royce car, of England, Frederick H. Royce this week filed suit in the United States District Court for the Southern District of New York against the R. & L. Co., which distributes Garford cars and trucks in the metropolitan district. Royce charges that there has been infringement of his patent, No. 888,535, granted May 26, 1908.

The patent covers a four-point mounting in which the supporting arms at the front contain a hinged compensating arrangement which tends to prevent strain on the power plant when the chassis frame warps during travel over rough roads. The supporting arms for the support of the rear of the unit are rigidly fixed to the chassis frame.

Royce's attorney stated that so far as he knows no other American car builder infringes the Royce patent and that the Garford builders did not do so until a comparatively recent date. The plaintiff asks an injunction and accounting and states that the infringement has damaged him to the extent of $10,000. Royce gives his address as Cook street, Manchester, England.

New Men Enter Premier Directorate.

Following the increase of its capital stock from $1,500,000 to $1,750,000, several new men have entered the directorate of the Premier Motor Mfg. Co., of Indianapolis, Ind. As now constituted, the board is as follows: F. Barnickol, C. O. Baxter, A. L. Reeves, Clarence Stanley, H. O. Smith, Timanus J. Wilson and G. A. Weidely.

SUBSTITUTING PORCELAINS IN RAJAH PLUGS NOT LEGAL

Added Light Thrown on Patent Licensing Situation — Court Holds Rajah Can Control Use Even if Not the Price of Plug.

When the United States Supreme Court ruled in the Sanatogen case that a manufacturer parts with all title to his goods when he sells them to a retailer, those who had been operating on a price-license system recognized it as a hard blow to price maintenance, but that the manufacturer does not part with all control of his produce was indicated this week in the United States District Court for the Southern District of New York. The court held that the manufacturer still controls the use of its product and can restrain another from selling parts to be used in connection with the product.

The suit in question was brought by the Rajah Auto Supply Co., of Bloomfield, N. J., against the Rex Ignition Mfg. Co., of New York City, which, it was charged, had been selling porcelain parts with the knowledge that they were to be used in Rajah plugs. The court enjoined the Rex company and recognized the Rajah's right to specify what porcelain should be used in a Rajah plug.

Judge Ward in his opinion set aside the contentions of the Rex company that it did not know the porcelains were to be used in Rajah plugs.

"The complainant seeks to hold the defendant as a contributory infringer on the ground that it sells the Rex porcelains knowing that they are intended to be used in the Rajah plug, in violation of the license under which that plug is sold," said Judge Ward. The patent is No. 825,856. "The defendant denies that this is done, but I am satisfied that in several instances its agents have done this deliberately. . . .

"Finally the defendant contends that the license accompanying the sale of the Rajah plugs is void and therefore that it has an absolute right to sell Rex porcelains even with knowledge that the purchaser intends to use them in Rajah plugs.

"The motion is to be decided in favor of the complainant or in favor of the defendant according as the situation is found to be within the case of Henry v. Dick Co., 224 U. S. 1, or within the case of Bauer v. O'Donnell, 229 U. S. 1.

"I think the sale in question is not an absolute sale but a sale accompanied by restriction of the right to use, exactly like the license sustained in the Henry case.

"In the subsequent Bauer case the court held that a restriction as to the price at which a patented article shall be sold is not a limitation as to the use of it and that in such a case the sale is absolute and the restriction invalid. In this way the case was distinguished from the prior decision.

"In view of the marked diversity of opinion among the judges of the highest court in these two cases, an inferior court cannot be confident. The defendant very truly suggests in its brief that on the evidence before the court, if an injunction is granted, it may as well be a final one. If the parties agree on this point a final injunction will be issued. In the meantime the motion for a preliminary injunction is granted."

Dean Creditors in Protective Committee.

In an effort to conserve the assets of the long established Dean Electric Co., of Elyria, O., and as a measure of self-protection, 20 of the larger creditors have formed a protective committee with A. L. Garford as chairman and L. B. Fauver as secretary.

The action was taken on the initiative of A. L. Garford, representing several Elyria banks, and the committee is now inviting other creditors to deposit their claims before Wednesday next, 26th inst., with the Guardian Savings & Trust Co., of Cleveland, which will act as the company's depositary.

While no definite plan has yet been formulated, an audit is being made and it will be the aim of the committee to bring about such a readjustment of Dean securities, or a reorganization of its finances, as will assist it out of the troubled water on which it is now afloat.

New York American-Marion Succumbs.

The American-Marion Sales Co., of New York City, which is controlled by J. I. Handley Co., of Indianapolis, was the object of a petition in bankruptcy filed this week in the Federal court in New York City; the petitioners and their claims are: Louis T. Hollister, $628; Bettes & Ebsen, $132; Auto Supply Co., $31. Clifford C. Ludvigh was appointed receiver under a $1,000 bond with authority to carry on the business for five days. The company was incorporated in June, 1911, with capital stock of $100,000, and handled both American and Marion cars. When Handley's Indianapolis companies which produced them failed three weeks ago, embarrassment of the New York establishment not unnaturally followed.

No Assembling Plants for Cadillac.

Published reports that the Cadillac Motor Co., of Detroit, is erecting an assembling plant in Cleveland—or anywhere else—are wholly untrue. The Cleveland yarn arose from the erection by the Cadillac dealer there of a new store and service station.

WAY FINALLY CLEARED FOR INTERNATIONAL'S MORTGAGE

Court Changes Mind and Wipes Out Restrictions After Imposing Them —Minority Stockholders to Continue Their Fight.

Judge Garretson, of the New York Supreme Court in Brooklyn, underwent a complete change of mind between Thursday last, 13th inst., and yesterday, 19th inst. As a result, the International Motor Co., of New York, has been freed of at least some of the perplexities which beset it since its minority stockholders took the trail in the effort to prevent the execution of a mortgage for $1,200,000 on the Mack truck properties, which are owned by the International company.

On Thursday last, his honor, in the suit brought by George E. Blakeslee, one of the minority stockholders, denied the plaintiff's motion for the appointment of a receiver and also lifted the temporary injunction restraining the company from executing a mortgage on its assets. In doing so, however, Judge Garretson required the latter to give bond for $50,000 to indemnify the plaintiff for whatever loss he might sustain pending the trial of the case upon its merits, and also requiring that satisfactory stipulation be given that no mortgage would be executed nor its unsecured liabilities be increased by a loan in excess of $500,000 without permission of the court. Failing to agree to these terms, Judge Garretson stated that he would continue the injunction during litigation and would hear further argument bearing on the appointment of a receiver.

While this decision apparently favored the International Motor Co., the Blakeslee interests viewed it as a victory. It is certain, at any rate, that it does not afford solace to the International officials, as the requirement of a $50,000 bond placed Blakeslee in the position of being a preferred creditor, thereby paving the way for similar claims from other creditors. Accordingly, the International counsel prevailed on Judge Garretson to reopen the case and yesterday, Wednesday, he completely reversed his ruling, the application of the plaintiff being "in all respects" denied and the injunction vacated, thus clearing the way for the placing of the mortgage which gave rise to the litigation.

Blakeslee, however, declares that the fight will go on. His suit for the dissolution of the International corporation, is distinct from the receivership proceedings, and whether it takes one year or two, he says it will be pressed to a conclusion.

GENERAL MOTORS FILLS TWO VACANCIES IN DIRECTORATE

Otherwise Everybody, Including Durant, is Reelected—Chairman Nash Pointedly Discusses Existing Trade Conditions.

Save for the election of two new members to fill vacancies, the General Motors Co. at its annual meeting in New York on Tuesday, 18th inst., reelected the present board of directors, which in turn reelected the incumbent officers. The directors are as follows: Joseph Boyer, Emory W. Clark, W. C. Durant, Robert F. Herrick, J. H. McClement, Edwin D. Metcalf, C. S. Mott, M. J. Murphy, Charles W. Nash, Thomas Neal, Albert Strauss, James J. Storrow, N. L. Tilney and Jacob Wertheim.

Herrick, who is a Boston banker, was elected to fill the vacancy caused by the death of Anthony N. Brady, and C. S. Mott, who is mayor of Flint, Mich., and president of the Weston-Mott Co., one of the General Motors subsidiaries, was chosen to succeed Andrew H. Green, Jr., resigned. Director Clark was also chosen a voting trustee to fill the vacancy caused by Brady's death.

The officers reelected are as follows: C. W. Nash, president; Thomas Neal, chairman of the board of directors; J. J. Storrow, chairman of the finance committee; W. C. Durant, vice-president; E. W. Clark, vice-president; Standish Backus, secretary, and James T. Shaw, treasurer.

Vice-president Durant is the same Durant who organized General Motors but who during the last two years has devoted himself to the Republic-Chevrolet projects.

Its financial statement for the fiscal year ending July 31st last, which was printed in Motor World of October 2nd, proved it to have been a banner year for the big corporation and, according to statements of President Nash, the business to date shows no signs of diminishing. The cash received from the sale of cars since August 1st, he states, has exceeded last year's record of $4,500,000, and the cash position of the company is $2,000,000 stronger.

Thomas Neal, chairman of the General Motors board of directors, also permitted himself to be quoted, what he said being very much to the point.

"Talk of a 'panic' in the automobile business is nonsense," he said. "There is no 'panic.' There are many reports of automobile concerns going out of business, but not all of them are, strictly speaking, failures. For various reasons they are liquidating their inventories and going out of business, but not under a load of liabilities. Most of them have been inadequately financed and not managed properly.

"The banks will not be damaged by the automobile failures, as they have been extending much credit to motor car manufacturers for several years.

"Speaking of the General Motors Co. alone, I can say that we have done a better business since the close of our record fiscal year on July 31 than we anticipated. Just what the future holds cannot be foretold, and if there is any serious depression in general business it will no doubt affect the automobile industry in some degree. There is, however, a normal demand for motor cars which must be filled. This demand under slack conditions would probably be somewhere between 200,000 and 300,000 machines.

"The dissolution of the small producers will result in larger sales for the big organizations which are well supplied with cash and which have their operating costs reduced to a minimum."

Merging Goodrich and Diamond Branches.

The Goodrich and Diamond tire branches in both Indianapolis and Cincinnati have been consolidated. In the former city, the Goodrich store will be closed and the business concentrated in the Diamond establishment under the management of H. A. Little, former head of the Goodrich branch. O. C. Reevill, former Diamond manager, will serve as special representative. In Cincinnati, the Diamond, located at 807 Race street, will be retained as the office and salesroom, while the Goodrich place will be utilized as a service station. The Cincinnati manager will be C. W. Simpson.

To Produce Electric Trucks in Denver.

For the purpose of producing shaft-driven electric trucks, the Capitol Hill Truck Mfg. Co. has been formed in Denver, Col., with Charles A. Scott as its president. He already is largely interested in the Capitol Hill Garage in that city. He expects to erect a plant on Speer Boulevard and produce between 50 and 100 vehicles during 1914. The truck, of which several are in use in Denver, is distinguished by a battery divided into three parts, one part carried under the bonnet in front of the dash and the other parts being slung, respectively, on running boards at the sides.

Ford May Lease Plant in New Brunswick.

The Ford Motor Co. of Canada is negotiating for the lease of the Maratime Motor Car Co.'s plant in St. Johns, New Brunswick, but the deal has not yet been closed. Only a few months ago it was stated that the Maratime company had secured the right to reproduce Palmer-Singer cars in Canada.

MORE THAN MILLION MAY BE LOST BY R. C. H. CREDITORS

Those Who Waived Claims When Committee Took Charge Likely to Lose All—$135,000 Bid for Assets is Rejected.

As predicted, the bid of $135,000 tendered by J. F. Hartz, Harry S. Grant and their associates for the entire assets of the R.C.H. Corporation, of Detroit, was rejected by the referee in bankruptcy when it came before him for confirmation on Monday last. Action was taken on recommendation of the receiver, the Security Trust Co., which also has been named as trustee. The referee, Lee E. Joslyn, believes that the personal property alone should bring at least $400,000, apart from the valuable real estate at stake.

Harris Bros. & Co., the Chicago house wreckers, who desired to bid on the property when it was offered for sale on the 11th inst., and who did not do so because of lack of time to make proper inspection, offered a bid of $150,000 for the personal property and it is possible that this offer may be increased after a more thorough inventory is made. At any rate, new bids will be invited by the trustee, all of which must be in hand not later than November 27th.

At the trustee's hearing on Monday it developed that creditors whose claims amount to $1,373,259 may realize nothing. This unpleasant prospect arises from the fact that on October 25, 1912, these creditors waived their claims in favor of corporations that were willing to supply material to permit the continuance of the business by a creditors' committee, which took charge of the R.C.H. property on that date and elected officers of its own, J. F. Hartz being the creditors' president.

According to the receiver, creditors of record on October 25, 1912, whose claims amount to $270,777, and those who did not sign the agreement of that date, their claims being $24,280, will receive between 40 and 75 cents on the dollar.

Harrises Now Buy up Milwaukee Motor.

At the receiver's sale of the Milwaukee Motor Co., of Milwaukee, Wis., on Tuesday last, 18th inst., the plant and equipment were bid in for $86,000 by Harris Bros. & Co., who constitute the Chicago House Wrecking Co. There is no doubt that the court will approve the sale at this price. The company, which built gasolene engines, was petitioned into bankruptcy on June inth last with liabilities amounting to $280,000.

LIFTS BLAME FOR FALLING ELEVATOR FROM GARAGEMAN

If Mechanism Was Properly Installed, Inspected and Maintained, Owner of Damaged Car Must Stand Loss—Court's Opinion.

When a garage elevator falls and damages a car owned by a patron of the garage it does not necessarily mean that the garageman must pay for the damage done to the car, according to an opinion handed down last week in the Appellate Division, Second Department, of the New York State Supreme Court. If the garageman can prove that the accident was entirely unforeseen and through no negligence on the part of himself or his employes, the owner of the car must stand the loss.

The suit that brought this ruling was filed by James B. Reagan, proprietor of the Knickerbocker Hotel in New York City, against Burr & Co., body builders; Reagan's Pierce-Arrow was taken to the Burr place of business to have a new body fitted, and in the course of that work the company's employes were taking the car from an upper floor to the basement on the elevator.

The elevator was of the type which may be started and stopped from any floor by pulling on ropes or chains which extend from the top to the bottom of the elevator shaft; in the elevator near the chains was a bolt which projected three-eighths of an inch through a nut, and this projection caught in the control chain and made it impossible for the Burr workmen to stop the elevator, which went at rapid speed until it struck the bottom. Then the counterweights broke loose and fell upon the car.

Experts testified that the accident was unforeseen and extremely uncommon and that the Burr company was not negligent in the operation of this piece of machinery. The lower courts gave Reagan a verdict for the full value of the car but this the Appellate Division reversed and directed a new trial.

"Upon the whole case," said the court, "as presented to us, not only did the plaintiff fail to prove negligence upon the part of the defendant in the installation or operation of this elevator, but the preponderence of the proof is that the elevator was a proper and sufficient one at the time of its installation, that it was maintained in proper condition by frequent and adequate inspection, and that the existence of this slight projection in the bolts beyond the surface of the nuts through which they passed was not one from which it would reasonably be apprehended that danger would arise.

"As a matter of fact, no one had foreseen the possibility of such an accident occurring due to this cause. We are of the opinion, therefore, that the finding that the defendant was negligent in the maintainance and operation of the elevator is against the weight of evidence and the judgment, and the order must be reversed with costs and a new trial granted."

Mosler Planning Royalty Proceedings.

Although the upholding of the Canfield patent, No. 612,701, by the United States Circuit Court of Appeals, gave to A. R. Mosler & Co. control of production, no license agreement or other legal forms have yet been formulated, but it is certain that proceedings will be promptly instituted against other plug manufacturers; the case will not be officially remanded to the lower court until tomorrow and nothing can be done until after that date, anyway.

As to the date from which royalties will be computed, W. A. Redding, Mosler's attorney, stated this week that it would depend largely upon when the individual suits were started and injunctions secured; he also said that probably no attempt would be made to collect back damages from concerns which have been established in business any appreciable length of time. The statute itself bars collection beyond six years. The Champion Ignition Co., of Flint, Mich., secured a license under the patent three years ago and is therefore the only manufacturer immune from prosecution.

Junk Man Involved in Tire Chain Deal.

Atlas grips, a thorn which the Weed Chain Tire Grip Co. successfully removed from its own side some time ago, are now —a carload of them, at least—a thorn in the side of D. S. Gray, a metropolitan junk dealer; Gray bought a carload of them at auction and may have congratulated himself on his fine purchase, but, if so, his dreams of a young chain business were shattered this week when the Weed company filed suit against him in the United States District Court for the Southern District of New York. He is charged with infringing the Parsons patent, No. 723,299, and the court is asked to enjoin him from selling the grips.

Mitchell Discontinues Philadelphia Branch.

The Mitchell-Lewis Motor Co. has discontinued its branch in Philadelphia and transferred the manager thereof, Charles P. Skinner, to the management of its branch in New York. In Philadelphia hereafter the Mitchell car will be handled by an agency, the Fanning Paxson Co., of 158 North Broad street.

UTILITY CAR COMPANY IS "PANNED" BY EX-EMPLOYE

Smith Says He Helped Promoters Nearly Two Years and Would Like to See Some Real Money —Demands His Wages.

The Utility Car Co. of Delaware, the Utility Car Co. of New York and the Auto-Tri Mfg. Co., of Buffalo, are three closely-related corporations that set out several years ago to produce a three-wheeler package delivery vehicle and did turn out a few which looked good, but little was heard of the companies until this week, when Albert L. Smith filed a suit in the New York City Court against the first two for back wages and with his suit filed a long affidavit as to what he thinks of the Utility promoters. He secured a judgment for $1,893.26 this week but let it be set aside when the defendants so requested.

George R. Bidwell, one-time collector of the port of New York and an old bicycle man, is president and Charles E. Locke is named by Smith as treasurer of the two Utility companies. Smith classes the affair as a promotion scheme and suggests that the present whereabouts of money he turned over on stock sales will stand investigation.

Smith claims that he was engaged February 1, 1912, to sell stock of the Delaware Utility company—which he states is a holding company for the New York Utility company—and to manage the package delivery business of the defendants and to look after the interests of both generally in the city of New York. He was to get $50 a week. He worked from February 1, 1912, to October 30, 1913, when he left because his wages for many months previous were unpaid. Out of $4,500 he drew $2,629.79.

The Utility project is going, or has gone, the way of all other three-wheelers, according to Smith, and, anyway, never did much more than promote itself. He alleges that both companies "have been idle, dormant companies for about one year past, and have made and sold no cars to speak of but have been actively engaged in selling stock and maintaining the package delivery service that I managed.

"They have always claimed that they were promoting a vast enterprise and that the business of making and delivering the cars would not be started until they had about $1,000,000 in the treasury, and that they would start with putting 1,000 cars on the market and that they would not start in a small way; and so all activities were spent in selling corporate stock and using the moneys that came in, so I am informed, for the expenses of promoting."

The Week's Incorporations

Macon, Ga.—Ellis Garage, under Georgia laws; authorized capital, $6,000. Corporators—G. F. Ellis and J. C. Ellis.

Chicago, Ill.—Triple Action Spring Co., under Illinois laws; authorized capital, $25,000. Corporators—Oliver G. Temme, Richard H. Mather and Claude R. Church.

Boston, Mass.—Shimpf Starter Co., under Massachusetts laws; authorized capital, $50,000. Corporators—L. C. Marshall, J. Henderson and M. J. Page, all of Boston.

Boston, Mass.—Dart Motor Truck Co., under Massachusetts laws; authorized capital, $5,000. Corporators—Walter F. Magill, Gertrude A. Magill and Stephen J. Richards.

Cambridge, Mass.—Massachusetts Automobile Co., under Massachusetts laws; authorized capital, $10,000; to deal in motor cars. Corporators—Roland C. Jewett and others.

Detroit, Mich.—Keystone Tire Repair Co., under Michigan laws; authorized capital, $1,000. Corporators—William F. Hausen, Noah L. Henninger and James E. Gowan.

Bronx, N. Y.—Washington Taxi Service Inc., under New York laws; authorized capital, $500. Corporators—Harry Rieders, Abraham Bernstein and Joseph Brucker, all of 1199 Fulton avenue.

Joliet, Ill.—Auto Specialty Co., under Illinois laws; authorized capital, $2,500; to conduct a general automobile business. Corporators—Fred D. Byrd, Fred W. Walter and Ralph W. Walsh.

Detroit, Mich.—Detroit Nassau Tire Co., under Michigan laws; authorized capital, $1,200; to manufacture automobile tires. Corporators—Stanley Houghton, Charles Catter and James Dillon.

Petaluma, Cal.—Automobile Sales Underwriting Co., under California laws; authorized capital, $100,000; to finance automobile dealers. Corporators—Charles L. Clise, San Francisco, and others.

Crawfordsville, O.—Miller Vehicle Heater Co., under Ohio laws; authorized capital, $5,000; to manufacture road vehicle heaters. Corporators—W. H. Miller, Fred F. Doherty and Austin H. Long.

Logan, Utah—Utah-Idaho Auto Co., under Utah laws; authorized capital, $25,000. Corporators—Morgan Knapp, J. P. Griffin, Wilford O. Johnson, John Everton, Franklin, Ida., and W. H. Stewart.

Boston, Mass.—Henderson Motor Co. of New England, under Massachusetts laws; authorized capital, $25,000; to deal in motor cars. Corporators—James A. Binney, Porter B. Chase and E. Barton Chapin.

Milford, Mass.—Baker Motor Sales Co., under Massachusetts laws; authorized capital, $5,000; to deal in motor cars. Corporators—William H. Baker, William D. Leahy, Frank P. Dillon and John C. Lynch.

Chicago, Ill.—Austin Safety Storage Co., under Illinois laws; authorized capital, $25,000; storage and teaming, automobiles and horses. Corporators—Francis Woodsmall, George Delaney and Bazel W. Veirs.

Rushville, Ind.—Power Transmission Clutch Co., under Indiana laws; authorized capital, $30,000; to manufacture appliances for motor cars. Corporators—O. E. Woolridge, Jesse Wiley and John Striegle.

Utica, N. Y.—Xardell Bros. Co., under New York laws; authorized capital, $20,000; to manufacture motor car supplies. Corporators—Joseph A. Xardell, Charles A. Xardell and W. K. Teefey, all of Utica.

Lowell, Mass.—Howard Street Garage, under Massachusetts laws; authorized capital, $2,000; to operate a garage. Corporators—David Ziskind, Michael Cohen, Clarence J. Howarth and William H. Jolly.

Akron, O.—Tanner-Hower Mfg. Co., under Ohio laws; authorized capital, $50,000; to manufacture brass cylinders, gauges and various motor car parts. Corporators—M. Otis Hower, Perry E. Tanner and others.

La Crosse, Wis.—Motor Truck Service Co., under Wisconsin laws; authorized capital, $10,000; to deal in motor trucks. Corporators—F. J. Noetzel and Herbert Lewis, of La Crosse; W. H. Ristow, West Salem.

Ludlow, Ky.—Eureka Resilient Wheel Co., under Kentucky laws; authorized capital, $10,000; to manufacture a patented automobile wheel. Corporators—G. A. Simpson, Ludlow; Charles Schroeder, Cincinnati, O.

Chicago, Ill.—Chicago Great Western Motor Car Co., under Illinois laws; authorized capital, $15,000; to manufacture, buy and sell motor cars. Corporators—S. Darmstadter, M. Darmstadter and A. J. Schuett.

Cincinnati, O.—Franklin Motor Car Co., under Ohio laws; authorized capital, $20,000; to operate a garage. Corporators—Newman Samuel, R. C. Anderson, F. H. Aufderbecke, J. C. Lueders and John Frederick Koch.

Kearney, N. J.—Arlington Motor Car Co., under New Jersey laws; authorized capital, $100,000; to carry on an automobile business at 720 Devon street. Corporators—S. R. Bewley, J. R. and M. P. O'Connor and S. T. Urwin.

Chicago, Ill.—Chicago Grant Motor Sales Co., under Illinois laws; authorized capital, $5,000; to manufacture and deal in motor cars, parts, accessories, etc. Corporators—C. C. Mowbray, Edwin H. Abbott and Eugene W. Fassett.

Chicago, Ill.—Luxmore Differential Co., under Illinois laws; authorized capital, $7,500; to manufacture and deal in motor car accessories and machinery. Corporators—Edbert Robertson, Lazarus Krinsky and John L. Anderson.

Chicago, Ill.—Motor Devices Co., under Illinois laws; authorized capital, $3,000; to manufacture and sell motor car accessories, machinery and motor car devices. Corporators—G. M. Shonts, George A. Kelly and Rupert D. Donovan.

Buffalo, N. Y.—Meyer Motor Car Co., under New York laws; authorized capital, $50,000; to conduct a general motor vehicle business. Corporators—Arthur C. Meyer, Clayton H. Meyer and Franklin B. L. Stone, all of Buffalo.

New York, N. Y.—State Auto Repair & Sales Co., under New York laws; authorized capital, $5,000. Corporators—Robert Kaiser, 530 West 124th street; Lou J. H. Schmitt 529 East 150th street; Arthur Larnett, 1029 College avenue.

Fall River, Mass.—J. E. Newton Co., under Massachusetts laws; authorized capital, $50,000; to manufacture and repair bicycles, motorcycles and motor cars. Corporators—Newton R. Gifford, James E. Newton and Fred Crossley.

New York, N. Y.—Leather Tire Goods Co., under New York laws; authorized capital, $7,000; to deal in motor car supplies, tires, etc. Corporators—Hans Gurlitt, 1608 Broadway; H. V. Dodge and Wm. Loebman, both of 1610 Broadway.

BRITAIN CAUSES EXPORTS OF CARS TO REGISTER A GAIN

Recently One of Heaviest Losers, United Kingdom Leads in Increases in September—Tires Gain and Engines Lose.

Conditions in the automobile export trade in the month of September differ from other recent months in that the United Kingdom—which had decreased its American purchases—made a larger increase than all other geographic divisions and saved the exports from being registered in the loss column. The United Kingdom gained by 316 cars, or 206 per cent., and by $206,019, or 198 per cent., over its takings for September, 1912, and helped the total export of cars to increase by 169, or 11 per cent., and $118,848, or 8 per cent.

British Oceania, which generally follows in the lead of its mother country, gained by 30 cars, or 13 per cent., and $24,676, or 12 per cent. The West Indies and Bermuda, the latter of which is a British possession, advanced by 25 cars, or 109 per cent., and by $20,515, or 104 per cent. The only other division to mark an increase was Other Countries, which moved upward by 167 cars, or 159 per cent., and $116,415, or 120 per cent. Canada, generally one of the largest purchasers of American cars, is still the largest, but it lost by 218 cars, or 46 per cent., and $128,370, or 27 per cent.

Another division which has in the immediate past been a large purchaser of American cars is South America, but in September this country decreased its purchases by 24 cars, or 16 per cent., and $38,395, or 53 per cent.

Asia and Other Oceania bought 41 less cars, a decrease of 23 per cent., and the value shrank by $10,428, a falling off of 7 per cent.

Of the total exportation of vehicles, trucks gained 8 in number, or 20 per cent., and $5,057, or 6 per cent. Pleasure vehicles advanced by 161, or 10 per cent., and $113,791, or 8 per cent. Parts increased by $180,847, or 66 per cent., and the total value of cars and parts by $299,195, or 17 per cent.

The average value of the trucks shipped abroad in September, 1912, was $2,149, and in September, 1913, $1,876, a decrease in valuation of $273, or 12 per cent. The pleasure cars during the former period averaged $872 in value and in September, 1913, $857, a decrease of $15, or 2 per cent. The average value for the United Kingdom in September, 1912, was $680, and in September, 1913, $661, a decrease of $19, or 3 per cent.

Engine exports fell off by 89 per cent. in number and 91 per cent., in value, the shipments dropped from 517 engines valued at $110,068 in September, 1912, to 52 engines valued at $9,836 in the same month of the present year. This is a decrease of 465 in number and $100,232 in value. Foreign sales of tires during September, 1912, amounted to $292,809 and in September, 1913, to $321,815, a gain of $29,006, or 10 per cent.

The total value of cars, parts, engines and tires exported during September, 1912, amounted to $2,123,692 and in the same month of the present year the volume was $2,352,161, an advance of $228,469, or 11 per cent. In nine months ending with September, 1912, cars gained by 2,547, or 13 per cent., and in value by $3,049,559, or 17 per cent. For these same periods the total value of cars, parts, engines and tires advanced by $5,006,435, or nearly 20 per cent. The figures in detail follow:

IMPORTING OF AUTOMOBILES STILL INCLINES DOWNWARD

All Divisions Fail to Record Gains in Number of Cars Purchased in September — Total of Cars and Parts 47 per Cent. Less.

Importation of automobiles by the United States diminished still further during September last, the shipments of cars decreasing by 46, or 55 per cent., in number and $86,567, or 52 per cent., in value. Parts, also, showed a loss, dropping off by $3,150, or 13 per cent. The total of cars and parts shrank by $89,717, or 47 per cent.

Considering the five geographic divisions into which the world is divided by the import statisticians, but two increases of any description were made; the American purchases in the United Kingdom and in Other Countries were the same in number in both Septembers—1912 and 1913—but the value of the United Kingdom's sales to America gained by $6,414, or 47 per cent., and those of Other Countries by $1,465, or 107.

The heaviest loss was recorded by France, which decreased its American sales by 35 cars, or 73 per cent., and by $76,603, or 72 per cent. Italy's sales were eight cars, or 36 per cent. less and were less in value by $14,772, or 48 per cent. The figures in detail follow:

	September 1912 No.	September 1912 Values.	September 1913 No.	September 1913 Values.
France	48	$109,004	13	$32,401

In the RETAIL WORLD

The Texas Motor Car & Supply Co., with salesrooms in Victoria, Cuero, Yoakum and Corpus Christi, Tex., has sold its business in the latter town to T. M. Barnhill, of Uvalde, and W. J. Woods, of Sabinal, both in the same State; the consideration was about $15,000. The Corpus Christi salesrooms and garage are located at 713-15 Mesquite street; the deal includes the Paige and Chalmers agencies. C. V. Reeves, who has been manager of the Corpus Christi branch, becomes manager of the Yoakum establishment.

The Chase Reo Sales Co. has been formed in Oakland, Cal., and will handle Reo sales in Alameda county; S. Hal Chase, who has been identified with the Reo interests in San Jose and who was secretary of the S. H. Chase Lumber Co., of the same town, heads the new concern. C. H. Hunter, who has been connected with the distribution of Kissels in Los Angeles, Wintons in Seattle, Reos in Des Moines and Ramblers in Chicago, is sales manager. The company has been located at 2838 Broadway.

The garage firm of Steffes & Thompson, of Chilton, Wis., has been dissolved; John Thompson has retired and will engage in the garage business elsewhere. Theodore Steffes, the other partner, has admitted his father, Anton Steffes, Sr., to partnership and they will continue the business as Steffes & Steffes. The company, which handles Overland and Jeffery cars, erected a new garage last spring.

The Utah-Idaho Auto Co. has been formed in Logan, Utah, with a capitalization of $25,000; the officers are: President, Morgan Knapp; vice-president, J. P. Griffin; secretary and treasurer, Wilford Johnson; additional directors, John Everton, of Preston, Ida., and W. H. Stewardt, of Logan. The company will deal in Maxwell cars.

In North Hackensack, N. J., a new brick and cement garage, 50 x 80 feet, has just been completed by Fred Rademann at a cost of $8,000. Under the title Johnson Avenue Garage it will be maintained as a service and repair-shop, carrying tires and oils; later a line of cars will be handled.

The Fond du Lac (Wis.) Auto & Repair Co. has been taken over by W. H. Collins and Harry Treleven; Collins formerly was sales manager for the Ford agency in Fond du Lac while Treleven managed the Auto Supply Co., on Forest avenue. The company stocks Ramblers and Buicks.

Harry B. Mummert, for several years engaged in the real estate trade in Dallas, Tex., has "gone into" automobiles; he has secured the agency for Marathon cars and is located at 216 West Rittenhouse street. salesrooms of the Tri-State Sales Co., at 1509 Commerce street.

Clarendon Davis, a banker and farmer in Huntsville, Ala., and D. C. Finney, of the same place, have been made Oakland distributers in Northern Alabama; they will maintain headquarters in Huntsville and Birmingham, with J. R. Hertzler in charge in the former town.

The Gas Power Engineering Co., of Milwaukee, Wis., has broken ground at North avenue and 2nd street for a two-story garage, repair-shop and electrical machine works, 50 x 150 feet; the company is now located at 917 3d street. The new building will cost $25,000.

Williams & Morford plan to enter the garage trade in New York City at 205-11 West End avenue; they have leased a building at this address from The White Co., of Cleveland, O., at an aggregate rental of $175,000. It contains 55,000 feet of floor space.

The Adams-Lancia Co., importer of Lancia cars, is about to remove from 235 West 58th street, New York City, to a new location on Broadway, the city's "automobile row"; space has been leased at the southwest corner of Broadway and West 57th street.

B. W. Price and J. A. Demerly have leased the Jamison Bros. Garage in Lafayette, Ind. They will reopen it after installing new equipment. Price has been a real estate man, while Demerly has been a repairman in Chicago for five years.

F. D. Palmer and L. E. Schwartz have entered the used car trade in New York City under the style Automobile Dealers' Outlet Co. They have located at 110 West 63d street. Both have been engaged in the used car business for some time.

The Conley-Judd Motor Co. has been formed in Green Bay, Wis., by L. E. Conley and Earl C. Judd; they have opened salesrooms for Maxwell cars in a building on Adams street formerly occupied by the United States Express Co.

The Fox River Valley Motor Car Co., of Green Bay, Wis., is equipping a new salesroom, garage and service station in the Hoberg building at 415-17 Main street; the company handles Fords. Charles W. Collier is manager.

Theodore Lochen has purchased a site in West Bend, Wis., and will erect a one-story garage, 45 x 80 feet; Lochen, who recently sold his hardware business in Newburg, in the same State, to Crass Bros., also will deal in Fords.

Louis Bleick, who has been connected with the Gorges Auto Co. in Appleton, Wis., has branched out for himself; he has opened a garage and salesrooms on Morrison street and is selling Mitchell and Detroiter cars.

The Lozier Sales Co., of Cleveland, O., has been reorganized as the Cuyahoga Sales Co. The personnel remains the same, and Ray M. Colwell continues as manager. The company handles Loziers and Chandlers.

J. J. Russell has entered the trade in Cedar Rapids, Ia., as a Studebaker dealer; he has taken space in the garage of the Courtney Motor Co., which recently discontinued its dealership in this line.

Ehresman & Rick, of Gridley, Ill., have sold their garage to B. F. Klopfenstein and John Diggle; possession will be given January 1. The former owners will remove with their families to Peoria.

Harold L. Detienne has formed the Wisconsin State Rubber Co. in Milwaukee with a capitalization of $10,000; the company will deal in tires, accessories and rubber goods.

T. J. Claer has taken over the business, stock and equipment of the Spencer (Ia.) Auto Co. He also has secured the repair business of L. H. Foster and will combine both.

Dillon Stallcup is about to enter the trade in Alliance, O. He has leased and will operate the Forestone & Mummertand Garage, at Oxford street and Arch avenue.

The Automobile Tire Co., of New York City, has opened a branch in Washington, D. C. It is located at 1026 14th street and is managed by H. Robert Clausius.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Hugh Warner, one-time president of the Muncie Gear Works, of Muncie, Ind., has been appointed designing engineer of the Detroit Standard Gear Works.

A. C. Banker, one of the veterans of the automobile industry, has acquired an interest in the Cole Motor Co., of Boston, of which he will become the manager.

R. C. Hoffman has been appointed chief draftsman of the Haynes Automobile Co., of Kokomo, Ind. Previously he was identified with the J. I. Case T. M. Co., in Racine, Wis.

A. C. Foster has been appointed general manager of the No-Shammy Products Co., of Cleveland, manufacturer of the No-Shammy funnels. Previously he was sales manager of the E. H. Bryant (Lock) Co

E. M. Lubeck, who for the past three years was sales manager of the Studebaker wholesale branch in Chicago, has resigned that post and become attached to the sales staff of the Buick Motor Co.'s branch in the same city.

Harvey J. Woodard has resigned the post of sales manager of the Century Tire & Rubber Co., of New York. Woodard, who for many years prior to joining the Century staff, was identified with Diamond tires, has not yet indicated his future plans.

H. L. Goodwin has been appointed general sales manager of the Woods Motor Vehicle Co., of Chicago, to fill the vacancy created by the resignation of O. J. Woodard. Simultaneously, W. A. Simonson has been made sales manager of the company.

L. C. Flaherty, who for several years covered territory for the C. A. Shaler Co., has resigned that connection to become sales manager for the Adamson Mfg. Co., which produces vulcanizers, among other things. He, of course, will be located at the Adamson factory in East Palestine, O.

A. T. Smith has been promoted to the management of the Firestone tire branch in Los Angeles, which has been vacant since the tragic death of R. D. Barr in July last. Smith has been connected with the Firestone company for several years, latterly being attached to its Chicago branch.

W. A. McDermid, for the past two years sales and advertising manager of the Service Recorder Co., of Cleveland, maker of truck recorders, has resigned that connection to become identified with the newly organized Falcon Cyclecar Co., of the same city. He will have charge of its sales and advertising.

E. A. Williams, former president of the Castle Lamp Co., has been appointed assistant manager of the Willys-Gramm Motor Truck Co., of Lima, O. The Castle lamp, like the Gramm truck, is the possession of John N. Willys, the lamp company having been only recently removed from Battle Creek, Mich., to Toledo.

George H. Smith, until last week manager of the Peerless branch in Newark, N. J., has been promoted to the management of the Peerless marble palace in New York City, succeeding E. Irving. Concurrently, H. T. Birnie, one of the star New York salesmen, has been elevated to the post of assistant manager.

Harry L. Bill, former factory manager for the Disco Co., of Detroit, has assumed the same post in the Hayes Mfg. Co., of that city, and hereafter will have to do with metal bodies and other metal specialties. Bill has had wide experience, having been identified with the Corbin, Chalmers and Metzger companies, among others.

Charles P. Skinner, manager of the Mitchell branch in Philadelphia, which has been discontinued, has been transferred to the management of the Mitchell establishment in New York City. He succeeds J. M. Cram, who has returned to his home in Racine. Skinner's brother, George A., has also succeeded W. W. Burke as sales manager of the New York branch, which controls 11 Eastern States. Burke has not yet placed himself. Skinner handled the Mitchell car in New York until two years ago, when his business was taken over by the parent Mitchell-Lewis Co., which continued it as a branch, Skinner being given the Philadelphia berth.

Recent Losses by Fire.

Netcong, N. J.—Piper Garage; destroyed. Loss, $4,000.

Sheffield, Ia.—L. E. Dow; garage damaged. Loss not stated.

Lowell, Mass.—M. Chalifoux, 144 Cumberland road; garage destroyed. Loss not stated.

Davenport, Ia.—Schmidt Bros. Co., gasolene engine manufacturers; plant destroyed. Loss, $150,000.

St. Louis, Mo.—Theodore Kinstre, 6211 Plymouth avenue; garage and cars damaged. Loss, $2,000.

Parkersburg, W. Va.—Parkersburg Motor Car Co., Juliana street; garage destroyed. Loss not stated.

Indianapolis, Ind.—Central Transfer & Storage Co., Charles Roesner, proprietor; garage damaged. Loss, $13,000.

Covington, Ky.—Covington Automobile Co., John Hanauer, proprietor, 411 Madison avenue; garage and 12 cars destroyed. Loss, $25,000.

Minor Business Troubles.

The Milton G. Smith Garage & Auto Co., of South Bend, Wis., was sold at a receiver's sale last week; it brought $2,626.

H. H. Woodsmall & Co. has asked that a receiver be appointed for the Indianapolis (Ind.) Auto Clearing House; the plaintiff claims it is a debtor to the extent of $106.09.

A receiver for the Indianapolis (Ind.) Motor Car Co. has been asked for by the Wabash County Loan & Trust Co. The first named company operates a garage and is alleged to owe the bank $6,000.

The Dominant Motor Co., which conducted a garage and salesrooms in Albany, N. Y., at Northern boulevard and Washington avenue, has been placed in the hands of a trustee in bankruptcy; the latter has been instructed by the court to sell the property.

A receiver in bankruptcy has been appointed in the Federal court in Cincinnati for the Borland Mfg. Co., of that city, upon the petition of its vice-president and manager J. Archer Borland; a hearing upon the question of a dissolution will be held February 11, 1914. The company manufactured automobile wheels, and failure to secure sufficient working capital is said to have caused the embarrassment.

Charles A. Coey, who has been a figure in Chicago's automobile trade for 13 years, became involved in the bankruptcy court last week when a petition was filed against the C. A. Coey School of Motoring, which he operated at 1424-26 Michigan avenue; his liabilities are said to be between $6,000 and $7,000 and to exceed his assets by a small amount. The action, it is stated, was instituted because Coey was drawing on the company's funds without rendering an accounting.

Because the Latham-Phelps Co., Inc., could not come to an agreement with the Shawmut Tire Co. of New York, Inc., regarding the distribution of tires in Long Island, the tire company had a receiver appointed this week in the Supreme Court for New York county for the Latham-Phelps concern; the members of the latter are Charles H. Latham and Harry E. Phelps and they held a contract whereby they had the sole distribution of Shawmut tires in Long Island. When a dispute arose and relations neared the breaking point the Shawmut demanded an accounting of the business transacted by the Latham-Phelps. The receiver answers this purpose.

SCANDAL-MONGERS OF THE TRADE.

When a tire is inflated too hard, it ceases to afford real comfort. If there is a weak spot in its structure, a blow-out usually occurs, or, at any rate, to obtain comfort it is necessary to press down the valve plunger and let some of the wind escape.

This rather homely simile best represents the condition of the automobile industry. For several years, it has been as plain as a pikestaff that it has been inflated to the danger point—that it was being overdone and over-exploited. To all except the super-cheerful, many of whom remained blind solely because they would not see, the gift of second sight was not required to foresee that sooner or later some of the wind must be permitted to escape in order to restore comfort and normal conditions. This is really all that has been happening during recent months. Creditors have been depressing plunger valves and, though the structure of the trade has been in no wise affected, the hiss of the escaping wind has caused so much noise as to affright not a few people.

This lessening of internal pressure is gradually relieving the structure of undue strain and is making for a restoration of natural and, therefore, healthier condition.

While it is regrettable that there should have been any strain to relieve, regrettable is too mild a word to apply to the manner in which of late unfounded suspicions have been cast on many good names. The reputation of no one in the industry has been safe from the loose tongues of the scandal-mongers. They have respected no one; they have dropped ugly suggestions in every direction. "I hear that Soandso is going to fail," "I hear that Soandso is going to quit making cars," "If Soandso fails, you won't be able to get cars," is the burden of their talk which, unfortunately, is reechoed by the hills. There is some evidence, and even more reason to believe, that too many of these scandal-mongers of the trade wear the garb of traveling salesmen, who in their efforts to "make an opening" and get orders do not scruple to magnify or, if need be, to question credits and create suspicions the better to serve their purposes.

Apparently some of them do not wholly realize the enormity of their offense; in others, it appears to be studied and devilish cunning. But whatever it may be, it is too general to remain unchecked. It is so highly dishonorable, so injuriously far-reaching, that there is no manufacturer of cars or parts or accessories who should not caution or, if need be, issue printed instructions sternly forbidding his salesmen and his dealers to make use of such poison—for it is poison and to a greater or less degree its effects are felt by all who have to do with the industry. In the absence of such letters, it may be well for all concerned to bear in mind that at least one dealer in the West has been made the defendant in a suit for $10,000 for uttering poisonous statements of the sort. In some States the circulation of stories affecting credits is a jailable offense—a fact which also should serve to give pause to the scandal-mongers.

SOUNDING WAR CRY OF THE CYCLECAR.

If cyclecars are conspicuous by their fewness, indications point to no lack of publications devoted to their interests. There are signs that the seed is germinating in some unsuspected places, and already there is evidence that publishers who have done indifferently well in other fields see in the cyclecar a peg on which to hang renewed hope and are sounding the war cry in their pages with more or less "patriotic" enthusiasm. If the rush continues, the output of cyclecar journals is not unlikely to exceed the output of the little vehicles themselves.

Abroad, where unrutted roads are the general rule and where narrow gauge cyclecars, therefore, have more chance of success, they have had one or more cyclecar journals for these many months, but, remarkable to relate, one of the oldest of them has just seen a large, white light and changed its title from "Cycle Car" to "Light Car," a fact which should not be without bulging significance even in this "land of the free."

As for the cyclecar situation on these shores, was it ever more deliciously, if unconsciously, described than by a Chicago newspaper, which, only last week, blithely remarked that the manager of a particular cyclecar project "is taking orders so rapidly that his company soon will have to decide upon a site for its new factory to make good on deliveries"?

30 ELECTRICS STAGED IN BOSTON'S BALLROOM SHOW

Makers and Dealers Display Nine Brands of Electric Vehicles in First Exhibition of the Kind—Some of the Beauteous Exhibits.

Boston's first electric vehicle salon, which is also the first exhibition of electric vehicles exclusively to be held anywhere, was opened with due formalities on Monday evening, 17th inst., and it proved all that its promoters, the Electric Motor Car Club, hoped for it and perhaps a little bit more. All told, 30-odd pleasure vehicles were disposed about the grand ballroom of the Copley-Plaza Hotel in the Back Bay section of the city, and, needless to point out, every one of them represented the latest effort of its respective maker. Nine dealers and manufacturers were responsible for the car exhibit and several battery makers "helped out," so to speak. The exhibition was formally closed last (Wednesday) night. The list of car exhibitors was as follows:

J. W. Bowman Co., Waverley; Peerless Motor Car Co., Rauch & Lang; S. R. Bailey Co., Bailey; W. L. Russell Co., Buffalo; Whitten-Gilmore Co., Woods; F. N. Phelps, Baker; Anderson Electric Car Co., Detroit; D. C. Tiffany, Ohio; W. H. Stevens, Standard.

For the most part the exhibition was made up of closed cars as being particularly seasonable for the time of year; here and there, however, there were two or three examples of open runabout bodies, and it goes without saying that the Bailey company exhibited its new four-passenger touring car which made its debut at the New York Electrical Show. Another car at the Bailey space which drew considerable attention was the roadster which S. R. Bailey recently drove all the way from Boston to Chicago.

Waverley products were represented by a leather-trimmed victoria, a limousine four, a roadster and a brougham; the Rauch & Lang space held what is termed a demi-brougham, a roadster, a town car and a full-sized brougham. Three Buffalos—roadster, coupe and brougham—were flanked by Woods cars in four- and five-passenger capacity.

Among the more conspicuous vehicles there was a Baker that drew more than one sigh from the far sex. It mounted a special type of five-passenger coupe body upholstered in silk and satin and decorated by no less a person than Paul Poiret, who is generally credited with the responsibility for the so-called minaret gown. Another Baker done all in cream velvet velour drew almost as much admiration, especially from those who are familiar with the fabrics used.

The list of battery makers included the Edison Storage Battery Co., the Philadelphia Storage Battery Co., the Electric Storage Battery Co., and the American Storage Battery Co., their products being, respectively, Edison, Philadelphia, Exide and Harvard.

Feb. 21-28, Cincinnati, O.—Automobile Dealers' Association's pleasure vehicle show in Music Hall.

Feb. 23-28, Omaha, Neb.—Omaha Automobile Show Association's annual show.

March 2, 3, 4, Cincinnati, O.—Automobile Dealers' Association's commercial vehicle show in Music Hall.

March 2-6, Fort Dodge, Iowa—Automobile Dealers' Association's show in the Armory.

Mar. 9-14, Des Moines, Ia.—Automobile Dealers' Association's annual show.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's 12th annual pleasure car show in Mechanics Building.

March 17-21, Boston, Mass.—Boston Commercial Motor Vehicle Association's 12th annual commercial vehicle show in Mechanics Building.

Case Founder Dies at Ripe Old Age.

Stephen Bull, known as the "grand old man" of Racine, Wis., and the last survivor of the four founders of the enormous J. I. Case T. M. Co., of that city, died at his home there on Saturday last, 15th inst., after a short illness.

Death was due simply to the inevitable infirmities of old age, Mr. Bull having celebrated his 91st birthday on March 14th last. He had been blind for 10 years. J. I. Case was his brother-in-law. The business bearing Case's name was established in 1857. As a mark of respect, the entire Case manufacturing establishment remained still during the time of the funeral services, which were held on Tuesday.

RAILROADS GIVEN DECISION IN THE OREGON RATE CASE

Interstate Commission Rules Against Dealers in Long-Pending Dispute—Arguments Brought to Bear by the Railroads.

In dismissing the complaints and handing down an opinion in the cases of H. L. Keats Auto Co. v. Oregon-Washington Railroad & Navigation Co. et al., and the Menzies Du Bois Auto Co. against the same carriers, the Interstate Commerce Commission last week declared that the present less-than-carload ratings on automobiles from New York and Syracuse to Portland, Ore., is not unreasonable.

The shipments in each instance, consisted of two automobiles, not crated, on which a rate of $7 per 100 pounds was charged. Complainants averred that a rate not to exceed $4.50 should have been charged, and reparation was asked on that basis. At the time the shipments moved—August and September, 1909—there was in effect a carload commodity rating on automobiles of $3 per 100 pounds, with a carload minimum of 12,000 pounds. It was insisted that the difference between the CL and LCL ratings was too great.

How the railroad companies view automobile shipments was disclosed by their stand in those two cases. In justification of the rate charged, they cited the fact that automobiles in less than carloads, not boxed or crated, are rated double first class in both the Western and Southern Classifications, and at two and one-half times first class in Official Classification. The first class rate of $3 which was in effect at the time the shipments moved has since been increased to $3.70. This first class rate, it is contended by the carriers, is water-compelled rate, and is less than it would be were it not for that fact. Automobiles do not move by water, hence there was not that element to be considered.

It was asserted also that there are perhaps few articles of freight more subject to injury and unsatisfactory to handle than uncrated automobiles; when shipped in less-than-carload quantities, they must be handled with the greatest of care to prevent injury from other freight, while a comparatively small injury to an average automobile will generally result in damages equal to or in excess of the revenue received for its transportation. As evidence it was pointed out that during the year 1911 the Oregon-Washington Railroad & Navigation Co. alone paid $5,022.34 loss and damage claims on automobiles which it transported during that year, and in which the total revenue received by all the carriers involved in the transportation movement of those automobiles only amount to $23,412.63.

Since the date of the hearing the carriers have increased the carload rating between New York and Syracuse to Portland from $3.00 to $3.30, have eliminated the less-than-carload commodity rate of $7, thus putting the LCL shipments in at double first class under Western Classification, or at a rate of $7.40, an increase of 40 cents over the rate complained of. The tariff carrying the increase was suspended and investigated by the commission, and afterwards allowed to become effective.

Stratton Buys Jeffery New York Branch.

In pursuance of its policy of discontinuing its branches, the Thomas B. Jeffery Co., of Kenosha, Wis., has disposed of its New York establishment to F. E. Walbridge and Gilbert M. Stratton, who, trading as the Stratton Motor Car Co., hereafter will handle the Rambler, or Jeffery, car on a dealership basis. Walbridge and Stratton at present constitute the Pope Motor Car Co., which handles the Pope-Hartford car in New York and which will be succeeded by the Stratton company. Pope-Hartfords, however, will continue to be sold, but whether the Stratton company will occupy the Jeffery branch or remain in the present Pope-Hartford quarters, both of which are on Broadway within three blocks of each other, has not yet been settled.

White to Try Body Suit Once More.

A judgment of $1,567.62, which George B. Marx, of New York City, secured in March against The White Co. in the New York City Court, is not to stand, the Appellate Term of the Supreme Court for New York county this week having ordered the case retried. Marx claimed the amount named was due him for labor and services rendered in connection with placing 20 bodies on as many White chasses. He claims he was entitled to a total of $7,647.15 and received but $6,259.34. The White Co. entered a counterclaim of $185.

Tanner Gauge Becomes Tanner-Hower.

The Tanner Gauge Co., of Akron, O., which for several years has manufactured gasolene gauges, has been reorganized and reincorporated with an authorized capital of $50,000 as the Tanner-Hower Mfg. Co. Its officers are M. Otis Hower, president; Perry E. Tanner, vice-president and general manager; W. T. Helfer, secretary and sales manager; A. W. Tanner, treasurer. It is the intention of the new company to branch out into the manufacture of other goods. The new president is also the head of the Akron Sales Co.

DEFRAUDING CREDITORS IS CHARGE AGAINST SUPPLYMEN

Kansas City Firm's Members in Uncle Sam's Grasp — State's Evidence Reveals Inside of Alleged Bankruptcy Swindle.

One way of "trimming your creditors" was described last week in the Federal court in Kansas City, where Harry D. Todd, former president, and Leonard Ulmann, former attorney of the Auto Specialty Co., of that city, are on trial on a charge of conspiracy; until the summer of 1912 the company was located at 1516 Grand avenue, but when it got into deep water it is charged that a conspiracy to defraud the creditors was launched.

The man who undertook to disclose the internal operations of the concern was John T. Fenn, who formerly was sales manager for the company and who also is a defendant.

"They led me into a trap," he said in giving testimony. "Every dollar I had in the world was in the business, and as I am more than fifty years old and have a wife, I could only watch their fraudulent statements and overtures for settlement with their creditors. I couldn't protest; I was dragged into it.

"Todd told me he had hidden tires, horns, spark plugs and platinum points in the store in trunks, on the roof, in the attic and in the cellar a few days before the receivers were appointed," Fenn said in answer to the questions of the assistant district attorney. "We were to retrieve the goods after a settlement had been made and put them back on sale."

When Albert J. Martin, United States marshal, made an inventory of the company's stock he found thousands of dollars' worth of goods hidden as Fenn testified.

"Todd destroyed all the checks, deposit slips and inventories made while I was with the company about July 1," the witness continued. "On January 1 of 1912 an inventory showed we had a stock of about $28,000. This was raised to $41,000 to make a showing for a commercial rating. On March 1 we owed $3,000. Then the company began buying stock so heavily that on July 1 it owed about $55,000. A statement had been prepared April 1, saying that the assets exceeded the liabilities of the company by $43,700. That was wrong; the company was behind all that year."

The assistant district attorney read a letter which Fenn said Ulmann had sent to all of the company's creditors offering to pay them thirty cents on the dollar, rather than go through a receivership.

PLAYING SQUARE IN SELLING

Salesman Who Lost Out by "Double Crossing" His Customers—And the Salesman Who Built Confidence and Got the Orders.

The salesman for a well known accessory jobber had been making a certain town in his territory for years. There were six automobile dealers there and every one of them sold accessories, and every one of them did business with a competing jobber. Through frequent calling the salesman was acquainted personally with each dealer, but never had he taken a single order. It seemed to him as if he would never get any business there. Nothing he could say appeared to interest the trade.

Then he Got All the Orders.

Then one fine morning when he was calling on the biggest dealer first, according to his custom, something happened. He got an order—and it was a good one. The next dealer he called on also gave him a fair order, and before the day was over he had orders from all six. For a moment, when he got back to the hotel that night, he felt as if he were dreaming; but the signed orders proved the reality of the situation. He was extremely curious to find out what had brought about this change of heart. Later he broached the subject to the leading dealer. "I have called on you and every other dealer in this town for three years but never got an order till a month ago," he said. "Then I not only got your business but that of every other dealer here. Can you give me a key to the situation?"

"Well," said the dealer, "we all work together here. We have a little organization among ourselves by means of which we help ourselves. Things pertaining to the practical side of our business are discussed freely and we stand by one another. Until your last visit all our business had gone to a competitor of yours; but we secured positive information that he was not only selling us goods but had a man up here selling goods to our customers at prices it is impossible for us to meet. That was not square and we decided to do business with someone else. You were given the business because we all knew you and because during the time you have called here you have never been known to 'knock' any of your competitors. You have paid attention to your own goods and your own house and for that reason you stand out from all of the other jobbers' representatives who call on us. Your prices are no lower than the others, but your methods are square . . . and you will get our trade so long as they continue to be square."

"That was a year ago," said the salesman in concluding his story of the incident. "I make that town every thirty days and never yet have I failed to get an order from each of those six dealers every time I called. That town is one of the most profitable in my entire territory."

The secret of the situation was that the salesman was building confidence in himself and his house all the time, though he didn't know it. At the proper time after that confidence was established he secured the business—and the methods that inspired that confidence are keeping the business. "You cannot cast the shadow unless you have the substance," says a well-known writer, and proof of this comes in the work of every good salesman.

APPEAL TO ELECTRIC OWNERS THAT EARNED BIG GOOD-WILL

Realizing the value of the public's good-will, the Anderson Electric Car Co., which handles Detroit electrics in Kansas City, recently took advantage of a public resentment against an obnoxious city ordinance and allied itself with the owners of electric cars. The ordinance provided that no car should be left standing in any one place for longer than one hour, which regulation was particularly disliked by those who attend the theater in their electrics.

The dealer ran an ad. which said, "No More Police Tea Parties," and it drew many responses, coming just at a time when several prominent citizens—women included—had been haled into court for violating the new rule. The Anderson company offered to take care of electrics without charge for any reasonable length of time and arranged to take cars from and return them to the theaters for the owners. Attendants are stationed at the theaters and leading stores for the purpose of making good on this unusual service offer.

MAKING A HORN MOTOR SERVE MORE THAN ONE PURPOSE

The Acme Tire Repair Co., 226 Jefferson avenue, Detroit, had a novel window display a few days ago that attracted more than ordinary attention. It consisted of a regular artillery wheel studded with colored electric lights and kept revolving by means of the small motor in a Newtone electric horn that was connected with a Witherbee storage battery.

This moving display served to rivet attention on a window full of horns and, incidentally, demonstrated the power of the Newtone motor. A legibly printed card invited the public to come inside and get a demonstration of Newtone efficiency.

Making Use of Printed Matter.

When the manufacturer ships you a supply of printed matter, what do you do with it? Booklets in boxes in the storeroom might better be back in the factory. They have been sent you for a purpose. That purpose is to have you place them in the hands of your local prospects. Are you doing it systematically? Are you doing the way you would like to have it done if you were paying the bills?

AWAKE-N-DISING WORLD

HURRY-UP JOB A BOOMERANG

Work, Rushed to Please Customer, Caused Enduring Trouble for Repairman—

Wisdom of Being Sure Each Job Is "Finished."

Finish it up.

Don't let a job get out of your repair-shop till you know it is finished.

Don't let the impatience of the owner cause you to break this rule. Your reputation is the one that suffers. If there are any shortcomings on the work the owner is likely to forget that he hurried you.

It's far better to keep him waiting and deliver the job right.

Rush Job Came Back Three Times.

A few days ago a certain motorist went into a repair-shop and left his car. His brakes were "frozen." He wanted them fixed. When could he get the job? Oh, in about half an hour. He came back in two hours. The job was not done for the very good reason that what seemed like a very simple situation had on examination proved to be a serious case of bent rear axle. Several new parts were necessary.

It would take at least a day longer.

At the end of the promised time the man came after his car. It was just done. He got it and drove off in it. Next morning he was back. Brakes were dragging. "Is that so? We'll fix that in a short time," said the repairman. The car was delivered to the customer in 45 minutes. And next day the man was back again. Brakes still dragging.

Work had to be done over three times. Why? Just because it had never been thoroughly inspected and tested. Why? Because the customer was in a hurry and the proprietor had too great a desire to please. And whom did it hurt? It hurt the customer some because he was obliged to come back three times. He thought less of the garage than he had ever thought before. It hurt the garage. It hurt its pocketbook and it hurt its reputation..

WEATHER REPORTS AS GUIDES FOR SALE OF CERTAIN GOODS

Watch the almanac. Watch the weather reports. It is good business. It will tell you what goods to push on the day that is to come. The accessory jobber who has a large number of customers can post them in advance what to stock of those things particularly adapted for bad weather.

Is it going to freeze? The weather man can usually give the right answer within 24 hours. Have your window display all planned. If you have local customers it gives you a chance to call them up and pull in several orders for the seasonable stuff.

Do you keep a garage? Why not make money by selling anti-freezing solutions. It may be alcohol; it may be something else that you recommend. Go at it in earnest and make some money out of it. Don't wait for your customers to come in; call them up by 'phone. Tell them cold weather is on the way. Suggest that they drive in in the morning or whenever it is convenient and have their radiators filled up. Don't let them stumble upon the need when they are far away from you and have to buy elsewhere. Show that you are on to your job and are really out to sell stuff. You will make the sales and the money. Volume is what counts. You can have it by following out some such method. Try it.

REACHING INTO OTHER TRADES FOR HELPFUL SUGGESTIONS

If you are an automobile dealer the object of your business is to sell cars. Leaving aside all ethical considerations, it would seem that, if you are handling the right car—a car which you can stand back of—the larger the volume of your sales the more profitable would be your business.

"Of course!" you say, and add: "What's the man driving at?" It seems so simple no one would dispute it. Nevertheless, if one judges many dealers by their actions it would seem as if the matter were the one farthest from their thoughts. For only a few automobile dealers are reaching into other businesses to see what they can obtain in the way of ideas and suggestion that will be profitable.

What can the automobile dealer learn from the hardware man? The adding machine salesman? The typewriter salesman? The drygoods store? The department store? Surely there must be some lesson in good merchandising that will help the dealer who discovers it sell more automobiles.

Examine each and every department of their business and its presentation to the public by printed word, by catalog, by living sales people, by window displays, by countless other methods—old as the hills, perhaps, but still just as effective as ever.

USING TAGS TO FURTHER THE SALE OF ELECTRIC STARTERS

All sorts of devices have been advertised by attaching cards to steering wheels of cars left standing at the curb, but it remained for F. Jos. Lamb, 940 Jefferson avenue, Detroit, to advertise electric starters by attaching his advertisement to the crank itself. Lamb uses a heavy yellow tag six and a quarter inches long by three and one-quarter inches wide. His entire proposition is brief, pointed and complete. His tag says: "I will attach an electric starter in place of this crank for $150"; then follows his name and address. The message is in plain, large, black-face type and reads the same on both sides. The idea is simple and effective. Lamb has sold a considerable number of starters through the plan, which is capable of much elaboration, if elaboration is desired.

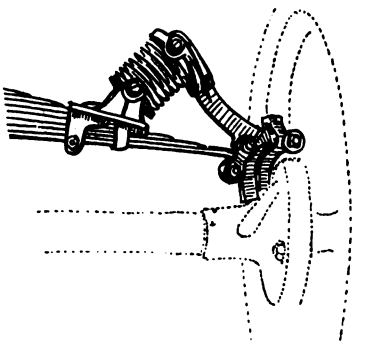
RECENT DEVELOPMENTS in ACCESSORIES

Here's the Individual Windshield.

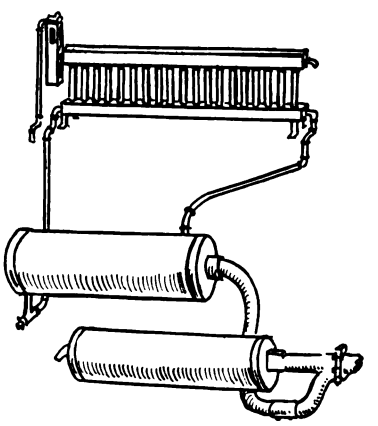
The windshield has gone a long way toward making the automobile more comfortable than it used to be, and so thoroughly is this appreciated that a car without a windshield somehow has a rather bare look. But the ordinary windshield confers most of its benefits on the occupants of the front seat—which, as everyone knows, is the most comfortable place to ride in anyway.

To put the occupants of the rear seats on an equal footing with the driver and his seat-mate several types of tonneau windshields have been brought out. Most of the devices are attached to the back of the front seat, in which they differ radically from the Clark tonneau windshield, manufactured by A. N. Clark & Son, of Plainville, Conn., and shown so clearly in the accompanying illustration that the advantages are readily perceived.

In reality the Clark windshield, in its complete form, is two windshields, one for each side of the rear seat. Not only is the device a comfort when there is a head wind, but in case of a side wind it can be swung around to afford the desired protection and, of course, can be placed at any intermediate angle. The glass is removably set in an aluminum frame which is carried in a fitting screwed to the seat under the cushions. It is adjustable for height. If it is not needed it can be unshipped and packed into a leather case. The only tool needed to make the attachment is a screwdriver.



CLARK INDIVIDUAL SHIELDS



Shock Absorber that is Unusual.

The enormous number of Ford cars in use and constantly pouring out of the factories makes the Ford field a particularly attractive one for manufacturers of accessories, because there are so many possible purchasers. Hence there is a long and rapidly lengthening category of devices ,each designed to improve the operation of the car in some detail. Perhaps the latest of these devices—one of the latest, anyway—is the Hassler shock absorber, which is made by Robert H. Hassler, of West 10th and Canal streets, Indianapolis, Ind., and which is illustrated herewith.

The construction of the Hassler shock absorber is so easily understood from the picture that a detailed description is quite unnecessary. It may be mentioned, however, that the springs, which are of flat steel, have an aggregate length of no less than 36 feet, there being 9 feet of steel in each of the four coils. The springs work under compression at all times, and their durability is ensured by the fact that they work over a range of about one-third their capacity. Rebound is checked by the auxiliary springs because when the leaf spring of the car rises above a certain point the main lever of the shock absorber is held stationary and the coil springs again are compressed, so that both upward and downward movements compress the coil.

HASSLER SHOCK ABSORBER

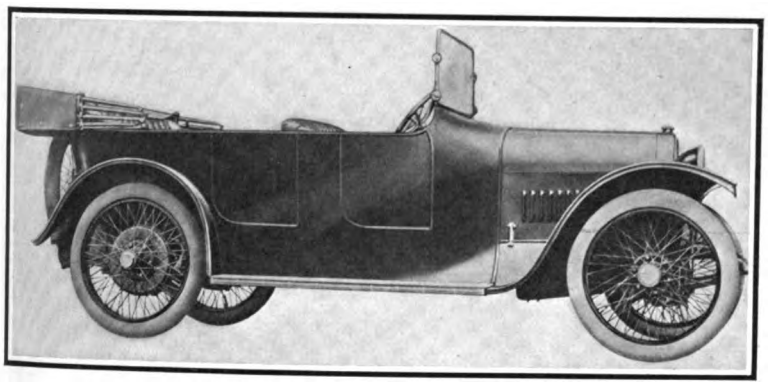
ROBINSON WATER HEATER

The Hassler shock absorber is said to be so sensitive that when the car is unoccupied pressure of the hand on the body will move it on the coils; yet the springs cannot "bottom." A set consists of four, two for each leaf spring of the car. The Ford spring perches are used for attachment, simply being reversed, on the front axle; on the rear they are bolted to the brake housings in place of the spring perches.

Heating the Car with Hot Water.

Heating by hot water has certain advantages of its own that are undeniable. Water cannot get more than just so hot, and at the hottest cannot burn anything. It affords a mild, steady heating effect that is particularly agreeable, and it cannot become so hot as to be unpleasant. For these reasons, apart from other considerations, there should be merit in the Robinson auto heater, which is the product of the Robinson Auto Heater Co., of Milwaukee, Wis.

The principle of the Robinson heater is simple, and so is the construction, as the accompanying illustration shows plainly enough. The heat is extracted from the exhaust gases, which are diverted from their usual path and made to flow through a cylindrical chamber containing a water heater connected, through pipes at either end, to a radiator which is installed wherever it is desired to have the heat—which means inside the car. Circulation is maintained by gravity—that is, the water rises into the radiator when heated and falls, through the cold-water pipe, back to the heater when its heat has been given off.



The heat is controlled by means of a valve which acts on the exhaust, directing the gases through the heater in sufficient volume to produce the desired warmth. Any amount of gas, from the full volume sent out by the engine to none at all, can be turned into the heater, which, incidentally, is also a muffler and acts as such when the gases pass through it. There is an expansion chamber on the radiator to take care of any increase in the volume of water due to heat, an overflow pipe running down through the car floor. The radiator can be installed in any desired part of the car, and even two radiators can be put in. If there is not sufficient room under the car for two mufflers, there is a combination device to take the place of the car muffler.

MOLINE LOWEST PRICED CAR FITTED WITH KNIGHT MOTOR

Four-Cylinder Motor Block-Cast with Gravity Cooling System—Clean Design a Notable Feature—Clever Body Construction.

Of course, it was no secret that the Moline Automobile Co., of East Moline, Ill., was preparing for the market a Knight-engined car; but since the statement of the simple fact, made in Motor World of August 28, but little has become known regarding the details of the expected model. The announcement of the company that it had entered the lists with other Knights was a surprise, and it has kept the details "up its sleeve," or up the sleeves of its motor, perhaps, for the purpose of holding

MOLINE-KNIGHT FIVE-PASSENGER MODEL WHICH SELLS FOR $2,400

another little surprise party at the right time. The right time having arrived, it transpires that the Moline-Knight car differs in a number of important respects from other Knight cars, though the peculiarities are confined to the motor, the rest of the chassis following established Moline lines closely and adhering to standard engineering practice.

Not the least of the unusual features of the Moline-Knight is its price, $2,400, which is lower than that of any other Knight-engined machine on the market, and includes a full equipment list, headed by a dual-unit electric starting and lighting system. Mechanical innovations in the motor consist in casting the four cylinders in a single block and cooling by thermo-siphonic action—practices that are not followed in other American motors of this type. As for the outline specifications of the car, it is a touring car with seating capacity for five, but with provision for two extra seats if it is desired to carry seven; the motor and gearset—three-speed selective—are mounted as a unit on a three-point suspension; wheels are 38 inches in diameter with 4½-inch tires and the wheelbase is 128 inches; and the steering wheel is on the left side with the usual corollary of center control. The clutch is a leather-faced cone.

The exterior of the motor presents an appearance of cleanness that is notable even in this day of clean-designed motors. Perhaps the chief factor in bringing about unusual cleanness is the casting of both intake and exhaust manifolds integral with the cylinders and water jacketing; the manifolds, incidentally, are entirely surrounded by water, so that one is cooled and the other warmed, the water being cooler than the exhaust gases and warmer than the incoming vapor.

The cylinder heads are separate parts and are held down by nuts which are of bronze because they are within the water space. The water space is closed at the top by a bolted-on cover with which is cast the upper water manifold. The spark plugs set into little wells such as are familiar in Knight engines. The water jackets thus cool the cylinder heads and the sliding sleeves, the only portions of the sleeves not jacketed being the extreme lower ends, which do not need cooling. Special means are adopted for securing even distribution of the cooling water; there are two pipes leading from the radiator to the lower water intakes, one at each end of the motor, so that the cooling effect of the incoming water is not concentrated, and the dangers of unequal cooling and the development of hot spots are eliminated. The cylinder heads are hemispherical inside and the piston heads are cupped, so that the combustion chambers are almost spherical—a form that is theoreticaly correct for high efficiency.

The all-important sleeves are reciprocated by the usual arrangement of eccentrics and connecting rods, the eccentrics being 2 5/16 inches in diameter and the eccentric pins 1⅛ x 1¼ inches, so that there is ample wearing surface. Drive from the crankshaft to the eccentrtic shaft is by "silent" chain. The magneto and the electric lighting generator also are driven from the valve chain, both being mounted on the left side of the motor, as the illustration shows, and both on the same bracket casting. This bracket is mounted on a pivot upon which it can be swiveled; thus the driving chain can be adjusted for wear by a slight turning of the bracket on its support, and one of the common objections to the use of the "silent" type of chain is eliminated. The sprocket over which the chain runs is on the magneto, from the shaft of which another chain, smaller of course, drives to the generator. Adjustment is conveniently made by means of a screw on the chain housing.

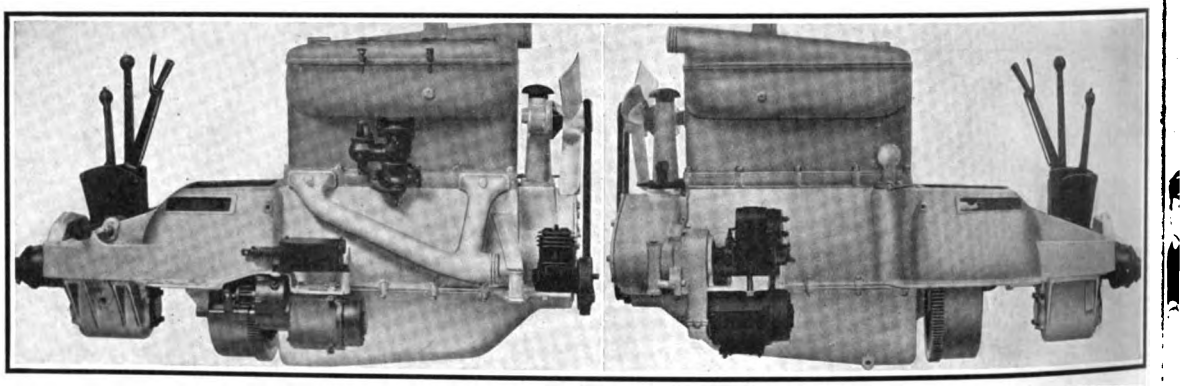
The lubrication system has been worked out with a completeness that would seem to afford adequate provision for the needs of the motor. There is the usual oil reservoir in the bottom of the crankcase, from which oil is taken by a gear pump and forced to the various bearings at a pressure which varies with the speed, the maximum being about 20 pounds to the square inch. The idea is to "float" the bearings on oil films. The oil is forced through drilled passages and registering holes, first to the main bearings of the crankshaft, then to the connecting-rod big-end bearings and finally to the piston pins through the connecting rods, which are tubular, having ⅞-inch holes filled with oil throughout their length. The piston pin is hollow and moves in the piston, in which it is retained by the lower edge of the lowest of the three piston rings. A special oil lead carries lubricant to the eccentric shaft chain, and part of this goes to the small shaft bearings.

Regulation of the lubrication is automatically effected by means of a by-pass connected to the throttle lever; when the motor is running slowly nearly all the oil is by-passed back to the reservoir, while when the throttle is wide open the oil is all pumped to the bearings at its maximum pressure of 20 pounds. As might be expected from the block-casting of the cylinders, the crankshaft runs in three bearings, which are 2 inches in diameter; the front and middle bearings each are 2½ inches long and the rear bearing, which has the weight of the flywheel to carry, is 4 inches long.

The Moline people guarantee that their motor will develop 50 horsepower on the brake, and that they are perfectly safe in so doing would appear from the statement that on dynamometer test the horsepower ran up to 65 at 1,800 revolutions per minute, and then the capacity of the dynamometer was reached, making further measurement impossible. As it is said that the power curve showed no indication of beginning to fall off at that point, however, it would seem that even greater power may be developed by further increasing the

Digitized by Google

speed. The port areas are, of course, important factors in the large power output obtainable; the ports in the sleeves are 3⅞ inches long, the intake port ½ inch wide and the exhaust port ⅝ inch wide, giving opening areas double the areas of the Moline poppet valve motor, though its cylinder dimensions are a trifle greater than those of the sleeve valve motor.



The extremely quiet running of the motor was emphasized when it came to equipping it with an electric starting system. Naturally it was desired to keep down what might be termed auxiliary noises as well as motor noises, and it was discovered that the slight squeaking of the starting motor brushes was distinctly audible when getting under way. So the commutator and brush design was slightly changed to eliminate this ordinarily inaudible sound. The starting motor is bracketed low down on the engine and drives through a pinion meshing with a steel gear ring on the flywheel. A lever located beside the gear-shifting lever operates the starting motor switch and at the same time throws the motor pinion into mesh with the flywheel gear. The motor takes a current of 220 amperes at 12 volts from the battery at the instant of starting, but this drops to 75 amperes as soon as the flywheel begins to roll. The motor will turn the engine over at the rate of 120 revolutions per minute. Though the starting motor takes 12 volts, the lighting system is wired for 6 volts. The battery is an LBA rated at 80 ampere hours and is placed under the front seat of the car.

The fan standard, carrying the cooling fan, which is driven by belt from a pulley on the crankshaft, is also the breather and the oil filler, being hollow, of course. Part of the equipment of the motor is a two-cylinder air pump for tire inflation, driven by gears from the crankshaft, an intermediate gear swinging on a pivot providing the means for engaging the pump. The operating lever is at the front of the car under the radiator; the pump gears do not run unless the pump is in actual operation.

As already has been intimated, the chassis is a typically Moline design apart from the new motor. Changes have been made, however, by substituting semi-elliptic rear springs for the full-elliptic springs that the Moline people formerly employed, and underslinging them. A full-floating rear axle still is used, driving the wheels, which run on double annular ball bearings, through eight studs. The pressed steel frame has a rear kick-up sufficient to permit lowering the body four inches, to the enhancement of the general appearance of the car.

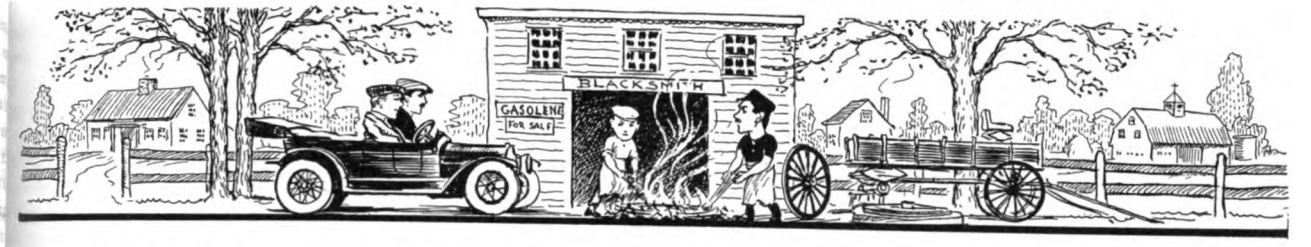
Stream-line curves, unbroken from end to end of the car, characterize the body, which is designed along European lines. The lines are not broken at the junction of the hood and the skuttle because of the slope of the hood, which carries forward the skuttle line. The body is high-sided, so that the backs of the seats project only slightly. Though the body is lighter than in previous Moline models, it is considerably stronger and stiffer by virtue of a skeleton truss framing system in lieu of the usual solid sills. The car is of clean appearance, having clean running boards and no side lamps. The headlights are provided with dimmers for city service. The fenders are crowned and are without the usual rivets.

In addition to the starting and lighting system and the air pump, the equipment of the car consists of a top of the "one man" type, with cover and curtains, windshield, electric horn, Warner speedometer, Truffault-Hartford shock absorbers, gasolene and oil gauges on the dash, eight-day clock and the usual rails, tools, tire repair kit, and so on. Wire wheels will be supplied at an extra cost of $75.

RIGHT AND LEFT SIDES OF MOLINE-KNIGHT MOTOR SHOWING BLOCK CASTING AND INTEGRAL MANIFOLDS

Spooner Plans "Helping Hand" Society.

Stealing time from the exploitation of cyclecars, the irrepressible F. Ed Spooner, of Chicago, New York and elsewhere but now of Detroit, is endeavoring to organize a "benevolent society of veterans of the automobile industry" and expects to hold a meeting for the purpose in Detroit during next month. The purpose of the organization, if formed, will be to "keep track of old-timers and also to look after the interests of their families in time of need." To employ Spooner's words, "Many men have given the best years of their life to the propagation of the motoring business without laying by money for rainy days, as is ever the case, and many will feel much easier when they know that temporarily, at least, they and theirs will be looked after."



American Starter for German Emperor.

Whatever may be the attitude of the German automobile manufacturers toward electric lighting and starting systems, Kaiser Wilhelm himself evidently has no doubts of their utility and convenience. At any rate, two 60-horsepower Knight-engined Mercedes which he has ordered from the Daimler company will be equipped with made-in-America Bijur electric lighters and starters, the current being supplied by an American storage battery, the Willard. This electrical equipment, it is stated, was shipped from the Bijur plant in Hoboken, N. J., and was installed at the Bijur plant in Germany.

Why Socket Wrenches Must Fit Properly.

While it is necessary to use care in working with an ordinary wrench to see that the wrench fits the nut properly in order to avoid the deterioration of the wrench or the nut, or both, it is even more important in the case of some of the very thin-walled socket or box wrenches on the market. These are very useful where there is little space around the nut; but if the wrench is considerably larger than the nut it is likely to be forced out of shape if any amount of pressure is applied, and the deformation, once started, will progress rapidly.

PROMOTING TEAM WORK BETWEEN DEPARTMENTS

Lack of Cooperation in Organizations a Business Ill Which Reilly Deems Worthy of Efficient Doctoring—Repair Foreman's Half-hearted Help to Sales Department and the Harm It Did.

"Can we get a little 'gas'?"

The sign on the front of the country blacksmith shop said Reilly could get "gas" but the question was a natural way to open negotiations.

The smith with one heavy-soled shoe kicked the embers up about a two-inch wagon tire which was baking in front of

"COME ON, JIMMY! DON'T POUR WATER ON THAT WHEEL ALL DAY!"

the shop under a circular bonfire of old fence boards.

"I can't git it myself for a few minutes; we've got to drop this tire on. George!" he shouted in the direction of an upstairs window, "Can yuh come down and draw a little "gas'?"

Smith's Painter Wouldn't Draw "Gas."

The answer was as prompt as the echo of a thunder clap. "No, darn it! I gotta git this body done. I ain't got no time to monkey with any 'gas.'"

The leather-aproned smith cussed as only a leather-aproned smith can cuss; then he added: "Ain't got no harmony at all in this here shop. Can't git nothin' done unless I do it myself. I'll git the 'gas' in a couple of minutes," he said. "Have to have a wood-and-paint man up there, but the sonufagun wan't do a darned thing for any other part of the shop, and if he does it takes him a week and then he don't do it right. Have more darned trouble with my help——

"Come on, now, Jimmy."

Reilly and the Sales Manager watched with interest while Jimmy, the smithy's son, grabbed one side of the big tire with a pair of tongs; the smith grabbed the other side and the hot iron band was removed from its bed of embers with a jerk. The smith poked a punch through a hole in the tire and the rim, he and the boy hammered the tire down into position, and, while the smith walked around upon the tire-stone and belted the wheel together with a hammer, Jimmy traveled a like course with a watering pot and cooled the tire before it could burn the felly. And even this entailed considerable verbal effort.

Rasping Relations Not Laughing Matter.

The smith gave a final yank to the cranked screw which held the hub down and left the rest of the job to Jimmy and his watering pots while the proprietor poured gasolene into Reilly's 'gas' tank.

As the car pulled out into the road with enough 'gas' in to get it home the two automobile men heard another inharmonious clash: "Come on! Come on, Jimmy! Don't pour water on that tire all day. Git at that other wheel!"

"Gee! But that old cuss has a tough time, doesn't he?" commented the Sales Manager, settling down for the ride.

"His disposition is partly to blame," responded Reilly. Then, after several minutes of silence, "But I'd 'can' that painter."

"He certainly seems to have trouble with his 'departments.'"

"'Ain't got no harmony' is a very good description, I should say; he evidently knows what ails his business and doesn't know how to remedy things. I would suggest as a starter that he develop a harmonious disposition himself."

"Guess I'll send down old Blukey from the factory; he's got a lot of ideas on coordination of departments and departmental cooperation."

"Well, believe me! It's not to be laughed at," retorted Reilly. "If a man can coordinate his departments and employes he has done one of the biggest things he can accomplish."

"So?"

"BUT WAIT! WE'VE FOUND MISTAKES. I'LL CALL UP THE SHOP"

"Quite so. That's one of the biggest things about the Old Man; he has pulled everything in the factory into line. That's one reason why you don't realize the value of what he's done; you don't know what it means not to have things working like a well-oiled machine."

"The organization certainly works well."

Carburetter Branch Worked Badly.

"You should get around and see how some of them don't work. I ran across a hot one a few weeks ago. You know Aleck McGraw, who used to live up next to me. He has a big, heavy, six-cylinder car and he thought the carburetter the manufacturer put on wasn't doing as well as it might. He nosed around and decided to put on a Mace carburetter——"

"That's a good carburetter, isn't it?" supplied the Sales Manager as Reilly broke off his conversation to concentrate on missing a passing car and the edge of a culvert.

Digitized by Google

"Nothing the matter with the carburetter," replied Reilly, straightening away on a smooth stretch. "The trouble is with their branch in our town. It's run on a par with the old blacksmith's 'departments.' 'There ain't no harmony.'"

"What happened?"

"Well——" Reilly bit the superfluous fan-tailed effect from the end of his 'dry' cigar. "Well, McGraw went down to the Mace branch, as a beginning—he lives about fifteen miles out now, near his business. He told them the make of car he had and asked them if one of the carburetters would fit his wagon. The salesman was nice enough. He looked in a catalog and said the catalog indicated that special fittings would be required for the kind of car McGraw drives.

Foreman's Attitude Not Congenial.

"McGraw wanted to know how long it would take to get the special fittings made. 'Oh, two or three hours,' guessed the salesman. 'But wait,' he added. 'We've found mistakes in this catalog and it may be that your car won't require special fittings. I'll call up the shop.'

"McGraw could hear the conversation on both ends, the 'phone was such a loud one, and when the shop foreman said special fittings wouldn't be necessary McGraw rather doubted him because he said it in a tone of voice which indicated that he didn't give a darn whether it would fit or not. But the salesman said he was sure the carburetter would drop right into place. McGraw told him that the carburetter would be put on in a small shop several miles from town, in the garage where McGraw has some of his little jobs done, and that if it didn't fit it was going to mean a great inconvenience.

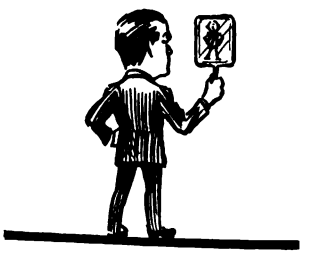
Lack of Harmony Led to Difficulty.

"But the salesman insisted it would fit; he said the mechanical man ought to know. McGraw is not much of an engineer himself, and he thought the salesman ought to know what he was talking about, so he put the carburetter in the car and drove home. When he got out there he asked the repairman to change the carburetters. The repairman got the car on the shop floor, took the old carburetter off and started to put the Mace on, but she wouldn't go.

"The repairman telephoned McGraw that special fittings would be necessary. McGraw said that couldn't be true, that the carburetter people had looked it up and were sure none would be required. But the repairman insisted that special fittings were necessary, so there was nothing for McGraw to do but have the things put back together again and make another trip to town. He was pretty sore about it and I guess he gave a young imitation of that blacksmith when he got started."

"That was a —— of a situation, wasn't it? Why don't the Mace people straighten things out?"

"I doubt whether they know about it; it's possible the branch manager doesn't know about it and has never thought of it, but it's certain the owners of the business aren't



"HE SAID HE WAS BUSY AND I WOULDN'T KNOW ANYTHING ABOUT IT ANYWAY"

anxious to have such a rasping contact point between themselves and the public. That's the reason for a lot of this lack of cooperation in business; the man who would be the most anxious to remedy conditions doesn't know about it. He has his organization under him and believes it is doing its work as it should, and, busy in what he regards as the larger business affairs, he doesn't delve into this part of his business. I've often thought such men should drop into their branches or salesrooms once in a while and play the part of purchasers just to see how their customers are handled."

"I should call team work one of those 'larger business affairs,'" commented the Sales Manager.

"And so would anyone," agreed Reilly, slowing down as they passed a speed sign at the edge of the city. "There isn't a more important thing in any establishment. Ben Doyno has worked it out pretty well in his

"HE OUGHT TO LOOK IN A MIRRORSCOPE AND SEE HIS REAL SIZE"

supply store. Ben's a pretty affable sort of man and he is a good handler of men. Ben didn't call all his employes together and preach a sermon and he didn't paste up a lot of 'hot stuff' rules and suggestions on efficiency, but he has built a wonderful little organization. There isn't a man there who wouldn't jump quick to give a boost to any other department of the business.

"He pays his employes all they're worth and they have come to know that the man who sits back in the breeching and doesn't pull with the rest of the team isn't worth much. He makes a study of his organization and the man who pulls the best gets ahead the fastest. If a store salesman whistles up to the stockroom for something in a hurry, the stockroom lads send it down in a hurry, and everything works fine.

Doesn't Keep Man Who Can't "Fit In."

"Another thing Ben does is not keep a man who doesn't seem to be able to fit in with the rest. If a new man develops one of those I'm-a-salesman-and-I'm-not-supposed-to-do-anything-else attitudes and can't get over the disease he doesn't stay long. It isn't driving men, it's getting in and helping them to pull with you. Ben would just as soon sweep the floor if there wasn't anyone else to do it, and no man who works for him can afford to balk at imitating the spirit of the boss."

"Not everyone could do that," interposed the Sales Manager.

"Probably not," replied Reilly, "but they haven't all tried it, I'll wager. I went into a piano store the other day to ask about the insides of the machine we have up at the house and the salesman said he would take me up to their mechanical department. When we got there the head mechanical man said it wouldn't do any good to show me, that I wouldn't know anything about them if he did and that he was busy.

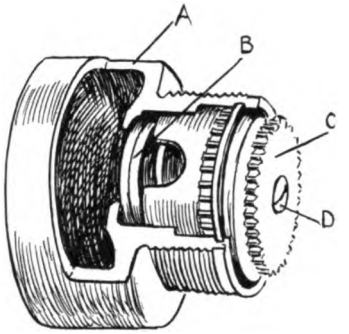
Spent Unneeded Time in Sputtering.

"I found out later that what he said was true; the adjustment I wanted made required an expert piano repairman and it wouldn't have done any good to have shown me the insides. But the repairman showed plainly that there was friction between the departments. The way he acted embarrassed the salesman and gave me a few bad minutes myself. If he had taken half the time he spent in sputtering and explained in a few words that an expert repairman would have to attend to the job it would have been about seven hundred per cent. better."

"And, again, probably the head of the house isn't aware of that friction."

"I was almost tempted to tell him, for his own good," asserted the dealer.

"As I suggested before, I think I'll send old Blukey down to see him," suggested the Sales Manager, who seemed to have a derogatory opinion of that member.



"A-g-g-h!" exclaimed Reilly. "His idea of cooperation is to have everyone do things his way. He ought to take a look at himself in a reducing mirrorscope and see himself in his real size."

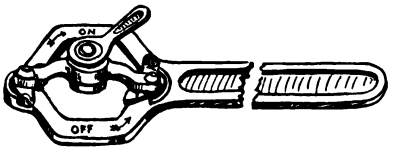
SIMPLE AUTOMATIC LOCK IN DUNLOP DETACHABLE WHEEL

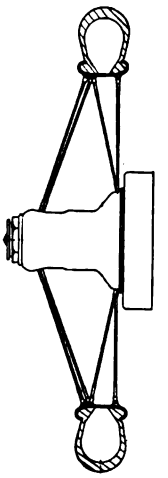
Absence of Loose Parts and Positiveness of Lock Principal Features—American Production to Include Special Ford Wheel.

Having completed arrangements for the American production of Dunlop detachable wire wheels by the acquisition of a factory in Long Island City, and not in New York City as at first was proposed, the Dunlop Wire Wheel Corporation of America, which was formed last April with $400,000 capital to manufacture under exclusive American rights from the parent company in England, is practically ready to market its productions, though some few weeks still must elapse before deliveries can be commenced. In the meantime, the company, which as



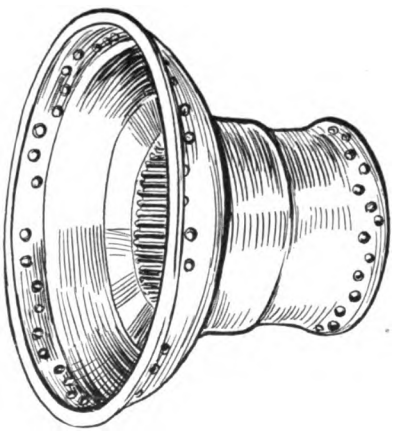
LOCKING DEVICE IN DETAIL

was stated soon after its formation has behind it such well known and influential persons as Horace M. Kilbourne of the National City Bank and Walter L. Fry, who is president of the company, is filling orders with imported wheels. Orson Kilbourne, son of H. M. Kilbourne, is vice-president and general manager of the company, which has removed its offices from 17 West 72d street to 2130 Broadway, where its sales and demonstration room is spacious and splendidly appointed.



The Dunlop detachable wire wheel in its present form has been on the foreign market only about two years, though even in that comparatively short space of time it has demonstrated itself to be worthy of adoption by such well-known manufacturers as Minerva, Talbot, Panhard & Levassor, Rolls-Royce and a number of others. The American wheel differs not a bit from its foreign cousin and incorporates all of the distinctive and interesting features to be found in it, not the least important of which is the unusual and positive locking mechanism.

One of the most interesting features of the wheel as a whole is that it has not a single loose part; even when the wheel is taken off its spindle the wrench with which the work is done becomes, temporarily at least, a veritable part of the wheel, though

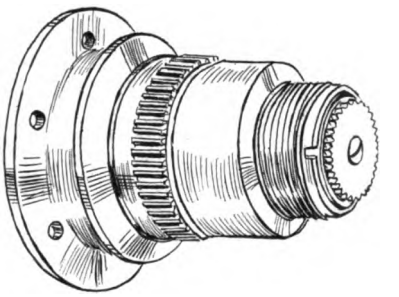


WHEEL REMOVING WRENCH

it can be removed easily enough for use on another wheel. The value of the elimination of small, loose parts is a feature that is self-evident, for it disposes of the possi-

SPOKING METHOD

bility of delay due to their loss or misplacement. Incidentally, apart from being ingenious, the Dunlop wheel is not by any means fragile, a high factor of safety being



DRIVING SERRATIONS IN SHELL

incorporated in both design and construction quite as a matter of course.

Insofar as the design of the wheel itself is concerned, it is of the quadruple spoked type, one of the important advantages of which, outside of its resistance to shock coupled with the maximum amount of resiliency, is that it does not increase the distance between wheel tracks, which remain the same as when the ordinary type of artillery wheel is used. The spokes are arranged so as to form a series of double struts, their disposition being best made plain with the aid of the accompanying sectional drawing. Although not shown by the picture, the spokes are countersunk into the rims and the shells thus providing rigid support and eliminating the possibility of slackening through wear in the spoke holes.

The locking device, which is by far the most important part of any detachable wheel inasmuch as it virtually represents the assurance of safety or accident to those who ride in the car, differs from anything else of its kind primarily in that it is devoid of ratchets and pawls and delicate springs, and secondarily in that it is absolutely dust proof, the latter being a valuable feature in a mechanism outwardly exposed to road dirt for long periods without act-

DUNLOP HUB COMPLETE

ually coming into use. There is a spring in the locking mechanism, but it is an exceptionally heavy spring that nothing short of a fertile imagination could rupture during the life of the car.

It is upon this spring, in fact, that the operation of the locking device depends and because of which it is quite automatic in operation despite the thoughlessness of the operator; even if the wheel should be put in place and left unlocked, it would lock itself instantly at the first quarter revolution of the wheel in either direction.

The complete rear hub with the locking device assembled is illustrated herewith, and in another picture a part sectional view of the locking mechanism alone is shown. In the latter picture, A is the front of the inner hub and B is the heavy spring which actuates the lock; the lock itself is designated C; D is merely a plug for the insertion of grease so that the bearings can be lubricated without the necessity for dismantling the wheel. The teeth in the lock itself engage with similar teeth in the revolving nut on the wheel and prevent the nut from working loose. The better way to make the operation plain perhaps, is to

Digitized by Google

describe the operation of removing a wheel.

The wrench with which the wheel is taken off is a special device and is illustrated herewith. In use, it is placed around the wheel nut, where it is held in place by the engagement of pawls in a special ring on the hub. The small handle then is turned to the right on a thread which forces the locking device in against its spring, thus disengaging the teeth. A few turns of the whole wrench to the left then suffices to disengage the wheel, which can be lifted off, disclosing the inner permanent hub and the driving serrations. The driving serrations in the wheel hub are shown in another illustration, which also makes plain the simplicity and the ruggedness of the construction; the shell is a steel stamping.

From the description of the wheel removing spanner and its method of use it should be apparent that it is impossible to remove a wheel until it has been properly unlocked. Incidentally, as the locking device is not enclosed but is out in the open —though there are no projecting parts to be knocked off or to catch in anything—a glance suffices to make plain whether or not the wheel is locked. In replacing the wheel, the operation of removing it is reversed, the wheel nut first being screwed up, after which the smaller handle is turned to the left, releasing the lock, which automatically engages its teeth with those in the nut. If, however, the wrench should be removed without first unscrewing the smaller handle so as to engage the locking teeth, the spring pressure behind the sliding portion is more than sufficient to force it out and bring the teeth into engagement: furthermore, if the teeth should be in a position, against one another, where they will not engage, the first movement of the wheel backward or forward will cause them to engage under the influence of the spring.

Needless to point out, the Dunlop detachable wire wheels are made in all the various rim sizes and may be had with either the straight clincher type rim or with the quick-detachable rim; inasmuch as no little of the advantage of the wire wheel exists by reason of its lightness at the rim, however ,the clincher type is to be preferred as being the lighter of the two.

In addition to supplying the regulation Dunlop detachable wheel, the American company also is specializing on a light, non-detachable wire wheel for attachment to Ford cars. In construction, the wheel is quite like its larger brother, except that it is devoid of the detaching mechanism, of course. Its principal advantage, outside of the advantages that are put forward for wire wheels in the concrete, is that it can be put on a Ford axle in place of the regular wood wheel without making any changes in construction whatsoever.

MOTORISTS UPSET LAW THAT GOVERNOR JAMMED THROUGH

Court Holds Ohio's Car Tax Unconstitutional—Says it Was Levied for Revenue Only — Defiant Executive Humbled.

The Warnes law, which Gov. Cox of Ohio is declared to have "jammed through" the legislature in the face of a storm of protests, has met the fate which the State's motorists have wished and predicted for it.

It was declared unconstitutional last week by Judge E. B. Kinkead, of the Franklin County Court, on the grounds that it violates that provision of the constitution which provides that taxation shall be levied at a uniform rate on real and personal property. This shelves the law and saves the car owners of Ohio from paying automobile taxes ranging as high as about $18, following January 1.

The suit which "broke" the law was filed by C. C. Janes, of Columbus, president of the Ohio State Automobile Association, against Secretary of State Graves. The law would tax cars according to their horsepower, ranging from $5 on electrics to about $18 for the larger gasolene cars. The measure further provided that one-third of the revenue should go toward the repairing and policing of the State's roads, although the State has made no provision for policing.

Judge Kinkead stated that there would be a surplus of $1,000,000 after the secretary of State defrays the expenses of administering the law, that $333,000 would go to the road repairing and policing and the other two-thirds to the State treasury.

Bearing out the court's opinion that the bill was designed for revenue only, it is stated by a delegation of Ohio motorists that when they went to the Governor to protest against the law he informed them that "the number of saloons in the State is to be materially reduced through the new licensing law. This, of course, means a heavy loss in revenue, and you automobile fellows must make up the difference. That's all there is to the matter."

Hill Climbing for a Bean Pot.

There was a hill climb in the city of Hartford—the one in Connecticut—on Thursday last, 13th inst., and the trophy was a massive bean pot. It came about in this wise: But before delving deeper into the mysteries of the Harmony Hill Climb Association, which was responsible for the event, it may be well to mention, casual-like, that Clayton P. Chamberlain, at the wheel of a six-cylinder Locomobile, won the ceramic object d'art—an object suggestive of leguminous banquets by families with gargantuan appetites.

The Harmony Hill Climb Association exists principally because of the efforts of E. C. Willson. Those who rally around him —about 25 in number—may be described without exaggeration as fairly well known persons in Connecticut's capital. All of them streaked away from home ties on Thursday afternoon to rendezvous at the corner of Albany and West Hartford streets, whence President Wilson led the cortege to Avon mountain, where the afternoon's activities wer ecommenced.

George L. Best started things by whirling up the slant in a Maxwell and thereafter at two-minute intervals seven others followed him to the top, and, whisper it softly, nearly every one of them beat him. Chamberlain, as already has been pointed out, made the best time, and this is how he finished at the head of the bunch:

Driver and car.	Time.
C. P. Chamberlain, Locomobile	3:14⅘
R. D. Britton, Everitt	3:29⅗
B. L. Newton, Cadillac	3:30⅕
F. E. Harvey, Packard	3:59⅗
H. R. Lathrop, Pierce-Arrow	4:00⅕
G. R. Best, Maxwell	4:00⅗
H. K. Taylor, Studebaker	4:22⅘
W. H. Scoville, Columbia	5:15⅗

After the timers had mastered the intricacies of their stop-watches and announced the times, the procession headed back to Hartford and came to a halt at the Hartford Club, where the hill climb was run all over again over "extensive arrangements to expedite the lubrication of all moving parts as well as a complete replenishing of such materials as are necessary to reproduce waste tissue," according to the program.

Curtain Fasteners that Should be in Order.

One of the most ordinary of the little things that can cause annoyance on a car is to have the fasteners for the side curtains out of order. When side curtains are wanted on the road they usually are wanted in more or less of a hurry, and then there is no time to fix up the fasteners. And who has not known the annoyance that can be caused by a loose corner? The time to put the fasteners right is when the car is in the garage and the work can be done at leisure—in other words, in time of peace prepare for war.

Gasolene War Brings Down the Price.

Missouri motorists have finally come into their own, due to the war between the Standard Oil Co. of Indiana and the Pierce Oil Corporation of Missouri. Two cuts in the price of gasolene have been made within a week, bringing the price from 17½ cents to 14½ cents a gallon, with the end not yet in sight. During the same period the price of kerosene has been cut from nine to seven cents a gallon.

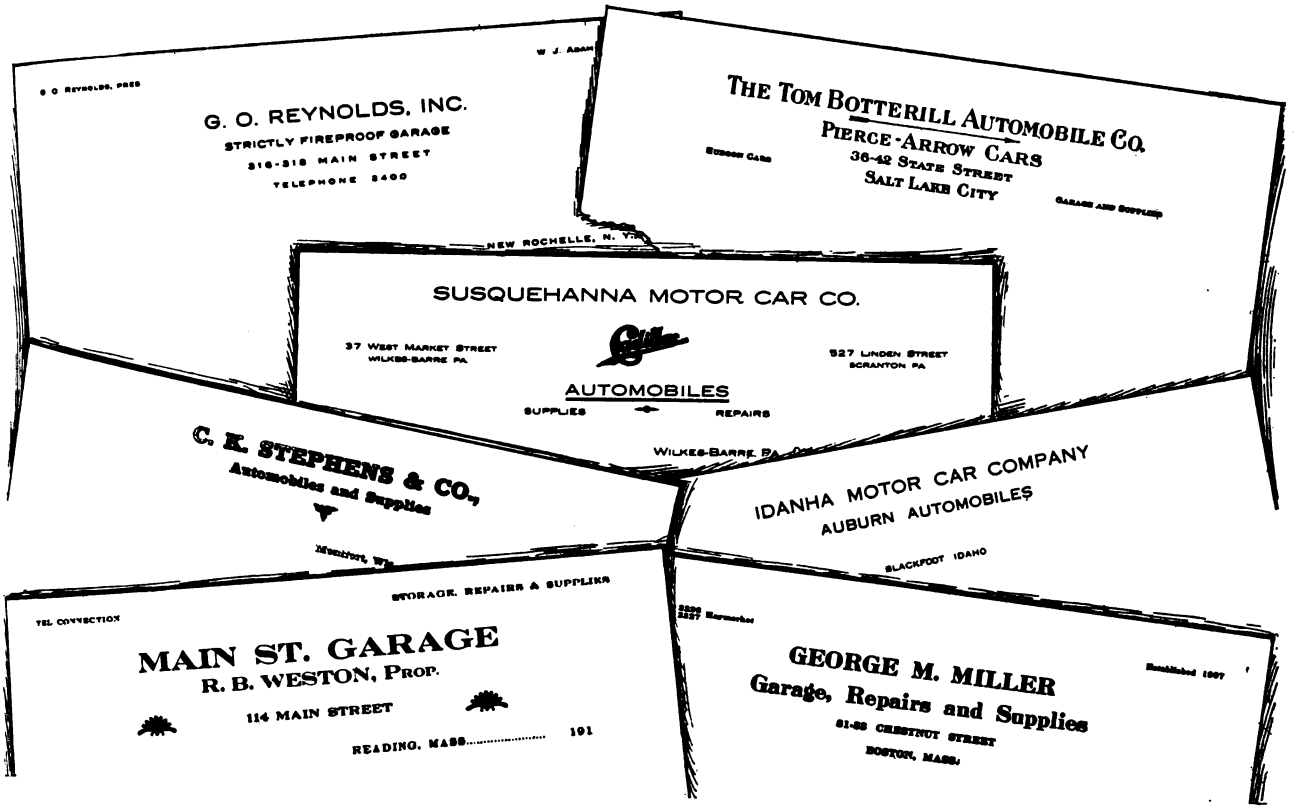
"SILENT SALESMEN" AND WAYS OF DRESSING THEM

Letterheads That Lack the "Appearance" Which the Employer Demands in His Flesh-and-blood Employes—Types of Well Chosen and Poor Styles—Simplicity and Neatness Always Safe Choice.

When the dealer sends his salesman to see a prospect it is safe to assume that he is certain the salesman has his face washed, hasn't a two-days growth of beard on his face and looks as if he had been put together by a tailor, not by an inventor of spring wheels.

This doesn't necessarily mean that the dealer calls the salesman up for inspection every time the latter contemplates going out to try to get a little business; what it means is that if the dealer is any kind of a dealer at all he never would have engaged the salesman if the latter had not been respectably and rather neatly attired. It doesn't imply that the salesman must be a dude or a fashion plate, but just a decent looking man.



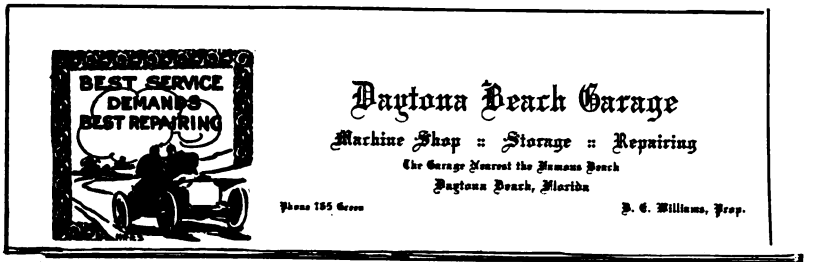
All this may apply to the attitude of the dealer or garageman toward his employes, the flesh and blood representatives which are the points of contact between his business and and the big public, but oftentimes the business men who are most strict in their requisites as to animate salesmen are very lax in respect to one other indication of the character of their business.

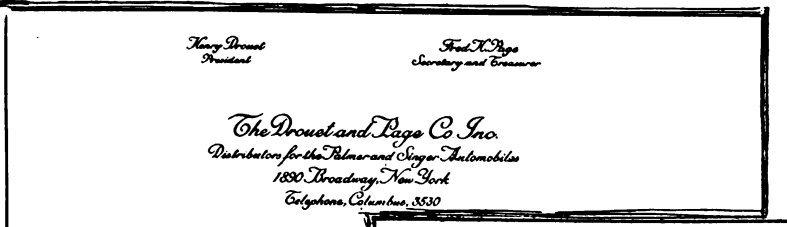
The salesman and other employes may be kept groomed like thoroughbreds while the employer many times a day sends out a "silent salesman" whose clothes are of the 1872 model and whose upkeep apparently doesn't run very high. This "silent representative" is the dealer's business letter paper. And while the quality of paper is an important item in the consideration, the letterhead which surmounts the message to the recipient of the missive is even more important.

There are letterheads and letterheads; they range all the way from regular letterheads to signboards, and some of them aren't even that—they're just a mess! How they ever got onto a sheet of business paper Heaven only knows; the dealer himself couldn't tell on a bet.

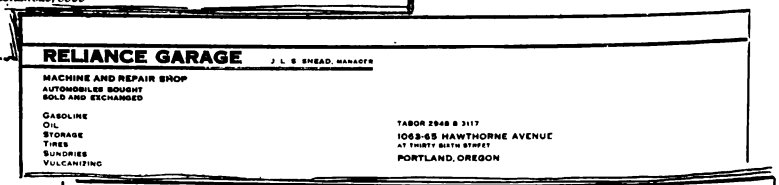
In Motor World's letter files are thousands of letters; they come from dealers, garagemen, accessory men and the multitude of tradesmen throughout the United States. These files contain probably a sample of nearly every variety of letterhead and in commenting upon this phase of business a few of most recent receipt have been selected as types, not necessarily as models to be followed, but as types to indicate what in the opinion of Motor World is the best form of head for business paper.

In the selection one consideration has been the location of the business man; it stands to reason that a big dealer in Chicago can get and afford a better job than a little garageman in Thief River Falls, and the group which has been selected as worthy of emulation by the man who is having a letterhead made up is one which





SEVEN WELL-DESIGNED LETTERHEADS THAT CANNOT FAIL TO CREATE GOOD IMPRESSIONS



Digitized by Google

could be made by a printer who had any kind of a shop at all.

In a group which is here reproduced two letterheads which are as neat, attractive and clean-cut as any are those of G. O. Reynolds, Inc., of New Rochelle, N. Y., and The Tom Botterill Automobile Co., of Salt Lake City. One is a small-town garageman and the other is a city dealer. The Reynolds design probably could be produced by any print-shop and is a close rival of the Botterill head for the dealer or garageman in the medium-sized towns. The

DISTINCTIVE STYLES THAT DEVIATE FROM THE ORDINARY

type comes within what the printing trade terms the Blair series of type, but seems a trifle heavier than the regular Blair.

The Reynolds head has the virtue of not assembling several different styles or series of type in the one head; too many styles work out on much the same plan as putting on a straw hat, an overcoat, a long rubber boot and a low shoe—they don't seem to fit well together; there is no harmony. This head is also well but simply arranged; the company name is the dominating part, the head is far from crowded and the two names on the upper corners add just enough balance.

Avoiding Crowding in Arrangement.

The Botterill head is of a different style; the Reynolds type might appeal to one man more than would the Roman characters in the Botterill head, but the latter is nevertheless one of the attractive letters circulated in the trade. This particular head is plate-printed, or engraved, and is an unusually good specimen of handicraft, but no dealer should experience much difficulty in accomplishing much the same effect even if it be not embossed, engraved or plate-printed.

In designing a heading the dealer who elects to follow these styles should notice that the heads are not crowded. The Botterill business is big, but all that is required is told in few words, whereas many a much smaller business carries a letterhead that is overburdened with type. The words "Hudson Cars" and "Garage and Supplies" under the wings of the inverted pyramid of type give a proper balance.

While the Reynolds and Botterill heads are cited as good examples the others included in the same group are good, even if not quite so good as the two mentioned. What is meant by balance is shown in the case of the Susquehanna Motor Car Co., which tops off its design with the company name, places its two addresses in smaller type and in subsidiary positions at right and left and below and brings up the bottom with the words stating what its business it. In the center is the Cadillac name—or trade mark—and while it is red in the original the use of color is questionable, because of its glaring, signboard possibilities.

This company has adhered to a Blair style throughout. The rule under the word "Automobiles" might have been left off and the little mark under the rule was classified by one of Motor World's printers as a "Dingbollick," whatever that is. He also wanted to know "what in —— they put that thing there for." This one remark may be crystallized into a caution against over-decoration. No decoration at all is better than too much, if it is not best in any case. The lower part of the Susquehanna head, with its rule and "dingbollick," tends toward decorativeness. The "curleycues" of the Cadillac name would have been quite sufficient.

Simplicity Always a Safe Choice.

The Idanha Motor Car Co.'s design appears to be in much the same type as the Reynolds and Susquehanna, but is more of a Medium Gothic. It is good because of its pure simplicity. It says enough and stops; no more is necessary.

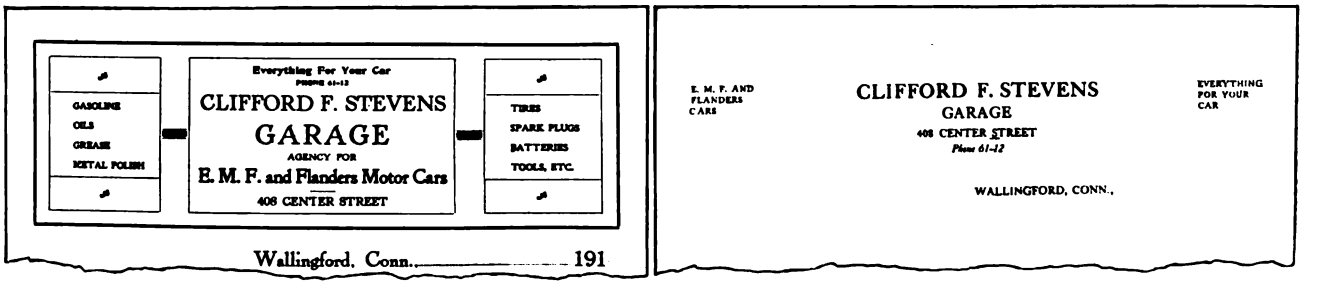
George M. Miller and the Main St. Garage do very well with a somewhat heavier style of type. The Miller is a near approach to the Hancock series, while the Main St. is Mercantile type. Both of these are well-balanced, are not crowded and are neat. The Main St. attempts to effect balance by filling vacant space on both sides with a couple of "dingbollicks," whereas raising the head a trifle and bringing the "Tel. Connection" and "Storage, Repairs and Supplies" down would have been better.

C. K. Stephens & Co., while attractive and simple, differs from the others in that it employs an old-fashioned, shaded letter. This has an element of attractiveness even as some old-fashioned clothes have, but that is the main point of adverse criticism.

The Daytona Beach Garage, which employs an attractive Plate Text, would have done better had it omitted the over-decorated cut at the left. The head, of itself, is pleasing and refined, and how much better it might be may be shown by holding one hand over the black, heavy, decorated cut. There! Doesn't it look better?

The Drouet & Page Co., Inc., has followed what is in accordance with the pre-

Digitized by Google



LETTERHEAD BADLY MARRED BY BLURRED PICTURE

cise and correct modern style of letterhead; this is script. Script may not appeal to many business men as in accord with the dry and routine matters which so generally find their way into business correspondence, and it certainly would be conspicuous if script goes out of style, but for a dealer who is distributing a car which is rated as having "class" the script head is so plain and understandable as a comparison. For this purpose Motor World has reset the Clifford F. Stevens head. The superfluous matter has been cut out, a better balance has been effected, and the rules and decorations which look like several truck gardens with a budding crop of cauliflower have been removed; they are unnecessary. Also one style of type, Caslon, consider using a poor-style card, or one covered with rules and adornments, and the letterhead takes the place of the business card in non-personal calls.

Getting as much type on a letter as is possible is not "getting your money's worth." The reverse is more the case. Many heads are due to the advice of small-town printers, many of whom have been left to work out the design without suggestions. Many of the best heads in use are the result of printers' planning, as are some of the worst, but there is no reason why the dealer or garageman himself should not design what he feels his business requires and make a selection which he would not be ashamed to hold up and say, "This is an indication of the character of my business."

Oil Shortage Pays More Fine Profits.

Due to that fearful shortage — don't laugh!—of crude oil which caused the price

OVER-DECORATED, CROWDED AND NOT WELL DESIGNED—THE SAME HEAD REARRANGED AND RESET

does well. It certainly fits in with the class of people who buy Palmer-Singer cars.

J. L. S. Snead did something original and "different" with his paper, which is brown; this colored paper is an asset in a way, in that the Reliance letter can be picked with ease from a stack of a score of plain white letters. The Service Motor Car Co.'s type probably could not be found in the average shop, for it resembles a reproduction of a hand drawing, although there are types which approach it. It, like the Reliance, is shown as illustrating something different from the ordinary.

The place of business of the B. & O. Motor Co. looks enterprising, but the company went away wrong when it elected to put that heavy black cut on its letter page. The original looks much heavier and more smeared than does the reproduction shown herewith and cannot compare with the heads in the group first discussed. The Jerome Garage Co. would have been better satisfied without the cloudy-day cut on the left of its sheet, and the possibilities in its arrangement are seen, as in a previous instance, by covering the cut with one hand.

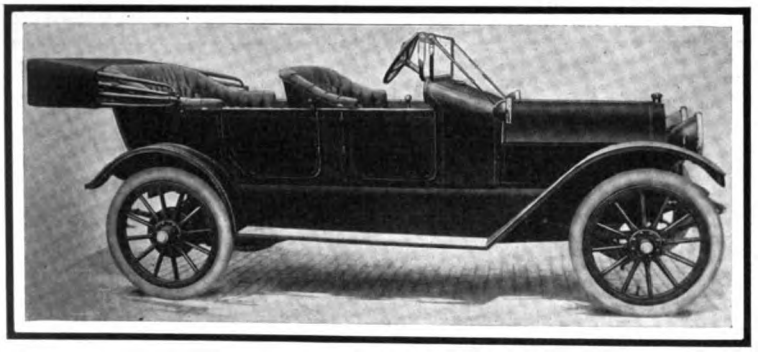
But in all criticism and comment nothing has been used; the original contains three —De Vinne, Pabst and Jensen. A regular job shop might do even better, but the resetting serves to show what may be accomplished.

A cursory inspection should make apparent the attractiveness lying in the plain, neat and unembellished type of letterhead. If a calling card is made along these lines, why not a letterhead? Few dealers would

Getting as much type on a letter as is possible is not "getting your money's worth." The reverse is more the case. Many heads are due to the advice of small-town printers, many of whom have been left to work out the design without suggestions. Many of the best heads in use are the result of printers' planning, as are some of the worst, but there is no reason why the dealer or garageman himself should not design what he feels his business requires and make a selection which he would not be ashamed to hold up and say, "This is an indication of the character of my business."

Oil Shortage Pays More Fine Profits.

Due to that fearful shortage — don't laugh!—of crude oil which caused the price of gasolene to mount from 9 cents to 17 cents per gallon, the Ohio Oil Co., a former Standard Oil subsidiary, on Monday last declared not only its regular quarterly dividend of $1.25 per share but on extra disbursement of $6.75 per share. As the stock has a par value of $25, the extra payment is equivalent to 27 per cent. If oil has become thus more plentiful "gas" may come down—perhaps.



ALL THAT A LETTERHEAD SHOULD NOT BE

CHOICE OF TWO MOTORS OFFERED WITH LAMBERTS

Continental or Rutenber Power Plant Optional in Two Models, One of Which is New—Shift to Left Control Among Changes.

In addition to adding to its line a new four-cylinder model slightly smaller than the one that has been standard for the past four or five years, the Buckeye Mfg. Co., of Anderson, Ind., long known as the producer of Lambert "gearless"—which means friction driven—cars, has inaugurated an innovation in engine equipment in both models which likely will prove an appealing feature to dealers whose prospects are "sot in their ways," so to speak, and who display a preference for a particular brand of power plant. In either model, the purchaser can be given his choice of Continental or Rutenber motor. Otherwise, the changes that have been made in the larger model are few and far between; it is styled model 60, series C, and lists at $1,395 without electric lighting and engine starting equipment, which increases the price $200. The smaller model—46, series C—lists at $1,200 with electric equipment. The larger chassis also is supplied with roadster body at $1,365.

NEWEST LAMBERT FRICTION-DRIVE MODEL LISTING AT $1,200

The two most important alterations that have been made in the larger model concern the fuel container and the control mechanism. Instead of being under the seat, as in the past, the gasolene tank now is housed in the deep skuttle after the most approved and modern fashion and the filler hole is located outside, where it is easily "getatable" without the necessity for disturbing any of the occupants of the car. The construction of the smaller model is the same. Also, in both models the steering gear has been shifted over to the left side in conformity with the natural tendency among the majority of manufacturers and the control levers have been placed in the center of the footboard. One interesting feature of the control is that the emergency brake levers are fitted with integral locks by way of discouraging the unwelcome attention of persons other than the owner.

As already has been made plain, in neither model is the motor an arbitrary feature, and both Continental and Rutenber products are sufficiently well known to the motoring public and to those who serve it to make unnecessary any detailed description of their individualities. Suffice it to say that in the larger car the motor may be either a Continental with four cylinders measuring 4⅛ x 5¼ inches, or a four-cylinder Rutenber with cylinder dimensions of 4¼ x 5¼. In the smaller model, the cylinder dimensions are the same whether the purchaser elects to cast in his lot with either engine maker; the bore is 3¾ inches and the stroke 5¼ inches. The smaller model differs from the larger one in that it is fitted with an electric lighting and engine starting system as regular equipment. The system, by the way, is guaranteed for the life of the car and not for any specified period.

Needless to point out, the distinctive gearless transmission system about which Lambert cars always have been built is retained in toto and without change. As an indication of the growing popularity of the system it is pointed out by the manufacturers with just pride that during the past year the demand for Lambert cars has resulted in a 40 per cent. increase in sales over the preceding year.

The Lambert friction system probably is familiar enough to those who are familiar with it and a reiteration of its description can serve only to make plainer its inordinate simplicity. The engine drives a flat metal disk against the edge of which there is pressed the periphery of a paper-fiber faced driven member which slides across the face of the driving disk is on a splined shaft. From the splined shaft power is transmitted to the rear axle through the intermediary of a Renolds "silent" chain which is fully enclosed in a dustproof casing and runs in an oil bath. The various forward gear ratios are obtained by sliding the driven disk across the face of the driving disk to a spot near the center for low gear and to a spot near the edge for high gear; sliding the driven member across the center of the flat side gives the reverse motion. The mere fact that the system has endured for the past five years is an eloquent tribute to its reliability and its efficiency under all sorts of conditions.

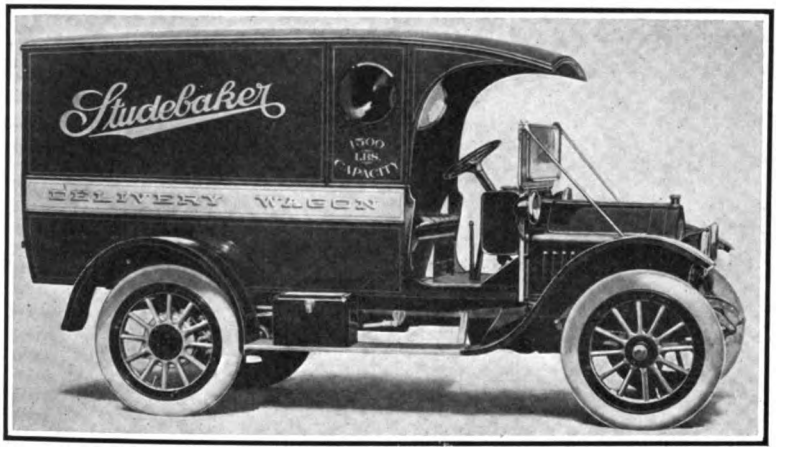
With regard to the bodies on the two Lambert models, the changes that have been made have been suggested by the possibility of increasing the bodily comfort of those who ride in them and are in line with the latter-day practice of other makers. Which is to say, seats have been made a little roomier and are padded a little more thickly. At the same time, the doors have been slightly widened and their hinges and catches put out of sight along with such things as generally litter running boards. The spring suspension remains unchanged and includes semi-elliptic members in front and full-elliptic members at the rear; the wheelbase of the larger model measures 117 inches.

Although the list price of the larger car does not include electric lighting and starting apparatus, the list is otherwise complete and includes mohair top with boot and side curtains, windshield, speedometer and the other usual features. For the smaller model the equipment list is the same, except that it includes the electric lighter and starter without extra cost.

Engineers' School Owes for its Rent.

When the West Side Y. M. C. A., of New York City, took over the New York School of Automobile Engineers, Inc., a few weeks ago it was not generally known that the latter owed its landlord quite a little bill; that such was the case, however, is indicated in a suit which was filed this week in the Supreme Court for New York county against the school by Guillaume Reusens, landlord of the premises at 146 West 56th street, into which the school moved October 1, 1908, under the annual rental of $2,000 Reusens claims but $280 was paid since April 1 last, leaving a balance of $720, which he demands.

Cox Establishes Branch in Chicago.



The Cox Brass Mfg. Co., of Albany, N. Y., has established a branch in Chicago, at 1345 Michigan avenue, where a full stock of its shock absorbers, carbon removers and other accessories will be carried. It will be in charge of Charles Fisher, who previously had to do with Mogul trucks.

SELF-STARTING STUDEBAKER FOR LIGHT DELIVERY WORK

Latest Commercial Car Also Has Electrical Lights—Four-Cylinder Motor Under Governor Control—Optional Body Types.

With a keen appreciation of the vast difference that exists between the service expected of a pleasure car and the work demanded of a commercial vehicle, even though it be a light delivery car, the Studebaker Corporation, of Detroit, has designed a chassis for rapid delivery work that is distinctly a working chassis in every respect—and the fact that its four-cylinder motor is identical with that used in the Studebaker

STUDEBAKER ELECTRICALLY LIGHTED AND STARTED DELIVERY WAGON

"four" pleasure car merely indicates that the engine is plenty sturdy enough for the service, having been designed with the distinct intention that it should be amply able to stand up under hard work.

From a purely enginering point of view the machine, which has a capacity of 1,500 pounds, is devoid of novel features. There is not a single attempt to work in something "unusual" for the sake of being different from the others. From the point of view of the user of commercial vehicles, however, there is an unusual feature in the electric lighting and starting system which, be it said, is installed for the most practical of reasons. In making the many stops that are necessary when delivering small packages there inevitably is a loss, when no starter is fitted, of time in cranking if the motor is stopped, or of fuel if the motor is left running. With the electric starter both are eliminated, for the driver presses the heel-button when he gets into his seat and the thing is done. With a good starter the gasolene car is invested with one of the prime advantages of the electric—economy of time and economy of power when making stops.

The motor does not differ in its major aspects from the four-cylinder motor that was part of the smaller "four" of the preceding Studebaker series, unless the addition of a governor to compel the maintenanne of a reasonable maximum speed may be considered in that light. The cylinders are cast in a single block and the bore and stroke are 3½ x 5 inches; all the valves are on the left side and are enclosed. It is necessary to take a look into the cylinders for at least one of the slight alterations that have been made. The pistons, which were domed on top in the older Studebaker models, now are flat-topped, this form having been proved to have advantages that were well worth seizing. The piston pins are clamped in the connecting rod ends, as before, but whereas they formerly worked in bearings bored in the cast iron of the piston bosses, they now are mounted in removable bronze bushings.

The electric lighting and starting equipment is of the dual unit type, there being a generator and a separate starting motor and, of course, the indispensable storage battery. The motor and generator are made by the Wagner electric company of St. Louis, the specifications being provided by the Studebaker engineers. The former system was of the single unit design. The generator is on the right side of the engine and is driven by a shaft taking motion from the camshaft gear through a pinion; the starting motor is on the left side and drives through a roller clutch and chain. The gear reduction is about 20 to 1. The Willard six-volt battery is slung to the chassis frame. The employment of an automatic overrunning clutch makes manual control unnecessary for engaging or disengaging the starting drive. With the change in the electrical system has come also a change in the ignition. In lieu of a magneto there is a distributer and coil taking current from the storage battery.

The frame of the delivery car is different from that of the pleasure car in that it is considerably heavier and is straight. In fact, all the parts are heavier than the pleasure car parts. The rear axle is full-floating, with Timken roller bearings, and is of a size and weight calculated to give the freedom from trouble and delay demanded in a commercial machine. The wheels are 34-inch, with 4½-inch pneumatic tires, and the wheelbase is 106 inches.

Whether the machine is equipped with an express body with a canopy top or with a panel body—the Studebaker people give the option—the price is the same, $1,150. The purchaser also can specify the maximum speed for which the governor is to be set and sealed. Left steer and center control are standard.

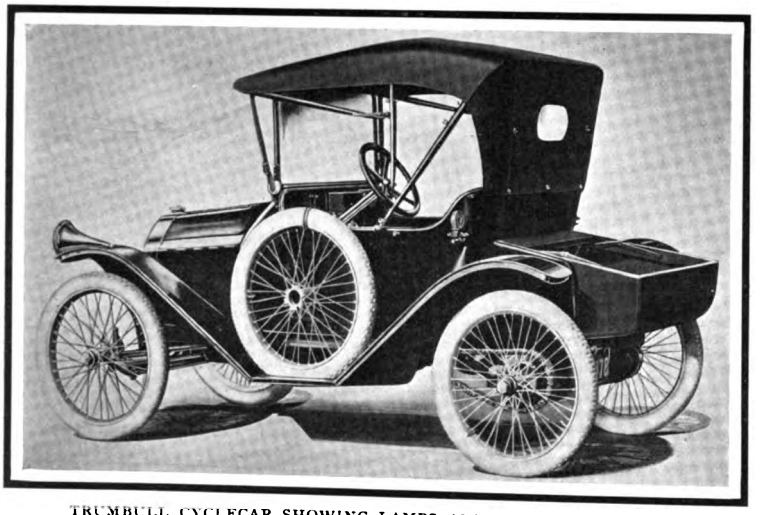
Free Export Trade School Opened.

To further the foreign trade interests of this country, there was inaugurated in New York on Tuesday last a free export trade school by the foreign division of the National Association of Manufacturers. This school is intended to give additional training to employes of the association's members who already have some experience in export business. For the present the sessions will be held in the association's library on Tuesday and Friday evenings. The course is under the supervision of V. Gonzales, the association's foreign trade and banking expert, and 48 men have so far enrolled. It includes commercial geography, means of transportation and details of obtaining and maintaining foreign business, the relation of American money to that of all other commercial countries, and instruction in handling exchange in foreign trade.

Federal Branch in its Own Building.

The New England branch of the Federal Rubber Mfg. Co., of Milwaukee, formerly located at 261 Dartmouth street, Boston, has been removed to the new and larger building at 173 Massachusetts avenue which was erected specially for its occupancy. It will remain in charge of Chase Langmaid and Guy D. Nibes, who will act as joint managers.

Eisemann Moves Offices to Brooklyn.



The Eisemann Magneto Co. has removed its general offices, which, of course, include the sales department, from 225-227 West 57th street, Manhattan, to the other side of the big bridge, that is, Brooklyn, N. Y., where its factory is located in Bush Terminal Building No. 8, at 32 33rd street. The service station at the Manhattan address, however, will still be continued.

FIRST TRUMBULL CYCLECAR IS MINIATURE AUTOMOBILE

Four-Cylinder Water-Cooled Motor with Starter, Friction Transmission and 44-Inch Tread its Features —To Sell for $425.

Following the acquisition in August last of the American Cyclecar Co. by the Connecticut Electric Mfg. Co., of Bridgeport, Conn., which, in turn, is owned and controlled by A. H. and I. B. Trumbull, the first product of the company, which retains its original title, now is ready for the market. Its lines, revealed by the accompanying illustration, make plain that it is a veritable miniature automobile exhibiting very few of the attributes generally credited with the responsibility for the designation "cyclecar." The list price of the car has been set at $425 and this includes the equipment that is shown in the picture and a mechanical engine starter that is not shown.

TRUMBULL CYCLECAR SHOWING LAMPS AND EXTENSIBLE BACK

In at least two respects, the Trumbull cyclecar, as it is styled, is true to its class; "all on," as the British say, which means with all the equipment in place, it tips the beam at about 650 pounds and therefore is considerably under the R. A. C. limit, which has been arbitrarily set at 784 pounds. Similarly, its tread is considerably less than that of a full-sized car, measuring but 44 inches.

In other respects, however, the construction of the little car closely follows accepted automobile practice. The power plant consists of a four-cylinder, vertical, water-cooled motor with L-head cylinders measuring 2⅞ x 4 inches; the A. L. A. M. horsepower rating therefore is 13.37. Ignition is effected by a Unisparker, with automatic advance, furnished with current from a storage battery; moving parts are lubricated partly by pump feed and partly by splash, the main bearings having direct feeds.

As suggesting the simplest possible mechanism for the purpose, combined with light weight and comparatively low manufacturing cost, the manufacturers have adopted the friction type of transmission. From the motor, power is transmitted to a heavy plate beneath the body, and against it the driven disk is pressed. The latter is slidably mounted in its shaft so as to provide the necessary changes in gear ratio. At the outer ends of the splined shaft there are sprockets from which the drive is transmitted to the rear wheels through the usual side chains. The differential is contained in the cross shaft, and the brakes, which are of the external contracting variety, are mounted on rear wheel drums and operated by pedal.

The wheelbase is 80 inches and the chassis is mounted both fore and aft on transverse semi-elliptic spring members shackled to the axles. The frame is pressed steel with a channel section and the motor is supported at three points. Detachable wire wheels are standard equipment and they are shod with 28 x 3 inch clincher tires. One interesting feature of the wheels is that they may be removed without the necessity for disturbing the bearings; incidentally, they are interchangeable.

The body is of the standard roadster type with a large luggage compartment at the rear which is unlike anything else of its kind. So that it can be made to accommodate either much or little, it is extensible and, when fully extended, provides rather more storage space than might be supposed in such a small car. Following the latest practice,the gasolene tank is placed in the deep skuttle, and, it is pointed out by the makers, the fuel consumption of the motor is so moderate as to allow of at least 35 miles being covered on a single gallon of fuel. The single pair of lamps is mounted on the mudguards and to provide for accommodation to city driving regulations a dimming device is furnished as standard equipment.

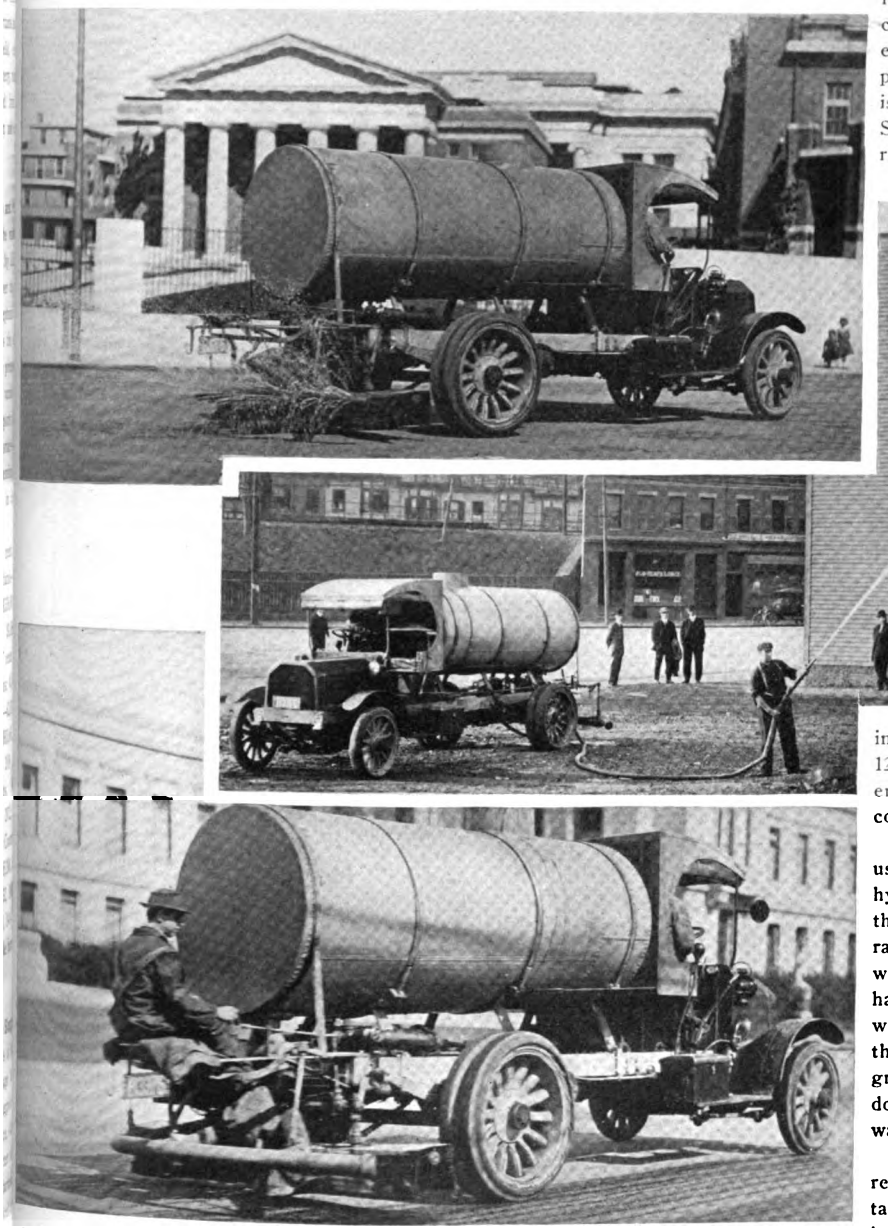
In addition to the usual complement of tools, jack, tire pump, etc., the equipment list includes top with side curtains and envelope, adjustable windshield, electric lights fed from a storage battery, mechanical engine starter operated from the driver's seat, an electric horn and an oil gauge.

September Gasolene Exports and Prices.

Gasolene exports during the month of September just passed gained by 12,279,739 gallons, or 174 per cent., over the shipments of the product during September of a year ago; Other Europe was the largest purchaser and, as is usual, the price to the different geographic divisions varied, even for the same month. The exports follow, the figures being given in this order—Country buying, gallons in September, 1912, value, average price; gallons in September, 1913, value, price:

Belgium—27,114, $4,662, 12.2 cents; 740,000, $112,500, 15 cents. Netherlands—None in September, 1912; 2,400,000, $336,000, 14.8 cents. Other Europe—5,208, $1,356, 26 cents; 7,671,309, $1,049,582, 13.7 cents. Canada—6,396,432, $765,377, 12 cents; 4,179,278, $486,737, 11.6 cents. Argentina—62,000, $9,970, 16.1 cents; 2,180,581, $383,665, 17.6 cents. Brazil—95,077, $18,806, 19.9 cents; 1,113,413, $215,220, 19.4 cents. British Oceania—None in September, 1912; 435,500, $91,886, 21.1 cents. Other Countries—459,701, $82,203, 17.9 cents; 595,190, $118,113, 19.8 cents. Total—7,045,532, $882,374, 12.5 cents; 19,325,271, $2,793,703, 14.4 cents. The average price for the whole increased 1.9 cents, or 15 per cent.

Cold that May Make Starter Sluggish.



It is one of the characteristics of the ordinary type of lead-acid storage battery that its action is likely to be sluggish when the electrolyte is chilled. Hence, sluggish response from the engine starter after a car has been housed in an unwarmed garage all night should not be harbored against the system as a defect. As the battery is used, the chemical action will raise its temperature a certain amount and the response will be quicker. The obvious way to overcome such difficulties, of course, is to warm the garage.

PEERLESS TRUCK IN BOSTON BECOMES HIGHLY VERSATILE

Service Changed to Suit Seasons—Accomplishments Range from Collecting Garbage to Extinguishing Fires.

Whether or not there is truth in the ancient adage which says that there is no rest for the wicked, it is certain that there is no rest for a certain Peerless three-ton truck that belongs to the city of Boston. The civic authorities of the city of erudition have learned, among many other things, that a motor truck pays the best returns on the investment it involves when kept steadily at work; and as the machine cannot be kept at the same job all the year round for the simple reason that some jobs, such as street sprinkling, are rather out of place in freezing weather, it has been provided with the equipment necessary to enable it to do both summer and winter work. It is a striking illustration of the adaptability of the motor-driven commercial vehicle.

BOSTON'S VERSATILE THREE-TON TRUCK—AS AN ORDINARY STREET SPRINKLER; AS A FIRE ENGINE AND AS AN OIL DISTRIBUTER

To prove that if the job won't dignify the truck the truck must dignify the job, the Peerless is used in the winter for the collection of garbage. The body fitted is of the power dumping type, the lifting action being obtained through the medium of a screw gearing. In this service the machine covers about 40 miles a day doing the work of four teams.

When the spring sun becomes hot enough to make the roads and streets dusty the truck is stripped of its dumping body and in its place is mounted a 900-gallon steel tank. This may be filled either with water for sprinkling and flushing the streets or with oil for surfacing macadam roads. A rotary pressure pump driven by power, of course, discharges the liquid "road refreshers" under a pressure that is entirely independent of the amount left in the tank. It is usual to sprinkle and flush the streets on Sundays and on days when the macadam roads are not in proper condition for oiling. The sprinkling speed of the truck is 12 miles an hour; the routes formerly covered by three horse-drawn sprinklers are covered by the machine.

The pressure pump is made additionally useful when the machine is out of reach of hydrants. By means of a three-way cock the pump can be made to draw water from railroad and other tanks. Horse-drawn watering carts are filled by long labor at hand pumps from such sources of supply with a considerable loss of time. Clearly the time saved in filling up by power is a great gain in the total time required for doing sprinkling and flushing with tank water.

For use as a road oiler the only change required is a change in the contents of the tank; a little water in the oil or a little oil in the water can do no harm. The truck speed is considerably less for oiling than for watering, being 8 miles an hour. The pump forces the oil into the road at a pressure of 45 pounds to the square inch and discharges a load in 18 minutes, covering a

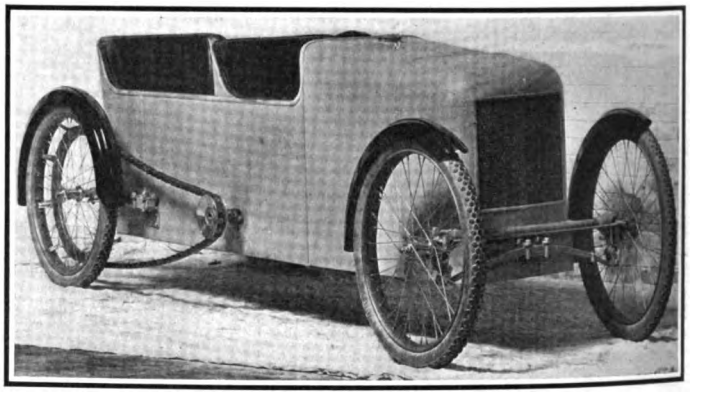
Digitized by Google

surface of 12,500 square yards. Before the coming of the Peerless it was necessary to employ no less than six horses to do the work.

Even this does not end the list of useful purposes to which this versatile truck is put. When the tank is full of water the machine can be converted into a fire-engine of no mean ability by diverting the course of the water from the pressure pump through a two-inch hose instead of through the sprinkling pipes. Fires in dump piles are not unusual occurrences, and the Peerless fire engine is useful for putting them out and, of course, it can be pressed into service under any circumstances where a stream of moderate size will answer the purpose. The accompanying picture gives some idea of the volume of a stream that can be thrown and the height it will reach.

Promoting Fire Extinguisher Equipment.

By way of encouraging dealers, manufacturers and individual owners of automobiles to take precautionary methods against fire, the Ætna Accident & Liability Co., and the Automobile Insurance Co., of Hartford, Conn., which jointly issue a combination automobile policy covering fire, accident, liability and practically every other kind of an automobile hazard, have let it be known that henceforth the premium rate on vehicles equipped with fire extinguishers of an approved form will be considerably less than the premium rate on vehicles not so equipped. To dealers and manufacturers, a discount of 10 per cent. on the fire premium will be allowed, provided the vehicle is equipped with a one-quart pump-type Pyrene extinguisher approved by the National Board of Fire Underwriters; to individual owners, the discount amounts to 15 per cent. To take advantage of the discount, the person applying for insurance must furnish a certificate to the effect that the vehicle to be covered is equipped with the approved type of Pyrene device.



Pays $400 for Misdescribing Bottles.

Even though the Interstate Commerce Commission may not be generally known to have this power, it successfully prosecuted a case of misdescription of freight this week in the Federal Court in New York City against the American Thermos Bottle Co., a fine of $400 resulting from the defendant's plea of guilty. The commission charged that the bottle company labeled boxes "glass bottles" when they should have been labeled "insulated and jacketed bottles." The rate for the former is much less than that for the latter. The prosecution was at the instance of the Trunk Line Association.

FRICTION DRIVEN MERCURY HAS REAL CYCLECAR LINES

It's the Real Thing, not a Compromise —Has Neither Frame, Differential, nor Gears, and Has an Air-Cooled Motor.

One of the newest cyclecars, which is an out-and-out cyclecar, with all the cyclecar's characteristic features, narrow tread and all, and that doesn't pretend to be anything but a cyclecar, is the Mercury, the product of the Mercury Cyclecar Co., of Detroit. The appearance of the machine speaks very distinctly for itself, as the accompanying illustration shows, and, though the picture does not bring out the fact, there is a surprising amount of space for the two occupants, due largely to the fact that they are seated tandem. The driver sits in the front seat.

MERCURY BELT-DRIVEN CYCLECAR IN WHICH PASSENGERS SIT TANDEM

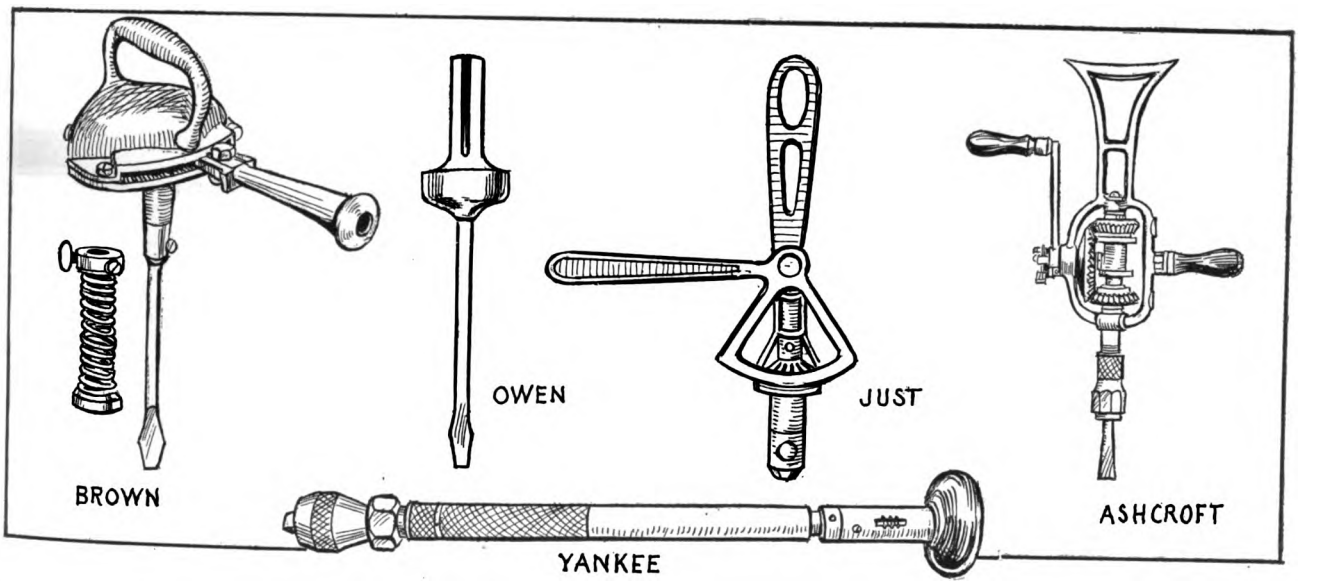
The more important details of the Mercury cyclecar include a Spacke De Luxe motor, air-cooled, of the two-cylinder V-type, friction change-speed system, final drive by V-belts, 36-inch tread and wire wheels. In the construction of the machine there are a number of points where it has been found possible to effect economies in weight and in price—the machine sells for $375, incidentally — without affecting the good qualities of the car. For instance, there is no frame, properly speaking, distinct from the body, which is as much as saying that the body acts as the frame. The single front spring is a transverse semi-elliptic, underslung, and the rear springs are quarter elliptics with one end bolted to the body and the other clipped to the rear axle, which, of course, is of the stationary type.

The wire wheels run on ball bearings, reducing friction to a minimum, and are 28 inches in diameter with 2½-inch pneumatic tires. The wheelbase is 100 inches, which is ample for easy riding and yet not so long as to make the machine unwieldy in its overall length. The engine is, of course, mounted forward under the hood and the gasolene tank is placed in the cowl, high enough to give a good head of fuel to the Schebler carburetter. Ignition is by Bosch high-tension magneto, and lubrication is effected by a simple though efficient gravity system.

The friction transmission system is particularly adapted to the needs of light machines; in the two-disk arrangement used in the Mercury, but one part is subjected to sufficient wear and tear to call for occasional replacement, and that is the driven wheel, which has a fiber-filled edge which can be cheaply replaced in half an hour with a wrench and a screwdriver as tools. The machine manifestly is economical in other respects, for the tires are comparatively inexpensive on account of their small size, while a gallon of gasolene is said to give from 40 to 50 miles on the road, in average running.

Owner Was Exasperated $2,950 Worth.

When the generator won't generate and the starter won't start and a few other things about a car act in a contrary manner the driver—or would-be driver—generally is exasperated, to put it mildly; just how exasperated he is he probably couldn't state himself, but a valuation has been placed on this state of mind by Harry F. Payer, an attorney, of Cleveland, O., in a suit brought by him against an automobile dealer.



Because the car Payer bought from the dealer turned out to have many defects, so he states, and caused him great exasperation he has figured out that the latter is worth $2,950; in fact, he paid but $2,050 for the car, and in his complaint he asks this amount, too, the combined sums footing up to a total of $5,000.

DEVICES THAT FACILITATE GRINDING OF VALVES

Simple Garage Tools That Should Relegate the Screwdriver to the Background—Their Value As Stock in Trade and for Everyday Use—Why Specially Developed Abrasives Are Better Than Emery.

It is one of the evils, perhaps, of the ordinary type of poppet valve that it requires to be ground from time to time. Some of them will go for longer periods than will others without manifesting the necessity for grinding, though the fact remains that they must all be ground in the end—that is, if the engine is to be run at anywhere near its proper efficiency.

FIVE TYPES OF SIMPLE VALVE GRINDING TOOLS THAT ARE SUITABLE FOR GARAGE EQUIPMENT

Of course, no repair-man needs to be told these things; experience is a grand little teacher. Similarly, most individual owners know them, but that some of them don't is well indicated by their labored attempts to force their cars up inclines that once could be "taken on high like a scared cat." At any rate, reiteration of the statement serves to draw attention to the fact that even in such matters as valve grinding, accessory manufacturers have kept more than one eye wide open to the possibility of producing devices that will permit the work to be done quicker and better and with less real labor than it ever could be done with a plain screwdriver or a brace with a screwdriver bit.

The amount of valve grinding work done in the average repair-shop is not very great—unless the shop is a very large one, of course—which probably accounts for the popularity of screwdriver and brace and bit methods. The inclination to install special tools for such a limited amount of work is not strong in the majority of breasts, though if it were stronger the repair business probably would be placed on a firmer footing. It is a foregone conclusion that shop efficiency requires that the greatest amount of good work be turned out in the smallest amount of time, and there can be no gainsaying the fact that tools which are especially designed for one kind of work are better for that work than are other tools primarily designed for something else and used as a sort of makeshift.

Profit That Lies in Small Tools.

But barring the desirability from every view-point of proper valve grinding tools for the use of garage and repair-shop employes, there is another side to the question. In many cases, the individual owner prefers doing odd jobs about his car himself, not so much to save the expense of having others do them for him as for the real enjoyment he gets out of the work. As a rule, this class of owners forms an excellent source of profit to the garageman who is awake to the possibilities of his business. Such persons generally are on the lookout for new devices; their possession and their use appeals more or less to their vanity or to something else that gives them pride in owning good tools.

The garage proprietor who is aware of this frailty of human nature is a "wise guy," to use a slangy expression that loses nothing for being slangy. He will put on his shelves—or, better still, he will display in a showcase—small tools of the kind along with his stock of spark plugs, greases, pliers, grease guns, etc. The effect of the arrangement can be expected to work out something like this:

Jones, whose car is being overhauled, drops in to take a slant at the work. In the course of his inspection he catches slight of the garage mechanic grinding valves with a little nickel-plated device that certainly does the work a good deal quicker than Jones has ever seen it done before with a screwdriver. Jones thinks it's a pretty good thing. Business of inquiring its name and where it can be purchased. Jones winds up by exchanging a check for a patent valve grinder and the check goes into the garage proprietor's cash register.

Of course, the system applies to other things as well as to valve grinders. But valve grinders are a good thing to make a start on; there probably is greater variety in such things than the average person guesses; they are inexpensive, easy to op-

Digitized by Google

erate and there always is a use for them. In the accompanying illustration five different types of tools designed especially for the purpose are shown by way of making plain the variety that exists.

Valve Grinding Operations Made Plain.

Assuming that even the veriest novice knows how to go about the work of grinding valves—that the valve must not be rotated continually in one direction on its seat for fear of wearing ridges in it that can only be removed by resurfacing the valve in a lathe; that, instead, it must be rotated first about three-quarters of a turn in one direction and the same amount in the other; that only light pressure is needed, for heavier pressure will cause ridges; and that the valve must be lifted off its seat every once in so often the better to distribute the abrasive material that is used—the operation of the Owen valve grinder, which is produced by Stewart & Co., of 175 Broadway, New York City, becomes delightfully simple.

The Owen valve grinder undoubtedly is the simplest of all such devices. As the accompanying illustration makes plain, it is little more than a modified screwdriver and it is used in exactly the same manner as one. There is this important difference about the tool, however. It is considerably heavier than a screwdriver; between the handle and the blade, and forming part of the handle, in fact, there is a weight cast, and it is this weight that makes the operation of the tool so easy and the results obtained with it so uniform. In operation, the tool is merely rotated between the hands; it is not necessary to employ pressure, for the weight serves that end, and as the weight remains constant the surfaces on a number of valves are sure to be uniform provided the same amount of work is done on each. To make the operation of the tool easy, the handle is fluted and a supplementary spiral spring for lifting the valve off its seat is supplied with the device.

Wherein Abrasive Materials Differ.

A word with regard to the abrasive material that is best to use with any valve grinding tool: There are on the market an almost unlimited number of special and patented materials which have been developed especially for the purpose and which can be expected to do the work quickly and efficaciously. For the most part they are compounds of carborundum or powdered glass or emery and a mediumly heavy grease to serve as a vehicle; some, however, are mixed with a vehicle that is solvent in water. It is advisable, where possible, to use such materials in preference to anything else, for as a rule they are quicker and sharper than either powdered emery or powdered glass and are not as likely to leave ridges on the valves and valve seats. Finely powdered emery long has been the favorite of the old-fashioned mechanic, but great care must be taken when it is used, for it is likely to leave ridges. The concensus of opinion seems to be that powdered glass is the better material to use in the absence of some special compound.

Incidentally, it may be well to interpolate, by way of dampening the ardor of those who imagine that a valve grinder represents a palliative for all valve evils, that badly pitted valves, or valves that have deep ridges in their seats, require something more than mere grinding. A whole lot of grinding may cure them; but much the better plan is to resurface them in a lathe or with one of the several resurfacing tools that are on the market. In grinding valves, it is not necessary to continue the operation until the whole of the surface is polished, thus giving indication that all of it comes in contact with the valve seat. An unbroken polished ring about an eighth of an inch in width all the way around will suffice.

Devices That Impart Semi-Rotary Motion.

But to get back to the tools themselves: The Just Simplicity valve grinder, which is produced by the J. H. Just Specialty Works of Syracuse, N. Y., is as simple as its name implies; it scarcely requires any description at all, for all of its parts are shown by the accompanying illustration. There are only two parts, in fact, neglecting the chuck for holding the screwdriver bit—the handle for holding the tool and the handle for operating it. The latter is connected to the chuck through the intermediary of bevel gearing, which makes plain that a straight up-and-down movement of the handle rotates the screwdriver bit backward and forward just the required amount for proper grinding. The chuck, by the way, is mounted in ball bearings, thus making the operation of the tool quite easy.

The Brown valve grinding tool—or, rather, the Brown valve grinding set, for it consists of three things, the tool, a spring and the grinding compound—is a little more pretentious than any of the others and has been designed primarily as a tool kit adjunct; it is produced by the Brown Co., of Syracuse, N. Y., and is shown complete in the accompanying illustration. As is the case with the Just device, the Brown imparts a semi-rotary motiton to the valve, the important difference between the two devices being that whereas the former requires an up-an-down motion in operation the latter operates by a horizontal motion of the actuating lever. The lever, by the way, can be taken off, as can the screwdriver portion, and the whole device packed into a box of very small compass.

The horizontal actuating motion necessary with the Brown is multiplied in the device itself through the intermediary of rack and pinion gearing that is completely enclosed. In operation, the tool is held with one hand by means of the handle provided at the top and only sufficient pressure exerted to overcome the lifting spring which is fastened to the valve stem. The spring itself is brass and is fitted with collars having two set screws permitting adjustment to stems of varying diameters. Once the collars have been adjusted, the adjustment is not disturbed, the spring being tightened in place by means of a thumbscrew provided for the purpose. The compound is a high grade abrasive held in suspension in a suitable lubricant and is in the form of a paste.

Combining the Valve Grinder and Drill.

The Ashcroft valve grinder, which is marketed by Stevens & Co., of 375 Broadway, New York City, differs from any of the others in construction; unlike them it is a little more than a mere valve grinder; it is, in fact, a combined heavy breast drill with a ratchet handle and a valve grinder. As an ordinary breast drill the device is no less powerful and quick acting than it is as a valve grinder; a chuck is provided to hold all the ordinary sizes of straight and taper shank drills. To obtain the necessary backward and forward motion of the screwdriver bit for valve grinding an ingenious cam arrangement is employed. The cam is mounted at the inner extremity of the short shaft, which carries the bevel driving gear with which is rotates. This cam comes in contact with a collar on the central spindle when the handle is turned and shifts the two driven gears so that a continuous rotary motion of the handle becomes a semi-rotary motion at the valve. In other words, when the driving gear meshes with the upper driven gear the spindle makes three-quarters of a turn in one direction before the cam moves and shifts the other gear into mesh with the driving gear, thus causing the spindle to move one-quarter revolution in the opposite direction, the operation being repeated as long as the handle is turned.

Somewhat like the Ashcroft in utility, though totally unlike it in appearance and construction and operation, the Yankee push brace, which is designated among the multitudinous Yankee products by the number 75, has a wide field of usefulness about an automobile repair-shop or a garage, not the least important of which is the grinding of valves. The tool has not been designed as a valve grinder, nor is it especially recommended for the work by the

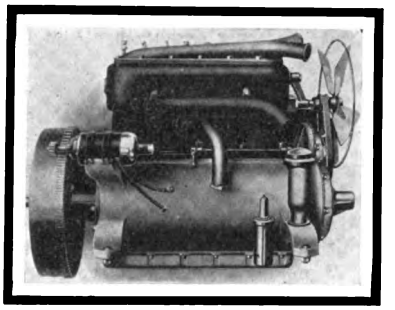
Digitized by Google

makers, North Bros. Mfg. Co., of Philadelphia, Pa. The fact remains, however, that it will grind valves and grind them quickly and well with a minimum of expenditure of muscular power on the part of the operator.

The tool is styled a push brace because it will hold all the tools ordinarily held by brace or breast drill and is operated simply by pushing the handle down and drawing it up, a spirally slotted steel rod in the center imparting motion to the chuck that holds the tools. Inasmuch as the chuck moves one way when the handle is pushed downward and the opposite way when the handle is pulled up, the simplicity of obtaining the necessary reciprocating motion of the screwdriver bit is plainly apparent. In using the tool, however, it is necessary to move the handle only about three inches in each direction in order to obtain three-quarters of a turn of the valve in each direction. Used for purposes other than valve grinding, the tool has four movements—right-hand, left-hand, plain and ratchet—the ratchet movement being used for the occasional heavy work that cannot conveniently be done by the push movement.

Putting Spark Plugs in Cylinders.

Putting spark plugs into cylinders is quite a scientific little performance all by itself, and the way it is done has a great deal to do with the way it must be undone. In other words, the way a plug is put into the cylinder is what determines the way the plug must be taken out. There are two things to be considered. The plug must be gas-tight, and it must also be tight enough so that it will not work out of itself. Beyond this there is no earthly sense in tightening a plug, unless one wants to help on the spark plug industry by spoiling plugs.



Bearing in mind the fact that a gas-tight plug is tight enough, it is easy to see how foolish it is to put a wrench on the plug and lean back until not another fraction of a turn can be taken. This sort of a proceeding wears the thread, flattens the gasket until it has no life left and causes porcelain breakage. Another point is that a plug expands when heated while the hole in the cylinder contracts, making the joint tighter when the engine is hot than when it is cold, though it is a common thing to hear the contrary view expressed. A plug screwed into a cylinder hard and tight when the engine is cold may be almost immovable when the engine is hot. On the other hand, a plug put into a hot cylinder is likely to loosen up considerably when the engine cools and present difficulties, possibly, in effecting a removal. Plugs should, therefore be tightened enough to prevent leakage—and no more.

RUSHMORE ENGINE STARTER STARTS THE CAR AS WELL

Makers Recommend the Practice as Harmless to Battery and Motor—Characteristics of Latest Rushmore-Regal Equipment.

Indicating its measure of faith in the ability of its latest type starting motor as applied to the new model T Regal cars, the Rushmore Dynamo Works of Plainfield, N. J., has placed itself on record with the rather unusual recommendation that not only the engine but the whole car, engine included, be started at once by the simple expedient of pressing the starting button.

The recommendation grows out of the fact that the Model C starter with which Regal cars are equipped is so abundantly powerful that it will "spin" the engine at practically the same speed, regardless of whether it is pulling the car in low gear or

RUSHMORE-REGAL STARTER

not. So confident of the ability of the starter is the Rushmore company, in fact, that it has offered to stand back of the Regal company in a challenge to the whole field for a 'starter race" for a liberal prize to the car equipped with a starter other than a Rushmore that will beat the Regal across a line 25 feet from the start when propelled by its starter alone.

The Model C starter with which Regal cars are equipped is exactly the same as the model adopted for standard equipment by the Simplex company, and though it weighs but 30 pounds and is only five inches in diameter, is sufficiently powerful to "spin" the Regal motor at 200 revolutions a minute with wide-open throttle. Under the conditions, it draws 100 amperes at six volts; the working efficiency of the motor is 72 per cent. Indicating the reserve power that remains, it is pointed out that the torque developed when turning the Regal motor at 200 revolutions is but 2.2 foot pounds whereas the maximum torque obtainable is 27.4 foot pounds before the motor will stall. As may be seen by the picture, the starting motor is mounted on the gasolene engine on a bracket cast integral with the crankcase and drives through the intermediary of gearing cut in the periphery of the flywheel. The Regal cylinders measure 3¾ x 4½ and the starting motor gearing is 7 to 1.

Meaning of Ampere-Hour Capacity.

Due in no small degree to the widespread adoption of electrical apparatus for the modern automobile, much of the confusion over electrical terms that not so long ago harrassed the individual motorist no longer exists. The majority of terms now signify something definite to the man in the street, though no little confusion still exists concerning the term "ampere-hour capacity" as applied to a storage battery. The term means, briefly, that a 120 ampere-hour storage battery will light lamps drawing 10 amperes for just 12 hours. The term signifies, in other words, the normal rate of discharge multiplied by the length of time the discharge will remain practically constant. However, it is one of the characteristics of the storage battery that its ampere-hour capacity is dependent upon the rate of discharge. Thus, though the 120 ampere-hour battery will light lamps drawing 10 amperes for 12 hours, it will light lamps drawing only five amperes for more than 24 hours.

Necessity for Proper Consistency in Grease

In packing differential cases with grease, it is well to remember that the grease must be thin enough to work in between the teeth of the gears or it will do no good. If the grease is too thick, the gear teeth will merely cut a path in it. It is a good plain to use grease that will just flow without being heated in the summer and a slightly lighter grade in the colder months to offset the natural thickening due to cold. If the grease is too thin it is likely to work along the shafts and get into the brakes.

Where Tires Must be Securely Fastened.

With the growing practice of carrying spare tires at the back of the tonneau the necessity for perfectly secure fastenings becomes of greater importance. Probably few persons would be likely to overlook the loss of a tire from the running board with the car under weigh; and probably still fewer would know of one lost from the back until the car was garaged.

Precautions Necessary When Tinning.

When tinning metal surfaces by dipping it is not always sufficient to immerse the parts to be coated in melted metal. With some fluxes it is necessary to rub the surface to cause the solder to adhere; a flat-ended copper rod answers the purpose.

FAR-REACHING RULES FOR NEW YORK DEALERS' RUN

Accessories and Tires as Well as the Car to Be Subjected to Penalization—Classification by Piston Displacement.

That 500-mile New York Reliability Contest which is to be started in New York by the Motor Dealers' Contest Association on December 3rd next, is likely to prove a hummer, as far as the rules are concerned. For not only will penalties be meted out for time lost on the road, as is usual, and for work done on the cars, as well as for discrepancies shown by a final technical examination, but every accessory on every car with the exception of the clock is to be taken into account as well in the final reckoning—not even tires are overlooked, 10 points being charged for blow-outs, though punctures are not counted, and engine starters, of whatever type, must be capable of performing their duties in a maximum of two minutes, or the score of the entrant will suffer.

The rules as they have been laid down are by far the most complete that ever have been promulgated for any reliability contest and suggest those tried in Chicago several years ago, which brought howls from car makers who were penalized for such trifles as broken lamp lenses. In the concrete, they differ from the American Automobile Association Grade I rules in three important respects: Accessories are included as part of a car and as such are subject to penalization; tire blow-outs are penalized; and the cars are classified according to the piston displacement of their motors, a method which is brand new.

The complete rules, which are in the hands of George Robertson of the Auto Supply Co., Broadway and 59th street, who also has the entry blanks, reveal that the contest is to be a class E non-stock event.

Entrants will be divided into two classes, according to the cars they drive, one class being for touring cars and the other for roadsters. Both of these classes will be further divided, cars with less than 230 inches displacement going into Division I, those with between 231 and 300 inches going into Division II and all those over 301 inches going into Division III. Touring cars will be required to carry four passengers whose average weight is 125 pounds, or the equivalent in ballast supplied by the committee, and roadsters must carry two passengers whose average weight is 125 pounds. Cars in Division I will be required to maintain an average speed of 16 miles an hour; those in Division II, 18 miles an hour, and those in Division II, 20 miles an hour.

As is usual, the penalty for work done on the road is one point per man per minute, except where parts are replaced, when the penalty is doubled. Work on tires, however, can be done without penalization—including the adjustment and removal of non-skid devices—and "time out" is allowed for it; this does not apply to blow-outs, as already has been made plain. Work of the kind must be done on the road, the penalty for entering a garage being disqualification. Gasolene can be replenished only at regular controls under penalty of 3 points per occurrence for other replenishment and the same penalization applies to water and oil stocking. In each control, 45 minutes is to be allowed for lubrication of the car. As usual, motor stops will be penalized at the rate of one point per minute. All parts are to be sealed, and the breaking of any seal will cost the entrant five points. Discontinuance as a contestant carries with it 1,000 points penalty, in addition to any that may have been earned.

The rules covering derangements of the motor and running gear made manifest by the final out-door operative tests conform to A. A. A. regulations and include five points for a missing cylinder and 10 points for a perceptible knock in the motor; five points if the car fails to climb a six-inch curb, the motor stalls or the wheels do not spin with the clutch in and low gear engaged; 25 points if any gear in the gearset is inoperative and similar penalties for lack of proper functioning of automatic gear shifters or multi-speed rear axles; one point on the brake test if the car fails to stop within 50 feet, five points per foot for failure to stop between 60 and 70 feet, and 10 points per foot for failure to stop in more than 70 feet.

Penalties for derangements disclosed by the final technical examination also conform to A. A. A. regulations and range from five points for a broken spring to 500 points for a broken frame member or a broken crankshaft, including penalties on carburation, ignition, cooling and lubrication systems of from one to 25 points.

Penalties for faulty equipment, one of the new parts of the rules, summarized are as follows: One point for a loose windshield bolt to five points for a cracked or broken glass; one point for a loose lamp to five points for a missing one; one point for each loose speedometer nut or bolt to 25 points for an instrument entirely inoperative; one point for a loose horn nut to five points for an inoperative horn, the same minimum and maximum penalties applying also to tire racks and bumpers; shock absorber penalties range from two points for a broken rebound strap or a loose nut to five points for a broken shock absorber; tops, from two points for broken bow holders or straps to five points for a broken bow; storage batteries, from three points for replacing a battery where no recharging apparatus is part of the equipment, to 25 points for a discharged battery that is part of a lighting system including generator; gas lighting, 25 points each for inoperative generator or gas tank; electric generator or starter, 25 points each for failure to operate; bodies, from one point for broken or loose floor-boards to six points for broken fender irons or running-board brackets.

The contest is to be started each day from in front of the headquarters of the association in the Manhattan Automobile Club, 222 West 59th street, the first day's run taking the entrants out over Long Island roads, the second day over Westchester and Connecticut roads, and the third day to Poughkeepsie, N. Y., and return. Each night the cars will be garaged and under the eyes of observers. The entry list closes with George Robertson at midnight, December 1st.

Speed Law Doctors Assemble Tomorrow.

The General Conference of Interstate Commissions, which aims to effect more uniform automobile and traffic legislation, will convene in New York City tomorrow, 21st inst. Among the objects of the conferees are uniform touring privileges, uniform speed laws, and a general averaging up of the conglomerate mass of statutes now extant. The meeting will convene in the Hotel Belmont and will be attended by officially appointed representatives from the following 11 States: Massachusetts, New York, New Jersey, Connecticut, Pennsylvania, Maryland, Maine, New Hampshire, Vermont, Rhode Island and Delaware. There undoubtedly will be a great conflict of opinions and if the conference is able to harmonize them and effect anything approaching real uniformity it will be remarkable, indeed.

Objects to Speed of German Royalty.

America may have its troubles with speed law violators, but it has not the same class of speed violator which has been made the object of censure by Berlin newspapers; the Morgen Post appeared a few days ago with an objection to the manner in which the cars of the royalty are piloted about the streets, calling attention to the fact that within a short time five fatalities have resulted. The Post declares that the royal cars have become a "perfect terror in the streets, owing to their reckless pace," and demands that such machines shall in the future be subject to the rules governing ordinary traffic.

Service

Now go on and smile—with some it may be a sad smile. All because this word service is the most universally used and abused word in automobile selling. Our ambition is not merely the sale of a National but the pride in keeping it sold to a satisfied customer.

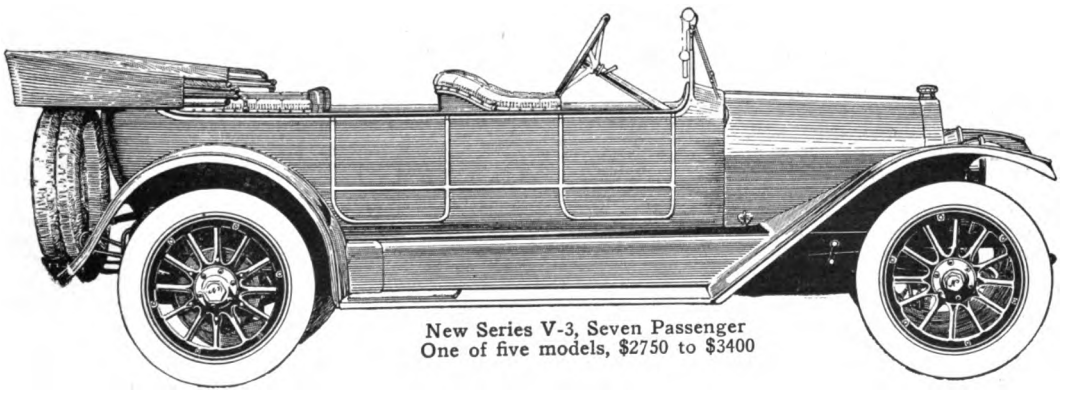
THERE is no generally accepted standard by which you can judge service. Experience is the only way to find out, and sometimes this is too unfortunate and too costly. Everybody promises service; every dealer offers service as an inducement; every manufacturer boasts of his service. This word is becoming a joke—and a disastrous joke.

AS a matter of fact, every dealer and every manufacturer can not give the same degree of good service. Yet, when a man looks along auto row for a car, he gets equal promises of service from every dealer. Even if the dealer means well, he won't give good service to his customer if the factory the dealer represents does not give **him** good service. As a result the public has grown skeptical—and it is the manufacturer's own fault. Service-promises mean much or nothing, depending upon who makes the promise.

Stock Champion.
Fastest
Stock Car Mile.

National

International
500-Mile
Record Holder



The National Motor Vehicle Co., Indianapolis, Indiana, offers you the following service guarantee. We believe no other company can give you better, and we know we can give you all we promise. Ours **is** a prosperous concern, and therefore in a better position to be liberal.

1. Service starts with the National car and is not a mere after-apology. We put service into your car when it is built so that it requires a minimum attention in your hands.

2. A company of 14 years' success, of enviable reputation and stability as well as ability is your guarantee that our promises will be fulfilled.

3. Liberal attitude toward dealers in supplying parts with dispatch and cheerfulness and in guaranteeing to private owners that every National dealer's service will be satisfactory.

4. Our policy is to keep our good name and our cars' good reputation above reproach. **Satisfied** and service-fied customers is our successful ambition.

1,064,381. Resilient Tire. Marshall C. Rogers, Williams, Cal. Filed Feb. 15, 1912. Serial No. 677,848. (Wheel with peripheral rubber tire and an inner rubber cushion.) 4 claims.

1,064,389. Dirigible Light. Ralph De Slazo Smith, Cordell, Okla. Filed June 8, 1912. Serial No. 702,611. (Headlight moving with steering gear.) 1 claim.

1,064,391. Pneumatic Tire. Enos Stanley, Des Moines, Iowa. Filed Nov. 11, 1910. Serial No. 591,768. (Puncture-healing compound for inner tubes.) 5 claims.

1,064,438. Spring-Wheel. Frederick William Bristow, Dorrisville, Ill. Filed Dec. 23, 1912. Serial No. 738,336. (Wheel with crossed spring spokes.) 1 claim.

1,064,454. Lamp Support for Vehicles. Arthur E. Dobbs, Winona, Minn. Filed July 31, 1912. Serial No. 712,607. (Headlight moving with steering gear.) 1 claim.

1,064,476. Gasolene-Eugine. William E. Haskell, Brattleboro, Vt. Filed Dec. 22, 1911. Serial No. 667,279. (Rotary valve.) 14 claims.

1,064,496. Automobile Front Axle. Carl Lagergren, Osterville, Mass. Filed Feb. 23, 1912. Serial No. 679,325. (Steering road wheel pivoted on two balls.) 5 claims.

1,064,514. Method of Regulating and Controlling the Valve-Motion in Explosive-Motors. Gustav Meec, Barmen, Germany, assignor, by mesne assignments, to The Colonial Trust Company, trustee, Pittsburgh, Pa., a corporation of Pennsylvania. Original application filed Apr. 16, 1904, Serial No. 203,450. Divided and this application filed Jan. 18, 1906. Serial No. 296,668. (Motor regulation by control of quantity and quality of mixture.) 1 claim.

1,064,581. Means for Cooling Combustion-Engines. Harold S. Wheeler, Manistee, Mich. Filed May 13, 1910. Serial No. 561,080. (Forced air cooling system.) 1 claim.

1,064,582. Motor-Vehicle. Oswald B. Wippler, St. Louis, Mo. Filed July 3, 1912. Serial No. 707,511. (Detachable body.) 4 claims.

1,064,587. Hand-Grip. Arthur Youngs, Newburgh, N. Y. Filed Jan. 15, 1912. Serial No. 671,151. (Hand-warming grip.) 2 claims.

1,064,611. Tire. William G. Chipley, New Orleans, La., assignor to Pneumatic Rim & Tire Co., Wilmington, Del., a corporation of Delaware. Filed Apr. 10, 1911. Serial No. 620,038. (Double-chambered pneumatic tire.) 1 claim.

1,064,615. Testing Device for Motor-Vehicles. Charles John Cooke, Albany, N. Y. Filed Dec. 20, 1911. Serial No. 666,935. (Flexible tread upon which car runs, remaining stationary while tread runs over rollers driven by car.) 2 claims.

1,064,623. Automobile Running-Gear. Christian W. Duerrstein, Guilford, Ill. Filed June 20, 1911. Serial No. 634,229. (Steering road wheel mounting.) 1 claim.

1,064,627. Vaporizer. Orville H. Ensign, Los Angeles, Cal. Filed Jan. 5, 1912. Serial No. 669,672. (Carburetter with inverted spray nozzle.) 23 claims.

1,064,628. Carburetter. Orville Hiram Ensign, Los Angeles, Cal. Filed Apr. 11, 1912. Serial No. 690,191. (Carburetter with inverted spray nozzle.) 8 claims.

1,064,636. Spring Vehicle-Wheel. John Gibson, Courtenay, N. D. Filed June 28, 1912. Serial No. 706,508. (Wheel with spring-and-plunger spokes.) 3 claims.

1,064,656. Vapor-Engine. William G. Johnston, Woodbury, N. J., assignor, by mesne assignments, to The Engineering and Development Company of America, Salisbury, Md., a corporation of Maryland. Filed May 2, 1910, Serial No. 558,838. Renewed Aug. 31, 1912. Serial No. 718,145. (Opposed cylinder two-cycle motor.) 13 claims.

1,064,661. Unperforable Metallic Band for Tires. Georges Auguste Victor Longuemare, Ste. Adress, France. Filed July 22, 1911. Serial No. 639,877. (Metal tire armor with rubber cover.) 2 claims.

1,064,662. Transmission Lever. John M. Mack, Allentown, Pa., assignor to International Motor Company, Wilmington, Del., a corporation of Delaware. Original application filed Apr. 28, 1906, Serial No. 314,226. Divided and this application filed Mar. 7, 1910. Serial No. 547,733. (Gear control system.) 3 claims.

1,064,694. Mechanically Operated Road Map. Max Bremsy, New Rochelle, N. Y. Filed Sept. 8, 1909. Serial No. 516,779. (Road map running over rollers.) 1 claim.

1,064,755. Auxiliary Wheel. Charles I. Manee, New York, N. Y. Filed June 28, 1912. Serial No. 706,341. (Auxiliary wheel with articulated spokes.) 2 claims.

1,064,765. Electric Controller for Explosive Engines and Associated Mechanisms. Charles O. Pearson, New York, N. Y. Filed Aug. 17, 1908. Serial No. 448,878. (Electric starting and control system.) 43 claims.

1,064,766. Vehicle Tire. Leroy S. Pfouts, Canton, Ohio. Filed Nov. 20, 1911. Serial No. 661,340. (Cushion tire with triangular annular air chamber.) 1 claim.

1,064,769. Preparation for Automatically Sealing Punctures in Pneumatic Tires. George Herbert Price, Queenstown, Cape Colony. Filed Aug. 14, 1911. Serial No. 643, 947. (Puncture-filling liquid.) 6 claims.

1,064,804. Steering Mechanism for Automobiles. Elbert L. Wood, Nevada, Iowa. Filed July 28, 1911. Serial No. 641,183. (Front wheels carried on separate frame pivoted to main frame and deflected bodily for steering.) 2 claims.

1,064,837. Spring Wheel. Thomas N. Jordan, Long Beach, Miss. Filed May 18, 1912. Serial No. 698,278. (Wheel with curved spring spokes.) 1 claim.

1,064,846. Accessory for the Ignition Systems of Internal Combustion Engines. Meldon H. Merrill, Boston, Mass. Filed Mey 10, 1911. Serial No. 626,215. (Spark plug switch.) 2 claims.

1,064,889. Transmission Gearing. Francois Deves, New York, N. Y. Filed July 17, 1911. Serial No. 638,958. (Individual clutch gear system.) 1 claim.

1,064,896. Spring Wheel. Clifford D. Freeman and Richard W. Cheesbrough, Bogus, Cal. Filed June 12, 1912. Serial No. 703,284. (Wheel and spring-and-plunger spokes.) 3 claims.

1,064,915. Means for Producing Ignition Sparks. August Kazenmaier, Stuttgart, Germany, assignor to The Firm of Robert Bosch, Stuttgart, Germany. Filed Jan. 17, 1913. Serial No. 742,659. (Magneto ignition system.) 2 claims.

1,064,942. Starting Device for Explosion Engines. Webester F. Traves, Cleveland, Ohio, assignor to William H. Becker, Cleveland, Ohio. Filed Feb. 2, 1911. Serial No. 606,227. (Spring starter.) 11 claims.

1,064,948. Automobile and Car Fender. George L. Wheeler, St. Louis, Mo. Filed Sept. 16, 1912. Serial No. 720,570. (Padded fender with spring backing.) 4 claims.

1,064,954. Indicator. Ander Peter Anderson, Akron, Ohio. Filed Oct. 7, 1912. Serial No. 724,473. (Float operated tank gauge.) 2 claims.

1,064,962. Internal Combustion Turbine Engine. William Carl Cooper, Perry, Mich. Filed Apr. 13, 1911. Serial No. 620,733. (Gas turbine with compression cylinders.) 3 claims.

1,064,969. Hood for Vehicles. Austin Hennessy, London, England. Filed Apr. 24, 1912. Serial No. 692,913. (Hood supported wholly from the rear section.) 3 claims.

1,064,974. Double Cage for Roller Bearings. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Company, Harrison, N. J., a Corporation of New Jersey. Filed Jan. 2, 1912. Serial No. 668,832. (Cage for double row of conical rollers.) 1 claim.

1,065,001. Valve Actuating Means for Internal Combustion Engines. Joseph Schleiter, Waterloo, Iowa. Filed Mar. 5, 1912. Serial No. 681,700. (Intermittent rotary motion for rotary valves.) 2 claims.

1,065,011. Sleigh Attachment for Power-Driven Vehicles. Andrew Vettel, Jr., Sandusky, Ohio. Filed May 10, 1912. Serial No. 696,483. (Track-tread device.) 12 claims.

1,065,025. Gas Engine Starter. Barnet Nixon Botts, Paso Robles, Cal., assignor of one-half to Verne Exline, Paso Robles, Cal. Filed Dec. 7, 1911. Serial No. 664,313. (Compressed air starter.) 2 claims.

1,065,064. Mud Hook. Rieman A. MacDonnell, Fernandina, Fla. Filed Sept. 17, 1912. Serial No. 720,812. (Grip for use in deep mud.) 1 claim.

1,065,067. Carburetter. John B. Naczek, Milwaukee, Wis.; Joseph Naczek, administrator of said John B. Naczek, deceased. Filed Aug. 7, 1911. Serial No. 642,625. (Carburetter with movable nozzle and fan in outlet.) 18 claims.

1,065,080. Resilient Wheel. Emil Radke, Blue Earth, Minn. Filed Dec. 16, 1911. Serial No. 666,131. (Wheel with spring spokes and sectional rim.) 1 claim.

1,065,084. Chain Mat for Wheel Tires. Charles E. Smith, Bridgeport, Conn., assignor to The Walker Tire Chain Company, Toledo, Ohio, a Corporation of Ohio. Filed Feb. 11, 1913. Serial No. 747,601. (Non-skid chains with ring treads.) 1 claim.

1,065,096. Anti-Skidding Device. Porter D. Albert, New Bethlehem, Pa. Filed Oct. 11, 1912. Serial No. 725,183. (Non-skids brought into action by wheel sliding laterally on axle.) 1 claim.

1,065,103. Lock for Automobiles. Lippman Baum and Charles Sandler, Washington, D. C. Filed June 11, 1912. Serial No. 703,050. (Steering wheel lock.) 6 claims.

1,065,139. Tire Fastening Device. James J. Kelly, Crafton, Pa. Filed Nov. 6, 1911. Serial No. 658,705. (Rim with one removable flange and holding pins.) 2 claims.

1,065,162. Airless and Punctureless Automobile Tire. Corwin E. Miller ,Peru, Ind. Filed Dec. 14, 1912. Serial No. 736,833. (Cushion tire.) 2 claims.

1,065,183. Steering Gear for Automobiles. Theodore D. Stanley, Detroit, Mich. Filed Aug. 24, 1912. Serial No. 716,818. (Screw-and-nut steering gear.) 3 claims.

1,065,189. Shifting Bow for Vehicle Tops. Charles E. Titchener, Binghamton, N. Y. Filed Dec. 27, 1911. Serial No. 668,173. (Hinge clip for top support.) 1 claim.

1,065,207. Resilient Mounting for Wheels. Henry W. Bowman, Barbourville, Ky. Filed Sept. 9, 1912. Serial No. 719,422. (Spring-cushioned hub.) 1 claim.

1,065,214. Chain Mat for Resilient Tires. Maurice A. Carter, Granville, N. Y., assignor to The Walker Tire Chain Company, Toledo, Ohio. Filed Nov. 7, 1912. Serial No. 730,004. (Non-skid chain with ring treads.) 3 claims.

1,065,271. Power Dumping Wagon. John P. Powers, Ossining, N. Y. Filed Sept. 27, 1912. Serial No. 722,601. (Truck body tilted by power.) 4 claims.

1,065,295. Road Map Holder. Thomas H. Connors, Seaforth, Minn. Filed Mrf. 28, 1912. Serial No. 686,816. (Tubular casing for map roll.) 1 claim.

1,065,327. Spark Plug Connector and Switch. Charles E. Semple, Jr., Youngstown, Ohio. Filed Apr. 27, 1911. Serial No. 623,699. (Combined switch and spark plug terminal.) 4 claims.

1,065,331. Carburetter. William J. Rubesky, Minneapolis, Minn. Filed Aug. 17, 1908. Serial No. 448,942. (Carburetter with wick device.) 19 claims.

1,065,357. Automobile. Jesse H. Hand, Ann Arbor, Mich. Filed Apr. 1, 1912. Serial No. 687,670. (Fifth-wheel steering gear.) 2 claims.

1,065,386. Spring Wheel. Frank J. Nicolet, Steubendale, Ohio Filed June 19, 1912. Serial No. 704,706. (Wheel with jointed spring spokes.) 1 claim.

1,065,391. Muffler Cut-Out. Arthur Piel, New York, N. Y. Filed Jan. 17, 1911. Serial No. 603,130. (Muffler cut-out with flap valve.) 5 claims.

1,065,410. Gas Turbine. Frank A. Voiles and Oscar M. Voiles, Chicago, Ill. Filed Aug. 14, 1911. Serial No. 643,944. (Combination of rotary and reciprocating pistons.) 10 claims.

Manufacturers of Electric Lighting and Starting Equipment Who Use and Recommend

Storage Batteries

Adams-Bagnall Electric Co.	Cleveland, O.
Adams & Westlake Co.	Chicago, Ill.
Bailey Electric Co.	Grand Rapids, Mich.
Bijur Motor Lighting Co.	Hoboken, N. J.
Briggs Magneto Co.	Elkhart, Ind
Dayton-Dick Co.	Quincy, Ill.
Dean Electric Co.	Elyria, O.
Detroit Electric Appliance Co.	Detroit, Mich.
Diehl Mfg. Co.	Elizabethtown, N. J.
Dyneto Electric Co.	Syracuse, N. Y.
Economy Mfg. Co.	York, Pa.
Electric Auto-Lite Co.	Toledo, O.
Electro Light & Starter Co.	Indianapolis, Ind.
Emerson Electric Co.	St. Louis, Mo.
Esterline Co.	Indianapolis, Ind.
Fisher Electrical Works	Detroit, Mich.
Gray & Davis	Boston, Mass.
Hartford Suspension Co.	Jersey City, N. J.
Holtzer-Cabot Electric Co.	Brookline, Mass.
Ide Engine Co.	Springfield, Ill.
Ignition Starter Co.	Detroit, Mich.
Jones Electric Starter Co.	Chicago, Ill.
Kemco Elec. Mfg. Co.	Cleveland, O.
Leece-Neville Co.	Cleveland, O.
National Coil Co.	Lansing, Mich.
North-East Electric Co.	Rochester, N. Y.
Northwestern Mfg. Co.	Milwaukee, Wis.
Remy Electric Co.	Anderson, Ind.
Rushmore Dynamo Works	Plainfield, N. J.
Splitdorf Electric Co.	Newark, N. J.
Wagner Electric Mfg. Co.	St. Louis, Mo.
Ward Leonard Electric Co.	Bronxville, N. Y.
R. C. Wells Mfg. Co.	Fond du Lac, Wis.
Westinghouse Elec. & Mfg. Co.	East Pittsburgh, Pa.

Count Them

and if you are at all familiar with the various Electric Lighting and Starting Systems you will readily note that there are but THREE MANUFACTURERS whose names do not appear in this list.

A Total of 37 Manufacturers of Whom 34 Recommend the Use of GLBA Batteries or 91.9%

and Agents for cars not equipped with GLBA Batteries are INSISTING that their manufacturers SHALL ADOPT them instead of those which are IMITATIONS of the GLBA

This overwhelming preference for GLBA Storage Batteries is not due to price consideration, as THEY ARE NOT SOLD ON PRICE.

The actual performance, superior quality, long life, enormous manufacturing facilities, and our unequalled service organization are the features that prompt the FAR-SEEING MANUFACTURERS to pin their faith to the GLBA

When you buy a car, remember that the starting and lighting system is a vital part of the car equipment.

YOU WANT THE BEST. If you insist on a system made by any firm in the above list, you get an GLBA Battery with it—if you ACCEPT one of the other 3, remember that you ARE NOT getting a system whose elements are of the best—and ONLY from a combination of the best can be secured that perfect, harmonious operation which insures the utmost efficiency and satisfaction.

Write us for full information

WILLARD STORAGE BATTERY CO., Cleveland, Ohio

New York Branch: 136 W. 52nd Street. Chicago Branch: 2241 Michigan Avenue.
Detroit Branch: 1191 Woodward Avenue. San Francisco Branch: 243 Monadnock Building.
Indianapolis Branch: 438 and 439 Indiana Pythian Building.
Depots in all principal cities in the United States, Canada and Mexico.

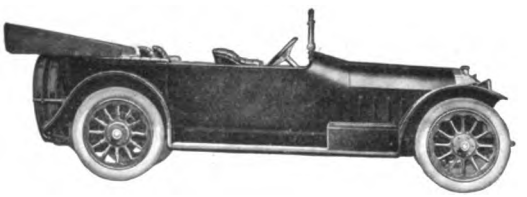
A Remarkable Record



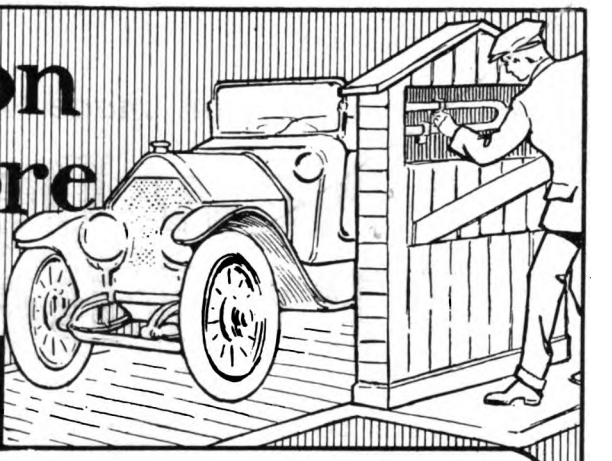
PATHFINDER

The Pathfinder Leather Stocking Model is the most talked about "six" on the market.

Before any public announcement of this car appeared we had actual car orders for one-quarter of our output. Orders received to date will take care of more than one half of our scheduled 1914 output of sixes.

Only a few of our friends knew about the Spectacular Six, but they told their friends who told their friends, and—now it looks like Pathfinder's biggest year.

The reason for the instantaneous popularity of the new Pathfinder Six is found in the "New Plan for Buying and Selling Automobiles." Get it—and read it.



Pathfinder body designs are generally described as "Beautiful." Learn why by writing for our art catalog and "101 Reasons."

MOTOR CAR MFG. CO., 1138 Division St., INDIANAPOLIS, USA

Digitized by Google

Put the car on the scales before you buy it!

If you want to know how much weight electrical equipment has added to the 1914 car, before you buy it---

WEIGH IT!

You're the one who will pay the tire bill, the fuel bills, the repair bills—**Weigh it!**

See that all the car's belongings are under the seats, water in the radiator and gasoline in the tank and then—**Weigh it!**

You don't have to take anyone's word for its weight—**Weigh it!**

If you want to know why the new car is sluggish, feeble on the hills, sudden death to tires and thirsty for gasoline—**Weigh it!**

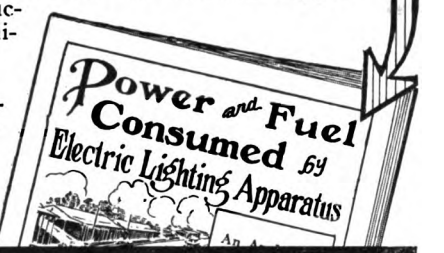
Then compare the weight with a 1910 or 1911 model of the same car.

Electrical equipment adds a dead weight of 150 to 250 pounds and in addition (by actual tests) consumes 8% to 12% of the engine power.

This calls for larger engine, heavier frames, axles, springs, tires—added weight all the way through.

Either you'll find this or you'll find something worse—for if the manufacturer has not enlarged the engine and other parts to carry excess weight the result is a weak, under-powered, over-loaded car.

If You Want a Real Automobile



full powered, simple, easier on tires, less troublesome, less expensive in every way—see that it is Prest-O-Lited.

Even if the car was designed to carry electrical equipment, the removal of the electric apparatus and the substitution of Prest-O-Lite will make a decided reduction in the weight, stop the power loss, and increase the safety, reliability and economy.

If you want to know why—send for this book.

It shows why electric lighting costs five times more than Prest-O-Lite—how you risk the safety of yourself and family by an unreliable lighting system.

It tells why thousands of motorists are keeping their old cars and refusing to buy the new ones with electric equipment.

The Prest-O-Lite Co., Inc.

287 Speedway, Indianapolis, Ind.

(*Contributor to Lincoln Highway*)

Prest-O-Lite can be lit, dimmed and extinguished from the driver's seat. It is the natural solution of your lighting troubles.

American made for American trade

New Departure Ball Bearings

THE complete success of New Departure ball bearings in meeting the demands of the American car manufacturer for a bearing of quality, capacity, efficiency and durability, is attested by the fact that **two-thousand skilled mechanics are operating ten and a half acres of modern machinery, producing ten-thousand guaranteed bearings per day.**

Can we send you Catalog?

The New Departure Mfg. Co., Bristol, Conn.

Western Branch, 1016-17 Ford Bldg., Detroit

Digitized by Google

We will not build a radiator in our factory that is not honestly and scientifically designed to do the work required of it. Our continued business relationship with the makers of America's best cars, year after year, offers abundant testimony of the soundness of this policy.

Mayo Radiator Company
NEW HAVEN, CONNECTICUT

CAPACITY
GURNEY
ENDURANCE

Trials are the Order of the Day

But erring and unfortunate men in high and low estate are not the only objects of judicial investigation. So impersonal a thing as a ball bearing must be subjected to the most relentless trial in testing laboratories and out on the road to discover any hidden fault or weakness. These courts are above any suspicion of partiality. Before these courts the Gurney Ball Bearing has been repeatedly on trial. The verdict is singularly unanimous.

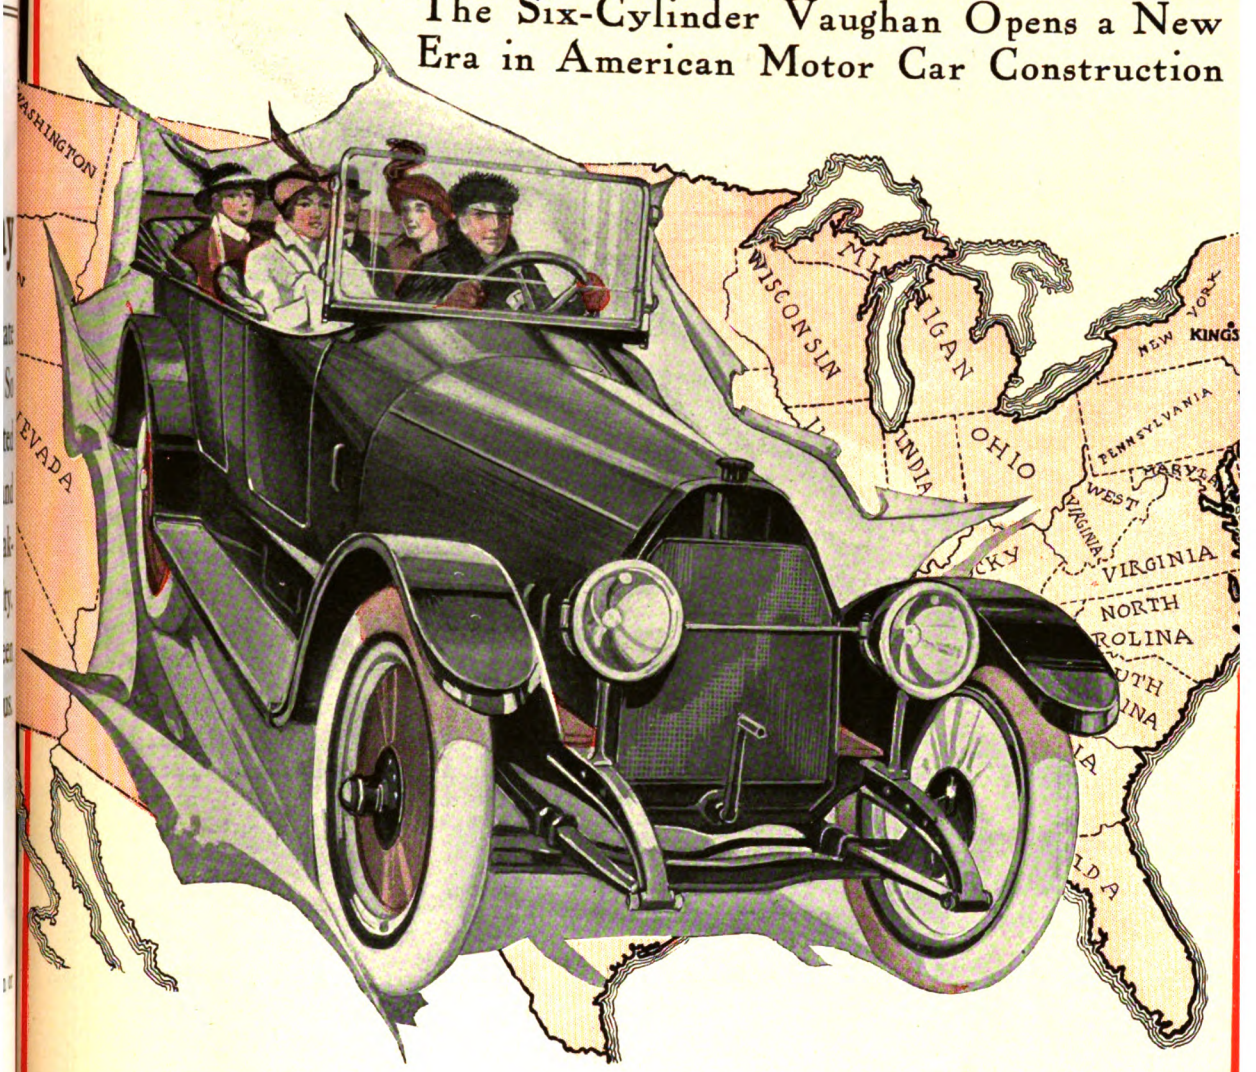
FIAT JUSTITIA

THE VERDICT

Steel—Uniformly good—none better.
Hardening—Uniform—None soft, none brittle.
Balls—The best obtainable.
Accuracy—Unequaled by any other, American or Foreign.
Concentricity—Unequaled by any other.
Load Capacity—Greater than any other.
Thrust Capacity—Much greater than any other.
Endurance—Greater than any other.

THE SENTENCE

Is written on an order blank.



GURNEY BALL BEARING COMPANY

Jamestown, N. Y.

The Real Automobile Has Arrived

The Six-Cylinder Vaughan Opens a New Era in American Motor Car Construction

It was time that *one* American manufacturer built a car that measured up to the best foreign practice in construction and design. We saw the opportunity — We BUILT THE CAR.

Digitized by Google

The Six-Cylinder Vaughan is the highest development of the master builder's art.

The car is ready—today:

One week ago we printed a new kind of advertisement of a new kind of automobile in three leading journals of the Automobile Industry. We said we needed 50 progressive men who should be thoroughly representative of the front rank of American automobile distributors.

We were quite sure before the First Advertisement appeared that we would be able to market our 1914 output.

NOW we are POSITIVE of it.

It is of the utmost importance to us that the representation of this new car shall be in the right hands. Our dealers must be men who know how to sell real automobiles and have a following that know *real automobiles.*

Every city now has its group of motor-wise men, who are quickly responsive to every real advance in motor car construction. We want these men to see this car, to ride in it, to drive it *first.*

The man who drives this car on the streets of your city is going to be met with this sort of conversation at his club and in his office:

"Stunning machine I saw you in this morning, old man—that's the handsomest automobile in *this* town. It's a foreign car, isn't it?"

Digitized by Google

Introducing the REAL Automobile

The moment the first car is in your show room, go to the telephone and call Mr. Jones, Mr. Brown, and Mr. Robinson, and say to them:

"Mr. Jones, the new car that I told you about has arrived. It is all that I said it was when I first talked to you about it.

"I want you to sit back of the wheel of this car and tell me what you think about it. I want you to drive it up to your door-step and ask Mrs. Jones what she thinks about it—and we will ask her to ride in it.

"You have been looking for a car that did not look like every other four-wheeler on the block—well, it is here, Mr. Jones. When are you coming up to see it?"

Mechanical efficiency? Yes—we will give you detailed information of the construction of this car in person or by mail.

The six-cylinder VAUGHAN has the stuff in it. As a plain business proposition we had to do this first. Every man who will sell this car knows what is good and what is not good in motor car development.

We had to be right—we are right.

The mechanical development of this motor car was under the supervision of those who knew how to build to win your appreciation and approval. It has "stood up" under the most rigid tests of modern motor engineering.

We are proud of the product. Proud of the six-cylinder VAUGHAN that has a distinction, a style, a character that will stop the man and his wife who instinctively recognize the refined, the beautiful things of this world.

Digitized by Google

We have a car that is not like any other car made in America.

We want the men who will sell and the men who will drive this car to know that we are expert automobile constructors and have been making and selling automobiles for many years. We know the things that a good dealer must have to satisfy him. We know what we must do to gain his interest, arouse his enthusiasm and win his friendship. We must, through our dealer-friends, make their customers our friends. There must be faith all through—faith in our product—our guarantees—our promises.

The contract we will make with our dealer-friends will be fair in spirit—in proper provision for the future.

We could sell more cars in 1914 than we could turn out, and turn out properly—but we will not.

We could get twice as many dealers as we expect to make contracts with, and disappoint a lot of them—but we will not.

We could make claims, so extravagant, so far reaching that you would say: "Where have I heard that story before?"—but it will not be necessary to go that far.

The car is priced $2750. Higher price would mean nothing except the payment for something *that could not be put into the car.*

The car is ready—just now—today. We want to hear from the right men in certain cities. We may have heard from your town, and we may not. *You* must tell us that "you are interested."

That is all we want YOU TO SAY TODAY.

Another BOSCH Victory

Los Angeles-Phoenix Road Race a 100 per cent Victory for Bosch Magnetos

1 Locomobile	Davis	Bosch
2 Marmon	Ball	Bosch
3 Buick	Nikrent	Bosch
4 Simplex	Rice	Bosch
5 Mercer	Buxton	Bosch
6 Mitchell	Greer	Bosch

85% of finishers used Bosch Plugs

THIS is a demonstration of Bosch Superiority—like others, it is sweeping, conclusive evidence of the Bosch Magneto's ability to withstand hard, continuous service without falter or miss.

In this race, across the desert sands and rugged mountains the cars were racked, jolted and jarred unmercifully, yet the Bosch Magnetos served perfect ignition—first at high, then at low speeds; short, sudden calls for quick, penetrating sparks to shoot thru highly compressed, heavy, oil laden mixtures. Carbonized plugs resulted and made ignition extremely difficult, but the Bosch Magnetos served irrespectively.

Bosch Ignition has always stood these severe tests and proved efficient, whether in the hands of a novice, a veteran, or an excited race-driver. Every Bosch Product is built to satisfy, built to uphold Bosch Reputation.

Specify

RESILIENT

Detroit Springs

TRADE MARK

SILENT = SELF-LUBRICATING

and you'll buy fewer tires—

That is only one of many reasons why you should demand Detroit Springs on your next car.

Detroit Springs are *flexible*—not merely bars of steel. The perfectly proportioned resiliency, the exact measure of flexibility that reduces strain and wear on tires, also reduces strain and wear on car mechanism and multiplies the comfort of riding.

And Detroit Springs are as superior in strength as they are in the finer details of service. They are built for the emergency shock. This extra life-insurance costs you nothing extra when you specify Detroit Springs.

One of the three decisive tests of Detroit Springs. The apparatus shown here brings a crushing weight upon the springs—far greater than any it will ever be called upon to bear in actual use. The pressure is applied steadily until the natural bow of the spring is almost reversed. If the spring breaks or fails to come back to its original position it is rejected.

Guaranteed Two Years

This extra long guarantee tells the story of Detroit Spring materials and character of workmanship. It proves that the responsibility of your safety, your comfort, your car investment has been keenly felt, fully accepted, and Detroit Springs built accordingly. You are safe from breakage, protected against "settling" of springs, assured of maximum comfort—and not for a few months only, but for years.

The Springs Without a Squeak

—Silent because self-lubricating. This great advantage is new even to Detroit Springs, and in itself is sufficient reason for you to see that they are on the car you buy. A cavity is stamped into each leaf, and filled with a long-lived lubricant. The more the spring is in action, the more lubricant is distributed, insuring silence and smooth operation, reducing friction, prolonging the life of the spring. Look for the "lubricating cup" at end of each leaf.

FREE—"From Ore to Motor Car"—Let us send you a copy of this book—the only one published to give you first-hand factory information about Automobile Springs. There are facts in this book that every owner of a car should know. Explains how Detroit Springs insure your safety and lengthen the life of your car and tires.

Only 30 pounds is the weight of the new

Simplex "38" with Rushmore Starter, Model C.

RUSHMORE STARTER MODEL C

The Model C Rushmore Starter runs normally at 1200 r.p.m. and develops its maximum of 1 1/5 h.p. at only 450 r.p.m. It is possible in a slow speed motor like this to eliminate certain electrical losses which accompany higher speeds. It is also possible to gear directly to the flywheel, thus reducing gear friction. This direct gearing, in turn, is made possible by the patented device of employing the magnetic pull of the pole pieces to shift the armature and pinion into engagement, and the counter electromotive force due to acceleration to release the same when the engine picks up its cycle.

Literature on request

The following cars use the Rushmore Starting and Lighting System:

Simplex	***Mercer***
Lancia	***Regal***
Knox	***Kline***

Rushmore Dynamo Works
Plainfield, N. J.

—yet it spins a 50-h.p. engine at 100 r.p.m., taking only 100 amperes at 5.5 volts.

The following performances are typical:

SIMPLEX "38" 4 *cylinders*, 4⅞ x 6½ *inches*.
Spinning speed 100 r.p.m., using 90 amperes at 5.6 volts.
Gear ratio 12 to 1.

This engine spun continuously 45 minutes on one charge of 120 ampere-hour battery. Rise in temperature of starter in 45 minutes, 40 degrees F.

MERCER: 4 *cylinders*, 4½ x 5 *inches*, *compression* 100 *pounds*.
Spinning speed 168 r.p.m., using 108 amperes at 5.5 volts.
Gear ratio 7.3 to 1.

This engine spun continuously at 168 r.p.m. for 45 minutes on a single charge of a 120 ampere-hour 6-volt Willard battery.

————: 6 *cylinders*, 4½ x 5½ *inches*.
Spinning speed 115 r.p.m., using 100 amperes at 5.5 volts.
Gear ratio 10 to 1.

————: 4 *cylinders*, 3 3-16 x 5⅛ *inches*.
Spinning speed 160 r.p.m., using 95 amperes at 5.6 volts.
Gear ratio 6¾ to 1.

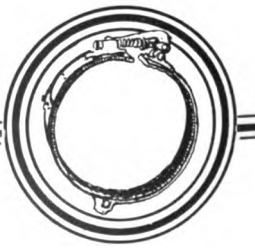
Ambesco

is Manufactured (not Assembled-) entirely within our own factory walls

AMERICAN ASBESTOS Co.
NORRISTOWN PENNA.

FROM MINE

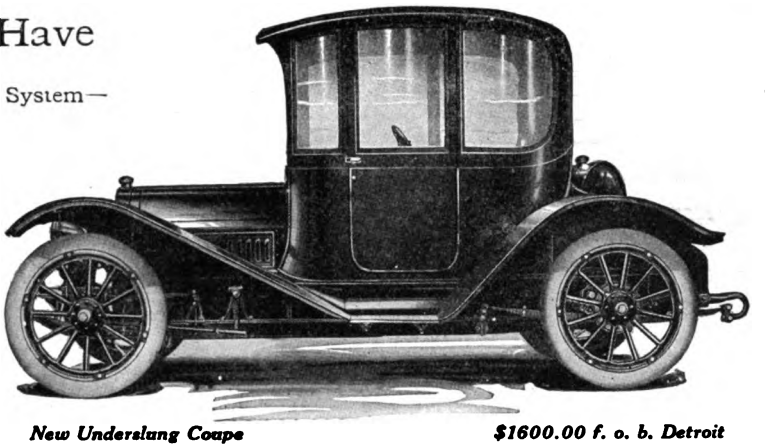


THE first great advantage we gain by manufacturing Ambesco—every detail from the crude asbestos at the mine to the finished brake linings—in our own factory, is that we eliminate every vestige of middleman profit. Woven asbestos products have been our specialty for years and we are, probably, better prepared to make superior woven asbestos specialties for less money than any other concern.

By eliminating middlemen profits, we save manufacturing costs.

With our equipment for handling every detail of brake lining manufacture we are able to govern the uniformity of Ambesco. For instance, yarn from one mill will vary from that of another. Concerns who buy from yarn or tape jobbers, as most others do, never know how many different mills spun the yarn that goes into their brake linings. Consequently the uniformity of their products cannot compare with Ambesco.

All this would be a small matter were it not for the fact that brake linings must have uniform thickness in order to perform their functions and stand up for even a reasonable length of time. A brake lining of varying thickness of strands wears unevenly, works inefficiently and cannot give the satisfaction Ambesco does at a lower relative price.



Write us for particulars and be sure to ask about our plan with relation to dealers and repairmen.

Popular Cars

Popular Prices!

New Underslung Coupe *$1600.00 f. o. b. Detroit*

Mr. Dealer—The Regal Line Sells the Year Round—Here's Why!

The Regal line of cars enables Regal dealers to sell cars 52 weeks in the year. There are no slow months during the winter. The Regal coupe completes the "all year round" line. The dealer taking the Regal line starts right in on a busy season — doesn't have to wait until spring.

Regal Underslungs Have MORE Selling Points Than Any Other Cars in Their Class

¶ We offer a variety of four models—an Underslung Touring car—an Underslung Roadster—an Underslung Coupe and an Overhung Touring car.

¶ All Regal cars are listed with *complete* equipment and with Rushmore Electric Starter and Lighter—Left Side Drive and Center Control.

¶ Regal cars are popular cars and sell at Popular Prices—(Half the battle).

¶ Regal cars are the only Popular Priced cars on the market offering *Underslung Construction* and the resultant advantages.

¶ We are making deliveries—not disappointing our dealers. Are expanding our plant in pace with the growing demand. We now cover 9½ acres.

¶ We invite you to investigate our financial status. A contract with a weak manufacturer might prove disastrous.

¶ Our export business is one of the greatest in the American Motor Car Industry.

¶ Don't forget that the first impression goes a mighty long way. The low, rakish beauty of the Regal wins it instant favor.

¶ Our co-operation is substantial and you find in us an organization that *can* and *will* back up its product—and its representatives.

¶ The commission is liberal and our dealers contract is RIGHT.

¶ If you are interested in the selling of motor cars it is decidedly to your interest to write or wire us *at once*. Should you be fortunate enough to be in open territory, you have an exceptional business opportunity before you. We have much more to tell you—write us *today*.

The New Regal Underslung Coupe

certainly sets a new standard of motor car value. It is of Underslung construction which makes possible its extremely graceful and winning lines. The interior is richly finished in buffed leather, blue broadcloth and nickel trimmings. Has extra folding seat for third passenger. Electric starter and lighter, left side drive and center control, dome light, dimming attachment for headlights and complete equipment are included. **The other three models are—**

Model "T"

Underslung 5-passenger touring car. The famous "Safest" car and the most popular of the popular priced cars. This is the car that makes your customer a *permanent* customer. Its specifications are interesting—get them. Price, **$1125**

Model "N"

Underslung Roadster. The "classiest" car at *any price!* It has the same chassis as model "T" and the same low, rakish lines. The ideal car for the business man, and has the stamina for endless service. It wins friends wherever it goes. Price, **$1125**

Model "C"

Overhung 5-passenger car. This car is *different*. The springs are hung *below* the axles, thus lowering the frame sufficiently to obtain a degree of safety found in no other overhung car. It also permits of the economical straight line drive. Price, **$1350**

What a Well Organized Delivery Car Department Means to Every Automobile Dealer

IF you are a progressive and successful dealer, you are interested in this question:

"Is it good business not to have a well organized Delivery Car Department?"

We believe we can show you that it is **not** good business.

You know the pleasure car business. You know that it's "streaky." You know that it is heavy today and light tomorrow, and that your overhead is as sure as death and taxes.

Some dealers—the successful and progressive dealers—have realized that it is not good business judgment to invest all their capital—or most of their capital—in garage, service, building, show rooms and salaried sales-force for the sale of pleasure cars exclusively.

These dealers have found a way to equalize the fat months and the lean, to carry the overhead until it carries itself; in a word, to change their business from a fickle, erratic trade, fluctuating with the seasons, to a steady twelve-months business.

These dealers have found and installed and developed the profitable delivery car department.

To them and to you—if you are among such progressive and successful dealers—The Commerce Motor Car Company has much to say.

In the first place, you must distinguish clearly between delivery cars built on pleasure car chassis (which have been unhappy and inevitable failures, and the Commerce Car, which is designed and constructed as a "fool-proof," efficient delivery car—and nothing else.

In the second place, you must separate your pleasure car selling force and your delivery car selling force. You must organize and operate them separately.

That done, you are ready for the extraordinary opportunity the Commerce Car offers you.

The Commerce Car is three years old—three years of service-giving, reputation-building and hard work. We have gone slowly—because we wanted to be sure and we wanted our Commerce owners and Commerce dealers **to be sure.**

You can sell the Commerce Car—with enormous success—if you sell it to business men as cash registers and adding machines are sold to business men—and send out diligent, intelligent, methodical and rational men to sell it.

You can confirm all we say of the Commerce Car by asking Commerce Car owners themselves. We will give you names and addresses and detailed reports.

If you are in the automobile business for steady, consistent growth and permanent, legitimate profits;

If you will organize a delivery car department on the right basis and maintain an alert delivery car sales-force;

If you will contract with us and work with us and build with us in the right spirit:

The Commerce Car will give you a twelve-months profitable business and a twelve-months success.

Write or wire for details. Or, better yet, come to Detroit, see the materials we are putting into Commerce Cars, and sense the spirit of the whole organization.

The Commerce Motor Car Company

Administration Dept., 625-630 Penobscot Bldg., Detroit, Mich.

Specifications:

1,000-pound capacity, **25 per cent. overload,** guaranteed.

Our Liberal One Year Guarantee

Stewart-Warner

We will repair or replace absolutely free of charge at our factory, branches or at any of our authorized service stations any Stewart Speedometer or Warner Auto-Meter or part that proves defective in material or workmanship within one year from date of sale to car buyer, provided transportation charges have been prepaid. This guarantee does not cover fibre pinions.

THE above guarantee is not only the ***most liberal*** speedometer guarantee ever made, but it is subject to the ***most liberal interpretation.***

In effect it covers and guarantees for one full year any Warner Auto-Meter or Stewart Speedometer from the date they go into use; that is to say, from the date any car is delivered to the retail buyer, and ***not*** from the date the instrument leaves our factory. There is a big difference.

According to terms of our guarantee if there is a defective part to be replaced you do ***not*** have to return the speedometer to the factory, as is the case with other speedometer manufacturers. Just get in touch with our nearest branch or service station. We now have fifteen branches and sixty service stations; before long we will have one hundred and fifty service stations.

Remember, ***in no instance,*** do we try to narrowly interpret this guarantee. We take the manufacturer's word, the dealer's word, or the customer's word.

This is the fairest and squarest speedometer guarantee that has ever been written.

This guarantee is backed by one of the largest organizations in the automobile business. It is also backed by the largest chain of speedometer branches, and speedometer service stations in the world.

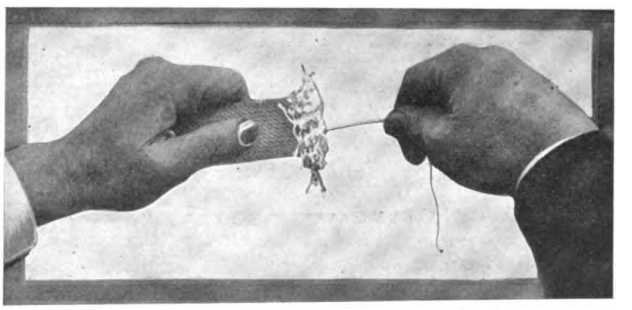
The Gilmer Rebound Strap



Our method of weaving selected material into Gilmer Rebound Straps, the water and weather-proofing they are treated with against decay, and the patented process of splicing the ends so as to make the weave continuous even where the joint occurs, gives them the strength to perform their functions better than any other type.

The sizes recommended for various cars have strength far in excess of the capacity required even by the sturdiest rear axle construction.

The Foreign Trend

The builders of motor cars abroad are constantly introducing new ideas, new body designs, new equipment and new methods of construction.

There are wire wheels and worm drive now. And other things are promised.

But some things there, as here, are standard.

One is The Jones Speedometer.

Seven years ago The Jones became Europe's most popular speedometer.

It won the Royal Automobile Club's gold medal for all around superiority in a test that covered 2,000 miles and lasted 30 days.

It was placed on the cars of the King of England, the Emperor of Germany, the Czar of Russia, the King of Italy, the King of Spain, and the Kings of Siam, Norway, Sweden, Denmark and Belgium. The President of Switzerland and the President of France and hundreds of other notables used it.

It is used by these rulers and thousands of others on the best cars today.

No other speedometer ever gained such prestige or was ever so widely sold abroad. No other sells there today like the Jones. The love of new things—the foreign trend—doesn't dislodge the Jones.

It is regarded as the Standard Instrument because of its accuracy. And nobody ever thinks of displacing it. The makers of thousands of American cars are factory-equipping their product this year with the New Jones Speedometer.

They expect their cars to be used the year 'round and they know the Jones ins't affected by temperature. The Jones is the Universal Speedometer. Makers and owners are finding this out. It is accurate, ***always***. The simplest in principle. And the longest-lived.

It's the product of Jos. W. Jones, the inventor of the speedometer as used on motor cars. Nothing else will ever serve like the Jones Speedometer.

Let us send you the man who knows it in detail and can give you the fullest information in regard to placing it on your car.

THE JONES SPEEDOMETER

Broadway at 76th Street NEW YORK CITY

This is the Gold Medal presented to The Jones Speedometer by the Royal Automobile Club of Great Britain and Ireland. Eleven different instruments competed in the test—foreign and American makes. The Jones made the only perfect score on seven points of superiority. And the Jones is the only speedometer that has ever won this medal.

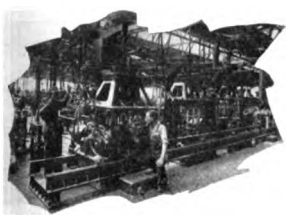
A well lighted factory.

Testing with Scleroscope for proper hardness.



The tool room of the Detroit plant.

Thirty-seven crank shaft dimensions which must be verified.

Special Boring Mill which operates ten cutters.

Drilling ninety-five holes in seven minutes.

Balancing a crank shaft on final test.

The Room of Silence in testing department.

"For Heaven's sake, give me cars," hundreds of dealers will wire frantically.

"We cannot get motors," many manufacturers will be forced to reply.

Continental Motors

The early months of next year will see a time of rush and turmoil in the automobile industry. Makers and dealers are holding back to an unusual degree this fall; and when demands come crowding—say next March—every manufacturer will press with might and main for delivery of parts, as his dealers begin to pour in their specifications.

There will be a shortage in some quarters. There must be.

But not of motors (the most important unit) for any car Continental equipped. Every firm that uses Continental co-operation in the building of its motors, knows to a certainty that its specifications will be carried through on the dot.

Every dealer who handles a car or truck Continental equipped, knows to a certainty that he will not be hampered in his sales campaign because the factory cannot get motors.

Two immense factories, ample resources and an organization intact year after year—these are the safeguards that insure Continental deliveries.

A reputation for service, universal good will, and a motor that is America's Standard—these are the safeguards that insure your sales.

INVADER OIL

WHICH is the best automobile? Which is the best tire?

¶ There is no way of finding out except by trying them all and then exercising your individual preference or caprice.

¶ Which is the best oil?

¶ Neither preference nor caprice enters into this. The best oil is simply the one whose chemical tests show it to be best suited to the mechanical conditions under which it is required to perform its work. Inasmuch as every motor operates within certain inflexible mechanical limits, and inasmuch as every oil possesses certain inflexible chemical tests, the selection of the best oil is merely a question of selecting the one with the best tests. Nothing more.

¶ It is a well-known scientific fact, for instance, that carbon in a motor oil is objectionable, and that the oil with the least carbon will (other things being equal) be the best.

MOTOR WORLD

November 20, 1913

Digitized by Google

¶ *It is an equally well-known scientific fact that t e amount of carbon in an oil is proportionate to the weight or "gravity" of the oil.* The lighter the gravity the less carbon the oil will contain. Even those who are only superficially familiar with these things know that gasoline with a light gravity contains less carbon than gasoline with a heavy gravity.

¶ It is not difficult to find out which of any two oils have the lightest gravity and contains the least carbon. Simply take two samples of oil in glass bottles (Invader oil and any other) and pour the other oil into Invader Oil. The other oil will sink to the bottom.

¶ Avoid the oil which sinks to the bottom---it has the most carbon, and carbon is the thing that causes trouble.

¶ Of the many oils being called to your attention, Invader Oil has the lightest gravity. It contains the least carbon. It is the best because its tests are better.

Territorial agents are in a position to fill orders as promptly and at the same prices as the main office or any branch of the Invader Oil Company

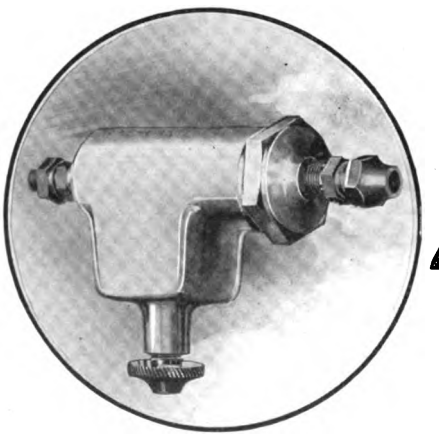
Rockefeller Finds His Own Gasoline Faulty

True to the old saying that no doctor likes to take his own medicine, William G. Rockefeller is finding fault with the gasoline turned out by the Standard Oil Company

According to the people of Greenwich, Conn., Mr. Rockefeller has had a man testing an invention ... gasoline on his motor ... also discovered th... his hom... er of the...



FROM N.Y. AMERICAN NOV. 12, 1913

Commercial Gasolene generally is not very "high test." Even if it were, such impurities as dirt, dust, grit, sediment, water etc., would cause as much carburetor trouble as ever. Carburetors will vaporize gasolene readily until the impurities of fuel cause trouble.

The Ellis Gasolene Purifier

filters out every impurity however small and keeps them away from the carburetor. It even catches water, which gathers in fuel tanks by condensation and mixes with the gasolene. By removing the causes of carburetor trouble the trouble itself must stop.

Every dealer in the country should have a Purifier on his demonstrator to guard against trouble. All your customers should have their cars so equipped. Write for our discounts to dealers. List price of the Purifier, $3.50.

"NOARK" FUSES

For the Protection of Automobile Lighting Systems

"Noark" Fuses offer protection to the various circuits of an automobile lighting system. They protect the lamps, wiring, storage battery, etc., from damage due to excess currents.

"Noark" Automobile Fuses are made with the same care and accuracy as are the larger capacities, recognized for years as the acme of perfection by Street Railway and Central Station Lighting Companies throughout the country.

As "Noark" Fuses always operate without arc or flash, they are especially desirable for the protection of Automobile Lighting Circuits where the emission of flame might possibly ignite gasoline vapors.

With "Noark" Automobile Fuses each lamp or circuit can be individually protected, as "Noark" Fuse Blocks or insulated bases are furnished for one, two, three or more fuses as conditions require.

LEWIS VALVES Toledo

Ask Lewis About Valves

There is one way to do a thing better—that is to specialize on it. Lewis specializes on valves—builds nothing else—and crowds into them 38 years of experience in mechanical engineering.

Lewis Valves are used on America's best motor car engines. A list of them would be a revelation.

For "Proof of the pudding" suppose you write Lewis and find out some of the users. Better still, send your blue-prints and get prices, terms and delivery dates.

COX OXYGEN CARBON CLEANER

Cold Weather Increases Carbon Deposits!

Winter Driving Facilitated

Cold weather calls for thin engine oils. Thin oils frequently cause imperfect or over-lubrication—and it is over-lubrication with incomplete combustion, that produces carbon deposits in cylinders.

Carbon deposits cause a lot of trouble which is hard to trace. You can rarely tell, without dismantling your engine, when it is carbon that is responsible for engine faults. Thus it is decidedly important that cylinders should be cleaned of carbon at regular intervals—to assure maximum of efficiency with minimum of trouble.

And the most ***complete*** and ***thorough*** while ***least expensive*** method for doing this is by use of a

COX OXYGEN CARBON REMOVER

No taking down engine! No half-finished scraping of cylinders and pistons! No tying up the car for a day or more!

The work is done quickly—within from 6 to 10 minutes per cylinder. It is done ***completely.*** The oxygen removes the carbon to the smallest detail and from every nook and corner—***even to the pores of the metal.***

Taxicab, Motor Truck and Large Private Owners will find this a means of not only saving money but also of easily and constantly keeping the cylinders of their cars in excellent condition. For them, one Cox Oxygen Carbon Remover will pay for itself many times over.

GARAGE OWNERS can make it pay a handsome dividend—while doing the work for their customers in much less time and with far better results. Owners can afford and will have you clean their engine cylinders frequently when they know it costs little, takes only a short time and will do the work ***right. The Cox Oxygen Carbon Remover has paid for itself twice over in one week---and can do the same for you.***

Send for full information

An Electric Lighting System at Moderate Cost

Throw away your old-fashioned oil lamps. You can now light your car by electricity—**economically.** No need to install a dynamo or storage battery. Simply equip it with a set of.

JM Mobilite Lamps

These lamps can be operated on dry batteries for one-third as much as standard equipment. They give a light of remarkable brilliance. Used for dash lights, tail lights and for illuminating speedometer and interior of car. Also for motor boats, camps, etc.

Made of vulcanized rubber fitted with a special Tungsten bulb mounted between a powerful lens and reflector. Easily and quickly installed.

Price, $3.00 each. Shipped prepaid from our nearest branch if not at your dealer's.

Write nearest Branch for Booklet

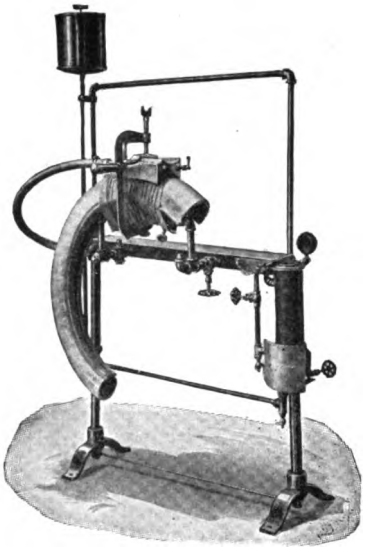
Blow-out repairs that outlast the tire

The only way to make **durable** blow-out repairs **economically** is to reinforce the tire with fabric applied to the inside, fill the hole through the tire with Para gum, then apply heat **both** to the inside and outside. This method avoids cutting away and wasting a lot of expensive tread stock, requires a minimum of fabric and makes a repair that is stronger than the tire. Anyone can use it because the work is all straightforward, requiring no special experience. One set of forms fits all sizes of tires. No extra moulds required.

SHALER Steam Vulcanizer

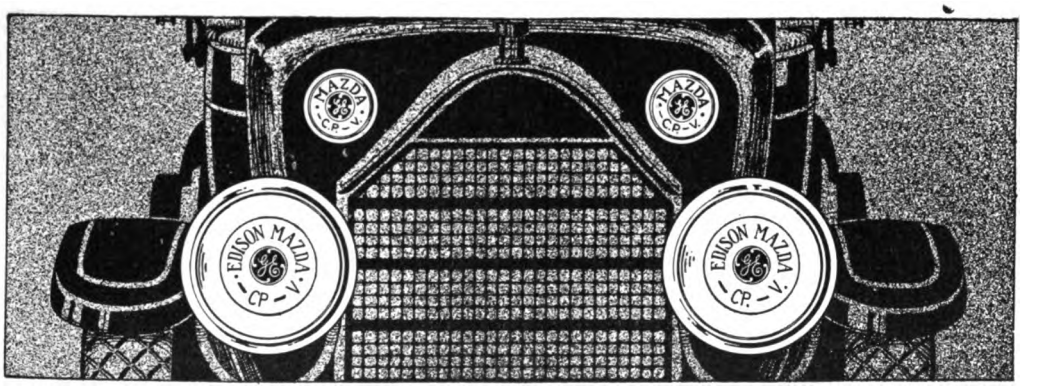
The Shaler is the only steam vulcanizer that permits using the approved wrapped tread method as it is the only one that applies heat to the inside and outside of a tire simultaneously. It makes perfect blow-out repairs.



To make it complete as a garage equipment it is provided with a tube plate 4 x 30 inches that will mend six tubes as quickly as one.

The boiler, a conical copper coil, heated by a powerful gas or gasoline burner, raises steam so quickly that you can profitably heat the Shaler even if you only have a tube puncture to mend.

The essential Shaler feature of a thermostat to hold the temperature at the vulcanizing degree automatically makes it impossible to overheat a tire. Simply light the burner, and steam is raised to the correct pressure and held there indefinitely.



Price of the complete outfit, including all attachments for tube and casing work, $45.

C. A. SHALER CO., 446 Fourth St., Waupun, Wis.

Free—a tire handbook for repairmen

Write today on your letterhead for a copy of "Common Sense About Tire Repairs." It contains a lot of money-making ideas about the most profitable part of the repair business.

All the high grade cars are electrically lighted

The good cars naturally have the highest type of equipment.

Heading the specifications of all the representative cars is "electrically lighted throughout" and the lamps used are invariably **Edison** Mazdas.

Car manufacturers recognize that to maintain sales and prestige, everything about the car, even down to the smallest details, must be *right*.

Whatever lighting system is adopted by car builders, the lamps are nearly always **Edison** Mazdas, because of the successful and continued service they give the car owner.

It is this reliability and the efficient and satisfactory operation, under all conditions that makes the use of **Elison** Mazda Lamps so general.

The thick strong filaments made from drawn wire tungsten are scientifically constructed so that a large volume of light issues from a small area. This concentrated light source enables the parabolic reflectors to give their maximum reflecting power.

Be sure the lamp you buy bear the name Edison.

Why don't you, too, sell

Vitalized Rubber

Diamond Tires

Squeegee Tread

Won't Skid

The Diamond Squeegee Tread is almost human in action.

The outside bars scrape off the grease and slime, the second bars dry the road surface, and the middle bars *grip* and *hold.*

The double thickness Squeegee Tread made of tough, road-resisting Vitalized Rubber insures a good, liberal mileage.

After the Squeegee Bars are worn from long service, there still remains a strong, thick, tough tread made of More Mileage Vitalized Rubber.

Long Wear

All types of Diamond Tires are made of Vitalized Rubber—a process that makes the tire tough enough to fight the road—elastic enough to absorb shocks.

This is one of the reasons why Diamond Tires last longer—because they are built that way.

Honestly Built

Diamond Vitalized Rubber Tires have been put to the severest tests by motorists everywhere and have *made good.*

Built by expert tire builders, assisted by the latest improved machinery, made of fabric and rubber that is of the highest quality obtainable, backed by sixteen years successful tire building, money cannot buy a better tire today than the Diamond.

Selling Satisfaction

You need not hesitate to recommend and sell Diamond Tires. Among all the different tires made, the Diamond stands out prominently as the one that has delivered *maximum* mileage at *minimum* expense—the tire that makes good for everybody everywhere.

Why continue experimenting when you can sell a tire that will *satisfy* and *hold* your trade—Diamond Tires.

Equip with Diamond Tires

Car Buyer: I see you advertise an "electric horn" in your equipment. Is it a Klaxon?

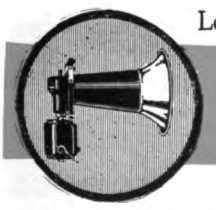
Car Agent: Well—no. But it's just about the same.

Car Buyer: In that case I suppose you would just as soon give me a Klaxon in place of it.

Car Agent: Hardly that. You see this signal comes with the car. If you want a Klaxon you have to buy it separately.

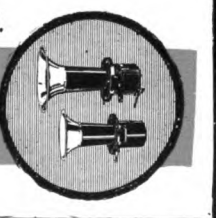
Car Buyer: What kind of a horn is the one on the car?

Car Agent: It's an "electric" horn—I don't know its name.



Car Buyer: That doesn't speak very well for your car maker. If he puts on an unknown, and evidently cheap signal, its a pretty good indication that he will skimp somewhere else in the car. I guess I'll look further.

---



64 car makers—including the makers of practically every high-grade car in America—believe it is a short-sighted policy to lay themselves open to this kind of criticism. They equip with the Klaxon

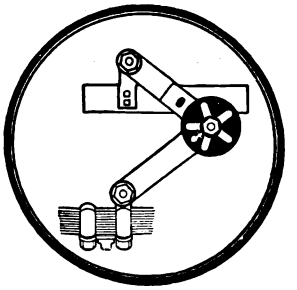
The New Moline-Knight will have Truffault-Hartford Shock Absorbers



Coincident with their determination to build a car embodying the latest type of the famous Knight power plant, the Moline Automobile Company determined that this new car to be known as the "Moline-Knight" should figure as one of the easiest riding cars on the market.

Tests were made by the Moline engineers of various types of springs and shock absorber equipment. In the final analysis it was proved that Truffault-Hartford Shock Absorbers used in conjunction with highly flexible springs furnished the ideal suspension.

As President of the Moline organization and an engineer of high standing, W. H. Van Dervoort has always been a warm advocate of Truffault-Hartford Shock Absorbers. And in the great victories scored by the Dreadnought Moline in the Glidden Tours and Chicago Automobile Club races Truffault-Hartfords have taken a prominent part.

The advent of the Moline-Knight for $2400, including as it does the famous Knight sleeve valve motor, would seem little less than phenomenal if it were not for the Moline Company's well-known factory facilities for economical production.

In furnishing Truffault-Hartford Shock Absorbers as standard equipment, the Moline Company becomes the twenty-sixth addition to the long list of leading manufacturers whose entire output is Truffault-Hartford-equipped. Dealers appreciate the importance of this device in selling the "comfort idea." Truffault-Hartfords completely eliminate jolt, jar and vibration, reducing the wear on the tires and increasing the endurance of every car part.

It is fast getting to the point where the car manufacturer who does not equip with the

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer and the Best"

will be an exception. Meantime car buyers will find it much to their advantage to insist upon Truffault-Hartfords. Five models, including the New Automatic, a shock absorber with three separate spring controls, $60 per set of four. Other models, $50, $40, $25 and $15.

Firestone---Your Tire Insurance

THE name which appears on every tire made in our factory is a pledge to the buyer that tire service, comfort, security and economy will be his.

The records achieved by Firestone Tires—in meeting the worst and most varied conditions of the speedway, boulevard, mountain road, desert trail and country highway—give a sense of satisfaction and safety to the user—the peace of mind that an insurance policy affords.

Experience is proving every day that Firestone Non-Skid Tires—because of their greater security, comfort and economy—are the practical tires, not only for the icy ways of winter, but for oiled roads, slippery pavements and rough going at any season; not only for rear wheels, but for front. In fact, the use of Firestone Non-Skid Tires for all seasons and all wheels makes tire insurance doubly good.

This insurance is supported by wrapped tread construction—by a two-cure process that allows the most rigid inspection in making—by an elimination of the defects which cause tire breakdowns—by an open steam vulcanizing process that gives an absolute toughness and wear-resistance to the tread.

Tire quality, tread toughness and the greater thickness of Firestone treads make the insurance value of these tires dependable and real—establish them as the tires of

Most Miles Per Dollar

Firestone character—as shown in materials, construction, knowledge and experience—includes these elements of tire security, comfort, economy and complete service. Every owner of an automobile should begin to enjoy them by starting in upon the use of Firestone Non-Skid Tires now.

WHY

MONOGRAM OIL

Is *Always* Best For *Your* Engine

Pennsylvania CRUDE oil sells in bulk for approximately six cents per gallon.

In the production of our automobile oil—MONOGRAM—only 4½ gallons of it, or 4½ per cent, is obtained from every lot of 100 gallons of Pennsylvania crude.

Therefore it takes over 21 gallons of Pennsylvania crude to make 1 gallon of MONOGRAM.

If there were no by-products, it would COST one dollar and twenty-six cents, plus the cost of refining, to produce one gallon of MONOGRAM OIL.

This 4½ per cent, is the very marrow of the crude with all its remarkable wearing and lubricating qualities and the other 95½ per cent, can only be used for such by-products as gasolene, kerosene, ordinary engine and machine oils, and black oils.

This is one reason why MONOGRAM OIL has been continually successful under that one brand name from the very start of the automobile industry.

Remember this when unscrupulous dealers try to hand you oil that costs them 15 cents a gallon (or less) as a "just as good" substitute for MONOGRAM at the SAME price for which MONOGRAM can be purchased.

Vol. XXXVII New York, U. S. A., Thursday, November 27, 1913 No. 10

POPE REORGANIZERS WAIT NAMING OF A 3D RECEIVER

Plans Unsettled Pending Court's Action on Massachusetts Stockholders' Request—Meanwhile, However, President Pope Steps Out.

Plans for the reorganization of the Pope Mfg. Co. are temporarily "in the air," pending the appointment of a third receiver to work with Col. George Pope and Charles A. Morss; the appointment probably will be made next week when the matter comes before the Federal Court in Boston.

The third man will be selected in response to the insistent demand of the Massachusetts stockholders' protective committee, which, having acquired control of proxies representing more than 50 per cent. of the Pope capital stock, is in position to make its influence felt.

It is probable that Charles A. Persons, a manufacturer of bicycle saddles in Worcester, Mass., will be named as the associate of Receivers Pope and Morss. His name was suggested when the protective committee made its first application for three receivers, at which time, however, Judge Aldrich named but two.

The Massachusetts stockholders already have gained one of the points which they sought—that is, the elimination of Albert A. Pope from the affairs of the company. While still retaining the nominal title of President, he has relinquished the duties and last week retired from active work, following, it is reported, a curtailment of his salary.

While the automobile factory in Hartford, Conn., is still being operated, the Massachusetts stockholders also succedeed in having all of the Pope bicycle and motorcycle departments concentrated in the factory at Westfield, Mass. The latter has been devoted wholly to the production of the two-wheelers, but the sales, credit and accounting departments had all remained in Hartford until this week, when they were transferred to Westfield. It is believed that this change in itself will effect economies.

Whether the manufacture of Pope automobiles will be continued is still an open question, but in the present state of the money market the chances are against it.

DISCO PLACES ITSELF IN HANDS OF RECEIVER.

Preceded by a few low rumbles, the Disco Co., of Detroit, maker of the widely known electric starter of that name, has gone into a voluntary receivership in order to protect itself and its creditors. The Security Trust Co, of Detroit, is acting as trustee. The assets are in excess of liabilities and, for the time being at least, factory operations will be continued.

To the Disco Co. really belongs the credit of giving impetus to the engine starter movement in this country. Its first device was a gas starter, which attained such a measure of popularity that the attention of the whole trade was attracted. In due course, however, the electric starter practically supplanted it, and after delaying slightly too long the Disco people brought out a system of that type.

McFarlan Adopts Gray Pneumatic Shifter.

Marking the first formal adoption of the Gray pneumatic gear shifting and engine starting system by any manufacturer, the McFarlan Motor Co., of Connersville, Ind., has let it be known that henceforth its six-cylinder model will carry this apparatus as standard equipment but at a slight increase in price over stock models. The Gray system, in its simplest aspect, consists of a small compressor which is driven by the engine, a compressed air reservoir and the gear shifting mechanism, which operates by selection through a quadrant on the steering wheel and plungers working in cylinders, the plungers being attached to the sliding gears. In operation, the desired gear is marked by the steering gear indicator and the shifting operation completed by depressing the clutch pedal.

TIRE PRICES GO DOWNWARD; REDUCTION OF 18 PER CENT

Following Guarantees to Dealers and a Firestone Notification, Goodrich Takes Action—Causes of the Reduction.

After some little fencing on the part of several of the more prominent manufacturers, the expected reduction in the price of tires was made a reality by the B. F. Goodrich Co., and its subsidiary, the Diamond Rubber Co., on Monday last, 24th inst. It amounts to 18.29 per cent. on plain tread casings and 10 per cent. on tubes, the discounts for preferred dealers also being increased 5 per cent.

Taking the most popular size, 34 x 4, as a basis, the new prices and the old work out as follows:

	Old price.	New price.
Casings	$29.80	$24.35
Tubes	5.65	4.90

None of the other tire manufacturers have yet announced reductions, but the announcements are due at any moment and will almost surely make their appearance before the end of the present week. That they will at least meet the Goodrich-Diamond quotations is certain.

While the Goodrich-Diamond figures were not announced until Monday, and so far as users are concerned will apply only from that date, they are retroactive to November 1st, so far as the trade is involved. Rebates will be made on all trade purchases made on and after that date.

For all of three months, and particularly since the passage of the Underwood tariff bill, and as was predicted in Motor World of September 25th, reductions in the prices of tires have been looked for. Indeed, reports to that effect were so persistent that on October 29th last the B. F. Goodrich Co. issued a notice of its intention to protect dealers against shrinkage in the value

Digitized by Google

of goods purchased on and after November 1st, this notification being made to "relieve the trade of anxiety and permit dealers to safely continue their stocks in a condition to supply their customers' requirements."

The United States Tire Co. and the Goodyear Tire & Rubber Co. promptly followed with similar assurances to the trade, but it was not until several days later, when the Firestone Tire & Rubber Co., whose prices always have ruled slightly higher than the others, not only assured protection but gave notice of its positive intention to reduce prices, that the forthcoming reduction was made a certainty. At that time, however, Firestone gave no figures.

Declaring that its intention had been "distorted and the situation rendered more unsettled," the Goodrich-Diamond interests then took the bull by the horns and announced its new list.

What will be the effect of the lower prices cannot be foretold, but one man uncommonly well informed predicts that it will play havoc with cut-price dealers and with those who have on hand large stocks of seconds and unguaranteed goods.

In forecasting its reduction, the exact extent of which is expected to be made public daily, the Firestone people stated that it would be based on the lower price of crude rubber, which, after reaching the unprecedented price of $3 per pound in 1910, steadily declined until, in February of this year, it fell below the dollar mark and on Monday last best Para was quoted at 75 cents. The reduction in the duty on tire ingredients and other essentials affected by the Underwood tariff has also exercised a downward influence.

Fischer Loses Out in Higher Court.

Charles Fischer, who holds a patent on a flexible shaft, probably doesn't attach much value to it now; he sued the Automobile Supply Mfg. Co., of Brooklyn, N. Y., for infringing it and the United States District Court for the Eastern District of New York threw the case out of court and last week the United States Circuit Court of Appeals, sitting in New York City, said the District Court did the right thing. Fischer's patent is No. 969,660 and was granted September 6, 1910, to Franz Schmidt and Albert Grundmann, of Berlin, Germany. It covers a shaft wherein coiled wire is covered by a coiled strip which fits into the depressions between the coils.

Bantam Bearings Opens Office in Detroit.

The Bantam Anti-Friction Co., of Bantam, Conn., has opened an office in Detroit in the Dime Savings Bank Building. It is in charge of J. W. Hill.

"LOOSE" CONTRACT LIKELY TO BE NO CONTRACT AT ALL

Dealer Made Deposit but Took No Cars, Yet Court Gave Him Money Back—Supposed Contract Declared Only an Option.

Builders or distributers of automobiles who establish contractual relations with a dealer or subdealer would do well to be sure they have prepared a good, binding contract, according to a suit which is now approaching argument in the Appellate Division of the New York Supreme Court, Second Department; thus far the case has gone against the manufacturer, who has been ordered to return the full amount of the deposit made by the dealer or salesman. The court made plain that a little legal advice before action would have saved a lot of trouble.

The action was brought by Charles W. Shaffer against Vandewater & Co., which now is the manufacturer of Correja cars; he had entered into an agreement with the Correja Motor Co. to sell 20 cars, and deposited $500 on the agreement. He ordered one car and then not only refused to take even that one, but demanded his money back. The Municipal Court of New York City, Judge Wells presiding, held that the contract wasn't a contract at all, but was nothing more than an option, whereupon he directed that Schaffer be returned all of the $500.

Judge Wells stated preliminarily that all ambiguities in a written contract are properly construed against the party who prepared the contract, which in this case was the Correja company, which later assigned the contract to Vandewater & Co. In his discussion of the form and validity of the agreement he said: "It is obvious that this agreement was a mere option granted the plaintiff by the Correja Motor Co. to purchase during one year 20 Correja runabout cars. This option became a binding agreement to purchase and accept and pay for these cars only 'as and when' the plaintiff 'ordered' the cars.

"Under this agreement a deposit of $500 was made by the plaintiff with the Correja company to 'apply as a blanket deposit on the cars ordered' and 'to be returned in full at the end of the season . . . with the understanding that the Correja company might credit against any account past due from the dealer to the company any portion of or all of said deposit not already applied upon the purchase price of any car.'

"The Correja company thus became trustee of these moneys and accountable to plaintiff for the return of the same in full at the end of the season."

Judge Wells touched upon the transfer of the contract by the Correja to the Vandewater company and said that the transfer was in reality a new contract. He also mentioned that the one car Schaffer had ordered was taken back and said, "I think there was a personal and express promise made by defendant to this plaintiff to repay this $500 at the end of the season in full. No part of this deposit appears to have been applied by the Correja company either to any account past due from plaintiff to it or to the purchase price of the car ordered by the plaintiff. In the absence of any such application the full amount was due from the Correja company to the plaintiff at the end of the season. Instead of this the Correja company elected to rescind the purchase and claimed damages for the breach.

"No assignment of this claim for damages accruing to the Correja company was made to defendant by the Correja company. It follows that defendant is not entitled to offset these damages, if any, due the Correja company against a recovery against defendant, as there never was any contract other than for the purchase of the one car mentioned, or any promise on part of plaintiff to pay for but that one car he ordered."

Shaffer Quits Cars to Build Engines.

Harry S. Shaffer, secretary and treasurer of the Keeton Motor Co., of Detroit, has resigned those offices and retired from that company to become president of the Shaffer Motor Mfg. Co., of Alexandria, Va. The company will manufacture the Dunham motor, patented by Herman E. Dunham while on the Pacific Coast and later brought to Detroit for experimental purposes. It is claimed that it will not only burn the lowest grade of fuel but will increase efficiency.

Victor L. Emerson, of the Emerson Mfg. Co., of Alexandria, which for years has built engines, chiefly of the marine type, has also become interested in the Dunham invention and it is in the Emerson plant that the Dunham motor will be produced. It is stated that the factory was purchased by Shaffer, who will retain Emerson's services.

Body Builders Sue Metropolitan Dealer.

The New Haven Carriage Co., of New Haven, Conn., which builds bodies for the automobile trade, filed suit this week in the Supreme Court for New York county against S. J. Wise & Co., Touraine and Paige dealer in the metropolitan district; the complaint states that between April 1 and August 22 of this year the Wise company contracted an indebtedness of $2,027.64 on which $2,004.16 remains unpaid.

COURT FAVORS GARAGE ON THREE INSURANCE POINTS

California Judge Says Presence of "Gas" Does not Necessarily Void Policy—Rules on Other Important "Gas" Matters.

"Provisions in an insurance policy are always construed so as to prevent a forfeiture, if the language will reasonably permit such a construction," is established according to the opinions of the California Supreme Court affirming the judgment of Judge Austin in what are known in the insurance world as the four W. J. O'Neill cases. They involved the policy conditions of suspension and non-liability for loss when more than a quart of gasolene is used or kept on the insured premises, which in the case at bar were used in part as an automobile repair-shop.

The decision as involving this point is the first of the California court on appeal and establishes the law as regards insurance policies containing this general condition. Three definite rulings are laid down as the law under policies covering the use and keeping of gasolene, and in view of the popularity of the automobile and the general use and keeping of gasolene in garages and automobile shops are of popular interest. The principles laid down are these:

"Where a policy of insurance against loss by fire allows the insured premises to be used as an automobile repair-shop a printed condition in the policy that the company shall not be liable for loss occurring while more than one quart of gasolene is used or kept on the premises does not exempt the company from liability for loss from fire occurring from the ignition of several gallons of gasolene emptied from the leaking gasolene reservoir of an automobile brought into the shop for the purpose of having the leak repaired as it is to be presumed that the company undertook to insure against all ordinary risks incident to the conduct of such a business.

"Under a clause in the policy forbidding the admission into the insured building of any gasolene other than that contained in the tanks of machines 'permanently or temporarily stabled therein' the policy is not suspended by the presence on the premises at the time of the fire of several other automobiles, each containing more than one quart of gasolene in its reservoir.

"Under the clause in the policy suspending the insurance while more than one quart of gasolene was kept on the premises, the fact that at divers times before the fire considerable quantities of gasolene had been kept therein in addition to that in tanks of machines, and that kept for use in repair work does not void the policy where no such excess was on hand at the time of the fire."

To Produce Hexter's Gas-Electric Truck.

For the purpose of taking over and producing the ingenious gas-electric truck developed by P. K. Hexter, of New York, the Roland Gas-Electric Vehicle Corporation was incorporated this week under the laws of New York, with an authorized capital of $200,000. Roland R. Conklin and Hexter himself are the chief figures in the enterprise, of which Hexter will be general manager.

The new company already has secured a factory at 236-242 Avenue B, New York, in which it is expected 100 vehicles will be produced for the 1914 market. The Hexter truck, in which the ingenious control permits it to be handled even from the sidewalk, was described in detail in Motor World of September 25th last.

L. P. C. Completes its Organization.

The L. P. C. Motor Co., which was organized last month in Racine, Wis., by William Mitchell Lewis, the former president of the Mitchell-Lewis Motor Co., has completed its organization by the election of F. S. Gordon as treasurer. Lewis himself, as was stated at the time the company was formed, is president; Rene M. Petard, vice-president and engineer, and James M. Cram secretary and sales manager. E. B. Hand is general counsel, C. B. Chamberlain purchasing agent, and O. R. Delamater superintendent. The "Lewis Six," as the car which the new company will produce will be styled, will sell for $1,600.

Better Bids for the R. C. H. Property.

For a while it looked as if Harris Bros. Co., of Chicago, would secure the R. C. H. assets in Detroit without serious competition. They raised their original offer of $150,000 for the personal property to $240,000, but as Theodore Friedberg, of New York, and the Lincoln Realty Co., of Detroit, made a bid on a commission basis, which they guaranteed would not be less than $240,000, the trustee has given the Harrises until tomorrow to raise their bid to $255,000, all of which indicates how inadequate was the bid of $135,000 tendered by J. F. Hartz, the R. C. H. president, and his associates, for the entire assets of the company.

Patent Tire Director Demands Loan.

W. T. Wheeler, a director of the Mechanical Rubber Tire Co., of Brooklyn, N. Y., filed judgment this week in the New York county clerk's office for $1,341.88; the amount asked for was for money loaned.

SUPPLYMAN GETS 3 YEARS IN JAIL ON FRAUD CHARGE

President of Kansas City Company Found Guilty of Trying to "Beat" Creditors — Jury Disagrees on Companion's Guilt.

Instead of defrauding his creditors, as it is charged he planned, Harry D. Todd, formerly president of the Auto Specialty Co., of Kansas City, is quite likely to serve three years in jail. He was found guilty last week on five counts on a charge of using the United States mails to defraud, and the judge imposed the three-year term. In addition to the time sentence, Judge Youmans in the Federal court imposed fines aggregating $1,250. Todd, however, has appealed and is at liberty under bond.

Leonard Ullman, another officer of the company, and John T. Fenn, the treasurer, were indicted for the same offense and Todd's conviction is due to the testimony of Fenn, who turned State's evidence. In the case of Ullman the jury failed to agree and it is said he will be tried again. The jury was unable to decide whether Ullman originated the scheme upon which the indictment was based.

The troubles of the specialty concern began, according to witnesses, when Todd, as president, ordered goods from manufacturers and jobbers in various parts of the country when he knew the business was in a failing condition. The amount of goods purchased and never paid for is estimated at between $40,000 and $50,000. When the firm finally went into the hands of a receiver about $2,000 worth of goods was found, it is alleged, hidden in various places about the store of the company. The testimony of Fenn was that it was the intention to get these goods out as soon as the bankruptcy proceedings were settled and sell them. A. J. Martin, United States deputy marshal, who acted as special receiver, testified that he discovered the articles.

Jackson Motor Shaft Adds $50,000.

The Jackson Motor Shaft Co., of Jackson, Mich., has increased its capital stock from $75,000 to $125,000, the increase being represented wholly by preferred stock, approximately $30,000 of which already has been subscribed and paid in. This refinancing gives the company a large margin of working capital and places it on Easy street. At the same time that the semi-reorganization was effected, the following officers were elected: L. C. Bloomfield, president and general manager; Winthrop Withington, vice-president; John L. Allen, treasurer; F. H. Lewis, secretary.

PREST-O-LITE AGAIN DONS WAR PAINT TO MEET AVERY

Milwaukee Man Sued Many Times Before, is Sued Again—Prest-O-Lite Claims He Violates Law in Refilling its Tanks.

Although Percy C. Avery, of Milwaukee, is generally credited with having conceived the Prest-O-Lite plan of storing gas in portable tanks, he isn't a stockholder in the Prest-O-Lite Co. and isn't traveling to fame and fortune on Prest-O-Lite dividends; instead he and the Prest-O-Lite Co. fell out several years ago and ever since then the Indianapolis corporation has periodically haled him to court.

The last attempted haling occurred last week in the United States District Court for the Eastern District of Wisconsin, sitting in Milwaukee, where the Prest-O-Lite Co. asked the court to stop Avery refilling and selling Prest-O-Lite tanks.

Avery appeared in the automobile world about 1902 with his canned gas invention and interested Carl G. Fisher and James A. Allison, who with Avery formed the company and began to turn out tanks under the Claude and Hess patent, No. 664,383, but a few years later Avery and his coworkers fell apart. They claimed he wasn't playing fair with them, and after the dust settled Avery was out of the company with about $33,000 in his pocket, and, soon after, his former partners entered the millionaire class.

Avery next appeared in the trade in Milwaukee, doing business as the Avery Portable Lighting Co. Besides doing business he was charged with making unkind remarks about the Prest-O-Lite people, who proceeded forthwith to file a libel suit, a suit for infringement of the Claude and Hess patent, a suit charging unfair competition in refilling Prest-O-Lite tanks and a suit demanding that Avery bring back a patent on a refilling device which he was charged with having taken when he made his departure from the Prest-O-Lite front door. The Avery Lighting Co., which operated in New York State as a subsidiary of the Milwaukee company, also was sued in the United States District Court in Northern New York.

A checking up of this mass of litigation reveals results in the New York suit, wherein Avery was ordered to stop business, and in the filling device patent case, Avery being ordered to return the patent.

When, several months ago, the Claude and Hess patent was overturned by the courts, Avery formed the Acetylene Gas Co. in Milwaukee, the business being the filling and selling of tanks. The Prest-O-Lite Co. now claims, however, that Avery not only filled and sold his own tanks but refilled and sold Prest-O-Lite tanks, hence the present suit.

Both Avery and the Prest-O-Lite Co. are waiting to hear what Judge Sanborn has to say about it.

Reorganizers to Make Parcel Wagons.

Frank T. Hulswit and his associates who bought the assets of the bankrupt Grand Rapids (Mich.) Motor Truck Co., are organizing a new corporation to operate the plant, which, however, will drop the larger truck produced by the old company. Instead, the reorganizers will manufacture a 15-horsepower 500-pound wagon designed especially for the delivery of small packages. It will be of the moto-kart type with the package receptacle in front and the driver in the rear.

Pelletier Promises Popular-Priced Electric.

E. LeRoy Pelletier, president of the Tiffany Electric Car Co., which purchased the electric vehicle plant of the Flanders Mfg. Co., in Pontiac, Mich., in July last, has let it be known that within 30 days his company will have ready for delivery a $750 two-passenger electric runabout. It will be styled the Tiffany Bijou and, according to Pelletier, the means and facilities to manufacture it in quantities have been assured.

Louisville About to Lose its Crown.

The Crown Motor Co., of Louisville, Ky., is preparing to remove from that city to Hamilton, O. Although organized nearly a year ago with an authorized capital of $500,000, the company has not cut much of a figure in the automobile industry. It is stated, however, that it has orders in hand for 10,000 automobiles for 1914 delivery.

Steenstrup Reenters Trade in Detroit.

Peter Steenstrup, one-time sales manager of the Hyatt Roller Bearing Co., and who also served as secretary of the Motor & Accessory Manufacturers, Inc., has returned from Oregon to again take up his home in Detroit. He will reenter the automobile business in that city, having already acquired control of the Livingston pressed steel wheel.

Monaco Now Claims the Gibson Project.

The Gibson Motor Car Co., which has an office in the Oliver Building in Pittsburgh, and which has been successively reported as being about to locate in Alliance, O., and Rochester, Pa., is now stated to have acquired a factory building in Monaco, Pa.; it is added that the building will be remodeled to suit its purposes.

NEW YORK STATE DEALERS' ASSOCIATION TAKING FORM

Representatives of Five Local Bodies Meet in Albany and Name Committee on Constitution—Organization Probable Dec. 2.

After many attempts, the endeavor to get the automobile dealers of New York State into one organization at last is in a definite way to bear fruit, as a result of the meeting called by the Automobile Dealers' Association of New York City which occurred in Hotel Ten Eyck, Albany, on Thursday last, 20th inst. Two hundred dealers were not present, as stated by one publication, the call which had been issued not being of a general nature and having been extended only to local organizations and not to individuals. Five local bodies, however, were represented — New York City, Buffalo, Rochester, Syracuse and Albany—and assurances of support from several absent organizations were also received.

The body, which will assume working shape at a meeting in Albany on Tuesday next, 2nd prox., will undoubtedly be styled the New York State Automobile Dealers' Association and will have headquarters in Hotel Woodward, New York City, where the New York City organization maintains an office.

Until the committee which is drafting the constitution and by-laws reports on Tuesday next, the exact form of government will not be known, but it is believed that the dues will be purely nominal, probably not more than $5 per annum. The committee entrusted with that work consists of R. H. Johnston, of New York, chairman; R. E. Brown of Buffalo, Wm. Berry of Rochester, C. D. Hakes of Albany, and E. Lascaris of the Importers' Automobile League.

Those present at the initial meeting on the 20th were as follows: New York Association—A. M. Day, R. H. Johnston, John F. Plummer and Charles A. Stewart; Buffalo—R. E. Brown, S. C. Miller and C. F Monroe; Rochester—William Berry, Thos. Northway and A. M. Zimbrick; Syracuse—George H. Harris; Albany—C. D. Hakes, E. V. Stratton, Westcott Burlington and M. Lansing.

Christie May Quit Hoboken for Erie.

The Christie Front Drive Truck Co., which started business in Hoboken, N. J., about a year ago, is now negotiating for a factory in Erie, Pa. The company builds fire apparatus and commercial vehicles employing the Christy front wheel drive, but has never manufactured very many of them.

The Week's Incorporations

Staunton, Va.—Falcon Cycle Car Co., under Virginia laws; authorized capital, $150,000; to manufacture cyclecars.

Jarkson, Mirh.—Standard Car Mfg. Co., under Michigan laws; authorized capital, $85,000; to manufacture motor vehicles.

Cleveland, O.—Foster-Birdsall Motor Car Co., under Ohio laws; authorized capital, $10,000. Corporators—C. R. Foster, F. W. Frey and J. G. Weil.

Buffalo, N. Y.—Motor Carette Co., under New York laws; authorized capital, $30,000. Corporators—Henry J. Carrigan, Charles J. Kern and A. M. Pearsall, all of Buffalo.

Chicago, Ill.—Robert M. Cutting Co., under Illinois laws; authorized capital, $10,000; to deal in motor cars. Corporators—Frank P. Page, L. M. O'Connor and James E. Hauronic.

Everitt, Wash.—Coast Four Wheel Drive Auto Co., under Washington laws; authorized capital, $10,000. Corporators—E. J. Kennedy, L. A. Frazier, M. A. Kennedy and C. R. Frazier.

Newcastle, Ind.—Goodwin-Gallivan Motor Co., under Indiana laws; authorized capital, $10,000; to retail motor cars. Corporators—William M. and John C. Goodwin and James P. Gallivan.

Walterboro, S. C.—Walterboro Garage Co., under South Carolina laws; to deal in motor cars and conduct a repair business. Corporators—R. H. Wichman, A. H. Wichman and P. J. Lucas.

Ottawa, Ill.—S. G. Gay Co., under Illinois laws; authorized capital, $200,000; to manufacture auto trucks. Corporators—S. G. Gay, L. W. Nichols and Chester T. Bangs, all of Ottawa.

Concord, N. C.—Cabarrus Motor Co., under North Carolina laws; authorized capital, $10,000; to conduct a general motcr vehicle business. Corporators—Parks Lafferty, Joe McCanless and others.

Florence, S. C.—Covington Co., under South Carolina laws; authorized capital, $15,000; to conduct a general motor vehicle business. Corporators—Frank J. Brand, of Spartansburg, and others.

Tiffin, O.—N. J. Cochrel Service Co., under Ohio laws; authorized capital, $10,000; to conduct an automobile service. Corporators—N. J. Cochrel, E. E. McNorris, M. L. Cleveland and James D. Watson.

Everitt, Wash.—Pacific Electric & Automobile Co., under Washington laws; authorized capital, $7,500; to deal in motor cars. Corporators—J. F. Reardon, F. D. Stockbridge and W. F. Knowles.

San Antonio, Tex.—Automobile Club of San Antonio, under Texas laws; authorized capital, $8,000. Corporators—W. A. Herring, Emil Frank, H. G. Staacke, Dr. Frederick Fielding and John B. Carrington.

Buffalo, N. Y.—Clement Motor Sales Co., under New York laws; authorized capital, $50,000. Corporators—William J. Clemens, 1413 Main street; John G. Lesswing, and R. B. Metro, both of 719 White Building.

Cleveland, O.—Quick Action Spring Repair Co., under Ohio laws; authorized capital, $15,000; to repair automobile springs. Corporators—Henry Wavro, G. H. Murchian, L. T. Jones, S. S. Levy and Fred Zumpft.

Kalamazoo, Mich.—Kalamazoo Auto Dealers' Association, under Michigan laws; to give speed exhibitions. Corporators—G. A. Coates, G. E. Bolye, L. A. Kraft, H. A. Wothington, Leo T. Flansburg and Harry A. Scott.

Waterloo, Ia.—Burd Auto & Supply Co., under Iowa laws; authorized capital, $15,000; to deal in motor cars and accessories. Corporators—Charles Burd, Waterloo; A. F. Burd, Grundy Center; Lizzie E. Burd, Waterloo.

Aberdeen, S. Dak.—Kerosene Karburetter Kompany, under South Dakota laws; authorized capital, $500,000. Corporators—W. B. McLaughlin, J. S. Tilney, George J. Hinds and Edward M. Skinner, of New York; H. G. Fuller, of Pierre.

New York, N. Y.—Merchants' Motors Sales Co., under New York laws; authorized capital, $120,000; to conduct a general motor vehicle business. Corporators—Bela Cukor, Henry V. Radonitz and Charles J. Quinn, all of 245 West 53rd street.

Louisville, Ky.—Louisville Automobile Light Controlling Co., under Kentucky laws; authorized capital, $10,000; to manufacture headlights. Corporators—James C. Stone and J. G. Harris, of Louisville; E. D. Lake and N. G. Marks, of Springfield.

Milwaukee, Wis.—Wisconsin State Rubber Co., under Wisconsin laws; authorized capital, $10,000; to establish a general rubber goods business and handle tires and accessories. Corporators—Harold D. Detienne, Mrs. Detienne and Mrs. Wallis.

New York, N. Y.—Lork Robe-Rail Co., under New York laws; authorized rapital, $5,000; to manufacture and deal in motor car accessories. Corporators—Clinton W. Crow and Willard J. Crichton, both of Rye; Reuben W. Johnson, Monmouth Beach, N. J.

New York, N. Y.—Paige-Detroit Co. of New York, under New York laws; authorized capital, $50,000; to deal in motor cars, etc. Corporators—Edward M. Dalley, Larchmont; S. J. Wise, 250 West 91st street; Fred W. Kolb, 766 Ocean avenue, Brooklyn.

Hammondsport, N. Y.—J. A. Osborne Mfg. Co., under New York laws; authorized capital, $5,000; to manufacture tandem attachments for motorcycles, etc. Corporators—John A. Osborne, Olive Osborne and J. Walter Pattison, all of Hammondsport.

Vermillion, S. D.—Vaughan-Harris Co., under South Dakota laws; authorized capital, $25,000; to manufacture the Radius Truss rod for use on motor cars and other vehicles. Corporators—M. A. Vaughan, R. E. Vaughan and George O. Harris ,all of Vermillion.

New York, N. Y.—Auto-Ped Co., under Delaware laws; authorized capital, $1,000,000; to manufacture, sell and deal in and with cars, carriages, boats and motor vehicles of all kinds. Corporators—Joseph F. Curtin and Clarence E. Eaton, both of New York City.

Bronx, N. Y.—Pneufiller Tire Co., under New York laws; authorized rapital, $1,000; to engage in a general tire business. Corporators—Frank Eden, 315 East 84th street, New York City; Harry L. Hill, 1337 Clinton avenue; Max Monfried, 299 Broadway, New York City.

New York, N. Y.—Golde Patent Mfg. Co., under New York laws; authorized capital, $200,000; to manufacture automobile supplies and accessories. Corporators—Hannah L. Geller, 846 Kelly street; Bernard C. McKenna and Nathaniel M. Kaplan, both of 149 Broadway, N. Y.

Bronx, N. Y.—Mott Haven Garage Co., under New York laws; authorized capital, $1,000; to operate a garage. Corporators

—Frederick J. Hinners and Katherine Hinners, both of 585 East 135th street, New York City; John P. Indorf, 160 St. Ann's avenue, New York City.

Auburn, N. Y.—McIntosh & Seymour Corporation, under New York laws; authorized capital, $2,200,000; to manufacture Diesel engines, etc. Corporators—Edwin S. Church, Franklin B. Kirkbridge, 55 Wall street, N. Y.; Philip W. Henry, 25 Broad street, New York.

Queens, N. Y.—G. Piel & Co., under New York laws; authorized capital, $100,000; to manufacture motors, engines, etc. Corporators—Gottfried Piel, 150 Riverside Drive, New York; Cornelius S. Pinkney, 716 Madison avenue, New York; Harry O. Robinson, 5000 Broadway, New York.

New York, N. Y.—United States Auto Rim Co., under New York laws; authorized capital, $50,000; to manufacture automobile rims, sundries, etc. Corporators—Christian W. Schildwachter, 45 West 127th street; Augustus Linden, 1883 Park avenue; Philip S. Smith, 1777 Broadway.

New York, N. Y.—Patent Rubber Co., under New York laws; authorized capital, $50,000; to manufacture tires and rubber goods. Corporators—William N. Croxton, 1123 Broadway; J. George Metz, 4286 Park avenue; Charles L. Brookheim, Riverview Manor, Hastings-on-Hudson, N. Y.

Parkersburg, W. Va.—Market Garage, under West Virginia laws; authorized capital, $25,000; to operate a garage and deal in motor cars and supplies. Corporators—E. McCoy, Norma V. McCoy, O. D. Strader, Carrie R. Strader, J. H. Knapp and Florrie Knapp, all of Parkersbirg.

Morgantown, W. Va.—Roberts Gas or Gasolene Engine & Car Co., under West Virginia laws; authorized capital, $150,000. Corporators—J. M. Roberts, Pittsburgh, Pa.; Leopold Sigwart and Frank Sigwart, of Morgantown; H. P. Keenan, Fairmont, W. Va.; Eugene Sommerville, Grafton, W. Va.

New York, N. Y.—H. Scott Johnston Co., under New York laws; authorized capital, $3,000; to deal in motor cars. Corporators—H. Scott Johnston, 35 Caroline avenue, Yonkers; William A. Hall, 15 Fort Washington avenue, New York City; Adolph Kornblum, 188 St. Nicholas avenue, New York City.

Pittsburgh, Pa.—Artillery Automobile Tire Protector Co., under Delaware laws; authorized capital, $100,000; to manufacture, sell and deal in automobile tires. Corporators—John C. Willington and H. C. May, of Pittsburgh; George A. Pestel, McKeesport; A. J. Coppock, Indianapolis, Ind.; Clarence J. Jacobs, Wilmington, Del.

LAUNCH $2,000,000 DIESEL ENGINE COMPANY IN AUBURN

Steam Engine Plant in New York State to Be Utilized by McIntosh & Seymour Corporation—Will Use Swedish License.

The Diesel engine, which "fires" through heat generated by compression and which is extensively used in ships, is to be manufactured in America by a corporation which was formed this week for that purpose—the McIntosh & Seymour Corporation. While this company's immediate plans include only the manufacture of stationary and marine types, the possibilities of the motor for automobile use have not been overlooked.

The new corporation will take over the McIntosh & Seymour Co., of Auburn, N. Y., a steam engine builder, and will operate in that company's factory; the steam engine manufacture will not be discontinued. The company is to operate under a license from the Swedish Diesel Motor Co., of Sweden, whose motors are built after a system developed by its chief engineer, Jonas E. Hesselman, and known by his name.

The company is incorporated at $2,200,000 and is backed by Frank A. Vanderlip, president of the National City Bank, of New York City; Thatcher M. Brown, of Brown Bros. & Co., New York bankers, and Marcus Wallenberg, president of Stockholm's Enskilda Bank, of Stockholm, Sweden.

Besides these, there are interested in the company Edwin S. Church, former head of the Akron plant of the International Harvester Co.; J. A. Semour, of Auburn, N. Y.; Franklin B. Kirkbride, of New York City; Oscar Lamm, of Stockholm; Philip W. Henry, of New York City, and W. M. Coleman, also of New York City, who is general counsel. French will be president of the company and Seymour, who now heads the Auburn company, will be vice-president and in charge of engineering work.

The motor was invented by Dr. Dudolph Diesel, who recently was drowned while crossing the North Sea. The Busch-Sulzer Bros. Diesel Engine Co., of St. Louis, was formed several years ago to make Diesel engines in America, but it is said that the licenses of this and the new corporation in no wise conflict. However, the Busch-Sulzer company declined to discuss the matter.

Figures That Should Check Pessimism.

While companies whose stock is listed on exchanges or traded in on curbs periodically make public approximate figures disclosing the volume of their business, the Moon Motor Car Co., of St. Louis, is one of the few which has permitted a real insight into the extent of its transactions of the last three months, which figures should serve to give pause to the pessimism which prevails in some quarters. They show an increase during the months of August, September and October of 52 per cent.

Shipments of Moon cars in October alone were 96.01 per cent. in excess of the record for October, 1912. The figures as disclosed by Vice-President McDonald, are as follows:

The total shipments for October, 1913, were $89,414.05, as against $47,612.58 in October, 1912, a gain of $41,801.47. The total shipments for the three months, August, September and October this year, were $190,451.69, as against $125,328.95, the total shipments for the same period last year, a gain of $65,122.74.

Briggs-Detroiter Earned 40 per Cent.

Orders for twice as many cars as were in hand at the same time last year were reported at the annual meeting of the Briggs-Detroiter Co., which occurred in Detroit last week. While the profits of the company are not definitely given, it is stated that they amounted to more than 40 per cent. of the company's capitalization. At the meeting all of the incumbent officers were reelected, as follows: C. S. Briggs, president; John A Doyle, vice-president; Emil D. Moessner, secretary and treasurer.

Monsieur Briscoe Again Visits America.

Benjamin Briscoe, of Briscoe Bros., of Paris, and former president of the United States Motor Co., is again in this country for a long visit. While his transactions largely will have to do with the marketing of his new Briscoe light car and Ajax cyclecar in the United States, Briscoe himself refuses to talk about his plans. His family came over with him and will make an indefinite stay.

Hood Rubber Adds Another Million.

The Hood Rubber Co., of Boston, which, among other things, produces Hood-Shawmut tires, has increased its capital stock from $2,500,000 to $3,500,000. The increase is represented wholly by preferred shares which the directors have been authorized to issue as needed but at not less than par value.

Sandusky's Assets and Debts Nearly Equal.

Schedules in bankruptcy filed last week by the Sandusky Auto Parts & Motor Truck Co., of Sandusky, O., which was brought down by the failure of the Michigan Buggy Co., of Kalamazoo, show a slight excess of assets over liabilities. The former total $310,305.45 and the liabilities $308,035.23.

In the RETAIL WORLD

The Van Motor Co., of Poughkeepsie, N .Y., which has a branch in Newburgh, N. Y., has taken over the business of the Mogul Auto Co. in the latter town; the Van company, whose Newburgh manager is Malcolm E. Perrott, has moved its branch from the Fowler building in Chambers street to the Mogul location at 117 Broadway. The Mogul company was formed three years ago and in that time is said to have handled $200,000 worth of new and used cars. Its heaviest stockholder, William H. Walker, of New Windsor, N. Y., recently opened a brokerage business in New York City and its manager, Joseph Judge, entered business for himself.

J. W. Atwood has been elected president of the Buick Automobile Co., of Dallas, Tex., to succeed F. W. A. Vesper, who several months since resigned to become sales manager of the parent company in Flint, Mich. The other officers of the Dallas corporation are E. O. Tenison, vice-president; L. F. Ohland, treasurer; Britt Webb, secretary.

Joseph Judge, who served with the Pope company since the bicycle days and who for the last three years has been manager of the Mogul Auto Co. in Newburgh, N. Y., has entered the trade for himself; he has secured the distribution of Ford and Reo cars in Rockland county and will maintain headquarters in Spring Valley and a branch establishment in Haverstraw.

C. A. Norton has sold the Buick Garage, at 135-37 Farmers avenue, Kalamazoo, Mich., to G. J. Coffey and R. A. Coffey; G. J. Coffey formerly was connected with the William Locher Sporting Goods Store, and R. A. Coffey formerly was with the Buckley-Kalamazoo Foundry & Machine Co.

The Iowa Motor Sales Co. has been formed in Des Moines, Ia., to act as distributer of Velie cars in Central Iowa; N. A. Cruzan, who previously has been a dealer, is manager of the new company, which has located at 909 Walnut street.

W. H. Drinkern, of Beloit, Kan., has purchased a partially completed garage which was started by W. H. Knarr and on which work was stopped by Knarr's death; when the building is completed it will be occupied by W. C. Brown.

Plynn Lyman, of Greenville, Mich., has purchased a half interest in the implement and vehicle business of Chris Hansen; the firm style will be Hansen & Lyman and trucks and cars will be added to the company's stock.

C. E. Tait, formerly of Concord township, Ohio, has entered the trade in Springfield, in the same State; he has purchased the Motorfix, on West Water street, and will operate it under the style Auto Inn.

John A. Dowsett, of Oneonta, N. Y., has sold his blacksmith-shop on Market street to Andrew J. and I. Jay Bookout; they have leased it to A. E. Oliver, who has opened up as a garageman and repairman.

J. M. Weaver, who has been connected with the trade in Utica, N. Y., for some time, has formed the National Stubs Motor Sales Co. in Syracuse; he has located at 698 South Salina street.

Elmer Salzmann has taken over the interests of his partner, John Harms, in the garage firm of Harms & Salzmann, in Highland, Wis. Harms contemplates entering the trade on his own account, both as a garageman and dealer.

Sidney Raymond, of North Crandon, Wis., has purchased the Carter Bros. Garage in Crandon, in the same State; he also has secured additional real estate and will enlarge the building.

Torrence & Wilcox, formerly of Jackson, Mich., have secured control of the Hayner Bros. Garage in Mason, in the same State; they have removed with their families from Jackson to Mason.

Fred Fiske has sold his interest in the Grand Traverse Auto Co., of Traverse City, Mich., to O. A. Thompson; Thompson and the other owner, M. D. Bryant, will continue the business.

The Queen City Garage & Repair Co. has succeeded to the business of the Model Garage in Cincinnati, O.; it is located at 21 East 9th street. L. W. Ross is manager of the new company.

Charles Krull and F. A. Stegeman, formerly of Hope, Kan., have opened a garage in Bakersfield, Cal., at 1020 19th street; they also will handle Maxwell cars in Kern county.

Joseph H. Schroeder, of St. Louis, has been granted permission to operate a garage; he will locate in a one-story brick building at 1110-20 North 12th street.

Peters & Gresslin, garagemen and dealers in Ackley, Ia., have dissolved partnership; Gresslin has sold his interest to Peters, who will continue the business.

Charles Bayart has entered the garage trade in New York City on West 66th street; formerly he was connected with the Renault Selling Branch, Inc.

E. G. Kading, of Adair, Mo., has purchased the Cushman Garage; he will continue the business with Claude O. Dutro, of Gorin, Mo., as a partner.

Charles Hathorn, of Mason City, Ia., has disposed of his interest in the Hathorn Garage to his brother, W. H. Hathorn; it is located on 5th street.

George and Perry Ashcraft, of Medford, Ore., have formed a partnership and have taken over the Medford Garage; they will continue the business.

T. J. Walton has opened a repair-shop in St. Louis, Mo., at 2007 Locust street; he formerly was superintendent of the police department's garage.

C. R. Yanington, formerly of Centralia, Mo., plans to enter the garage trade in Stockdale, Tex. He will locate in the V. R. Knox building.

F. F. Chesak, Fred Lonsdorf and Frank Hubing have formed the Athens (Wis.) Automobile Co. They plan to erect a garage, 40 x 68 feet.

William F. Baker, of Milford, Mass., has formed a company and will open a garage; a building costing $10,000 will be erected on School street.

Clifford Cadron is about to open a repair-shop in De Witt, Ia. He has leased a new building located at the rear of the Emmert Garage.

Albert Downing, formerly of Ann Arbor, Mich., and George C. Rolfe, formerly of Apthorp, N. H., plan to open a garage in Littleton, N. H.

W. H. Murphy is building a garage, 36 x 70 feet, in Fox Lake, Wis.; when it is completed he will operate it and will handle two lines of cars.

F. W. Moore, of Floresville, Tex., has sold his garage to S. V. Houston. J. H.

Digitized by Google

Mayes has purchased Moore's automobile agency.

Charles Thompson and Jesse Brenner are about to open a garage in Ferndale, Cal. The equipment will include a vulcanizing plant.

L. M. Neher has purchased the Warsaw (O.) Auto Co.'s garage; he also owns and operates a garage in Milford, in the same State.

J. R. Atwood and Charles Jackson have entered the trade in Nevinville, Ia. They will operate under the style Atwood Motor Co.

B. E. Bauer has retired from the Elroy (Wis.) Garage & Machine Works; R. E. Gibbens is now sole owner of the business.

A. P. & L. A. Yorton have opened salesrooms and a repair-shop in Three Rivers, Mich. They are located at 125 Main street.

Jules Gerard, of Green Bay, Wis., has sold his garage and agency to the Green Bay Motor Car Co. He handled Cadillacs.

The Hazelton (Pa.) Vulcanizing Works has been purchased by Vith Bros., of West Hazelton; they will operate the business.

Alexander Goldberg, of Germantown, Pa., has taken over the Rittenhouse Garage; it is located at 216 West Rittenhouse street.

George A. Herring, of Kearney, Neb., has taken over the Kearney Automobile Co. Possession was given immediately.

The Pioneer Garage, in Newman, Cal., has been purchased by Sidney Bell, of Crows' Landing, in the same State.

H. E. McCrea has purchased an interest in the Circle City Garage Co., of Corona, Cal. He will manage the business.

R. P. Ewing, of Spencer, Ia., has sold his garage to William Peterson, formerly of Hartley, in the same State.

C. F. and C. B. Rizer have entered the trade in Olar, S. C. They will sell cars and accessories.

Martin & Hodgin, of Winchester, Ky., have secured a site and will erect a garage and repair-shop.

Hiram Weaver has entered the trade in Rutland, Vt. He has the Ford and Buick agencies.

E. W. Preston has opened a garage in Campbell, Cal. It is located on Campbell avenue.

Theodore Baer has opened a garage in Peekskill, N. Y. It is located on Highland avenue.

H. D. Gorby has opened a garage in Pasadena, Cal. It is located at 29 South Lake avenue.

Charles Kim, of Taft, Cal., plans to open a garage in Bakersfield, in the same State.

The garage of Toburen Bros., in Champaign, Ill., has been sold to Christy Bros.

DURKEE SAYS THAT PYRENE DID NOT TREAT HIM RIGHT

Claims Fire Extinguisher Maker Broke Contract—Demands $11,000, Part on an Old Deal—How Distributer Figures the Total.

Despite the fact that Joseph W. Durkee, of Brooklyn, was empowered to sell Pyrene fire extinguishers in the whole United States with the exception of one or two comparatively small sections and had unlimited maritime selling rights. he does not appear to have enjoyed the most amiable relations with this manufacturer; at any rate, he has filed suit in the United States District Court for the Southern District of New York against the Pyrene Mfg. Co., of New York City, asking damages of $11,-288.10.

Durkee and the Pyrene company have had differences before. Some time ago the company claimed he was infringing a patent under which the extinguishers are manufactured and suit was instituted against him in the Federal court; this, however, was settled. By the terms of settlement Durkee was to receive $2,500 in cash and $2,500 through an extra 10 per cent. which he was to receive in addition to a regular percentage as a distributer of the company's product.

The selling contract held by Durkee provided renewal terms and the contract was once renewed. When it came time to renew again, however, a hitch developed and both sides claimed a grievance. The company claimed he should have renewed and Durkee claimed certain actions of the company made it impossible or inadvisable for him again to take up the selling rights.

When it seemed impossible to effect a settlement Durkee filed his suit; $10,000 of the amount he asks is for damages alleged to have been sustained through the Pyrene company's acts. The remaining $1,-288.10 he claims is part of the second $2,500, which he has not yet secured through the extra 10 per cent. commission.

Minor Business Troubles.

Wallace S. Todd, trading as Todd & Todd, automobile repairers, at 234 West 108th street, New York City, has assigned for the benefit of his creditors; the assignee is David L. Ostro.

Frank Calcarco, who operated an automobile transportation line between Waterloo and Seneca Falls and Cayuga Lake park, N. Y., has been declared a bankrupt; his creditors will hold their first meeting November 29.

A petition in bankruptcy has been filed against Charles E. Ball, Inc., a supply dealer in Newark, N. J., at 283 Halsey street; the petitioner was George Furst, representing the Hartford Suspension Co. Liabilities are $4,000 and assets $1,221.

The garage of the Reimers Motor Car Co., of Louisville, Ky., has been sold by a referee in bankruptcy to Rommel Bros. for $10,200, which is approximately the amount of a mortgage held against the company's property by the bidder. The company operated at Baxter street and Broadway.

Changes Among Prominent Tradesmen.

E. S. Jordan, former advertising manager of the Thomas B. Jeffery Co., of Kenosha, Wis., has been promoted to the post of general sales manager to fill the vacancy caused by the resignation of Harry E. Field. H. C. Hill will be his right-hand man, with the title of assistant general sales manager.

Edward A. Cassidy, formerly of Petry-Cassidy, Inc., of Philadelphia, has been appointed sales manager of the automobile accessory division of the H. W. Johns-Manville Co., of New York. He, of course, will remove from Philadelphia and make his headquarters in the big 12-story J-M building at Madison avenue and 41st street, New York.

F. W. Thatcher has been promoted to the management of the Firestone Tire & Rubber Co.'s branch in Memphis, Tenn. Previously, and for several years, he was one of the Firestone salesmen, attached to the Detroit office; previous to that he had been connected with the Warren and Winton companies. He is clean-cut and energetic and likely to make has influence felt in the South.

Recent Losses by Fire.

Winston-Salem, N. C.—J. L. Gilmer; garage destroyed. Loss not stated.

Reading, Pa.—F. H. Probst, South 18th street; garage destroyed. Loss not stated.

Coshocton, O.—Standard Automobile Co.; garage roof collapsed under weight of snow; 30 cars damaged. Loss, $7,000.

Stephenson's Assets Exceed Liabilities.

Schedules in bankruptcy filed by the Stephenson Motor Truck Co., of Milwaukee, which failed on October 23rd last, discloses excess assets of $22,000. The total liabilities, as scheduled, were but $15,576.77 and the assets $37,306.83.

Nationalizing the Chamber of Commerce.

The Automobile Chamber of Commerce has filed the customary application with the Supreme Court of New York for permission to change its title to the National Chamber of Commerce, Inc. The application is due to be heard on December 15th.

NEW YORK, NOVEMBER 27, 1913

DISENCHANTMENT OF THE CYCLECAR.

How "distance lends enchantment to the view" never was better illustrated than by the cyclecar. For all of a year, several industrious individuals in this country have written about it until it has been made appear "a thing of beauty and a joy forever," from any and all standpoints, most of this press-agentry being predicated on the alleged unbounded success of the cyclecar abroad, in Great Britain particularly.

Returning from Europe several months ago, even so shrewd and far-seeing a man as John N. Willys laughed at the cyclecar. In plain language, he described it as "a joke" and indicated quite clearly that its importance abroad was being exaggerated. Similarly, Motor World has time and again declared that it was a case of distance-enchantment.

When the British engineers, who were the guests of the Society of Automobile Engineers, were here last June, they said as much, and were so quoted in Motor World, all of which prepared the way for the real lifting of the curtain. For the truth is coming out and the fact is being made plain that, far from being a grand, gorgeous, glittering success, the faith of even the British public in the cyclecar "has been hopelessly shaken." This admission is made in the course of an almost tearful article appearing in the Cycle and Motor-Cycle Trader, one of the most conservative of the British trade publications, and written by a member of its editorial staff. Read it:

"I am not surprised to observe that something in the nature of consternation is affecting the advocates of the cyclecar movement and not without reason. The trend of affairs is certainly most discouraging to believers in the simple little vehicle built on motorcycle practice, for the sufficient reason that it has been tried and found wanting in many respects. The great majority have proved to be noisy rattle-trap affairs that shed their parts on the highway and are a source of endless trouble and expense to the unfortunate owners. Consequently the faith of the public has been hopelessly shaken at the very inception of the new movement. . . . While the cyclecar, therefore, has made very little progress, and it even may be said that the trend is now retrograde, the light car is going ahead by leaps and bounds."

If "consternation" reigns in England, where good roads are the rule, and "the trend of affairs is certainly most discouraging" and "the faith of the public has been hopelessly shaken," what will happen in this country of poor roads if ever the cyclecar obtains more than a press-agent start?

The answer is as plain as a pikestaff and should serve to make clearer why Motor World has consistently advised against the cyclecar and urged utmost caution in its promotion and purchase. It would be much easier for us to "play" for a share of the cyclecar money by lending our pages to the painting of glowing pictures, but with necessity for "toothpick construction," as one big manufacturer dubbed it, and with the impracticability of the narrow gauge cyclecar so distinctly defined, financial disaster is so plainly invited, if not foreshadowed, that we would be false to our conception of conserving the interests of the trade and of the duties of a trade journal did we not endeavor to point out the pitfall and display the danger signal over it. We are content to believe that those whose enthusiasm will not permit them to see it will rue the day when they count the cost as their foreign compeers now are counting it.

DISTRESS THAT PROVED PROFITABLE.

Now that the price of gasolene is toppling from its high estate, it would at least prove diverting to hear from all those wise gentlemen who, a year or so ago, dug deep into the bowels of the earth for figures to prove how truly terrifying was the shortage of the precious fluid.

The most remarkable feature of the situation, and the one which, as Motor World remarked at the time, indicated that the shortage was largely "manufactured," consisted of the continued payment of almost unholy dividends by the large oil producing corporations. Real shortages usually reflect their effects in balance sheets but despite the shrinking oil supply, to say nothing of the dissolution of the Standard Oil Co. by order of the government, expert tabulators have just presented figures to show that during this year of great distress, the dissolved companies have more than doubled their profits—111 per cent. as against 52 per cent. Dividends to the value of $111,000,000 already have been disbursed while several counties are still to be heard from. Who would not undergo distress for such a return?

DEER REELECTED PRESIDENT OF N. Y. STATE ASSOCIATION

Parsons Also Retained as Treasurer, but All Other Officers Are New —Resolutions Favoring Two Laws Are Adopted.

At the third annual convention of the New York State Automobile Association, which was held in Troy, N. Y., during Wednesday and Thursday last, 19th and 20th inst., President A. J. Deer of Hornell and Treasurer Fay C. Parsons of Cortland were unanimously reelected. All of the other officers, however, are new men, as follows: First vice-president, Frank M. Baucus of Troy (vice H. G. Strong of Rochester); second vice-president, John M. Ross of Utica (vice Howard Martin of Albany); third vice-president, W. W. Smith, of Johnstown (vice A. B. Maynard of Utica); acting secretary, Robert S. Ross of Albany (vice Frank D. Lyon of Albany).

The business sessions were held in the Y. M. C. A. Hall with President Baucus of the Troy Automobile Club in the chair, and during the course of the first session it was brought out that the membership has increased very materially during the past year. Dr. H. F. Meinhart, of Kingston, who is chairman of the membership committee, reported that there are at present 14,611 members enrolled, representing an increase of 2,453 over 1912. The treasurer's report revealed that during the year the receipts amounted to $9,304.52, of which $7,183.33 came from 62 affiliated clubs; the payments amounted to $8,193.33, leaving a balance in the treasury of $1,111.19.

Among the more important business that was transacted, the association placed itself on record as favoring the passage of a law that would make compulsory the carrying of tail lamps by all vehicles. At the same time, the resolution requesting the legislative committee to urge the passage of a law compelling railroads to place warning signs at least 300 feet from dangerous crossings was approved. It was proposed to change the time of the annual convention to the month of August, but the proposition did not meet with general approval and was dropped.

During the Thursday morning meeting and after urgent invitations from Watertown and Poughkeepsie had been read and discussed, the latter city was unanimously chosen for the fourth annual convention.

Before adjournment, President Deer made the following appointments: Chairman of the good roads committee, George C. Diehl, of Buffalo; chairman of law and legislative committee, Melvin Bender, of Albany; chairman of membership committee, Dr. H. F. Meinhart, of Kingston; chairman of the auditing committee, M. E. Gregory, of Corning. The convention was brought to a close with an automobile parade during the afternoon and a banquet at the Hotel Rensselaer in the evening.

*Indicates Sanction by A. A. A.

March 17-21, Boston, Mass.—Boston Commercial Motor Vehicle Association's 12th annual commercial vehicle show in Mechanics Building.

Pittsburghers Drive Over Dynamite.

Grant boulevard, one of Pittsburgh's most popular automobile drives, has been a dangerous place for three weeks, and the motorists of that city didn't know it until that time had elapsed; the police state that in less than a month they have picked up 120 sticks of dynamite which had been scattered systematically along the highway. They have arrested Herman Leidman on a charge of robbing a contractor's magazine, from which they claimed the dynamite was stolen.

Certificate No. 1 for President Wilson.

Contributor's Certificate No. 1 of the Lincoln Highway Association has been issued to President Woodrow Wilson, which not merely means that the President has contributed $5 to the gigantic project but is evidence of his sympathy therewith.

MOTOR LAW DOCTORS SEEK UNIFORM VEHICLE RULES

Representatives of Seven States Appoint Committee to Draft New Regulations for All—Existing Laws Called "Rotten."

Growing out of the adoption in March last of resolutions by the New Jersey legislature authorizing the appointment of three commissioners to confer with commissioners to be appointed by other States in an endeavor to bring order out of the chaotic condition of motor vehicle legislation, the Uniform Motor Vehicle Legislation Commission held its first session on Friday last, 21st inst., and before the meeting was brought to a close another start had been made to give impetus to the movement which several times before has been started but which always has petered out before it reached anywhere.

If the efforts of the present commission bear the kind of fruit that is hoped for, existing motor vehicle legislation in 11 States will be wiped clean off the slate and in its place there will be substituted new laws, or rather one new uniform law, based primarily on the common law of the highways.

Although it was intended that 11 States be represented at the gathering, and invitations had been issued to their representative to be present, only seven States sent delegates—Maine, New Hampshire, Vermont and Rhode Island being unrepresented. The States that were represented and those that represented them are as follows, the list including also the more important of the invited guests:

A. J. Deer, president of the New York State Automobile Association; Fay C. Parsons, secretary of the same organization; Samuel W. Taylor, who is head of the New York Commission and editor of "Rider and Driver," and William Phelps Eno, representing New York; Col. W. D. Sohier, chairman of the Massachusetts Highway Commission, representing Massachusetts; Charles J .Bennet, Commissioner of Highways; Alfred Phillips, Secretary of State, and A. H. Terry, City Engineer, of Bridgeport, representing Connecticut; E. M. Bigelow, Highway Commissioner, and Robert P. Hooper, president of the Pennsylvania Motor Federation, representing Pennsylvania; Chas. S. Guyer and L. D. Townsend, Jr., representing Delaware; Col. Edwin A. Stevens, Commissioner of Highways; Harry A. Roe, Commissioner of Motor Vehicles, and George L. Burton, representing New Jersey; Dr. H. M. Rowe, president of the Automobile Club of Maryland, and H. M. Luzius, its secretary representing Maryland.

After the appointment of Samuel W. Taylor, who is head of the New York Commission, as chairman of the joint body, the study of ways and means to effect the passage of uniform legislation was commenced. As a basis for the discussion, which at times became very long drawn out and involved many minor questions which had no direct bearing on the business in hand, the New Jersey commissioners had compiled and presented to the meeting a careful resume of the motor vehicle laws of all 11 States represented, showing wherein they differ and wherein their most conspicuous differences appear.

At the outset it became apparent that the commissioners were inclined to view the proceedings in a friendly spirit, and it was agreed with scarcely any exceptions that where differences appeared in the laws of the various States, they could be reconciled and uniformity of both phrase and intent obtained by concerted action. The sub-divisions that were discussed included fees, registration, computation of horsepower, drivers' licenses, penalties for the infringement of the laws, the indorsement of records of conviction of violations on licenses, and speed regulations.

In the end it was decided that the whole matter might better be thrashed out by a committee appointed for the purpose, and of those who attended Sohier, Phillips, Bigelow, Townsend, Roe and Burton were appointed to serve in this capacity; Taylor was made ex-officio chairman of the committee. It is the duty of the committee to consider the resume provided by the New Jersey commissioners and to draft a new set of State-wide traffic rules based primarily upon the common law of the road. Just when the committee will report has not been decided; it was to have reported this week, but it was found necessary to put the meeting over, probably until some time next week.

Of those who spoke at length against existing legislation in the concrete and against the marvellous differences in legislation in the various State, W. P. Eno, representing the National Civic Federation, and Charles Thaddeus Terry, of the American Automobile Association, occupied the most time, and both were accorded "round hands" at the conclusion of their respective efforts. In drawing attention to the necessity for simple, uniform rules and regulations for all vehicular traffic, Eno stated, in practically as many words, that all existing legislation is "rotten" and that it ought to be abolished, for, he pointed out, it is entirely possible for the owner or operator of a car to comply with the laws of one State and to travel five miles and be liable to fine and imprisonment for operating his car in exactly the same manner in another State.

In addition to endorsing the views of Eno, Terry also came out strongly for the complete abolishment of class legislation in all its forms and the substitution of a new law which will control both motor vehicles and every form of vehicular traffic.

In the new law which is being drafted by the committee appointed for the work it is proposed to incorporate a clause completely wiping out all existing laws relating to vehicular traffic of every nature; a second clause declaring and affirming the principles of the common law of the road also will be incorporated in it. One other respect in which the new measure will differ essentially from existing measures is that it will provide for the elimination of speed limits and all of the various forms of double taxation to which the motorists of some States now are subjected.

Extra! Here's Spooner's Cyclecar Club.

Having caused a lot of people to become excited over cyclecars, and inspired not a few of them to lay plans for engaging in their manufacture, F. Ed Spooner, by far the most prolific of the cyclecar press agents, has formed the Detroit Cyclecar and Motorette Club, of which, quite naturally, he has been elected president. The club was organized at a meeting held last week in the Pontchartrain Hotel in Detroit, in which city, according to Spooner, there are now 31 cyclecar companies actually building or organizing to meet the demand.

Apart from Spooner, the other officers are: J. P. LaVigne, LaVigne Cyclecar Co., first vice-president; J. J. Batterman, the Scripps-Booth Cyclecar Co., second vice-president; C. F. Gazeley, Detroit Commercial Axle Co., third vice-president; I. N. White, Princess Cyclecar Co., fourth vice-president; P. A. Teats, "P. E. T." Cyclecar Co., secretary; R. C. Albertus, Mercury Cyclecar Co., treasurer. These officers, with the following, will comprise the board of directors: K. L. Herrmann, Herrmann Cyclecar Co.; W. J. Marshall, Mercury Cyclecar Co.; Ernest Weigold, Detroit Cyclecar Co.; J. F. Wilkinson, Wilkinson Starter Co.; S. A. Clinton, Detroit Cyclecar Co.; James Scripps Booth, Scripps-Booth Cyclecar Co.; A. J. Farmer, Farmer Mfg. Co.; Theodore F. Millington, Detroit Body Co.; H. S. Baker, Hinchman & Baker, and P. Heseltine, Gadabout Motor Co.

The next number on the indefatigable Spooner's program is the organization of an association to assist the spenders—the "good fellows" of the trade who made money but failed to save any and who therefore may be bumping the bumps on the financial toboggan.

TIME CARDS SHOP ESSENTIAL

Why It Is Necessary to Know What a Man Does and How Long It Takes—Little Items That Injure Customer and Proprietor.

The statement that "time is money" has been made so often that it has lost much of its significance. Nevertheless, it is literally true in the garage and repair business—just as it is true in any business.

Time is the important element. Time represents labor. When a ticket for repair work is made out usually time is the largest item on that ticket. This would seem to suggest that it is well worth keeping track of in the most careful and exact fashion.

Notwithstanding this fact, time is not, generally speaking, as carefully looked after as it should be. If money is handled there is little doubt about the honesty of the average employe. He can be trusted. Also there is usually a check on money matters that would sooner or later bring any dishonesty to light. But with the handling of time the matter is seemingly regarded in a different light. There is no check, as a rule, consequently there is a great deal of unintentional dishonesty.

Both Proprietor and Customer Suffer.

Who suffers? The customer suffers and the proprietor suffers. The customer often feels that he is getting "soaked" and it is often true. The customer frequently pays for time that is never consumed on his work.

Why is it? The answer is that this condition exists largely because of indifferent and inexact methods of keeping track of time. Fifteen minutes in the average customer's bill represents 15 cents. With four or five men working on a job and each of them losing 15 or 20 minutes on it, the waste mounts up and what is a reasonable charge if just the time used were to be paid for becomes unreasonable and excessive.

A few days ago a motorist was in a garage waiting for his car The job was supposed to take about half an hour. It took two hours, and while he was waiting the motorist observed that the man working on his job was taken off it three distinct times—once to help carry a body which was being dismounted to be replaced by a coupe; once when another customer came in and wanted something done that "only took a few minutes," and once to shift a car out of the way. All together, the time consumed this way was over half an hour.

Daily Time Cards for Men the Remedy.

His bill called for two hours' labor. And he paid for it. But he wondered how much time he would pay for that he did not get if perchance he should have a big job in that shop. The remedy is a daily time card for each man that will keep track of his expenditures of time in units of 15 minutes or less. That would be an improvement. And, of course, there are other measures that will suggest themselves to the garage employer who is keen on having things paid for by the customer for whom the work is done.

There is a stock answer, "The matter is as broad as it is long"—what we give to one customer is just as likely to be given another." That is not the reply of efficiency. It is the excuse of the man who does not go to the bottom of things and who is not intent on exact houesty. The matter is worth much study, and dealers who have solved it satisfactorily are invited to contribute their findings to other dealers through the columns of Motor World.

LETTERS AS AN INDICATION OF CHARACTER OF BUSINESS

"The letters you write asking for business are the most important letters that leave your office," says a paper manufacturer in "boosting" his wares, and apart from his reference to his own product his assertions contain a point that is of genuine interest and importance to every business man.

"A scientific investigation has recently been made which proved beyond peradventure that the character of the paper used has very great influence on the effectiveness of letters asking for business," he continues, enunciating a truth that deserves more attention than it gets.

"Especially has this investigation shown that the thickness of the paper and the distinctiveness of its surface have a marked effect on the results obtained from sales-letters. As a man reads your letter, he thinks of what you say, but he feels the way you say it and he forms his judgment of you and your goods or service from the appearance and 'feel' of the paper on which your letter is written."

"THE VOICE WITHOUT SMILE" AND THE CUSTOMER IT LOST

"A certain textile house in this city lost a $3,500 order yesterday through a display of bad telephone manners on the part of the girl in charge of the house switchboard," says the New York Times. "According to the buyer, he called up this house rather early in the business morning and asked to speak to the manager.

"The girl had evidently been instructed to take the names of persons calling but had not been told how to do it. Instead of asking, 'May I have your name?' or 'Who is speaking, please?' she demanded sharply, 'Who are you?' To this the buyer answered, 'I'm a man who is through buying from your house as long as you are there.' He said he was not going to ask her discharge, but that he was going to buy somewhere else until the house got a girl who knew that 'the voice with the smile wins.'"

AWAKE N DISING WORLD

LATE BILLS MEAN LATE PAY

Statements Which Do Not Go Out on Time Often Responsible for Sluggish Business—A Bookkeeper Who Was Not an Asset.

Do your bills go out promptly? Do your statements go out with clock-like regularity on the last day of each month? So that the morning of the first the customer gets them along with his other bills and includes them in his plans for payment. Or do they go out somewhere between the first and the twentieth, so that the customer who gets them holds them to include with the following month's payments? You ought to know this, if you don't. And if you follow the experience of a successful dealer in Indiana you will be sure—very sure—to see that the night of the last day of the month sees a statement for current indebtedness go to every customer who ought to have one.

Found Out Why Money Came Slow.

This dealer formerly had a bookkeeper who did things just about as he felt inclined. If there was a chance to put anything off for a few days he put it off. Cash was slow in coming in and the "boss" did not know the reason why. His customers were good people who had been doing business with him for some time. They had always paid promptly, but now they were getting slow. Almost everyone was taking from 30 to 60 days. One day he solved the problem. A customer came in and when he paid his bill remarked, "You could just as well have had this a little sooner. Why on earth don't you send out your statements earlier in the month? I just got mine a few days ago."

It was the 23rd day of the month. Investigation of the bookkeeper's methods followed, with the result that very shortly thereafter a new bookkeeper was installed. Part of the understanding that the new one subscribed to was that bills were to go out immediately on completion of jobs or delivery of supplies, and that in no case were statements to be delayed beyond the first day of each month.

It was only a small point, but the carrying out of this idea has helped wonderfully in securing prompt payment of bills.

The psychology of it is very simple. Send your statements out late and the customer naturally thinks "This man is not in very much of a hurry. I will just let him wait." But when a bill follows the job quick and the statement comes promptly on the first the recipient naturally feels, "These people mean business; they are right on the dot. Guess I better send 'em a check and keep my credit good."

SALESMEN—SO-CALLED—WHO INVITE LOSS OF PROFITS

It does not require a salesman to sell an article at a cut price. Almost anyone can do it. The salesman is the man who sells an article at a profit.

There are men selling cars whose whole thought is that the purchaser is looking for something a little bit cheaper. Often perfectly good prospects are frightened away by these men. They suspect something is wrong because they see at once that all the salesman is thinking of is price.

"How much is that car?" asked a gentleman of one of these so-called salesmen.

"Eight hundred dollars, but, between you and me, I think you can buy it for considerably less," was the reply.

A cut in prices was not asked for by the visitor, nor did he expect it. He sold his own goods at the regular price and had followed that method for years. To him a "cut" was equal to a "keep-off" sign. He immediately lost confidence in the salesman and, after asking one or two questions about other cars, beat a hasty retreat.

Is it any wonder that the dealer whose men are not better trained than this has a liberal—far too liberal—stock of used cars on hand?

Many dealers could make money by watching the selling methods of their men and strengthening them where they are weak. Star players are usually the product of careful coaching.

TWO WAYS OF MAKING USE OF HELPFUL SUGGESTIONS

Keep your mind open.

The difference between the live ones and the dead one is the open mind.

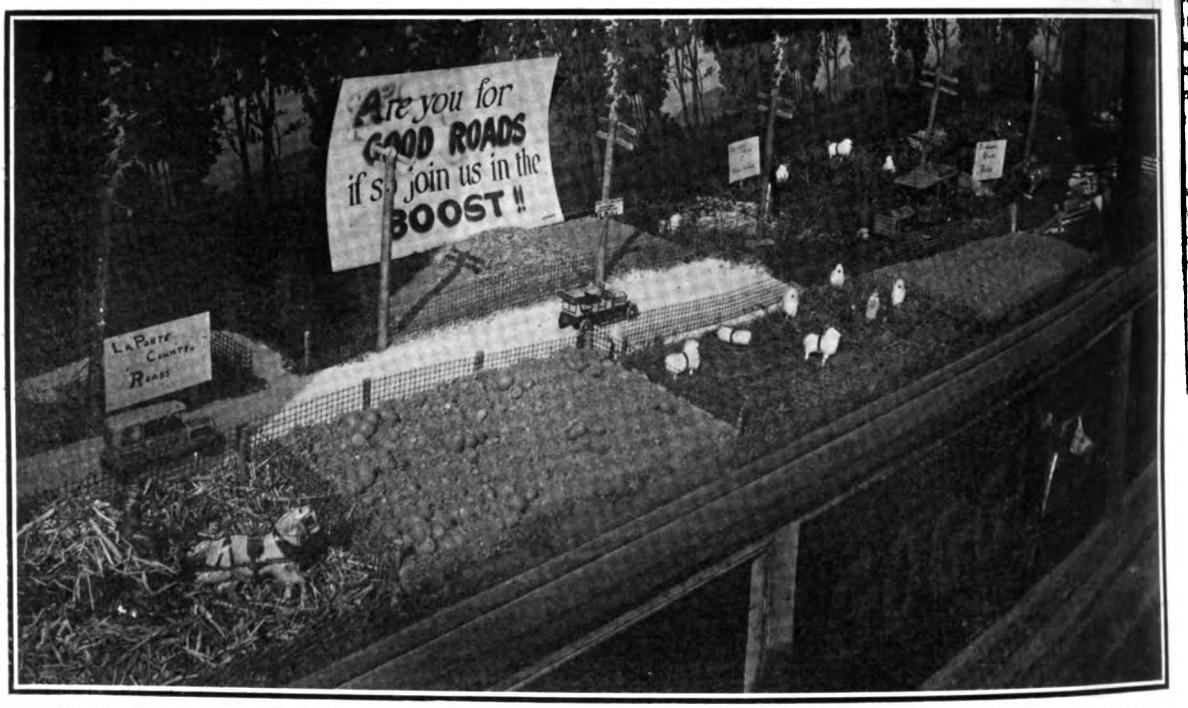
The live one does not think that whoever has been in the automobile business for ten years has all the knowledge of that business locked up in his cranium.

He realizes that business, at the bottom, at the base, is all the same. That his business is very much like that of the hardware man, the piano man, the drygoods man and every other merchant who is in business to sell goods at a profit. The dead one thinks his business is peculiar or different. "What you say is all right for Bill Jones; he's in hardware, but it would never work with me. I'm in the automobile business."

And he decides against it before he has tried it or before he has even given the idea serious thought.

The live one "mulls the idea over." The suggestion made does not fit exactly as presented. But how can it be made to fit? Presto! With a few changes the idea is just as practical in selling automobiles as in drygoods. Let's try it.

The live one tries it. He goes at it seriously, enthusiastically, hopefully. He is sure it will win. But he lays every detail of his plan carefully. Like a careful carpenter, he lays all the pieces together and fits them closely before he uses the glue and the screws. When he gets through his plan is a real plan. Every detail is complete. He puts it through successfully.



He is keen for suggestions. He analyzes, compares, thinks.

GOOD ROADS WORK "BOOSTED" BY CLEVER WINDOW DISPLAY

Object Lesson with Sharp Point Created by a South Bend Dealer—Miniature Landscape as Attractive as it is Instructive.

Whether or not it is good business policy to go to a whole lot of trouble to rig up a window display that does not directly advertise the cars sold inside, is a question that does not seem to have bothered the 20th Century Motor Car and Supply Co., of South Bend, Ind., in the least. If the matter received any consideration from a selfish point of view they probably figured that while they probably would sell no cars as a direct result of the display, they would certainly help to better the conditdions that most affect the use of automobiles—which is to say, road conditions—and by so doing give the automobile industry as a whole a "boost" and ultimately profit by the uplift.

STRIKING "GOOD ROADS" WINDOW DISPLAY OF THE 20TH CENTURY MOTOR CAR AND SUPPLY CO., OF SOUTH BEND, IND.

The window display that may or may not have brought up this question is shown in the accompanying illustration. It does not require much concentration to perceive that the object is to "boost" good roads by making odious comparisons—the "odious" applying to the poor highways, of course, and being reflected upon those who permit them to exist. The 20th Century people have devoted their window to a bit of miniature landscape gardening that is positively artistic, and is carried out with such attention to detail that it looks like the real thing viewed through reversed opera glasses. The feature of the display is the comparison made between the good piece of road, which represents the notably good roads of Laporte County, Ind., and the bad stretch, which represents any old bad road. And while cars are bowling merrily along the smooth stretch—that is to say, they are supposed to be "bowling merrily"—a car, less fortunate, is seen mired over at the right and in process of being hauled out by a farmer with a team of horses. The juxtaposition of the two typical conditions speaks loudly and positively for itself.

Conditions on the roads are reflected by the farms, there being abundant signs of "peace and plenty" along the good road, while barrenness and a general air of neglect are in evidence near where the farmer and his horses are giving first aid to the mired.

The display is one that makes people stop and look; it teaches its lesson at a glance and probably does it far better than a lot of dry statistics, however valuable and necessary the statistics may be from a practical point of view. And there can be no doubt that the 20th Century company will benefit more or less indirectly by the attention attracted to the place, without waiting for the full fruition of the movement in which it is taking part.

Automobile Vanquishes Locomotive.

So many automobiles have come to grief in front of railroad engines that motorists in Beaumont, Tex., are congratulating R. E. Ligon upon having literally chased a train off the track when it tried to run over him.

The train may have had a right to the crossing, but it was too late to arbitrate when both engineer and Ligon discovered their predicament. If Ligon went straight ahead the engine would probably hit him and the engineer could not stop; Ligon turned sharply to the right and ran down the tracks ahead of the train. The locomotive might have "got him" at that, had not the automobile collided with a switch lever, the collision opening the switch, and sent the train off the tracks. The engineer stopped then and managed to save the train from a bad wreck. Ligon's car was not badly damaged and he drove away while the wreckers were summoned.

German Consul Objects to License Tax.

If you don't want to pay an automobile license, get a job as consul for some foreign country. F. Kopp, German consul-general of San Francisco, has asked that his automobile be exempted from taxation because a German-American treaty exempts German government officials from paying personal property taxes in America.

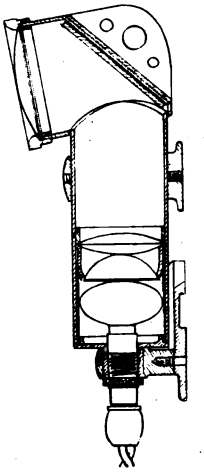
ROFFY ELECTRIC HEADLIGHT PROJECTS GLARELESS BEAM

Throws Sharply Defined and Powerful Light but Isn't Much Bigger Than a Side Lamp — It's All in the Lens System.

One of the natural lines of development of the automobile and its parts and accessories lies in the direction of concentration of useful energy and the elimination of superfluous bulk and weight. Results of such tendencies are visible in many details of the modern car, and though in many instances the effects are marked, it is not often that they are as pronounced as in the case of the lamp shown in the accompanying illustration—the Roffy lamp, made by the Roffy-Grace Corporation, of 1926 Broadway, New York.

While daylight demonstration of an automobile lamp cannot be expected to bring out all its best points, a daylight demonstration of the Roffy lamp made for a Motor World man made clear several things claimed by the makers. In the first place the beam of light thrown by the lamp is highly concentrated, like that of a stereopticon, and the edge of the disk of light is perfectly sharp—there is no diffusion of more or less faint light outside the beam. Standing in front of a Roffy lamp at any distance, it is impossible to see the light from the projecting lens without actually getting the eye within the sharply outlined circle. And in the second place, all the illuminated area in the disk is perfectly even, there being no dark rings or areas of variation of illumination even at the extreme range of the lamp. The beam of light is projected slightly downward, but the angle is so calculated that its upper edge nowhere is much more than four feet above the ground. Thus a man walking in the road toward a car fitted with the Rogy lamps would see nothing of the cencentrated pencil of light, his eyes being above it, though of course he could see the illuminated area ahead of the car.



Because the light is low down and is not diffused it is said by the makers to pass muster within city limits without dimming. Cars with Roffy lights have been driven in the city limits without molestation from the motorcycle or other police until, according to Roffy, the car has been stopped a number of times to ask the police if the lights were objectionable in any way. While seemingly puzzled as to just why the lights should be objectionable, as they evidently were bright enough, the "cops" could find no fault with them.

In the construction of the lamp, which just has been placed on the market, Roffy has gone somewhat deeply into the science of optics and has worked out a lens combination that makes possible the results sought. The accompanying cross-section shows the arrangement clearly. The main body of the lamp is of tubular form and stands vertically. In the bottom is a special

ROFFY-GRACE HEADLAMPS

tungsten bulb of mushroom shape. Immediately above the bulb is a condensing lens, and above it a double combination projecting lens which throws the light on a French reflecting mirror set at the proper angle in the hood at the top. At the front of the hood is another lens—a plano-convex. While the combination of lenses seems somewhat complex, it is explained that such an arrangement is necessary in order to

LAMP AND LENS POSITION

obtain the desired results. In reality the complexitly is only apparent, for the lenses are fixtures and need no attention.

The lower part of the lamp body—that is, the part immediately surrounding the bulb—is open except for vertical bridges, and is filled with a short cylinder of ground glass. From this is given off a white diffused light that illuminates objects in the immediate vicinity of the front of the car; it is a soft light that is not in the least dazzling, and it can be moderated as much as may be desired by the employment of glass cylinders of the required density.

The two lamps of a pair can be turned so as to concentrate both beams at any desired distance ahead, if so desired, which, of course, greatly increases the illumination of a smaller area. With standard bulb equipment the light is sufficiently intense to illuminate the road for about a block and a half ahead of the car; and one of the results that Roffy states he sought and has obtained is that the quality of the light is such that objects are seen much more plainly than with other lights of greater actual intensity. In other words, it is not so much the quantity of the light as the quality that produces results.

While bulbs of various powers are supplied, the regular outfit, and the one that is recommended as giving the most satisfactory all-round results, has bulbs that consume 4 watts when the lamps are connected in parallel for running, and 2 watts when in series. With each pair of lamps is supplied a switch for making the change from parallel to series, the latter connection being employed when the car is standing and less light is needed. The lamps are attached to the radiator by means of special brackets and bolts, the brackets being so made as to do no harm to the radiator. Another model is designed to attach to the dashboard.

Taking the Hum Out of Rear Axles.

In view of the simplicity of adjusting the resonant hum out of the rear axles of cars that are a year or so out of date, it is a little bit surprising that so many owners put up with the trouble. In the majority of cases, the trouble can be cured with a wrench in about two shakes of the proverbial ram's tail. Also, in the majority of cases the maker of the axle, or his agent, gladly will make the adjustment without cost—which merely goes to prove how really simple the job is.

Tinning Terminals to Perfect Contact.

Tinning the terminals of cables or wires may help considerably to maintain good electrical contact, for the soft coating is easily scraped clean by the screwing down of fasteners and there is a good "bedding-down" action. The tinning can be accomplished by rubbing the terminals with any soldering flux and dipping them into solder.

Making Paper Serve as Emergency Funnel.

A derby hat with a hole punched in the crown can be used, and has been used, as a funnel; but a paper cone answers the purpose about as well, and there are not many emergencies when there isn't a piece of paper within reach.

CITY HAS ABSOLUTE RIGHT TO NAME TAXICAB CHARGES

New York's Traffic Ordinance Upheld by Appellate Court—Even Goes so Far as to Say Cabmen Can Quit if They Don't Like it.

The rights of a city to its streets are absolute, according to a decision handed down last week by the Appellate Division of the Supreme Court, Second Department, in ruling upon the validity of the taxicab and hack stand ordinance which was to have gone into effect in New York City August 1 last. The opinion of the court dissolves an injunction secured against the enforcement of the ordinance and places all cab operators upon an equal footing.

The cab stands in front of clubs and hotels, which had been leased to the larger companies to the exclusion of the "little man," have been thrown open to all and the lower fares which the ordinance decreed have been made effective. The only way the cab men can avoid the ordinance is by having their cabs called to the hotels by telephone from a garage or similar location; that would enable them to avoid the law.

The big companies claimed the rates established were too low, in answer to which the court stated in substance that no one was compelling the companies to continue in business and that if they did not like the rates they had perfect liberty to quit business. It was held, also, that if a city has the right to rule taxicabs off the streets entirely it at least has the right to regulate their use and operation.

"The legislature intended to vest the board of aldermen with entire power to regulate the use of the streets of the City of New York, to regulate the nature of the vehicles that use the streets, and to prescribe the conditions upon which they shall be allowed within the city limits," said Justice Ingraham, "and with the unrestricted power to regulate the rates of fare to be charged by public conveyances using the streets. If any particular kind of vehicle in use in the city cannot be profitably operated at the rate of fare prescribed in the exercise of this power, the ordinance prescribing the rate of fare to be charged is not, I think, for that reason to be declared unreasonable or a violation of any provision of the Constitution or laws of the State. No one is bound to operate any particular kind of a vehicle or motor vehicle, and if the rate of fare fixed by the board of aldermen is not sufficient to allow motor vehicles to be operated in the streets of New York profitably, then the owners can cease from such operation. Nor does the fact that these motor vehicles had been operating in the streets under a license and at rates of fare that were profitable prevent the board of aldermen, in the exercise of the power vested in it by the legislature, from reducing the rates of fare. If vehicles were devised of such size and weight and propelled by power in such a way as to destroy the streets or prevent the use of streets by others, it seems to me that the board of aldermen would be justified in prohibiting the use of the vehicles of that class. If the legislature had the power to prohibit the use of any specified class of vehicles in the public streets, it had the power to delegate to the legislative body of the city the right to exercise that power. The Court of Appeals has lately determined that the legislature has that power."

Justice Scott write the following dissenting opinion:

"Under the former ordinance the hotel proprietor was able to exercise supervision and discipline over the cab stand in front of his hotel; he could see to it that only proper cabs stood there, and that only respectable drivers were employed, and that the existence of the cab stand did not interfere with the carrying on the business of the hotel, while under the present ordinance the cab stand will be opened to any licensed hack whose driver will choose to come there, and the proprietor of the hotel will be able to exercise no control or supervision whatever over either the cabs or their drivers. It is easy to see how a proprietor who was willing to have a special hack stand in front of his hotel, might well object to have a public hack stand established there. It may be safely assumed that at least in front of the larger hotels, the cab stands will be kept permanently filled up with waiting cabs, a new one moving up to take the place of each that leaves the stand. The practical effect of the ordinance will, therefore, be to keep waiting in front of each hotel, without the consent and against the will of the proprietor, a permanent line of hacks waiting and soliciting customers. In my opinion this would constitute an invasion of the abutter's property rights, which the law will not tolerate."

To Use Horns on Railroad Engines.

Because the locomotive whistles make too much noise and have come within the ken of the Anti-Noise Committee of Chicago, W. L. Park, vice-president of the Illinois Central Railway, is to try out automobile horns on the engines which operate along the lake front; one horn has been ordered and if it is satisfactory others will be placed in service. Lighter bell clappers also are to be used.

SALESMAN CANNOT KNOW TOO MUCH OF PRODUCT, SAYS JOY

Aims Blow at Belief that Salesman Who Knows Too Much About What He Sells is Handicapped —"Maximum Salesman."

The oft'-expressed belief that a salesman can sometimes know too much about the thing he is selling and can scale through to success through superficial methods is sliding rapidly down the ladder of present-day salesmanship. Attempting to argue about something about which a man is not fully informed is going into a fight only partially trained.

The Maximum Salesman, who is not the half-trained man, is described by Henry B. Joy, president of the Packard Motor Car Co. He prefaces his description with a tribute to Col. Goethals, the man who achieved success upon an isthmus strewn with the remnants of ruinous failure. "He did it," said Joy, "because it was his job. No obstacle was big enough to stop him.

"Industry and perseverance in a salesman," continues Joy, "without thorough understanding of, and belief in, the article he is selling will not make the maximum salesman! The qualities necessarily combined in the maximum salesman are varied but essential.

"Be a good listener. This habits puts shot in your locker. It gives you the psychology of the 'case' and puts your feet firmly on bed rock by permitting you to apply the basis measure—'Put yourself in his place.'

"Talk little, talk well and to the point!

"Know you are right in your facts and arguments. If your arguments are based on hearsay or 'hot air' you will not be convincing. Unless you have gathered the facts yourself the chances are you may be lying about your own goods!

"Argument vs. facts—You may think your opinion is argument. It is not nor is it convincing unless insinuatingly supported by facts gleaned from your own experience or that of known authorities of repute.

"The Maximum Salesman is born and improved by training. He does not work directly for the reward of dollars. He works to win his 'cases.' He works for the gratification resulting from his successful efforts.

"Artful equivocation is not salesmanship. It is double discounting the future. Each such sale is a stumbling block to future business. A maximum salesman's success results from the confidence in him which his dealings with his customers have created."

TRAINING SALESMEN TO GET KIND THAT SUITS

Reilly Takes Issue With the Man Who Says He Can't Get the Right Kind of Helper—Suggests to Sales Manager That the Dealer Train Men for His Own Service—Illustrates With Own Experience.

In the transfer from coop to crate the turkey made a break for liberty, and just as Reilly shot around the corner of the horse barn the bird threw in the reverse. Both the turkey and the old Reilly farm dog whisked between and around Reilly's legs in a cloud of tail feathers, straw and other things and the little dealer was thrown for a five-yard loss.

But the dog made a fine tail-end tackle in front of the barn and, after a desperate struggle, Reilly and the Sales Manager jammed the gobbler into the crate.

"There, darn yuh!" and Reilly drove home the last nail in the crate.

"What did you let him get out for, anyway?" demanded the Sales Manager as he helped boost the bird into the tonneau.

"Aw, why don't your mother keep ducks?" was the boyhood sarcasm.

They were half way to town and Reilly had nearly finished a dissertation on the whys and wherefores of turkey raising when the Sales Manager gave the conversational steering wheel a twist with the remark, "Oh, say! You don't want to get rid of your salesman, do you?"

"Not especially; why, who wants him?"

"Tommy Meck wrote in the other day that one of the dealers in his territory wants a man."

"Don't they have any salesmen out in that country?"

"Yes, they have salesmen, but this dealer seems to have had hard luck; he hasn't been able to get the kind of man he wants."

"Maybe he wants a hundred dollar man for about twenty a week."

"JUST THIS," SAID REILLY. "I'VE MADE THE SALESMAN LARGELY WHAT HE IS"

"Perhaps that is his trouble. But, at that, Reilly, some of these smaller dealers—and big ones, too—must have trouble getting the kind of men they want. You're pretty fortunate with the salesmen you have."

"Is that so?" exclaimed Reilly in a somewhat sarcastic tone.

"Isn't it?"

Helped Him Become Good Salesman.

"Maybe it is, but who's to blame for it? I suppose he walked in one day and said he wanted a job and kept right on working and never noticed all those good offers you imagine are made him."

"What do you mean 'Who's to blame?'"

"Just this—that I've made the salesman largely what he is. He wasn't much of a salesman when he came with me, and he'll tell you so if you care to ask him. I never could get one that just suited me, but I've got Charley and I'm going to keep him as long as I can."

"But you don't——"

"Yes, I do! It's pretty hard for any man to get a salesman who is exactly what he wants. They don't grow that way. The salesman might be a good man and all of that and still not exactly suit. The only way I know of to get just the kind of man you want is to take a man and train him—educate him in your own way. Then if——"

"You sonufagun!" The Sales Manager slapped his gloved hand on top the gobbler's head and persuaded the bird to leave off trying to pick the eyes out of the rival bird in the finish on the back of the front seat.

Training Man Best Way to Get One.

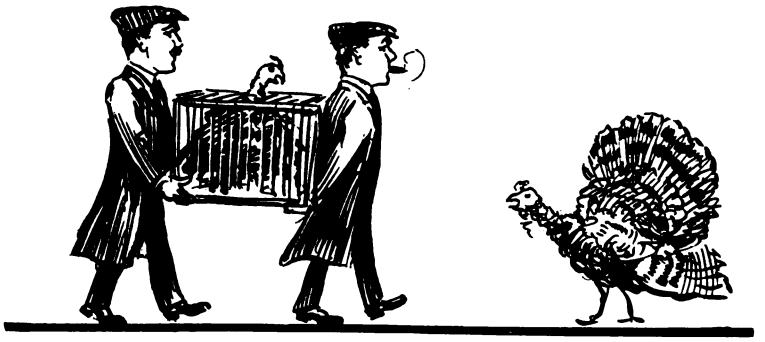
"Here; I'll fix him." And Reilly suited the word by arranging a robe over the crate and between it and the varnished back seat. Then they drove on again.

"Do you mean to say," demanded the Sales Manager, inspecting the pecked spot where his glove collided with the gobbler's beak, "that if a dealer wants a salesman the only way he can get one is to train one?"

"No, I don't mean that; but that is one way; also, probably for the dealer who doesn't want to pay any more than I do, that is the one way in which best results can be obtained. It stands to reason that if I have no salesman and want a salesman there must be one somewhere who approaches the standard that I have set up in my own mind, but it also is very likely that if I find this man he is a higher-priced man than I can afford to keep. There are hundreds of good salesmen but they can demand big money, and big money can't always be paid by the dealer who isn't making a startlingly big income himself.'"

"There's a lot of logic in that, too."

"I don't know how many dealers there are who are what you might call small dealers—men in the smaller towns of the country. Sometimes you will find a pretty



Digitized by Google

big dealer in a rather small town, but the rule does not hold. Many of these dealers must have salesmen and, as you say, the problem is 'How to get them.'

"When I first started in business I did most of my selling myself. I think every dealer ought to be able to do some selling even if he doesn't have to get into the thick of the work himself. Well, after the business began to grow and I saw that if it was to keep on growing I would have to have help, I gave thought to this same salesman question. I naturally dreamed first of bringing in a hot-shot salesman who would be even better than I was and give things such a boost that I would be a millionaire in a couple of years."

"Are you?"

"No, I'm not! I felt around for the kind of a man I wanted, but in every case I learned that the sort of salesman I had in mind wanted so much money that if I paid it it would mean lean pickings until the business got that 'millionaire boost.' The more I thought it over the less I believed I could get what I wanted. And, still, I wanted what I wanted. By and by this idea of developing a man seeped into my cranium and I then set my trap for a likely-looking piece of material. I found Charley.

"OH! HELLO, CYCLECAR!" SAID REILLY TO THE LESS PORTLY BIRD

Gradually Worked Into the Business.

"Charley had ability, I could see that; but he was young in the selling business. He was willing to come on at a reasonable salary and learn the business. Of course, he didn't go out and sell a million cars the first week; I didn't expect him to. But he worked into things nicely and got so he could handle any ordinary sale. And now—he can handle any sale."

"Why doesn't he leave you, now that he's good?"

"That's a good question, Jim. Why doesn't he? The only answer is that he doesn't leave me now for the same reason that he didn't leave me long ago. I've been fair and square with Charley and we like one another. I've made him feel that he has an interest in the business; every time I could help him in any way I've done so, as fast as he progressed I've made it worth while to him, he knows the inside of my business to a great extent and he knows that as the business grows he grows. We've gotten into the habit of pulling together and he stays because he likes the place.

Considers Taking on Another Pupil.

"But he'll go some day, and even though I may regret it I will not try to block him if it's a good move. Far be it from me to keep him from bettering himself, but—unless it's a chance to better himself a whole lot he won't go. I could use another salesman right now, and before long I'm going to get another promising young man and start him along the right path—my path, anyway."

"Do you mean that every dealer must take a kid and raise him?"

"Not that, not that! I prefer to pick a young fellow because they are easier to train, but there's nothing to prevent a dealer taking a man with gray whiskers if he wants to go to that trouble Also, you can get the young fellow at a more reasonable salary than you can the older man. But this statement that you can't get the kind of salesman you want loses much of its force when the possibilities in the educational line are revealed.

"At the same time I was looking around and found Charley one of the other dealers in town, who started about the same time I did, was confronted with the same problem. He hired an older and a better man and kept him for a short time and then let him go because they couldn't get along. The salesman didn't do things in this dealer's way. Instead of trying to mold the salesman into the dealer's way of working they had a scrap and the alliance broke up.

"Then the dealer got another one and the same thing happened. The dealer didn't seem to be 100 per cent. efficient in handling men, anyway, and before long this salesman departed. This dealer now has a salesman who has been with him for quite a long time, but the dealer still says he can't find a salesman to suit him. Instead of training this man the dealer stands at one side and tolerates him as he is; the dealer knows that if they clash the results won't be the best."

"Maybe this 'not suiting' holler is nothing but a notion. If a man can sell cars, isn't he a good salesman?"

"Sometimes he is," replied Reilly, "and sometimes he isn't. It is not always a question of whether the man is a good salesman. I know men who can sell cars hand over fist, but whom I wouldn't have around my salesroom if they worked for nothing. It's important to me to have a man with whom I can get along."

Unnecessary to Have Training School.

"What do you expect a man to do—start a training school?"

"He needn't go as far as that," asserted Reilly. "Neither does it mean that the dealer needs to lay out a course of instruction. Helping your man in little things is what counts the most. If he does some little detail in the wrong way, tell him; don't let him run along for a time and then fire him. That is what too many men do. They take on a new man and let him try to work out his own salvation. If he doesn't succeed he is let go.

"What the dealer should do is learn whether the new man is receptive to ideas and then try to boost him along. An undeveloped man with a receptive mind will show wonderful results if properly coached. Putting good sales reading matter and trade papers where he can get his hands on them and giving him a chance to pick up things himself are methods that are successful. The dealer also helps himself by training his men upward, for the better the man the better will be the dealer's business. Sometimes it can't be done, perhaps," said Reilly, as they drove in the driveway of Reilly's home, "but in most cases of failure it is because the dealer didn't try."

Sales Manager Aims "Dig" at Reilly.

As Reilly stopped the car back of the house and the Sales Manager prepared to assist Reilly in unloading the crated bird, a less portly feathered aristocrat stalked around the corner of the house.

"Kind of piggish, aren't you?" said the Sales Manager. "Going out and panhandling a turkey from your dad when you've got one at home."

Reilly turned to look. "Oh! Hello, Cyclecar!"

"Why Cyclecar?" asked the Sales Manager.

"We call him that," replied Reilly, "because he gobbles a lot but we don't think he'll amount to much."

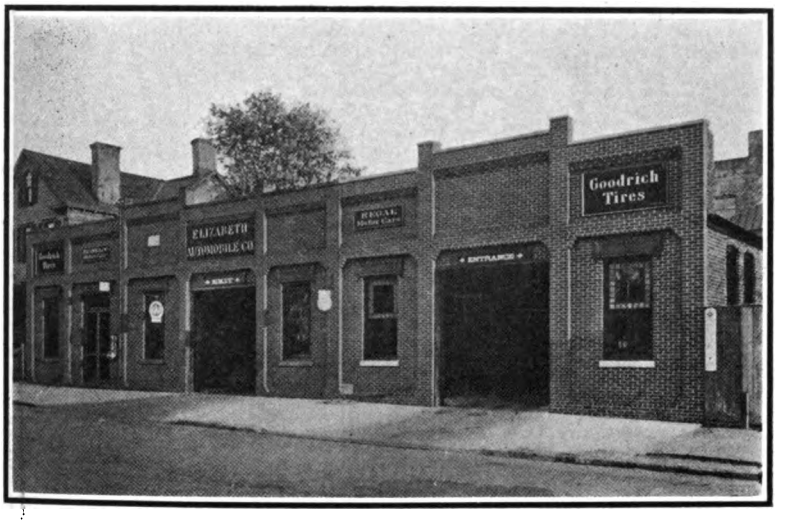
GARAGEMAN WHO MADE HIMSELF A BUSINESSMAN

Like Many Another, He Was Only a Mechanic—Ten Years of No Profits—Then He Hired an Auditor—Today Business Systems Prevail and Monthly Inspections Check Little Leaks—His Methods.

The Man with a Jag steered an uncertain course across a public square and bumped slam up against the iron fence which kept the public out of a little beflowered grass plot. The Man with a Jag felt the fence and pondered. He felt along the fence until he found a gate, but the gate was locked.



He pondered some more. Then he felt the fence all the way around the outstide of the grass plot and arrived back at the gate. The gate was still locked. After several trips around the fence, all of which brought him back to the locked gate, he said:

"'Sno use, 'll have tuh wait till somebody unlocks the gate and lets me out."

Wherewith he laid himself down on the sidewalk to slumber until someone came "to let him out."

Fourteen years ago F. V. Price, Jr., who is 97 per cent. of the Elizabeth Automobile Co., of Elizabeth, N. J., started in the garage business. He hoped to make money, and at first he thought he was doing so, but before long he discovered that he was up against the fence of "no profits." Unlike the drunk, Price really was inside the fence, and at the end of every twelvemonth course around the enclosure he found himself back at the same old gate with the same old lock.

For ten years Price fumbled around that fence and ten times he wound up at the gate with a bare living where he should have had a handsome profit; and, again unlike the drunk, he did not lie down to wait for someone to let him out. He set about unlocking the gate by his own efforts. Today the fence does not exist. The Elizabeth Automobile Co. is making money—not a fabulous sum, but a comfortable income.

FRONT VIEW OF ELIZABETH AUTOMOBILE CO.'S GARAGE

"I wasn't a business man," said Price, "and I knew it. I was a mechanical man, and all I've learned about business I have learned right here in my own place. But the place is paying today. And what's more, we know why it pays and where it pays, and if it loses we know where it loses and check the loss.

Mechanic, and Ignorant of Business.

"The trouble with me," Price continued, "was that I was like so many more garagemen; I was a mechanical man and knew nothing about business. Some of them are graduates of repair-shops and of the old bicycle days and never learned what they should about business methods. But it can be done, and some of the things we learned about the business rather surprised us."

Price today is a dealer as well as a garageman; he has handled Franklins and Regals for several years, and built up a good trade in these lines. He has a one-story garage, 104x90 feet, at 14 Westfield avenue, and thinks of adding another story. He can store 75 cars if necessary, but seldom accommodates this number. The establishment employs three night men and a day force of seven men and a foreman. Besides these there are Price, a bookkeeper and two salesmen. Price also has secured the Standard electric agency and one of the salesmen is engaged in doing missionary work along this latter line. Of Franklins and Regals the company sells from 35 to 45 a year.

That is what Price is today. Fourteen years ago—he was 16 then—he hired out to work for a couple of men who opened the garage "on a bluff." They lasted two months, when Price bought them out. He had a little machinery, got some more and made his venture into the automobile trade, which, comparatively, wasn't any older than Price.

Hasn't Been Closed in Fourteen Years.

One thing which has helped to bring trade to the garage is that—like some saloons—after it was opened up the proprietor figuratively threw away the key. The garage hasn't been closed day or night in 14 years. But despite the fact the trade liked Price, despite his success in selling cars and despite the loyal clientele he built up, he didn't make money. When he undertook to figure out why he was not running on the up grade he soon discovered it was a task that might well require more able help, so he hired an auditor.

The auditor is still a part of the business. Every month he calls at the garage, Price the shop foreman, the bookkeeper and the auditor go over the situation and whittle out little plugs to stop up business leaks. The auditor found a lot of things on his first visit to the garage. When he got through he showed Price that his business was like a sieve—an old, worn-out sieve at that. It wouldn't hold half-inch nuts.

This auditor inaugurated a business system and helped put Price on the way to being a business manager, and today Price keeps his hands out of the grease and dirt and lets the salesmen make most of the sales, while the "boss" acts as a manager. He learned well the lesson that the highest paid job is that of manager and that the proprietor of a place of any size doesn't

Digitized by Google

effect any economy by neglecting his managerial duties and taking the place of a floor boy in filling "gas" tanks.

The leaks that the auditor stopped were the flagrant ones, but every little while he stops another. Not long ago the auditor checked over the figures for oil bought and sold and discovered that there was a leak somewhere; every barrel of oil became less than a barrel when it was sold to the garage's customers. It might never have been noticed had not the auditor trotted out the figures in support of his statement.

Having demonstrated this, he and Price began an investigation. The answer was so simple as to appear trivial. Under a row of four cocks for different oils was a long trough which caught the drippings from the faucets. By the time the four cocks had dripped a gallon into this trough the mixture was no particular kind of oil, and was thrown away. The trough was replaced by four ordinary tin pails, and now when a pail collects an appreciable quantity it is filtered back into the barrel from which it came.

Found Cotter Pins Constituted Leak.

The auditor got to digging around among the bills one day and asked Price how much he got for cotter pins. Price said he didn't know—in fact, didn't believe he got anything for them. The auditor then told him how much he paid a year for these little pieces of metal and asked him how and where he ever got this money back. As a matter of fact, Price wisn't getting the money back; it was a loss.

With the auditor Price went over various bills and items and arrived at a solution. Now when a repair job leaves the shop the bill carries an item of 25 cents for cotter pins and several other little items of this sort. The amount spent in a year for pins and the number of repair jobs in a year helped arrive at this figure.

At this juncture it is not inappropriate to ask any dealer, "How much does your free inspection and service cost you?" It costs the Elizabeth Automobile Co. $6 a year per car; the $6 is not of so much importance as is the fact that Price knows what the cost is. Service may easily be made a business leak, but Price figures that out of this he gets a good, big $6 worth of advertising.

Outside of announcing the arrival of new cars, Price does little newspaper advertising; he considers his owners his greatest advertisement ,and what the Motor World man saw in the garage one morning bears out the statement. Everybody seemed to smile. Price smiled, the customers smiled, the bookkeeper smiled, the salesman smiled, the workmen smiled, a little tot who went by the door looked in and smiled at the proprietor and a mongrel dog which poked his head in the door did the best he could—anyway, Price smiled at the dog.

Inspection Card Insures Thoroughness.

The why of it is that Price does his best to keep his owners feeling good; every month each owner, during the first year of his ownership, gets a card asking him to have his car inspected. The workman who inspects fills out a "monthly inspection card" which covers everything about the car. New prospects generally are secured from owners and it is not uncommon for an unknown man to send in his check and ask how soon he can get a car.

Several of the company's customers are physicians. One day a patient said he thought of buying a car which lists at less than $1,000. "If you buy that I won't treat you another day," asserted the physician.

"Why?" demanded the patient.

"Because; your heart isn't good, and if you get that car you'll jolt yourself to pieces. You go down to Price and get a car; you can afford it. You're an old man and you'd better take my advice. I mean it; if you get that other car I won't treat you."

The old man is now one of Price's most satisfied owners, and there are other instances of how the company's customers have pushed business in his direction.

Has Built Up Loyal Force of Workers.

Apart from things exterior, a notable achievement has been consummated by the Elizabeth company in the loyal shop force which has been knitted together; some of the men have been there five and six years and seem satisfied to remain. There is no soldiering, no hanging back in the harness, and the organization affords a fair sample of what team work can be.

"How did I do it?" Price repeated the question. "I have been a long time at it. I have had to pick, choose and work. When I got a man I wanted I tried to keep him. There's one boy I brought down from the Catskill mountains and have had with me ever since. I have tried to make the men

see that whatever the business becomes is due to them, and they know that as the business progresses they will progress. Whenever a man deserves a raise he gets it, and I make it a point to know how they are getting along. But two men ever asked me for a raise, and I let them go.

"There's one man there who gets a $2 raise tonight. He gets $28 a week now and he won't know until he opens his envelope that he's to get $30. One man who found a raise in his envelope brought back the $2. He said he was satisfied and didn't want any more. Can you beat that? Lots of times I have to go out in the shop after 6 o'clock and drive the men home, they are so interested.

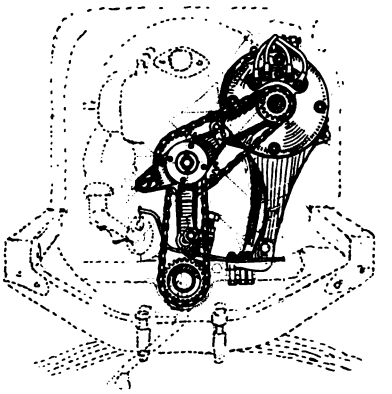
Methods of Keeping Men Feeling Good.

"They are very loyal and interested. I try to make them feel that the fact that circumstances have made me the 'boss' doesn't make me any better than they are. Occasionally I buy a row of seats and we all go to the theater, or we have a dinner. I do my best to show them I appreciate their work. They get along well together, too. They run baseball pools in the summer, and if they want to buy raincoats, for instance, they put in so much apiece every week and every week someone gets a raincoat."

As a means of aiding the men in becoming more efficient, a system of marking up jobs and time is employed. On a blank, which is illustrated herewith, the workman marks the time, owner of car and a letter which describes the work he has been doing.

Letter Key System That Saves Time.

The use of 18 letters saves time the workman would have to spend in writing down the task. The letters and the jobs they indicate are: A, battery charging; B, cash job; C, changing tires and tubes; D, changing springs; E, demonstrating; F, delivering car; G, driving—rentals; H, greasing; I, guarantee time (service); J, oiling; K, patching tube; L, shop work; M, shop repair; N, selling gas; O, selling oil; P, storage; Q, towing car; Z, miscellaneous. Thus—1, J. K. Brown, Q, means that the workman spent an hour towing in Brown's car.



The equipment includes an automatic air-compressor and a charging station, with a not large but sufficient machine-shop equipment. The front of the garage is of red brick, on which the signs are arranged in panels and well balanced across the front—a style in which there are great possibilities. The company has three competitors within two blocks but does not worry; whatever worrying is done is done by the competitors.

NORTH EAST MAKERS DEVELOP ELECTRIC SYSTEM FOR FORDS

Combined Motor-Generator Can be Installed by Any One Without Engine Alterations — Improvements in Other Apparatus.

Bearing the distinction of being the first manufacturer to do so, the North East Electric Co., of Rochester, N. Y., has quietly developed and now has placed on the market an electric lighting and engine starting equipment for Ford cars; furthermore, the application of the apparatus is so simple and the equipment so complete, it is pointed out by the makers, that no Ford owner need have any hesitation regarding his ability to make the installation himself.

The appearance of the apparatus as it is installed on a Ford engine is shown by

NORTH EAST FORD EQUIPMENT

the accompanying illustration, which makes plain that the whole apparatus consists of a chain sprocket which fits on the forward extension of the engine crankshaft, a bracket, two chains and the combined North East motor-generator; the battery that serves to start the motor and to furnish current for the lamps is mounted in a box on the running board or in any other convenient place.

Like all other electric lighting and engine starting systems, the North East is quite automatic in action once it has been installed. It differs from others, however, in that there is an arrangement of gears within the motor-generator casing, which are automatically shifted to afford the proper ratio between the engine and the electric unit according to whether it is used for starting the motor or for charging the battery. In operation, the unit becomes an engine starter instantly the starting button or pedal is depressed; when the engine has picked up its own cycle of operations and the button is released, the driving gears automatically are shifted and the unit becomes a dynamo and charges the battery. When the engine is stopped, the connection between the generator and the battery automatically is broken, thus protecting the battery and preventing it discharging itself through the generator.

Coincident with the development of the Ford equipment, the North East company has brought out a new form of combined lighter and starter which is direct driven instead of being driven through gears. It is adaptable to small four-cylinder motors having bores of less than four inches and is connected to the engine through a countershaft. For larger engines up to the largest "fours" and "sixes," the model B system has been revised and now is mounted on a gear box through which it carries on its functions; the connections are the same as those for the smaller model. A new switch also has been brought out in which provision is made for controlling both starting and lighting circuits. Owing to the construction of the switch, any or all of the lighting buttons can be locked either on or off in pairs or individually, thus precluding the possibility of any one other than the person holding the key tampering with the lights when the car is left unattended.

Special Unisparker for Ford Cars.

Apparently there is to be no end to the evolving of specialties for Ford cars. Probably the business will go on just as long as Henry Ford goes on turning out his little machines. The case in point, however, is that of the Atwater Kent Mfg. Works, of Philadelphia, which has designed an ignition system that any Ford owner can have—if he has the price—and which will, according to the makers, effect substantial improvement in the running of the motor and, taking the burden of ignition from the shoulders of the flywheel magneto, leaves it free to supply current for lights.

The outfit consists of a specially designed Unisparker with its bracket and the connections necessary to drive the shaft on which is mounted the elevated distributer, a non-vibrator coil which replaces the four Ford coils, switch and wiring. Current is taken from dry cells or a storage battery. The change can be made in about four hours, and the only tool needed is a screwdriver. Increased power, steadier running and great reliability are claimed for the system.

Very Little Gasolene—But Oh, My!

A good idea of the energy latent in gasolene may be gained from the fact that an explosive mixture contains approximately 1 part of liquid gasolene to 10,000 parts of air. But though the proportion of gasolene is small, the engine won't run without it.

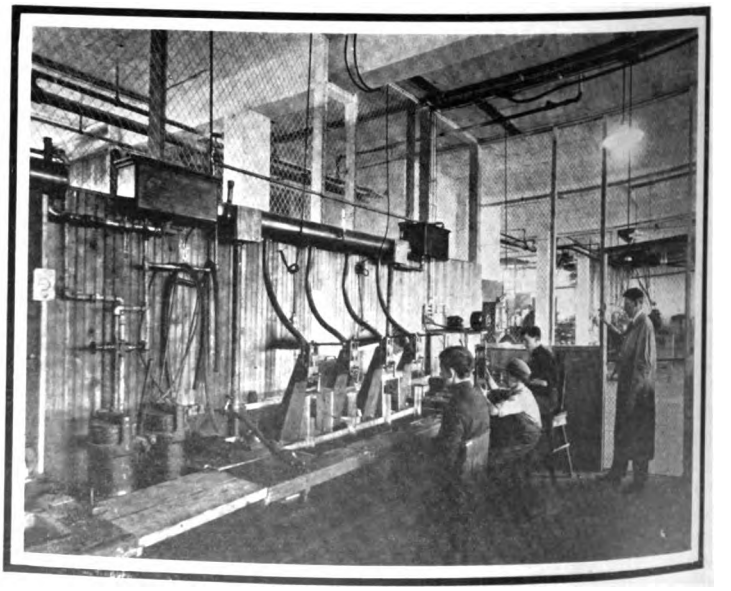
TROUBLE HUNTING METHODS IN UP-TO-DATE FACTORIES

How Water is Used to Ferret Out Faults that Escape the Eye—Fluid Flow for Measuring Spray-Nozzle Capacity.

It does not matter how careful a workman may be, how accurately his gauges and jigs are calibrated or how little of the human equasion enters into the building of an automobile; some parts out of the many that are built are certain to get past with imperfections that would make endless trouble in the future, or, at the very least, reduce the efficiency or the reliability of the cars of which they were component parts. For this reason the various testing processes that are in use in all factories where automobiles and their parts are manufactured are not only important, but indispensable; they are the detectives that ferret out things hidden from the eye and show up faults not otherwise discoverable before it is too late.

In a modern factory the testing operations are extended to include many parts that one might pardonably imagine did not need much testing after having been carefully inspected. To look at the water manifold of an Overland car one would not think, perhaps, that such a thing would have much chance to go wrong; yet every one of the thousands that are put into cars in the Willys-Overland factory in Toledo, O., is tested by itself.



The apparatus used for testing the water manifolds is shown in the accompanying illustration. One end of each manifold is clamped to a testing block with a rubber gasket under it; in other words, the end is blocked up watertight. The other end is then connected with a water main into which water is pumped at a pressure of 100 pounds to the square inch. The opening of a valve admits water to the manifold, and if there is the slightest leak anywhere it will be found out and betrayed by the escaping liquid, which will issue in drops or in a little jet according to the size of the hole. Cold water, be it said, is perhaps the most merciless agent known for showing up leaks, and is in general use for testing boilers and other structures subjected to pressure. While heat sometimes will help to stop a leak by causing the expansion of metal, the cold precludes this and if no leak shows under cold water pressure it is a sure sign that there is no leak at all. Moreover, in the case of the Overland manifolds, the testing pressure is so greatly in excess of the working pressure that leaks show up under test that would not develop in service for a long time, if, indeed, they ever came to light.

OVERLAND HYDRAULIC TEST FOR DEFECTS IN WATER MANIFOLDS

A very different kind of a test is carried out in another factory—different, though it is a water test and the water flows through holes. It is carried out in the plant of the Zenith Carburetter Co., of Detroit, and concerns one of the smallest, and yet one of the most important parts of the Zenith carburetter—the spray nozzle. The holes in the spray nozzles are designed to be of a certain fixed area; each hole must be of such size as to allow the passage of a certain amount of water per minute. If there is a very slight variation in the diameter of the hole there will be a very considerable variation in the flow of water through the nozzle, the area increasing much faster than the diameter. And it is obvious that there could be nothing but trouble from a lot of carburetters if the spray nozzles were not uniform in this respect.

So it comes that every single spray nozzle that goes through the Zenith factory is tested. The testing plant consists of a constant level tank mounted above a holder in which the nozzles under test are fastened. By having a constant water level a

WHERE ZENITH CARBURETTER JETS ARE TESTED WITH WATER

Digitized by Google

constant pressure is assured, and by using nothing but carefully filtered water a normally free flow is provided for. Under each nozzle holder there is a glass graduate into which the water is allowed to flow when turned on. A nozzle of a given size is calculated to fill the graduate up to a certain point in a minute—the time is carefully taken—and any nozzle that does not measure up to the standard is sent back and either made right or replaced if it cannot be improved.

This seemingly finicky exactness in the matter of spray nozzles is due to the most practical of reasons. Without uniformity of flow through jets of a given nominal size it would be impossible to predict, or to do anything but guess, at what might happen if a change of jets should be made in a carburetter, and the performance of two carburetters apparently identical might vary greatly because of a microscopic difference in the hole diameters. A tested nozzle, however, is something that can be relied upon; it is a known quantity, and if there is a lack of uniformity of action it can be looked for in other directions to the saving of time and trouble.

Inspection of Lamps that is Needed.

Just because electric head and side lamps are lighted and extinguished from the driver's seat is no good reason why they should be neglected for weeks on end. According to the investigations of an illuminating engineer, the efficiency of the electric lamps in a large factory was increased as much as 15 per cent. by periodic washing of the bulbs. Incidentally, the lamp fastenings should be examined from time to time to make certain that they have not worked loose through the effects of vibration.

ARGO COMPANY DEVELOPING STORAGE BATTERY TRACTOR

Powerful Machine Has Short Wheelbase and Battery Weight on Driving Wheels—Steel Tired Trailers Reduce Tire Expense.

The tractor principle—the idea of using power to haul loads on trailing vehicles rather than to carry them on the power truck itself—appears to be gaining adherents, judging not only by the increasing number of trailers in service, but also by the number of manufacturers who are trying out experimental outfits of the tractor types. Among the more important firms working along tentative lines is the Argo Electric Vehicle Co., of Saginaw, Mich., which, though not yet ready to market a tractor, is actively engaged in the preliminary experimental work, and, in fact, has practically perfected its machine.

As the accompanying illustration clearly indicates, the Argo tractor, in its present stage of progression toward commercial perfection, is a tractor pure and simple, with no provision for load-carrying. The wheelbase is very short, for the simple reasons that the body space permitted by a longer wheelbase is not required and that a short wheelbase economizes space and permits maneuvering in restricted places and rapid handling under all conditions. A long wheelbase tractor with a drawbar and a trailer behind would take up an unnecessarily great amount of room. What little platform space there is on the Argo tractor is occupied by the battery, which thus is brought directly over the driving wheels, where its very considerable weight is turned to account in affording the traction necessary for the application of power to move heavy loads.

The battery on the platform is in the most accessible position possible, and, barring the necessity for changing batteries instead of waiting for a fresh charge, or removing them altogether for overhauling or the like, can be left on the tractor indefinitely. Inspections and tests can be carried on just as well as if the cells were on the bench or the floor. The battery in the tractor illustrated consists of 40 cells of 17 plates per cell; the motor is a Westinghouse and the axles are Timkens.

The trailer is of the conventional horse-drawn truck type, in a general way. It is connected to the tractor by a drawbar that is jointed at both ends, the joint at the tractor end having lateral play and that at the trailer end vertical play, so that while there is motion enough to prevent jamming and binding on rough roads, there is sufficient rigidity to cause the front wheels of the trailer to follow the turns of the tractor. The tires are of steel, and this brings up the important advantage that the load on the rubber tires of the tractor is a constant load, barring the load imposed by the application of power from the motor, and is comparatively light, while the heaviest and the most variable loads are carried on the steel tires which, of course, cost far less to buy and to maintain than the rubber tires.

SIDE VIEW OF ARGO ELECTRIC TRACTOR SHOWING BATTERY WEIGHT OVER DRIVING WHEELS

Where Hammer Should Supplant Wrench.

If a nut is obstinate and will not yield to the wrench, or if the wrench is not a good fit, it is far better to remove the nut with a hammer and a blunt chisel or a punch than to spoil the wrench. It is a much smaller matter to get a new nut than a new wrench if the nut is spoiled.

RECENT DEVELOPMENTS in ACCESSORIES

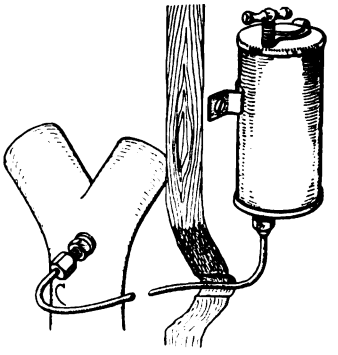
To Keep Warm Ford Driver's Hands.

Driving a car with cold-numbed hands does not rank high among agreeable pursuits; but there are thousands who do it—and not because they like cold hands, either. The Warm Hand Steering Wheel Co., Inc.—the "Inc." has been acquired recently, though the company has been making its devices for some time—makes its business the mitigation of digital chilliness, manufacturing steering wheels incorporating electric heaters, and its latest product is an improved special type for Ford cars. A factory has been established at Poughkeepsie, N. Y.

The Ford hand-warmer is built into a steering-wheel rim adapted to be put in the place of the regular Ford rim. The heating device consists of a coil of resistance wire wound around the rim; the wire is insulated and enclosed in a metal tube so that it is thoroughly protected and there is no possibility of the driver receiving a shock. There are two such coils, at points where the hands habitually grip the rim, and they are sunk so that they do not increase the diameter of the rim. The two coils are connected by a wire that runs in a groove on the inside of the rim. One end of the heating wire is connected to a plate that comes under the end of a spoke of the spider when the rim is in position, thus establishing a ground connection; the other end terminates in a socket into which fits a plug terminal on a flexible cable which, at its other end, is connected to the magneto. Beside the terminal socket referred to is a similar socket which, however, is a "dead end"—that is, it is insulated from the circuit completely, so that if the plug is transferred to it the current will be cut off. The current consumed is said to be so small as to have no effect whatever upon the ignition function.

WARM HAND WHEEL FOR FORDS

Woodworth Develops "Double-Grip" Tread.



A most seasonable offering designed for cars that are used throughout the winter is a non-skidding tread of special construction that is designed to give traction under the worst possible winter conditions. The tread is the latest product of the Leather Tire Goods Co., of Niagara Falls, N. Y., and bears the Woodworth name. Its general appearance is shown in the accompanying illustration.

The feature upon which the makers lay special emphasis is the rivet or stud that does the gripping. It is of steel with a comparatively small projecting center brought to a rounded point and hardened; the outer edge of the body of the rivet, at the base of the projecting center, is raised, so that when the center wears down the sharp rim takes hold and prevents slipping—which gives rise to the name "double-grip" which is applied to the stud. The studs are closely placed and are clinched through a base of soft material made up of an outer layer of chrome tanned grain leather treated to keep it permanently soft, three plies of treated Egyptian cotton fabric, and a thin inner strip of leather to hold the rivets firmly in place.

WOODWORTH "DOUBLE-GRIP" TREAD

Like all other Woodworth treads, the new non-skids are held in place by strong springs having a tension that takes up the inevitable stretch of the leather as fast as it occurs. The makers state that these springs, which are patented, are vital to the success of the tread. It is intended that the treads should be left on the tires all winter, affording traction under all conditions; and by spring, when road conditions are better, the stud centers will be worn down and the sharp edges will act as ordinary non-skids. The treads, of course, offer high resistance to puncture.

INDIANA DASH PRIMER

Here's Simplicity in Priming Device.

It is difficult to start a cold engine on a cold morning, not only because gasolene is difficult to vaporize at low temperatures but also because cold vapor is less easily ignited than warm vapor. However, when a car has to be started with a hand crank and the carburetter refuses to give up a starting charge, the only thing to do is to prime the cylinders. The time-honored system of opening the petcocks and squirting in gasolene with an oil can still is in common use, though it never, even in its palmiest days, could be said to be particularly "popular."

A much better way, so far as results are concerned, and a much easier way, is to use one of the modern priming systems. One of the most recent of these is the Indiana primer, made by the Engineering Equipment Co., of Indianapolis, Ind., and shown in the accompanying illustration. There is little to explain, for the outfit consists merely of a little tank that is attached to the dashboard and a pipe and connections for leading gasolene from the tank to the intake manifold. A valve in the tank permits gasolene to flow to the manifold and supply a good, rich mixture until the engine warms up a little. The device also is useful for working kerosene into the cylinders for removing carbon deposits. The tank holds half a pint.

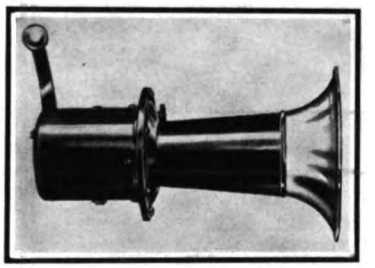
PROVIDENCE DEALERS STAGE SHOW IN JAPANESE GARDEN

Third Annual and Largest Exhibition Yet Reaches Even into State Armory Gallery—40 Brands of Cars and 12 of Trucks.

Spread out over the main floor, the whole of the basement and the gallery of the State Armory, the third annual show of the Providence (R. I.) Automobile Dealers' Association, which was opened on Saturday night, 22d inst., is by far the largest exhibit that ever has been staged in Rhode Island's largest city. All told, 40 brands of pleasure cars are staged on the main floor; 12 makes of commercial vehicles are disposed in the basement, together with six different makes of motorcycles; and seven exhibitors of accessories occupy the balcony.

In the matter of decorations, those who had charge of affairs reached out across the sea for inspiration and adapted scenes from the land of cherry blossoms for both main floor and basement. In other words, both stages, if such they may be termed, have been metamorphosed into Japanese gardens, the effect being heightened "up stairs" by an immense oil painting done on silk which hangs at the back of the hall. The complete list of exhibitors is as follows:



Pleasure cars: Whitten Motor Vehicle Co., Abbott-Detroit and Herreshoff; Pugh Bros. Co., American, Palmer-Singer, Overland and Maxwell; Adams & Knight, Apperson; Aetna Bottle & Stopper Co., Buick; Cadillac Auto Co., Cadillac; Davis Automobile Co., Chalmers, Winton, Regal and Locomobile; Wm. H. Fuller, Cole; E. E. Whipple, Detroiter; Fiat Motor Sales Co., Fiat; Wallace L. Wilcox Co., Franklin; L. N. Lorimer, Hudson; Lister, Smith & Welsh, Jackson and Paige-Detroit; Thos. B. Jeffery Co., Jeffery; King Motor Co., King; Nock Auto Co., Kissel; Hitchcock-Banks Motor Car Co., Knox; Providence Motor Car Co., Mercer; C. K. Setchel, McIntyre; P. S. Clark, Oakland; E. A. Sontag, Oldsmobile; Packard Motor Car Co., Packard; Peerless Motor Car Co., Peerless; Foss-Hughes Co., Pierce-Arrow; Herbert E. Bradford, Pilot; Pope-Hartford Auto Co., Pope-Hartford; John O'Donnel, Premier; Wm. Hughes Co., Reo; Capitol Motor Car Co., Stanley Steamer; J. E. Newton, Stevens-Duryea; Goodwin-Sherman Motor Car Co., Studebaker; Kendall Garage, Stutz; White Automobile Co., White.

Commercial vehicles: Pugh Bros. Co., Federal and Willys; F. B. & A. W. Hopkins, International; R. S. Longley, Kelly; Nock Auto Co., Kissel; Hitchcock-Banks Motor Car Co., Knox; U. S. Mill Supply Co., Mais; Packard Motor Car Co., Packard; Peerless Motor Car Co., Peerless; Pope-Hartford Auto Co., Pope-Hartford; Stanley Motor Carriage Co., Stanley steamer; White Automobile Co., White.

Sparton Adds Hand-Operated Signal.

If the inventive powers of designers of mechanically operated horns were to fail there would not be much cause for surprise, for the number and variety of horn designs that have been worked out is little less than phenomenal. But there appears to be no lack of fertility in the field, for there just has appeared still another hand-operated horn that embodies unusual features and has certain claims to advantages all of its own.

The horn, the "Sparton-Echo," is the latest member of the Sparton family, and the Sparks-Withington Co., of Jackson, Mich., which produces it, has been engaged in bringing it to commercial perfection for some little time. As the object of such a

SPARTON-ECHO LEVER HORN

device is to make a noise, the first claim made for the new horn is that it will emit a sound said to be equal to that of the motor-driven horn of the same make. And having established this fact, the makers go on to say that the way in which the noise is made—or, rather, what the operator has to do to make the horn work—is particularly deserving of commendation. There is a simple lever, as the accompanying illustration shows, projecting through the top of the casing at the rear of the horn. Pushing the lever forward sets in motion the hidden internal parts that vibrate the diaphragm that produces the sound.

If the tone of the horn is not just what it ought to be, or if the driver wants to change it for any reason, he can make adjustments from the outside with a screwdriver; the horn doesn't have to be taken apart for the purpose. Durability has been provided for by hardening all the wearing parts, and the makers state that no gears of any kind are employed in the "works." Two models are in preparation; model J, which will cost $7, and model B, the price of which will be a dollar more. Deliveries will commence about December 1st.

TAKING CHANCES ON THIEF MAKES INSURANCE CHEAPER

Eastern Rates Lowered by Elimination of Theft and Valued Policy Clauses—Damage Limit of $25 Takes a Different Form.

Alterations in rates relating to theft, damage and valued policy clauses have been promulgated by insurance companies operating in the eastern part of the United States, to take effect December 1; one change effects a lower rate by the elimination of the theft and valued policy clauses and another deals with a "$25 deductible average."

Should the owner of a car care to forego the right to a specified sum of money in the case of damage and permit the insurance company to make good only whatever loss—excluding theft—is sustained, the car owner can secure a policy at a reduction of approximately ¼ of 1 per cent. The new rate ranges from 1½ for new cars above $3,500 to 2 per cent. for those below $1,500. "Last year's cars" are rated at 1½ and 1¾.

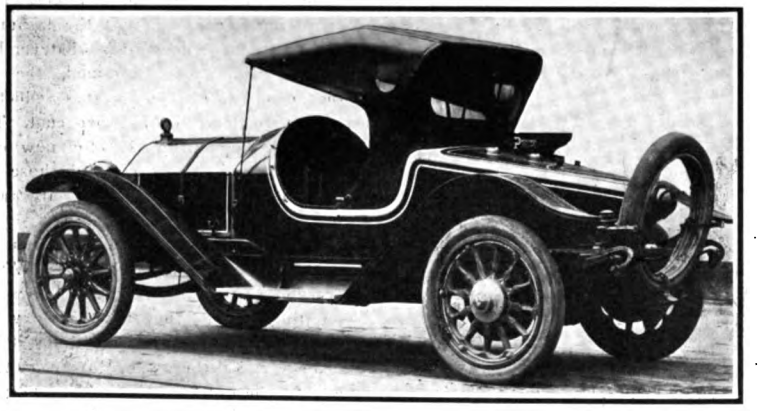
New policies covering damage to a car have been altered in this respect: Where the companies formerly paid losses "if amounting to $25" they now will pay "in excess of $25." Under the old policy if the damage was $20 the owner got nothing; if it was $35 he got $35. Under the new policy, if it $20 he gets nothing and if it is $35 he gets but $10.

There has been provided, however, a new clause which enables the car owner to secure full coverage for all losses by the payment of an additional $15.

Small Welding Outfit Developed by Cox.

To meet the growing demand for small, complete welding outfits that can be operated by the average owner or garage mechanic, the C. x Brass Mfg. Co., of Albany, N. Y., just has placed on the market an outfit of the kind. The purpose of the apparatus is to permit any one with average mechanical ability to repair small broken metal parts and thus to save the expense of having them done in a repair shop. Obviously, the outfit is just as applicable in a repair-shop, however. The apparatus is so arranged that it can be used with any acetylene gas tank.

May Manufacture Trucks in Florida.



The Haney Fire Apparatus Co., of Tampa, Fla., is reported to be making ready to take up the manufacture of motor trucks and automobile pumps. At present, the concern maintains a foundry and machine shop.

SPECIAL TOP FITS CRUISER FOR BAD WEATHER VOYAGES

Pathfinder Roadster Made an All-Weather Car by Addition of Protection for Passengers—Top Had to Be "Tailored."

The amply powered car of the roadster type has not a few qualities that make it a fine machine for use at all times and under all conditons where an automobile can be used at all. There is little pleasure, however, in driving a car in the rain, no matter how well it may behave so far as road conditions are concerned. Logically, therefore, there should be some means for protecting the occupants, and the Motor Car Mfg. Co., of Indianapolis, Ind., has taken this view of the matter and provided a special top for its Pathfinder "cruiser."

PATHFINDER CRUISER MODEL FITTED WITH ITS SPECIAL TOP

While it is easy enough to say "Put a top on the car," the doing of it is "something else again." There apparently are no standard or stock tops suitable for such service, so the Motor Car Mfg. people had to design one especially for the Pathfinder. Bows were bent to suit the car and the cloth was "tailored" to fit. Just how the car looks with its new hood can be seen from the accompanying illustration. The picture does not show the storm curtains, which are made to fit snugly all around, completely protecting the passengers. The effect of the top is quite in keeping with the character of the car as a whole, and certainly does not detract from the appearance that helped to gain for it the name of "cruiser."

Goodyear Takes Over Standard Protector.

Arrangements recently have been completed whereby the Standard Tire protector, made by the Standard Tire Protector Co., of Akron, O., has been taken over by the Goodyear Tire & Rubber Co., of Akron, which now is making and marketing the device. The protector has proved its worth in actual service, which fact, coupled with the Goodeyar company's position in the matter, goes far to stamp it as an accessory of no little value.

The Standard protector takes the place of the ordinary retread. It differs from it, however, in essential features. It is not vulcanized to the tire, and so the tire is saved from the slight over-curing which is said to result from the vulcanizing process necessary in ordinary retreading. Further, it is not only a separate thing from the tire, but it is not subject to direct air pressure and acts as a cushion for the casing to prevent cuts, stone bruises and blowouts. It is said that a puncturing point usually will glance off before reaching the tire proper, so that the Standard protector wards off a large percentage of possible punctures. If a tire that has been newly retreaded gives way the new tread is a dead loss, whereas if the protector is applied instead of a retread, the failure of the tire does not involve the loss of the protector, which can be transferred to another tire.

Hearse Chauffeur Arrested for Speeding.

Even if you die you can't get away from the traffic "cop."

Owen Wister was generally accredited with having established a record for speedy funerals in the Virginian, but a New York chauffeur now lays claim to the record; the chauffeur, Christian Frickey, was driving an automobile hearse through Long Island City last week with a somber line of cars behind, when a policeman stepped out into the street and told Frickey that was no way to go to a funeral. The chauffeur protested against being thus held up, but the adamantine arm of the law put in a charge of 35 miles an hour and the chauffeur—or his employer—paid.

ARE RUNNING GARAGE THAT NEVER OFFICIALLY STARTED

When Bridgeport Garagemen Ask Permit to Add to Building They Are Told to Get Permit to Build it—Queer Situation.

The proprietors claim they asked the alage, which is located on State street, near West avenue, Bridgeport, Conn., are in a peculiar situation. They want a permit to enlarge their garage and have been informed that they must first get a permit to open the garage; inasmuch as the garage has been in operation some time, they want to know "where they get off."

The proprietors claim they asked the aldermanic committee having such matters in charge for permission to open a garage last summer and were told to go ahead, "that everything would be all right." They went ahead, but everything isn't all right.

The records in the office of the city clerk show that the aldermanic committee never reported on the application of the proprietors of the garage, and as a result the application for a permit to maintain their garage was never brought before the aldermen.

The proprietors did not realize that anything was wrong until they decided to build an addition to the place and asked Alderman Malcolm MacFayden of the committee on fire department to see that they were given permission to make the addition. Mr. MacFayden, it is alleged, replied that his petitioners would have to get a waiver of opposition from all the surrounding property owners.

Since that time nothing has been done in the matter and the proprietors of the place called at the office of City Clerk Robinson for information, only to find that they were violating a city ordinance by operating their garage and that before they could be given a permit to enlarge their place of business they would have to first receive permission to operate the business.

It was also explained to them that the matter could not be taken up by the board of aldermen until after the meeting of December 1.

Helping Carburetter on a Cold Day.

A scheme that has been used to start a balky motor or to get going in cold weather is to blow gasolene into the air intake of the carburetter with an ordinary atomizer, removing the rubber bulb, however, and replacing it with a rubber tube through which someone blows while the engine is brisky cranked. The fine spray vaporizes much more readily than a priming of liquid gasolene.

PORTABLE ELECTRIC DRILLS FOR GARAGE USE

Practical Utility of Power-driven Garage Tools and Their Superiority Over Hand-operated Ones—Saving Time by Drilling at the Point of Assembly—Several Types of Boring Devices Described.

"Take the tool to the work," rather than take the work to the tool, is the spirit that animates modern industrial occupations, and it is a spirit that is equally applicable to the average automobile garage, regardless of whether much work or little is turned out.

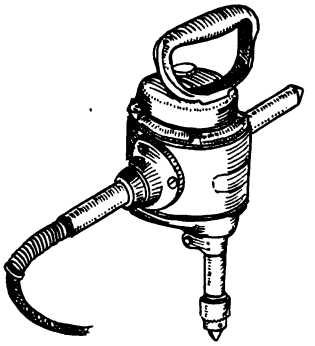
As a concrete example in point, the experience of one well-known repair-man who has seen the light of the times and equipped his shop with all the modern appliances he can use, is interesting and instructive. A car was placed in this man's shop and the order entered for some machine work on the bottom of the crankcase—work which normally would have required that the engine be disassembled, the part removed and properly fastened in a stationary drill and the engine afterward reassembled. But under the new order of things the car was merely jacked up so that a workman could crawl beneath it with a portable electric drill; the work was done in a mere fraction of the time that ordinarily would have been needed. The repair-man received good pay for the work and he saved his customer a whole lot of time, to say nothing of creating an abundance of that valuable asset, good-will.

As an example, this particular case is an excellent one, for it makes plain at once the practical utility of the tool and the foresightedness of the garage proprietor in equipping with it. He did considerably less work to accomplish a given end than John Jones would have done with his antiquated hand methods; therefore he immeasurably increased the efficiency of his shop. Do you suppose the garage man would part with his electrically driven drill after such an experience? In another case, a manufacturer drilled 120 two-inch holes in a large casting, weighing several tons, at the point of assembly, at one-fifth the previous cost because he avoided the necessity for handling the casting and locating it beneath a drill press; in addition, the machine shop and equipment was available for other work while the drilling was going on.

FOUR DIFFERENT TYPES OF ELECTRICALLY-OPERATED PORTABLE GARAGE DRILLS

Plenty of Portable Power Tools.

There are on the market at present an almost unlimited variety of small, portable, power-driven tools that have been designed to increase shop efficiency by replacing hand labor and thereby increasing production three or four times. Among them, the power-driven drill stands preeminent as the tool of greatest utility to the garageman and the repair-man. A drill every repair-man must have; it rests largely with himself whether it is to be a hand-operated device, slow and inefficient, or a power-driven one which is fast and which does a greater proportion of the work than does the other.



Of themselves, such drills are simple; qualifying adjectives are not necessary to describe the simplicity. The drill is inserted in the chuck and applied to the work; the pressure of a button starts the motor, and in less than half the time required with a hand drill the work is finished. Obviously either compressed air or electricity may be used for power, though electric machines far outnumber pneumatic ones; incidentally, the electrically-operated drill undoubtedly is less complicated than the other and probably is much more convenient for use in the average garage, for few garages are without electric lights and, on the other hand, few have compressed air equipment.

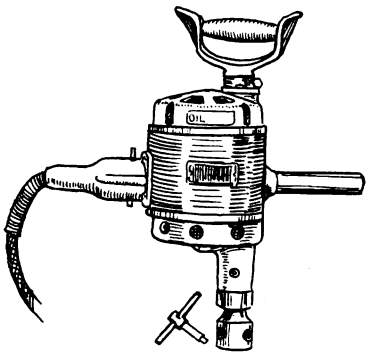
The variety that obtains in the construction of such devices is very great—probably much greater than the average person imagines—though it is essentially a difference of details rather than a difference in principle. Some drills are very small and some are quite large enough to take the place of all but the very largest drill press; some operate on alternating current, some on direct current and some on both, the latter being known as universal drills. Most important of all, perhaps, is that none of them are expensive either to operate or to purchase. For the most part, those who manufacture such devices produce them in a variety of sizes and styles, though obviously it would not be possible to illustrate and describe all in an article of the length of this one. Hence, only those that are deemed particularly suitable for the use

Digitized by Google

of the average garage or repair man are illustrated.

Along with a comprehensive line of pneumatically-operated tools of various kinds, the Chicago Pneumatic Tool Co., of Chicago, Ill., also produces Duntley electric portable tools scarcely in less variety, and among them the "midget" drill that is illustrated herewith is of a type that should prove almost worth its weight in gold to the up-to-date repair-man who uses it intelligently. In the first place it is exceptionally small and light—it weighs only six pounds and can be covered completely with one hand. In the second place, it is a veritable glutton for work and will operate with equal facility on either alternating or direct current.

GENERAL ELECTRIC TYPE



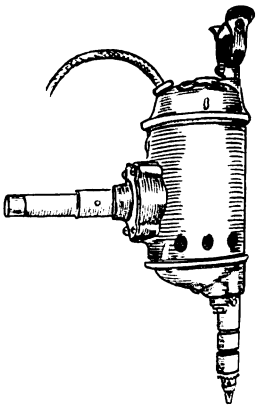
Current Conditions That Govern.

This current feature, by the way, is an important one, and should be borne in mind by intending purchasers of electrically-operated tools of any kind. Tools designed to operate on alternating current will not run on direct current and vice versa; similarly, in order to fill orders intelligently, the manufacturer must know the exact voltage upon which they are to be operated, and if it is alternating current, the number of cycles or alternations a minute. The voltage generally can be ascertained by examination of any electric light bulb, for most of them have a "sticker" on them giving this figure. If the voltage is not more than 110, the quickest way to discover whether it is direct or alternating is to place two fingers across the socket connections; alternating current will give a distinct though harmless shock; direct current will give little or no shock. The method should not be tried with voltages higher than 110, however. Otherwise, the simplest way to ascertain the characteristics of the current is to telephone the central station. One other point: Alternating current motors are constructed to operate on either single phase or double phase current; this factor can also be obtained from the central station and must be incorporated in the specifications to the manufacturer of the tool.

To get back to the "midget" drill: When operating at maximum capacity, the normal speed is 1,500 revolutions a minute, and it will drill holes in metal to 3/16 of an inch in diameter or in wood up to 5/16 of an inch. The chuck will accommodate drills having straight shanks up to 3/16 inch in diameter. The approximate energy consumption of the drill at full load is 160 watts, and as 746 watts represents one horsepower, it can be rated at approximately ⅕ horsepower.

Speed Automatically Regulated.

Most drills of the kind have what virtually amounts to automatic speed control. Which is to say, the larger the drill used up to the capacity of the machine, the slower will be the speed. In words with more of an engineering ring to them, the machines have "series speed characteristics." That is, their torque increases with the load. With a small drill in use, the speed is high; with a large drill the speed of rotation is correspondingly lowered through the inherent characteristics of the motor.



AMERICAN TWO-SPEED DRILL

The United States Electrical Tool Co., of Cincinnati, O., is another maker that produces portable electric drills in a variety of sizes ranging from the little one that is illustratetd herewith up to a veritable monster that will drill two-inch holes in steel. The one that is illustrated weighs but six pounds and will hold drills up to 3/16 of an inch in diameter; the normal speed is 1,000 revolutions a minute. The construction differs from that of the Duntley in that the drill spindle is eccentric to the casing, a feature which permits the drill to be used close up in corners on occasion. Needless to add, there is gearing between the motor armature shaft and the drill spindle. The gearing, however, is completely enclosed and operates in grease. The tool is wound to operate only on direct current and can be supplied for either 110 or 220 volts. In other styles, both alternating and direct current can be used.

Willey electrically-operated garage tools, which are produced by the Jas. Clark, Jr., Electric Co., of Louisville, Ky., also are made in a variety of styles and some are made to operate on both direct and alternating currents. The one illustrated, however, is intended for use only with direct current and weighs complete just 6½ pounds. Despite its diminutive size, however, it will drill ⅜-inch holes in hard wood and ¼-inch holes in steel, the maximum horsepower of the motor being 1/10th. In this drill, too, the spindle is eccentric to the motor armature and is driven through gearing which is a patented feature. Other styles of portable Willey drills have capacities up to two inches in steel, though obviously for the larger sizes screw feed is necessary.

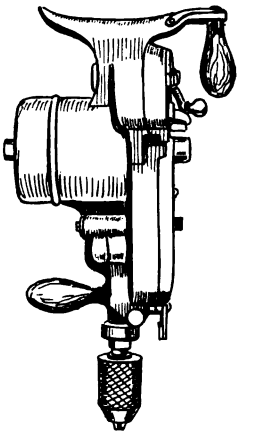
Variety in Shapes of Handles.

Quite as a matter of course, the General Electric Co., of Schenectady, N. Y., produces small electrically-driven shop tools as a part of its extensive line of motors and other electrical apparatus. The drill that is illustrated herewith is one of the smaller General Electric sizes and is particularly suitable for the ordinary garage. It is light in weight, so that it can be easily moved from place to place and can be supplied for either direct or alternating current of either 110 or 220 volts. In steel, cast iron and brass it will drill holes up to ⅜ of an inch in diameter—or ¼ of an inch working in wood. Its capacity, therefore, is slightly greater than any of the others. As ordinarily supplied, it is fitted with what is termed a spade handle, as is shown by the picture, though a breastplate is optional equipment. The equipment includes 10 feet of flexible cord and a Jacobs chuck.

CINCINNATI HEAVY DUTY TYPE

Two types of American electric drills are illustrated herewith, the essential difference between them being that one is a compara-

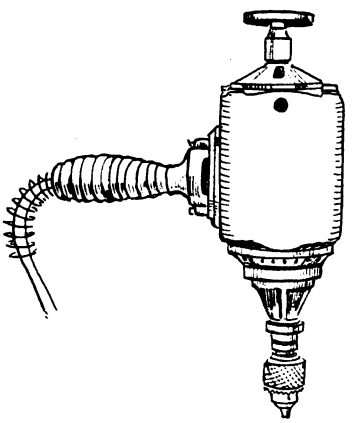
Digitized by Google



ively light model which operates at one speed and the other is a much heavier model which is fitted with a two-speed gearing to accommodate it to high speed work with small drills and lower speed with larger drills. Both are made by the American Electrical Tool Co., of West Newton, Mass. In the smaller tool, the drilling spindle is concentric with the motor armature, though in the larger one it is eccentric, thus permitting the use of the tool in restricted places. Another essential difference between the two tools is that the smaller will operate on either direct or alternating current, though the larger will operate only on one or the other, according to its construction. The smaller model weighs eight pounds complete and will drill ¼-inch holes in steel and ½-inch holes in wood, the normal speed being 900 revolutions a minute. The larger model weighs 23 pounds and will drill holes up to ½-inch in diameter in steel, the normal speeds being 350 and 650 revolutions a minute. The gear shifting to obtain the different speeds is accomplished by turning a thumb nut on the casing and the shift can be made while the drill is running.

Drills With Fans for Air Cooling.

The Cincinnati Electrical Tool Co., of the Ohio city for which it is named, is another company that produces electrical drills in considerable variety, the type illustrated being made in four sizes ranging in capacity from ¼- to ½-inch holes in steel; the largest size is fittted with a two-speed gearing, though the others operate normally at one speed—or rather at speeds which are varied automatically by the load through the characteristics of the motor. The drill spindle, as is made plain by the picture, is eccentrtic to the motor shaft and is in a direct line with the handle at the top. Both this handle and the other at the side are removable so that the drill can be used in close quarters on occasion. As is the case with many of the other drills, the Cincinnati can be furnished to operate on either direct or alternating current or on both. One of the distinctive features of the drills is that they are air-cooled, a small fan being mounted on the armature shaft.



The Temco portable electric drill which is produced by the Temco Electric Motor Co., of Leipsic, O., differs from any of the others in very nearly every respect, one of the principal differences being in the mounting of the motor and the method of drive. Instead of being mounted parallel to the drill spindle, the motor in the Temco is mounted at right angles to it and drives through spur and bevel gearing. Another excellent feature of the drill is that the motor is reversible, control being by means of a small switch which is on the casing within reach of the operator's thumb and finger. Because of this feature the machine can also be used for tapping.

In the arrangement of the chuck the manufacturers have adopted a method of

TEMCO MOTOR DRILL

construction which is unlike anything else of its kind and which makes for the highest possible efficiency. So that the chuck can be easily loosened or tightened without the necessity for using a wrench or a key, the whole lower portion, including the bevel gear through which the spindle is driven, can be "broken over," to use the maker's expression, the chuck then lying at right angles with the rest of the drill and having a squared portion of its shaft in a squared receptacle provided for the purpose. Another distinctive feature of the

DUNTLEY "MIDGET" MODEL

Temco is that provision is made for the mounting of a small emery wheel on the driving gear shaft. Thus, the workman can have at his hand a means for sharpening the drills that are being used. The Temco company also supplies a valve grinding attachment to fit the drill.

The overall length of the Temco drill, including the chuck, is but 15 inches and the weight of the whole apparatus is 11 pounds. Its capacity in wood varies from holes ½- to ¾-inch in diameter, and in steel it will drill holes up to ⅜ of an inch in diameter; in cast iron or thin sheet steel it will tap holes up to 3/16 inch in diameter. Under maximum load the energy consumed is about 200 watts and the speed of the spindle running idle is about 900 revolutions a minute. As is the case with many of the other drills, the Temco will operate on either alternating or direct current and is supplied for either 110 or 220 volts.

As the name of the manufacturer implies, the tool produced by the Valve Seating Tool Co., of Southport, Conn., is virtually two tools in one. It is both a compact electrically-operated drill with the drill spindle concentric with the motor armature and a valve grinding tool providing the necessary semi-rotary motion required for such work. As the illustration shows, the device is fitted with a convenient handle at the top and also with two side handles with which the operator can hold the tool securely when it is used as a drill. The motor is started and stopped by means of a small switch which is placed on the head of the motor casing. The gearing by means of which the rotary or semi-rotary motion is imparted to the drill or the screwdriver bit, as the case may be, is located in the chuck. The tool can be supplied to operate on either alternating or direct current and is furnished complete with the necessary plug and flexible cord for attachment.

Economy of Electric Drilling.

One feature of electrically-operated shop tools that is likely to be overlooked by the average person is that immediately the work is finished the cost of operating the tool stops. Hence, though the actual cost of operating such a device will appear on the monthly bill for current, its significance can only be gauged by balancing against it the cost of doing similar work with hand tools. Another feature is that with such tools, the shop is left clear; overhead shafting and belts are conspicuous by their absence; at the same time, their cost and their danger to operatives is eliminated.

Ball Valve Reseating Made Simple.

A ball valve seating that is leaky can be made perfectly tight again by the simple process of tapping the ball into the seat until the pressure makes a perfect joint. Of course, if the ball is of brass this is impracticable, as the ball would be as easily affected as the seat; but with a steel ball and a seating of softer metal it is a simple matter. If the ball is corroded or imperfect a new one can be substituted, and if it does not seat exactly right it can soon be made to do so.

WHY USE 30-HORSEPOWER TO PULL ONE-HORSE LOAD?

Contrasts in Motive Power That Look Queer but Are Easily Explained—What the Motor Does That the Horse Cannot Do.

The difference between a mechanical horsepower—the conventional unit of measurement of the energy developed by a motor—and the power of a flesh-and-blood horse has been commented upon often enough so that most people who are interested in matters mechanical understand that there is very little connection; that a horse actually can develop several times a conventional horsepower for a brief period, while there is no elasticity at all to a mechanical horsepower, any more than there is to the length of a yard-stick. Also it is more or less well known that James Watt, who was father to the horsepower—necessity for a unit of measurement was its mother—adopted the term and the figures to which it applies because he had no way of expressing the energy put forth by his steam engines and had to evolve a way of his own for doing so. But after all this has been more or less thoroughly digested there remains something that makes some people ask questions which they can't answer for themselves.

"There's an automobile delivery wagon out there," says one of the puzzled. "And on the brass plate on the front end is marked the carrying capacity—2,000 pounds. Now, what's the horsepower of the motor?"

"The motor is rated at 30 horsepower, but will develop something more than that when speeded up."

Different Powers for the Same Load.

"Well, never mind the power it will develop when speeded up. Let it go at 30 horsepower. Now look down the street. There comes a wagon that is loaded with one ton of coal, and there's one horse hitched to the front end of it. He doesn't seem to be having the slightest trouble moving the load along, does he? And he'll pull it right up the hill up the street without hurting himself a bit. Making due allowance for the fact that a horse can "turn up" five or six horsepower if he has a mind to, where do you get off with the 30 horsepower in the motor truck of the same carrying capacity? I know the motor wagon's faster, but I know that if that horse was to exert his five or six horsepower he could go a whole lot faster than he's going now. Now, how do you justify the use of that 30 horsepower?"

A motor of 30 horsepower, to take a common rating, certainly is plenty big enough for a one-ton vehicle; the work could be done with a good deal less. But there are very good reasons for the instalment of a motor of that size. To begin with, let it be understood that a motor having the same energy as a horse and installed in a one-ton wagon could do about what the horse does, and in very much the same way. By propelling the vehicle at the slow rate at which it is pulled by the animal the motor would be running at much less than its maximum power. By opening the throttle and increasing the power of the motor the speed would be increased to the maximum attainable by the horse—or even more, probably, for a motor is better for speed than a work horse. When climbing a hill the motor would have to do exactly what the horse does—pull very hard and move the vehicle very slowly. And just here it is pertinent to remark that the motor would be working right at the peak of its capacity, assuming the hill to be a fairly steep one, just as the horse would be doing, and that is something that is not conducive to long life and the best every-day results from either equine or engine.

Added Power Permits Greater Speed.

Suppose, now, that it is deseired to hurry up the one-ton load. It is possible to put on another horse, and so slightly increase the speed, especially on the hills; but beyond a slight increase it is not possible to go, for the simple reason that after the load on each horse has been reduced to a certain point two horses can't move any faster than one horse, any more than two men can run faster than one man. There is a slight gain due to the fact that the two horses will endure longer than one, but even this is of limited value.

With the motor things work out much better when power is increased. Speed can be "jacked up" until the vehicle moves just as fast as it is safe and practicable to move the load. Of course, it requires more power to do this than to move slowly, and if it is desired to maintain the same margin of power as the horse maintains—the parallel might as well be carried through—it is easy to see that the figures will grow rapidly. It is not at all desirable to make a motor work at the very top of its power any more than can be helped. To be sure, it often is done with a horse, but that is because horses have to be taken just as they come, and it pays better to overwork one horse occasionally than to greatly underwork two horses nearly all the time. It is easy, however, to make a motor sufficiently powerful without undue weight, so that it will be working well below maximum capacity all the time.

The extra power of the motor is necessary not to move the load on the level, which could be done at the best speed of the horse with a maximum power equal to that of the horse, but to maintain the proportionate speed increase on hills; to make possible rapid acceleration from a stand to maximum speed rather than the slow acceleration rate of a horse; to have power for getting the machine out of mud-holes or other bad places; and to insure that under all except the most unusual conditions the engine will be working well below its maximum power.

How Bad Roads Alter the Situation.

The power required for pulling out of bad spots in the road is something that demands special consideration. In the case of a horse and wagon, if the wagon is in the mud the horse usually is on comparatively firm ground, or can be put there if necessary. In the case of the motor wagon the vehicle and its power are all in the same boat, so to speak, and cannot be separated. Therefore the full power of the engine may be required to do what the horse might do with a good foot-hold. The fact that the motor vehicle carries the motive power helps to make it harder to pull out of a bog.

If people who use motor trucks were content to stick to horse speeds under all working conditions they could get along with motors of approximately the same power as actual horses. But a motor truck moving at horse speed with a horse load would satisfy nobody at all. Further, a motor differs from a horse in that, while nature does a great deal for the horse in the way of building up that which has been torn down by abnormal strains, a motor has to have a different kind of attention.

Business Man Desires to Save Time.

So there is nothing to be done but to make a motor of such capacity that it almost never will be forced to strain itself, so to speak. The initial cost of the comparatively slight additional poundage and the expense of carrying it around are considerably less than the expense of maintenance of a motor that is constantly kept going at something approaching its maximum power.

The whole thing simmers down to the fact that the chief aim of the business man is to save time, and in order to save time in the transportation of merchandise it is essential to have power. And while 30 horsepower sounds big as compared with even the maximum power of one horse, the difference really is small if the difference in the comparative efficiency of the two motors—one of metal and the other of muscle—are compared, as they inevitably are, on the books where profits and losses are set down.

National

Buy Service, Not Specifications

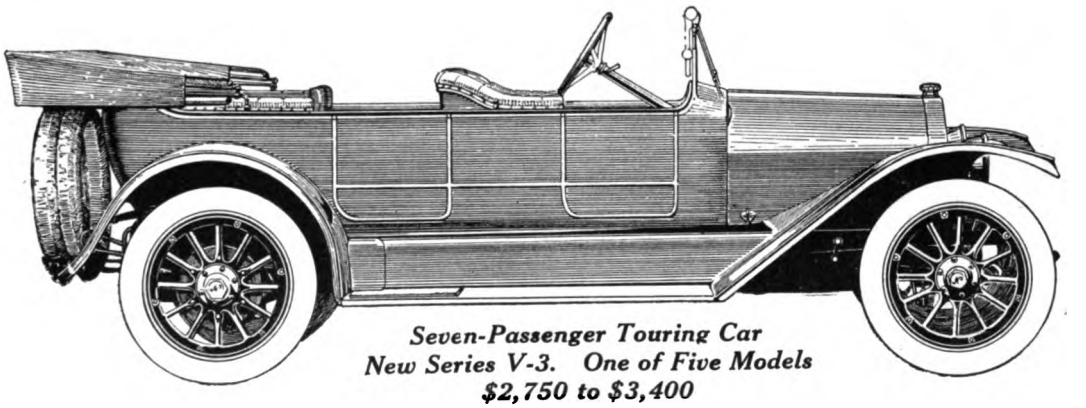
OUR Policy makes it possible to buy a National car as you do a reliable Watch, or a high-grade Piano. You want a watch to give accurate Time, and a piano because of its Quality. In other words, you buy a Watch and a Piano for Results—and not because of the particular individual parts that enter into their construction. You leave that to the makers.

OUR ambition is Quality. We take the responsibility for what enters into the car's makeup, while you need think only of its Performance.

JUDGE the National by what it can actually Do; how adequately and comfortably it Performs; and the Longevity of its efficient Service.

WE offer you a Whole Car where every mechanical part operates harmoniously to produce a Unit of satisfactory Results.

SPECIFICATIONS alone are misleading. An inferior car may have similar specifications, or similar parts to a quality car.



WE put the Right material in the Right place. Our experts devote their lives to this Duty. We take that Responsibility. You enjoy the Results.

WE give you a car you can buy without having to raise the hood to investigate; without worrying about its Insides and without bothering to make a detailed analysis of its various component Parts or Specifications.

ONLY a company of unimpeachable reputation, of sound financial standing, of reliability built upon years of success can make you this most Liberal Offer ever made by any automobile builder.

SERVICE, with us, begins when the car is built. Service is put into your car. This is why the National requires the least attention afterwards.

AND freedom from faults and complete abandon of worry about the mechanical operations taking place beneath your seat, can not be bought for less than the National.

Seven-Passenger Touring Car
New Series V-3. One of Five Models

1,065,413. Motor Vehicle. Eddy R. Whitney, Philadelphia, Pa., assignor to Commercial Truck Company of America, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Feb. 26, 1909. Serial No. 480,084. (Differential removable with axle casing cover.) 7 claims.

1,065,444. Vehicle Lamp. George G. Greenberg, Chicago, Ill. Filed Apr. 19, 1909. Serial No. 490,668. (Lamp for license holder.) 3 claims.

1,065,452. Apparatus for Hydraulically Storing and Delivering Hydrocarbon Oils. William G. Latimer, Detroit, Mich., assignor to E. B. Cadwell & Company, Detroit, Mich., a Copartnership. Filed Jan. 19, 1912. Serial No. 672,182. (Handling oil by water pressure.) 4 claims.

1,065,467. Muffler Cut-Out. Arthur Piel, New York, N. Y. Filed Apr. 13, 1910. Serial No. 555,255. (Muffler cut-out with flap valve.) 7 claims.

1,065,491. Regulator for Multiple Cylinder Engines. Edward A. Zolle, Minneapolis, Minn., assignor to Moore Carving Machine Company, Minneapolis, Minn., a Corporation of Minnesota. Filed June 3, 1911. Serial No. 631,185. (Governor for motor with separate charging pumps.) 13 claims.

1,065,498. Two-Part Fastener for Vehicle Tops, and the Like. Charles W. Beck, Rockville, Center, N. Y., assignor, by mesne assignments, to Michigan Motor Specialties Company, Detroit, Mich., a Corporation of Michigan. Filed Sept. 27, 1911. Serial No. 651,510. (Button recessed in fastening.) 2 claims.

1,065,503. Carburetter. John Byrom, Liverpool, England. Filed June 3, 1912. Serial No. 701,180. (Floatless carburetter.) 4 claims.

1,065,537. Vehicle Wheel. Andrew W. Livingston, Oakland, Cal., assignor to Standard Steel Wheel and Tire Armor Company, Oakland, Cal., a Corporation of Arizona. Filed Sept. 25, 1911. Serial No. 651,200. (Wheel with corrugated steel spokes.) 1 claim.

1,065,619. Explosive Engine. Raymond C. Mitchell, Springfield, Ohio. Filed Nov. 4, 1912. Serial No. 729,301. (Valve-operating mechanism.) 4 claims.

1,065,640. Fuel Vaporizing Device. John A. Thompson, Oskaloosa, Iowa. Filed May 10, 1912. Serial No. 696,397. (Electrically heated carburetter.) 3 claims.

1,065,668. Automobile. George W. Dunham, Detroit, Mich., assignor to Chalmers Motor Company, Detroit, Mich., a Corporation of Michigan. Filed Dec. 2, 1910. Serial No. 595,254. (Leather boot for closing pedal opening in footboard.) 1 claim.

1,065,700. Lamp Attachment for Automobiles. Robert S. Matheson, Lingayen, Philippine Islands. Filed Oct. 2, 1911. Serial No. 652,297. (Lamps movable with steering gear.) 4 claims.

1,065,708. Engine Starter. August C. Morgan, Groom, Tex. Filed July 13, 1912. Serial No. 712,551. (Pedal-operated ratchet starter.) 7 claims.

1,065,713. Resilient Wheel for Road Vehicles. James O'Reilly, Sr., and James O'Reilly, Jr., Hunters Hill, Sydney, New South Wales, Australia. Filed July 1, 1912. Serial No. 706,969. (Wheel with coiled springs around spokes.) 2 claims.

1,065,726. Adjustable Headlight. Henry E. A. Roche and Cleophas Roy, Hawkeshury, Ontario, Canada. Filed Sept. 19, 1912. Serial No. 721,289. (Headlights moving with steering gear.) 1 claim.

1,065,758. Device for Adjusting Tire Chains. William E. Woodwell, Pittsburgh, Pa., assignor of one-fourth to John K. Woodwell, Pittsburgh, Pa. Filed Dec. 9, 1912. Serial No. 735,627. (Clip for holding cross chains.) 7 claims.

1,065,784. Automobile Headlight Control. Clarence M. Crum, Hannah, N. D. Filed Oct. 1, 1912. Serial No. 723,382. (Headlights moving with steering gear.) 1 claim.

1,065,787. Repair Device for Pneumatic Tires, etc. Timothy C. Dobbins, Los Angeles, Cal. Filed Sept. 18, 1911. Serial No. 649,933. (Blow-out patch.) 12 claims.

1,065,795. Spring Tire. Porter C. Fox, Spokane, Wash., assignor to The Fox Company, Inc., Spokane, Wash., a Corporation of Washington. Filed Jan. 24, 1912. Serial No. 673,007. (Spring-backed tire.) 2 claims.

1,065,836. Inner Tube for Pneumatic Tires. Alfred Raymond and Albert Raymond, Washington, D. C. Filed May 26, 1913. Serial No. 769,867. (Three-part inner tube.) 4 claims.

1,065,849. Pneumatic Tire. George A. Shaw, Barberton, Ohio. Filed Oct. 22, 1912. Serial No. 727,241. (Pneumatic tire with metal band in tread.) 1 claim.

1,065,850. Starting Device for Engines. Henry M. Sheer, Quincy, Ill. Filed Nov. 22, 1912. Serial No. 732,974. (Ignition starter.) 16 claims.

1,065,854. Vehicle Sign. Venemon Lawrence Wallace, Salt Lake City, Utah. Filed Feb. 24, 1912. Serial No. 679,790. (License bracket and lamp.) 2 claims.

1,065,862. Electrical Igniting Device for Explosive Engines. Arthur R. Bullock, Cleveland, Ohio, assignor, by mesne assignments, to The Igniter Appliance Company, Cleveland, Ohio, a Corporation of Ohio. Filed Jan. 15, 1904. Serial No. 190,525. (Magnetic spark plug.) 10 claims.

1,065,886. Process of Producing Radiator Sections. Ivar A. Randel, Chicago, Ill. Filed Jan. 24, 1912. Serial No. 673,056. (Fusible core process for radiator manufacture.) 9 claims.

1,065,905. Steering Gear. Emil Gnoeth, Madisonville, Ohio, assignor to William F. Harmon, trustee, Cincinnati, Ohio. Filed June 3, 1912. Serial No. 701,422. (Double worm steering gear.) 11 claims.

1,065,915. Cushioned Wheel. Emilio Bronimann, Santa Rosalia, Chihuahua, Mexico. Filed Dec. 7, 1911. Serial No. 664,486. (Wheel with pneumatic cushions.) 1 claim.

1,065,916. Carburetter. Clement Brown, Birchfield, Birmingham, England. Filed Nov. 14, 1910. Serial No. 592,314. (Double piston throttle control.) 2 claims.

1,065,923. Igniting Mechanism for Explosive Engines. William F. Davis, Kansas City, Kans., assignor to McKeen Motor Car Company, Omaha, Neb., a Corporation of New Jersey. Filed Mar. 3, 1910. Serial No. 547,025. (Make-and-break ignition system.) 14 claims.

1,065,942. Vehicle Wheel. Ernest Hopkinson, East Orange, N. J. Filed Nov. 15, 1910. Serial No. 592,446. (Rim-fastening device.) 8 claims.

1,065,948. Carburetter. Gaston Paul Jean Lion, Levallois-Perret, and Auguste Eugene Brillie, Paris, France. Filed Dec. 5, 1907. Serial No. 405,259. (Exhaust heated carburetter for heavy fuel.) 9 claims.

1,065,949. Anti-Skid Stud. Maxime Lorme, London, England. Filed Nov. 16, 1912. Serial No. 731,890. (Rough-headed stud.) 2 claims.

1,065,959. Starting and Lighting Apparatus for Motor Vehicles. Morris Moskowitz, Montclair, N. J. Filed Dec. 13, 1912. Serial No. 737,485. (Electric starter and dynamo with friction drive.) 2 claims.

1,065,964. Gasifier for Liquid Fuels. Stanley H. Page and Charles J. Belden, San Francisco, Cal., assignors to Union Gas Engine Company, San Francisco, Cal., a Corporation of California. Filed Jan. 10, 1913. Serial No. 741,205. (Exhaust heated carburetter for heavy fuels.) 7 claims.

1,065,977. Carburetter. Elmer S. Smith, Boundbrook, N. J., assignor, by mesne assignments, to International Accessories Manufacturing Company, Wilmington, Del., a Corporation of Delaware. Filed May 27, 1911. Serial No. 629,864. (Carburetter with rotatable fuel receptacle.) 14 claims.

1,065,978. Tire. William Thomas Smith, Bolton, England. Filed June 24, 1907. Serial No. 380,571. (Tire of layers of canvas under tension.) 2 claims.

1,065,982. Vehicle Propelled by a Combination of Electrical and Mechanical Power. Willis N. Stewart, London, England, assignor of one-half to Frank Harris, London, England. Filed Jan. 19, 1909. Serial No. 743,143. (Gasolene-electric driving system.) 8 claims.

1,065,996. Transmission Gearing. Alfred N. Adams, Stockton, Cal. Filed Aug. 23, 1911. Serial No. 645,593. (One sliding gear meshing with successive gears of a cone.) 4 claims.

1,066,009. Wheel Runner. George E. Hersey, Cleveland, Ohio. Filed Sept. 4, 1912. Serial No. 718,534. (Sleigh-runner to fasten to automobile wheel.) 1 claim.

1,066,014. Engine Starter. Percy W. Hodgkinson, Rochester, N. Y., assignor of one-half to Jacob C. Lombard, Rochester, N. Y. Filed Apr. 20, 1912. Serial No. 622,418. (Manually operated ratchet starter.) 4 claims.

1,066,037. Automobile Horn. Nicoll C. Oddo, Middletown, N. Y. Filed Sept. 20, 1912. Serial No. 721,379. (Hand operated diaphragm horn.) 2 claims.

1,066,038. Automobile Horn. Nicoll C. Oddo, Middletown, N. Y. Filed Sept. 24, 1912. Serial No. 722,117. (Hand-operated diaphragm horn with automatic valve in bell.) 12 claims.

1,066,047. Spring Wheel. William J. Peterwe, Macy, Neb. Filed Nov. 27, 1912. Serial No. 733,3[illegible]. (Coiled springs under rim.) 3 claims.

1,066,062. Gas Engine Valve Mechanism. Martin A. Thiel, Mount Vernon, Ohio, assignor to The C. & G. Cooper Co., Mount Vernon, Ohio, a Corporation of West Virginia. Filed Sept. 22, 1910. Serial No. 583,298. (Combination of poppet and cylinder valves for regulating fuel admission.) 5 claims.

1,066,072. Motor Vehicle. Alphons Bonas, Coulterville, Ill. Filed Aug. 20, 1912. Serial No. 716,961. (Four-wheel drive system.) 5 claims.

1,066,124. Resilient Wheel. Harry Leap, Chicago, Ill. Filed Mar. 25, 1912. Serial No. 685,944. (Wheel with curved spring spokes.) 3 claims.

1,066,151. Liquid Level Controlling Apparatus. Rienzi Rice, Worcester, Mass. Filed Dec. 16, 1908. Serial No. 467,787. (Float controlled fuel valve for carburetters.) 3 claims.

1,066,160. Internal Combustion Engine. Joseph I. Stevenson, St. Louis, Mo. Filed Dec. 4, 1911. Serial No. 663,886. (Removable water-jacketed cylinder head.) 2 claims.

1,066,168. Explosion Engine. Louis C. Vanderlip, Elkhart, Ind. Filed Apr. 21, 1910. Serial No. 556,834. (Two-diameter cylinder.) 5 claims.

1,066,189. Apparatus for regulating the Pressure at Which Air is Blown Into Internal Combustion Engines. Ludwig Thaddaus Ebermann, Augsberg, Germany, assignor to Maschinenfabrik Augsburg Nurnberg, Aktiengesellschaft, Augsburg, Germany, a Corporation of Germany. Filed Feb. 27, 1913. Serial No. 751,179. (Air-control for fuel injection system of Diesel and like engines.) 6 claims.

1,066,191. Spring Vehicle Wheel. William H. Fahrney, Chicago, Ill. Filed Dec. 14, 1912. Serial No. 736,729. (Springs between inner and outer rims.) 3 claims.

1,066,228. Spring Wheel. Herschel A. Schermerhorn, Shabbona Grove, Ill. Filed Feb. 19, 1913. Serial No. 749,322. (Springs between inner and outer rims.) 2 claims.

1,066,235. Automatic Speed Controlling Means for Engines. Zoltan Tamassy, Cleveland, Ohio. Filed Dec. 4, 1911. Serial No. 663,707. (Centrifugally operated throttle governor.) 1 claim.

1,066,248. Starting Primer for Motors. Gilman W. Brown, West Newbury, Mass., assignor of one-half to Harriet L. Maddock, Haverhill, Mass., and one-half to Horace W. Brown, West Newbury, Mass. Filed Oct. 30, 1912. Serial No. 728,708. (Primer with separate fuel tank.) 18 claims.

1,066,255. Shock Absorber. Paul J. Cubbison and Robert G. McFarland, New Castle, Pa., assignors of one-third to Harry B. Cubbison, New Castle, Pa. Filed Aug. 15, 1911. Serial No. 644,150. (Hydraulic shock absorber.) 6 claims.

1,066,267. Vehicle Wheel. August Gerlert, New York, N. Y. Filed Aug. 7, 1912. Serial No. 713,781. (Wheel with curved spring spokes.) 2 claims.

1,066,269. Vehicle Curtain. Willard H. Goodfellow, Detroit, Mich. Filed Dec. 16, 1912. Serial No. 737,001. (Curtain construction for folding tops.) 5 claims.

The agent who tries to sell you a car equipped with an imitation of the L B A Battery and tells you it is "just as good," knows better.

Appearance cuts small figure. The imitation may look just as well as the L B A, but it's the "insides," the performance that counts.

Your Starting and Lighting equipment would be worth no more than junk without a reliable Storage Battery.

TUTO HORN

$15

LOOK FOR
Elyria-Dean
TRADE MARK
WHERE QUALITY'S SEEN

In the manufacturing of Elyria-Dean electrical products we doubly fortify our distributors with a salable accessory for which the demand is already created, and through our advertising and sales making campaign we place Elyria-Dean distributors in direct touch with automobile owners everywhere.

TUTO HORN

The ideal warning signal for all cars, formerly selling at $25 and now listing at $15.

The TUTO HORN is a distinctly TWO-TONE signal in all that the name implies. It performs every function of a warning signal intelligently and unfailingly.

Ordinary pressure on push button instantly sends forth an adequate danger warning which is sufficient nine times in ten. With other electric signals it is necessary to give minimum or maximum warning regardless of the conditions ahead.

To meet unusual conditions you simply press the push button way down and secure the harsh, abrupt car-coming warning which will instantly clear the road under any traffic conditions.

REXO HORN

$8

LOOK FOR
Elyria-Dean
TRADE MARK
WHERE QUALITY'S SEEN

In all things electrical the name Elyria-Dean carries a known guarantee of goodness and efficiency that is a valuable selling asset in competition. During the past year we made and delivered over 50,000 TUTO and REXO HORNS. During the coming twelve months we will outsell any other make or type of warning signal two to one.

REXO HORN

The big-little signal for medium and low priced cars. Built, tested and guaranteed to the Elyria-Dean standard and selling at $8. ready to attach.

The REXO HORN is at once the lowest priced high quality electrical warning signal in the world.

The construction, workmanship and finish is equal to any warning signal regardless of price. The warning signal delivered is fully adequate to meet any driving condition.

Elyria-Dean distributors everywhere endorse and recommend this REXO HORN. It's the one electric signal that will outsell any other make on price, efficiency or guarantee.

Our new selling campaign is now under way. We are sending the Elyria-Dean story to car owners wherever cars are sold. Wide-awake dealers will enjoy a profitable Fall business by adding our line of warning signals. Our selling campaign and the new Agency agreement will be sent to responsible dealers on request. Let us add your name to our mailing list. Our campaign will help you very materially to secure the accessory business in your territory.

To the Manufacturers Who Have Placed their Contracts for the Speedometer Equipment of their 1914 Cars

You should investigate the guarantee that the manufacturer of your speedometer gives with it.

Anything other than a permanent guarantee is not fair to you or to your car-purchasers.

The modifying of a guarantee—after the adoption of a speedometer as part of regular equipment—so that it becomes infinitely less attractive to prospective car-owners—a change which substitutes limited mileage for a long period of time—cannot react to your interests.

The guarantee under which the

CORBIN-BROWN SPEEDOMETER

"The Speedometer of Absolute Accuracy"

is sold is the same today as when the CORBIN-BROWN was first placed on the market. It is a real guarantee because it is a permanent guarantee.

The Permanent Corbin-Brown Guarantee

The Corbin-Brown Speedometer is guaranteed for twelve months from date of sale. We will replace any defective parts due to mechanical defects or workmanship, if returned prepaid to our factory, or branches subject to our inspection.

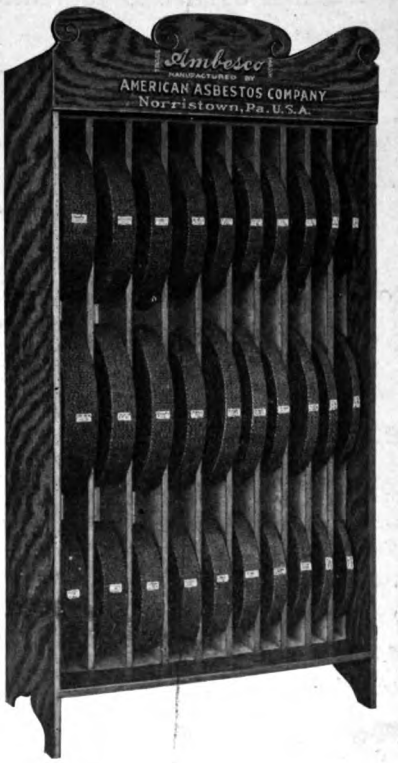
THE SUPERIOR BRAKE LINING

Ambesco



We Will Help You Carry a Complete Line of Ambesco

DETERMINED to have a full and complete line of Ambesco Brake Lining within easy access of every motorist in this country, we have adopted a selling plan that enables legitimate dealers and jobbers in every center to carry such a line without burdening himself or his business financially.

Illustrated herewith is the new Ambesco Brake Lining Rack which contains an ample stock of every size of brake lining made. All the odd sizes as well as the standard sizes are represented here, so that you dealers and jobbers who avail yourselves of our offer need never lose a profit because of not having stock.

Not only does our co-operative plan make it easy for you to carry this full line, but our plan also looks to the advertising and selling of this Ambesco in your local territory. In other words, we simply have to help you move this stock in order that our plan may succeed.

No manufacturer has ever gone farther to merchandise any commodity than we are going in the exploiting and marketing of Ambesco—and every wise, legitimate dealer or jobber in this country will do well to get in touch with us at once. In our plan we take practically all the chances—your only chance is to win.

Remember in considering brake lining that it is a staple article which offers you a big profit—and that it is only necessary for you to carry a complete line of a substantial and reliable MANUFACTURED product to corner most of the business of your territory.

Ambesco is manufactured by us from the raw stock to the finished product and we know that its quality is not only superior but absolutely uniform in every way.

Being certain of the product we now offer you a plan that will enable you to take full advantage of carrying a full and complete line, for which there is a real demand, without being forced to tie up a lot of money.

Doesn't this sound interesting? Write us—the details will interest you to a far greater degree.

AMERICAN ASBESTOS COMPANY, Norristown, Pa.

Dealers and manufacturers both---remember we are manufacturers also of Asbestos Friction Discs for Multiple Disc Clutches---also Asbestos Clutch Facing for Cone Clutches

SUBSTITUTING PORCELAINS IN RAJAH PLUGS NOT LEGAL

Added Light Thrown on Patent Licensing Situation — Court Holds Rajah Can Control Use Even if Not the Price of Plug.

When the United States Supreme Court ruled in the Sanatogen case that a manufacturer parts with all title to his goods when he sells them to a retailer, those who had been operating on a price-license system recognized it as a hard blow to price maintenance, but that the manufacturer does not part with all control of his produce was indicated this week in the United States District Court for the Southern District of New York The court held that the manufacturer still controls the use of its product and can restrain another from selling parts to be used in connection with the product.

The suit in question was brought by the Rajah Auto Supply Co., of Bloomfield, N. J., against the Rex Ignition Mfg. Co., of New York City, which, it was charged, had been selling porcelain parts with the knowledge that they were to be used in Rajah plugs. The court enjoined the Rex company and recognized the Rajah's right to specify what porcelain should be used in a Rajah plug.

Judge Ward in his opinion set aside the contentions of the Rex company that it did not know the porcelains were to be used in Rajah plugs.

Hupmobile

Now Europe claims half of all the cars we can build for 1914

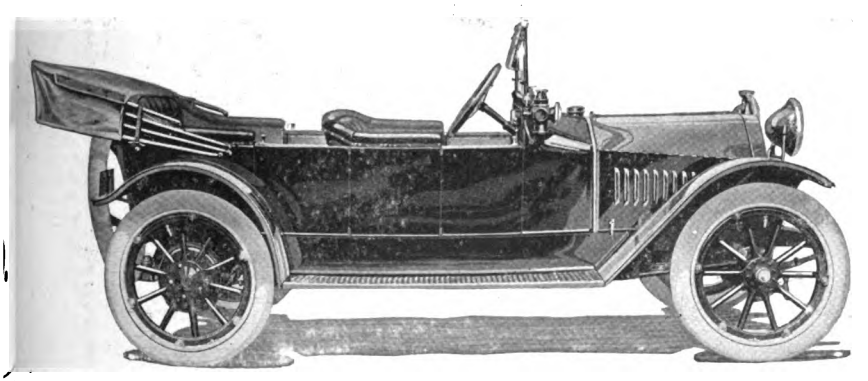
When we designed the Hupmobile we made it essentially an American car, for use under American conditions.

But Europe thinks the American Hupmobile such a good car, and so well suited to European requirements, that it stands ready to absorb half of the coming year's output of 1914 cars.

Can you imagine a tribute higher than this; or a more positive confirmation of our belief that the Hupmobile is the best car of its class in the world?

The Briton, the Frenchman, the German, pays $200 to $400 more for his Hupmobile than you do because he recognizes its high quality and its operating economy.

Likewise the Hupmobile buyers of South Africa, Australasia and New Zealand, where the Hupmobile has overcome an anti-American prejudice even stronger than that which exists in the European countries.



And in the Philippines — thousands of miles from home—the Hupmobile is as truly the car of the American family as here, as shown by the domination of its name on the registry lists.

Thus the belief that the Hupmobile is the best car of its class in the world rolls on to practically every section of the globe where automobiles are used.

The keen American in the Philippines - - - he, too, is loyal to the Hupmobile

Hupp Motor Car Company, 1254 Milwaukee Ave., Detroit, Mich.

"32" Touring Car or Roadster—$1050 f. o. b. Detroit

In Canada, $1230 f. o. b. Windsor

SPECIFICATIONS—Four-cylinder, long-stroke motor, 3¼ x 5½ inches; unit power plant. Selective type transmission, sliding gears. Center control. Full floating rear axle. 106-inch wheel base. Tires, 32 x 3½ Q. D. Rear shock absorber. Magneto cover.

EQUIPMENT—Rain vision, ventilating windshield; mohair top with envelope; Jiffy curtains; speedometer; cocoa mat in tonneau; Prest-O-Lite; oil lamps; trimmings, black and nickel.

For FORD Cars

A perfect hand warmer

Driving With Cold-Benumbed Hands is Uncomfortable and Unsafe, Driving with the Warm-Hand-Wheel is Comfortable and Safe.

Dealers:—As a dealer you know that SUPPLY follows DEMAND. There's a demand—a mighty big one—for warm hands during fall and winter driving. Here's an accessory that means a profit for you. Supply the demand—this way—see the WARM HAND STEERING WHEEL.

Owners:—Remember last winter—every part of your body was warm enough **but your hands!** Numb. Chilled. Blue with cold. Yes, of course, you had fur gloves, but when you wore them they didn't keep you warm or allow easy working of the wheel. If you had this experience last winter—then you are the very man who will appreciate the WARM HAND STEERING WHEEL. If this is your first winter of driving—be wise. Don't get the ordinary motorist's winter experience.

THE WARM HAND STEERING WHEEL

Gives you more comfort for fall, winter and spring driving than you can possibly obtain by any other means. Here's how.

We furnish you complete, a new wooden steering wheel rim, with the heater installed (as indicated with illustration) and wire connection from wheel to magneto which furnishes the heat. To turn on the heat you insert the plug in socket nearest the ribbed part or heater on left-hand side of wheel. To turn off heat, remove plug and place in next adjoining socket.

The heating coil is composed of an indestructible metal tube in which is carried a heavily insulated heating wire. It is impossible to get a shock.

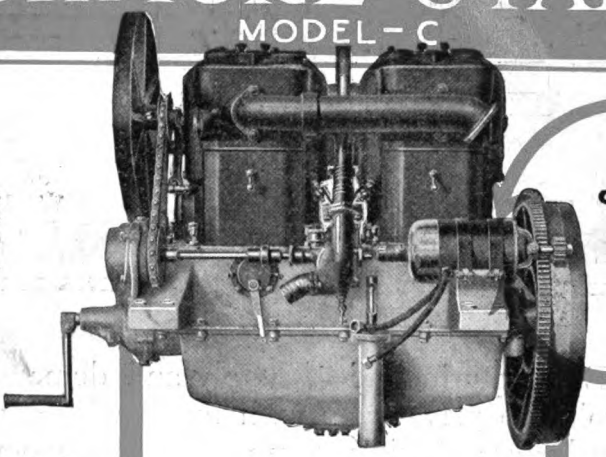
The rim we furnish is all ready to screw on in place of the rim you now have.

Write today for detailed description.

Satisfaction guaranteed.

Price $10.

Prepaid to any part of the United States.



The Warm Hand Steering Wheel Corp., Inc., Poughkeepsie, N. Y.

Patented April 23, 1907; Feb. 11, 1908; April 2, 1912. Other patents pending.

RUSHMORE STARTER

MODEL-C

Simplex "38," 4⅞ x 6½ in., with Rushmore Model C Starter. Spinning speed 100 r. p. m. using 90 amperes.

A Pigmy in size, but-!

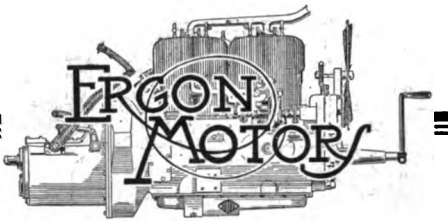
The new Rushmore Starter, Model C, is only 5 inches in diameter: it would almost go under a hat.

Yet it spins a 6-cyl. 4 1-2 x 5 1-2 in. engine at 100 r. p. m., taking only 100 amperes at 5.6 volts. It develops a maximum of 1 1-5 horsepower at the flywheel rim. Its armature pinion meshes and unmeshes automatically with the flywheel gear---the user simply presses the switch, nothing else.

End View of Simplex Engine (Find the Starter)

The secret of the Rushmore Starter's power is chiefly that a low speed motor is more efficient than a high-speed motor. By minimizing the magnetic and commutator losses inseparable from high speed, and by eliminating the wasteful intermediate gears, it more than makes up for the seeming handicap of lower speed.

The Rushmore Starting and Lighting System is used on the following cars:



Simplex
Lancia
Knox
Regal
Mercer
Kline

Even the smallest detail of the Rushmore Starter is absolutely first-class: it comes from a factory which has never produced anything but good goods. Yet the smallness and simplicity of the machine enable it to be sold at an astonishingly low price. It spins any engine up to 6 cyls., 5 x 6 in., from 25 to 50 per cent. faster than any other starter using the same current. Its mechanical simplicity saves the manufacturer from $25 to $50 per car. And its rugged build and completely automatic action are just what the owner wants.

Samples for test now ready

THE FUTURE

THE great principle of supply and demand is going to play havoc with many who apparently are letting temporarily unfavorable business conditions warp their saner judgment.

¶ Every order which is delayed in placing—every delivery specification which is set back or deferred means a rush and exhorbitant demands for deliveries sooner or later, which demand many part makers are going to be unable to meet promptly. The result will be delayed deliveries of complete cars.

¶ The manufacturers who use ERGON MOTORS, however, are going to be in better shape in so far as getting delivery on their motors is concerned. We always have prided ourselves on keeping to schedule and in case of need in being able to co-operate with our patrons in meeting extraordinary requirements.

¶ We have recently extended our manufacturing facilities and everything is in the best working order.

¶ This is an assurance of confidence to our present patrons—as well also an invitation to far sighted manufacturers to investigate our product, facilities for production and our business integrity.

Oldsmobile 1914

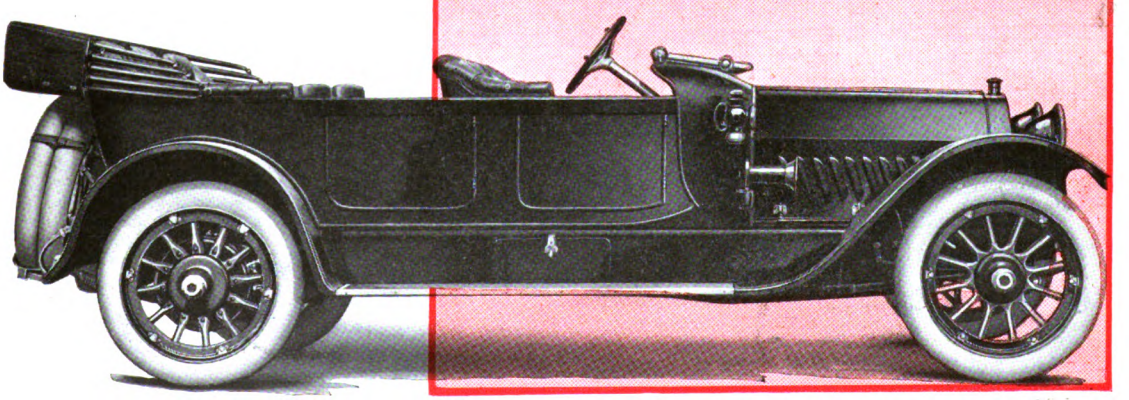
Established 1880 Incorporated 1899

THE dealer who sells the Oldsmobile is dealing in known values, and enjoys the prestige of leadership, together with the liberal profits that are always accorded a leader.

There is no question of Oldsmobile superiority. Everywhere it is recognized, and the dealer who sells it need never argue the point.

Wherever automobile men meet, the new Oldsmobile Model 54 commands their admiring comment, and it is frequently noted as remarkable that such a perfect car can be built and sold for such a price.

Combination Four or Five-Passenger Phaeton, Touring Body Type, $2975
Seven-Passenger Touring Body, $175 Extra
Limousine $4300



Our increased production for the season of 1914 permits us to allot territory to a few extra dealers.

Never in the history of this company have we been so well equipped to meet the demands of our dealers by prompt shipment of cars as ordered. We urge you to write us at once, if you are prepared to sell in your territory a car of the high standards of quality, material and design found in the Oldsmobile.

OLDS MOTOR WORKS, Lansing, Mich.

Equipment 1914 Oldsmobile Model 54

Combination electric and oil side and tail lamps, special Oldsmobile design. Special design Oldsmobile electric head lamps. Special design three-way adjustable ventilating windshield. Top, boot, and patent adjustable side curtains. 60 miles speedometer. Adjustable stem setting and winding Waltham clock. Rear tire irons, capacity for two tires. Demountable rims, one extra. Imported horse-hair tonneau mat. Motor-driven air pump. Famous Delco starting, lighting and ignition system. Electric light in tonneau. Extension electric trouble lamp. Tools, jack. Patented bow separating top holders. Adjustable auxiliary seats in seven-passenger. (Extra, at additional cost, wire wheels; special Oldsmobile touring trunks.) Motor, 50 horsepower, six cylinders, unit power plant, three-point suspension. Bore 4¼, stroke 5¼. Extreme length of four and five-passenger models, 16 feet. Extreme length of seven-passenger, 17 feet. Spring, front, semi-elliptic. Spring, rear, ¾-elliptic, underslung. Tires, 36 x 5, both front and rear. Gabriel snubbers. Klaxon horn.

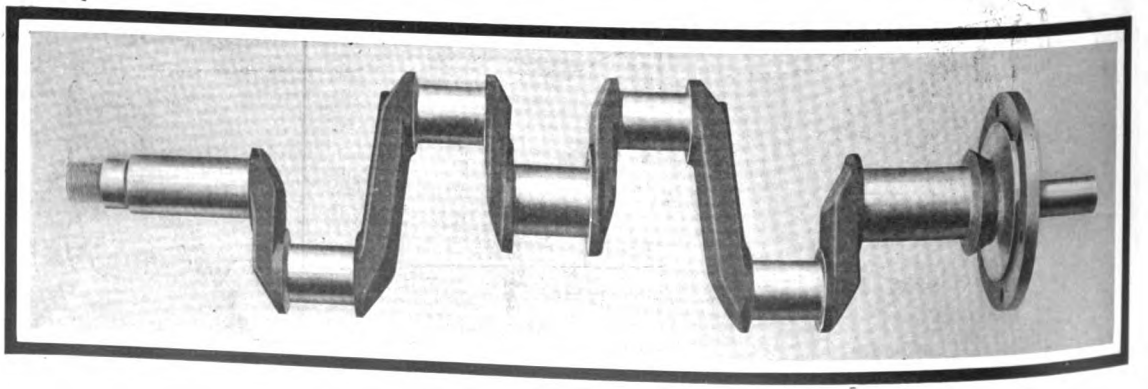
Better be SURE about getting MICHIGAN SERVICE on your crankshafts

YOU want MICHIGAN SERVICE on your crankshafts. You want that comfortable satisfaction that comes from knowing that your delivery requirements will absolutely be lived up to.

You want that practical satisfaction of knowing that the work will be right and that you won't have to turn down half of the shipment when it reaches you.

Our percentage of rejects for 1913 was less than TWO PER CENT. And our customers numbered some of the most exacting concerns in the industry.



The reason is that we do the inspecting here—and do it so carefully, so rigidly that we leave no chance for the customer to find fault.

That's our way of doing business. Couldn't do business that way if we didn't have the best machine and tool equipment money can buy and then back it up with EXPERIENCE and "KNOW HOW."

Don't wait too long. Remember we never accept orders beyond our capacity. Our customers take no chances. That means no aggravating, money-losing delays.

Send your blue-prints and specifications along quickly and we'll give you speedy action.

THE COMPANY BEHIND THE BEST SELLING ELECTRIC

The Detroit Electric is supreme among electrics. Not only in quality, but in numbers being built and in numbers being sold.

The profits of Detroit Electric dealers are double the profits of other electric dealers. For Detroit Electric sales are two for one over any other electric.

Several factors influence a dealer in selecting a car to handle. Not the least important is the company that builds the car. How long has it been in business? Is it sound financially? Is it laying its foundation for the future—expanding in the right direction?

The builders of the Detroit Electric possess a rare experience. Long before entering into the automobile business they had established an indelible reputation. This reputation they retain. Their commercial rating today is the highest possible for any company to have. It is the desired evidence that they have built wisely and well.

THE Detroit ELECTRIC

What a Large Output Permits

From the very start the builders of the Detroit Electric saw a big future ahead for any electric of quality. They realized that by the use of accurate machine methods, they could secure far greater quality than by near-accurate hand methods. They cut no corners at the expense of quality. They supplanted blacksmithing labor by the most modern machinery. A large output makes possible this system of improved manufacturing.

The Best Seller is the Best to Handle

The Detroit Electric for 1914 contains more new features than any other. It is better built than any other. It is built in our own factory—the largest electric pleasure car shops in the world—not merely assembled. In the electric car industry this means much.

Every dealer wants to handle a leader, whether an electric, a typewriter, an adding machine, or what not. A leader is easier to sell—generally it sells itself.

Dealers for the Detroit Electric, moreover, are among the most substantial and progressive men in their communities. They are men of wide vision. They look upon the representation for the Detroit Electric as a golden opportunity—and a permanent one.

We have a limited amount of open territory. It will repay you to get in touch with us.

ANDERSON ELECTRIC CAR COMPANY, Detroit, Mich.

YOU BUILD SILENCE, NEATNESS, SIMPLICITY AND EFFICIENCY INTO YOUR VEHICLES WHEN YOU EQUIP THEM WITH THE

SHELDON WORM DRIVE

Every Additional **part in** anything **mechanical** gen**erally** betokens **extra** wear and **possibly** trouble.

There **are more** than 3 **times as** many **double** reduction **parts as** worm drive **parts.** Of course **YOU** know **which is** most **efficient.**

A CHAIN is no stronger than its weakest link. Every nut, cotter, washer, head pin casting, forging, chain link and rivet is a necessary unit of the assembly it composes. The failure of one of those units may mean the wreck of your truck, and perhaps the damage of property and the loss of life.

Only one-third the number of parts required for a Worm Drive that are required for a two-step reduction of the chain driven type. This is convincing proof that, all things being equal, the single reduction Worm Drive has a three-to-one chance of giving better service than a two-step reduction with three times as many parts.

But all things are not equal. The Worm Drive is a single reduction, transmitting the power direct from the motor to the rear wheels. It is the only drive in which it is possible to secure this result.

The Worm Drive conserves power because it is a single reduction. Every moving power transmitting unit works in oil, reducing friction to a minimum.

Sheldon Worm Drive is non-adjustable. The Worm carrier is machined exactly true by specially constructed machines.

If the carrier is not true, the Worm can not be assembled. Once assembled the Worm and Worm Wheel can be removed and replaced without disturbing their alignment. No adjustment to tamper with.

It is not necessary to provide adjustment for wear. The slight wear of the imported Worm and Worm Wheel only adds to its efficiency.

Of course, the Worm and Worm Wheel wear out, but not during the life of one truck. The experience of the largest user of Worm Drives has proven this.

The Review of Reviews

In its November issue states, after referring to the many generally accepted types of Commercial Motor Vehicles:

> **"In addition to these, there is urgent need for a vehicle, possibly a mono-car with a package box, capable of carrying from 300 to 500 lbs., the cost to be from $350.00 to $400.00. This vehicle will displace a single horse wagon and compete with it fairly from a standpoint of initial cost, beat it for upkeep and vastly improve the service."**

THE MOTOKART

is the first and still only vehicle built in America fulfilling the above requirements. Among its many practical selling features are:

WATER-COOLED FOUR-CYCLE MOTOR, no pre-ignition choking or similar troubles.

FRICTION DRIVE, no gears to strip.
COMPACT DIMENSIONS, facilitating handling in crowded streets.
RIGID CONSTRUCTION, insuring structural safety under the most severe usage.
LARGE BOX AREA, greater than upon any other similar car.
SEMI-ELLIPTIC SPRINGS, assuring ease of carriage upon the roughest roads.
WIRE WHEELS, equipped with 26 x 2½ Non-Skid Tires.
PRICE, within the reach of every retailer in the United States.

$400.00

$2400
Nothing extra to buy

More Power
More Flexibility

More Economy
More Silence

It's here—a Moline-Knight—$2400

For the man who THINKS before he SPENDS

The old poppet valve has outlived its usefulness

The poppet valve served its purpose well in its day—it was the best available motor when it was designed years ago, but it has its limitations as any competent engineer or mechanical expert will admit.

But the things of yesterday will not satisfy you today. The sun dial gave correct time—but you wouldn't trade it for the watch you are carrying.

Once you were contented to ride miles in the old horse-drawn street car—but today even the swift moving electric driven street car seems slow.

The manufacturers of motors have known for a long time that the days of the poppet valve were numbered—they have spent fortunes and years of labor in an effort to get rid of the poppet valve. The Knight motor solves the problem.

Only a small number of motor car builders can obtain a license to build a Knight motor—yet there are thousands of Knight engines in actual use today giving more power, more flexibility, more economy, more silence than the old poppet valve motor.

Europe took the lead in discarding the poppet valve—and the result is such celebrated cars as the Mercedes, the Daimler, the Panhard and the Minerva. A few American builders then began to manufacture Knight motors—until today the Knight motor now holds ***undisputed established supremacy.***

Backed by 23 years of successful manufacturing

Charles Y. Knight—the inventor and designer of the Knight sleeve type of motor granted a license to the Moline Automobile Company because along with their nine years successful experience as motor car producers they had fourteen years experience as builders of gasoline engines.

Practically the same officials who constitute The Root & Van Dervoort Engineering Co., makers of the world famed R & V Engines, comprise those who direct the affairs of the Moline Automobile Company. The present output of R & V engines is over 20,000 per year.

Mr. Knight satisfied himself ***in advance*** that his master blue prints would be religiously adhered to and that the finished Moline-Knight car would be in keeping with his desires and a credit to his organization. He went a step farther — he brought from Europe his most competent engineers and designers and placed them at the disposal of the Moline Automobile Company.

No other organization in the entire motor car industry is better equipped with brains, experience, skilled workmen, modern machinery, plant or financial responsibility to build the ***supreme*** Knight than the Moline Automobile Company.

Every dealer and motor car owner candidly admits that the Knight design is more ***silent*** than any other type of motor, but the story of its unusual power, its proven economy, its extreme flexibility, has never been half told.

MOLINE KNIGHT

Digitized by Google

A Moline-Knight means

instantaneous getaway—every drop of gasoline consumed—no carbon—no valves to clog or grind—less consumption of fuel per horse power—more power per piston displacement—simpler parts, fewer parts, less to get out of order—economy

Why the motor of the future will not have poppet valves

High compression, large valves, strong springs and precipitous cams are necessary in the poppet valve engine in order to get great power and high speed.

These large valves and their seats will often warp. They do not cool properly because of their large area and the excess heat caused by high compression. The strong springs necessary to seat them at high speeds soon weaken, or actually pound the head of the valve out of shape. That's why racing motors are often built with two exhaust valves to the cylinder—so they can be kept small and cool.

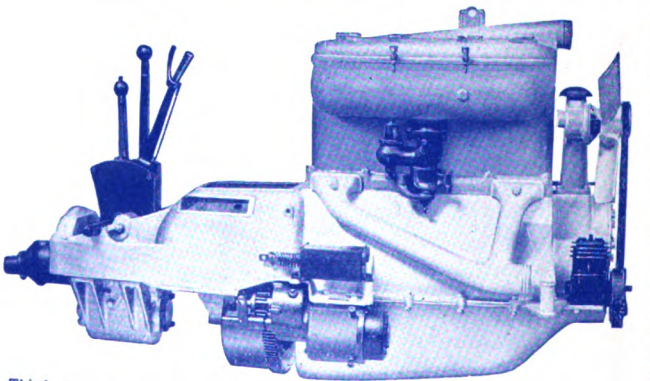
Strongest where the poppet valve is the weakest

In order to be anywhere near efficient, the poppet valve motor must have low compression, small valves, weak springs and a gradual opening cam.

Here is a weakness the poppet valve will never be able to overcome. Small valves and weak springs mean ***decreased*** efficiency in both power and fuel consumption. The small valves do not admit sufficient gas to generate high pressures behind the piston—the weak springs will not properly seat the valves at high speeds, thus causing them to lag and foul the mixture by permitting the piston to draw back into the cylinder exhaust gases through the exhaust ports when the springs fail to close this port at the proper time. The powerful poppet valve motor requires a cam capable of opening the valves suddenly and wide—and the very nature of this operation prohibits quietness, because the opening must be more or less in the nature of a hammer blow. You can see that quietness and power are impossible with the poppet valve motor.

Why the Moline-Knight is supreme

The superiority of the Moline-Knight engine over any poppet valve lies in the fact that the efficiency and durability of the sleeve valve system is not affected by high pressures. The explosion does not affect or shock it at any point because the sleeve valve is balanced against lateral pressure.



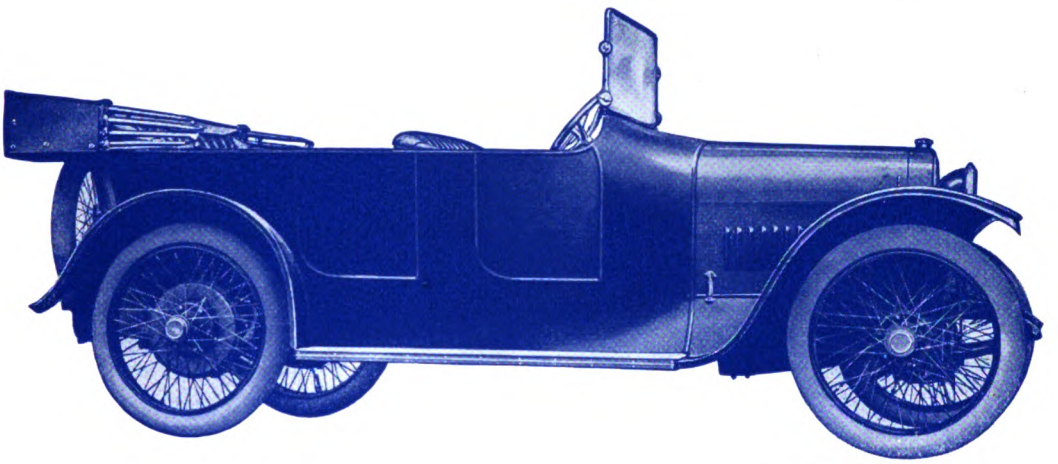
The ports are large, the inlet and outlet most effective for their area and the action of the motor is not affected adversely by their increased size.

In the sleeve valve motor is combined silence, endurance and reliability of the small poppet valves and low compression with the high efficiency of the high compression, large valves, powerful springs and precipitous cams of the racing poppet valve motor, consequently, the operator has in the one sleeve valve ***all the advantages*** of both types.

A standard sleeve valve motor is capable, as far as efficiency is concerned, of delivering all the power of the racer, with all the softness and quietness of the old style poppet valve motor.

In addition, the operator has within his easy control a surplus of power which he can call into instantaneous service when needed in emergencies. While ordinarily one cannot expect extreme speeds over country roads, yet in the Moline-Knight the power is there when required for acceleration and hill-climbing.

You have been given here a simple statement of the *facts*—now we are ready to prove to you by actual demonstration that the Moline-Knight has the most powerful, durable, flexible, economical and silent motor ever built—that it will give more satisfaction to the owner than the best poppet valve type of motor ever built.



This is the carburetor side of the new Moline-Knight motor. Note the tire pump in front, also the third control lever which operates the electric starter.

MOLINE KNIGHT

Digitized by Google

Moline-Knight

A big, roomy five-passenger car with an electric starter that starts each and every time—perfect streamline body

Four cylinder, five-passenger, guaranteed 50 H. P., 128-inch wheelbase, 36x4½-inch Tires, Bosch ignition, Moline-Wagner electric starting and lighting, $2400

The "Four" that makes the "Six" unnecessary

Perfect streamline body

In appearance the Moline-Knight is similar to the highest priced foreign cars—yet it has a distinctiveness and individuality. It is the only genuine streamline body built in America—note the absence of abrupt breaks in lines. This streamline is perfect, graceful and smooth, offering the least resistance to air pressure.

We believe that the body is larger than any other five-passenger car built today—it has ample room for the two auxiliary seats for which it is ironed—it will answer all the requirements of the man who wants either a five or a seven-passenger car.

As powerful and flexible as any "Six"

The Moline-Knight motor is a powerful 50 H. P. engine, having four cylinders—and we stand ready to demonstrate that it is as flexible as any six-cylinder poppet valve engine ever constructed—it has developed far more power and flexibility than any other motor of the same piston displacement that we have ever known.

All the durability-contest winning features retained

In the previous models of the Moline cars we demonstrated that we knew how to build a powerful, convenient and dependable car—these cars won durability contests from coast to coast—but in the Moline-Knight we have surpassed all previous efforts. From stem to stern the Moline-Knight is a thoroughbred.

All through the chassis are those parts that by their record have been demonstrated to be the very best—and you will also find them on cars selling from $1000 to $2500 more than the Moline-Knight.

Accepted under the Van Dervoort test

Every part selected to go into the Moline-Knight was subjected to the Van Dervoort test, based on President W. H. Van Dervoort's years of experience as a gasoline engine and motor car builder.

Scrutinize the Moline-Knight before you decide

What you get In the Moline-Knight, the motor, cone clutch in fly wheel and selective transmission are housed as a unit power plant which is carried on three point suspension.

All operating and mechanical parts are quickly accessible—simply raise the hood, remove the floor boards and you have everything back to the universal joint in plain view.

The frame is hydraulic pressed steel, tubular radiator, drop forged I beam front axle, full floating rear axle, 128 inch wheelbase, selective transmission, half elliptic rear springs of unusual length, Truffault-Hartford shock absorbers, Bosch ignition system, Schebler carburetor, Moline-Wagner electric starting and lighting, spark and throttle on steering wheel with foot accelerator, adjustable foot pedals, Gemmer steering gear, center control, left side drive, two accessible front doors, drive shaft encased in oil, lubrication by force feed through hollow shaft, 36x4½ artillery or wire wheels, Firestone demountable rims, 18 gallon gasoline pressure tank in rear, finished in blue-black, other colors optional with three weeks notice.

Regular equipment Mohair top, top cover and side curtains, automatic rain vision wind shield, electric starting and lighting system, electric horn, power tire pump, Warner 60-mile speedometer, 36x4½ Goodrich Unit Molded Tires, gasoline and oil gauge on dash, dash light illuminating gauge and speedometer, foot rail, robe rail, tire irons, complete set of tools, jack, tire repair kit, eight-day clock.

Dealers—send this for "Advance Information Folder"

Moline Automobile Co.,
100 Maple Ave., East Moline, Ill. (*Confidential*)

I am representing the_____
Automobile here and sell about_____cars a year. Without obligation on my part, send me by return mail, "Advance Information Folder" on the Moline-Knight—I'm interested.

Name _____

Firm_____

Address_____

Dimmer headlights The Moline-Knight is equipped with dimmer headlights. By pressing an electric button the big light goes off and the small light comes on. There are no side lights, the use of which would break the perfect streamline of the body.

Price $2400 Five-passenger with artillery wheels, $2400; five wire wheels $75 extra, and two auxiliary seats for seven passengers, $60 extra.

All prices F. O. B. East Moline, Ill.

Large demand in advance *To the dealer,* the Moline-Knight means dollars and prosperity—because he can now sell his trade the car it has long wanted.

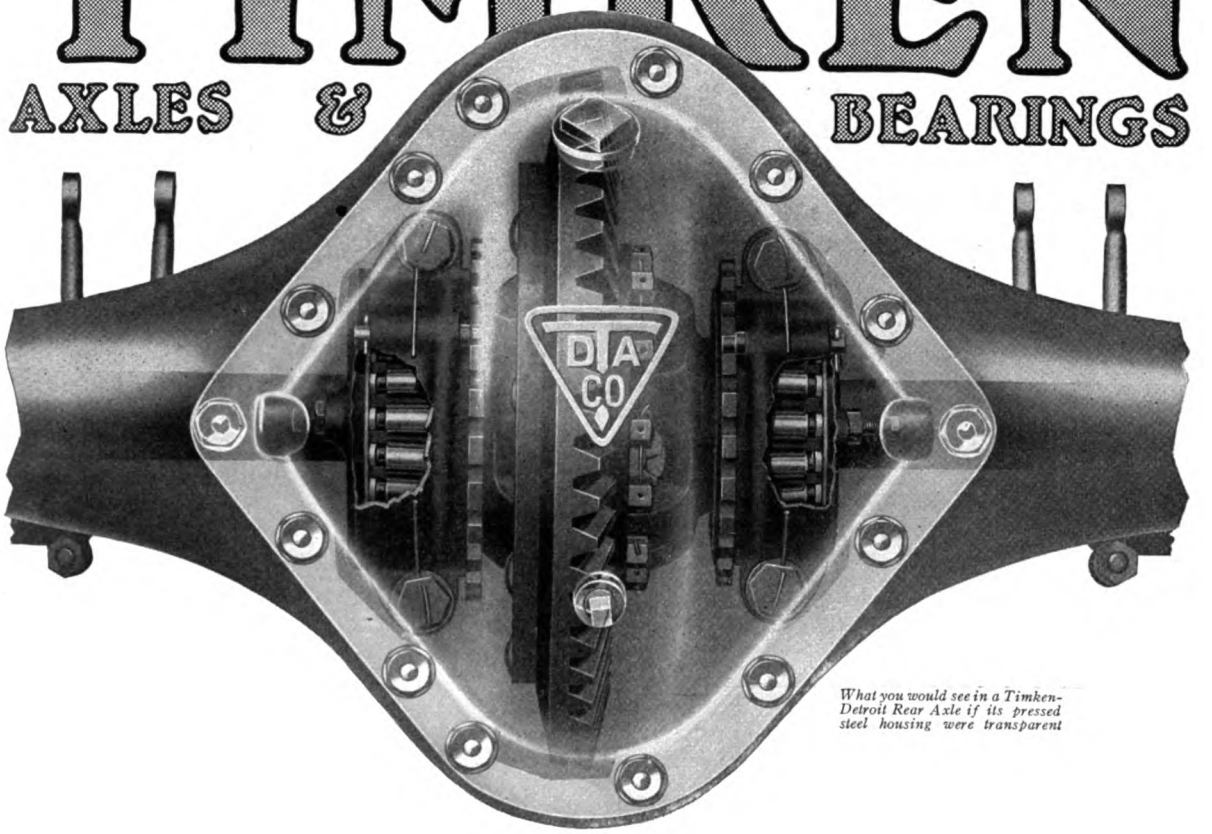
To the user, it means a Knight motor for *less money*—and the four things he has always wanted—more power, more flexibility, more economy, more silence.

The demand for the Moline-Knight is going to exceed the supply. But we will not sacrifice quality for quantity—every car must pass our rigid inspection before it leaves our factory.

Our object is to place our cars in the hands of the *right* dealers and not to oversell.

We are prepared to make a limited number of contracts with dealers. Just as soon as this season's output is contracted for, we will write no more contracts, because we will deliver our cars *on time* to every dealer holding one of our contracts.

If you are a user and wish to know more about the Moline-Knight—write us at once for our "Advance Information Folder."



If you believe you are the right dealer and entitled from your experience and financial standing to a contract for the Moline-Knight, act at once—wire, use the phone or coupon, or visit us at our factories. Get our "Advance Information Folder" immediately.

Moline Automobile Co.
100 Maple Avenue, East Moline, Ill.

TIMKEN
AXLES & BEARINGS

What you would see in a Timken-Detroit Rear Axle if its pressed steel housing were transparent

Look Into Your Rear Axle

X-Ray pictures of the human body reveal what the eye cannot see. They gently penetrate skin and muscles and show the wonderful structure of vital organs and bones. Could the X-Ray penetrate the pressed-steel housing (the skin) of a Timken-Detroit Rear Axle it would reveal what is shown in the picture above.

Hidden under the housing are the shining teeth of polished gears that transmit driving power from engine to wheels. Quiet running, full power, satisfaction, depend on the accurate meshing of those polished teeth.

EVERY curve and angle of the teeth has been calculated by expert engineers and has been made an accurate reality by the unique Timken process of grinding every gear to its master pinion, every pinion to its master gear.

But even that accuracy would not avail, except for the labor of many hands and brains, through which it becomes possible to *put the gears together right* and *keep them right* after they are in the axle.

This means conscientious labor in the tool-room, where jigs and gauges are made.

It means exactness in size and alignment of holes, of threads, of adjusting rings. It means firmness of clamping devices that hold the parts almost as solidly together as though they were welded.

It means many men, many operations, constant gauging to the finest limits of accuracy, exhaustive testing.

It means using bearings that show almost *no* wear after thousands of miles of running—yet can be adjusted to correct that small wear perfectly—bearings that meet side pressure as well as direct weight. The one bearing that *does all* these things is the Timken Tapered Roller Bearing—and no other has been used in the Timken-Detroit Axle.

It means, in short, a design built upon long experience with all types of motor cars, under all possible conditions of service, in all parts of the world.

Look Deeper Still

Go deep down below the finished whole, below the operations and materials, even below the design—get down to the very heart and core of Timken Axle Quality.

There you find an organization of men, wholly devoted to one ideal—the building of a perfect axle. Absolute perfection is their goal, and no lesser goal will serve these men. From the day of the first motor-car they have worked together toward that end.

And to this ideal is due the safety, comfort and satisfaction of the man who drives a Timken-equipped car today.

You can catch the X-Ray spirit and look into the hidden, important facts by writing today for the Timken Primers, T-7 "On the Anatomy of Automobile Axles" and T-8 "On the Care and Character of Bearings." Sent free post-paid from either address below.

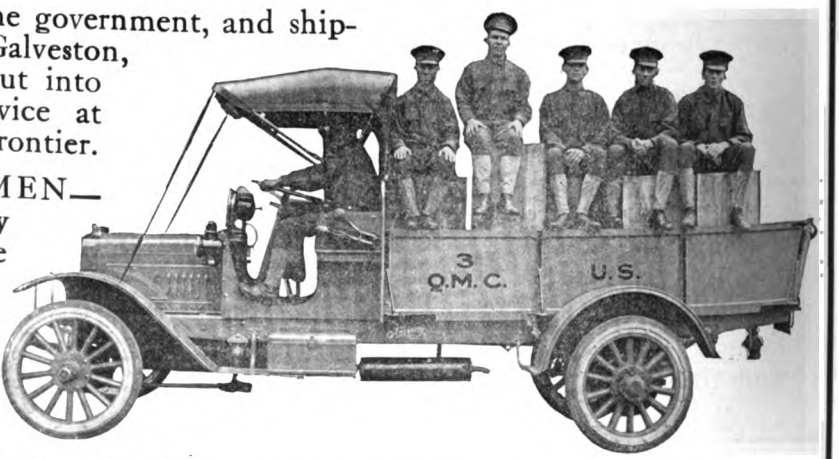
THE ATTERBURY LINE

Selected by the War Department Purely On Merit

The final test made under supervision of the inspector for the War Department—pronounced PERFECT.



IT DEMONSTRATED

Quickness of Action
Ease in Handling
Freedom from Heating
Quietness in Operation
Power for Steepest Grades
Economy in Fuel Consumption

Distance Traveled 103 Miles, Time, 7 1-2 Hours

Accepted for the government, and shipped at once to Galveston, Texas, to be put into immediate service at the Mexican frontier.

BUSINESS MEN—The Atterbury Truck will prove a great asset in bringing to *you bigger business.*

To the dealer who looks ahead—to the dealer who sees that one satisfactory sale made NOW means more sales in the future—to such a dealer we offer a splendid agency proposition.

EVERY MOTORIST should have this BOOK & CHART.

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

Write for Your Copy Today

and inform yourself regarding the care and operation of the modern Electric Starting, Lighting and Ignition Systems.

The information given in this handbook and on the operation chart which accompanies it will give you practical aid in the proper operation of all automobile electric systems.

Explains in detail functions of the various parts, how to locate and remedy troubles of all kinds. It is the best written book on the subject so far produced.

The large operation chart which it contains is alone worth the price.

Regular price 50 cents.

Will be sent to you for 10 cents in stamps if you use this coupon.

"As Sure as the Whirl of the World."

This Book Covers the Following Subjects

Electric Starting and Lighting Systems
The Generator
The Storage Battery
The Motor
The Controls
The Wiring
The Circuit Breaker
The Governor
The Ammeter
The Switches

The Electric Auto-Lite Co.

The Pioneer Makers of the 6-Volt Electric System

TOLEDO, OHIO

Jeffery

The Jeffery Four—$1550

America's First High-Grade Moderate-Priced Car

Powerful and Light

Not alone in the introduction of a high speed mono-bloc motor is the Jeffery Four a year or two in advance of other American cars. Our engineers brought from abroad minute data on preferred tested foreign materials. As a result we make our springs, rear axle, drive shafts and front axle from vanadium steel. The best American bearings didn't satisfy our ideal; we adopted the best imported annular ball bearings. Rothschild designed the body; we bought an $18,000 giant press to carry out his ideas in its manufacture.

In fact, Jeffery specifications read like the dream of those who are motor-wise and who've been wanting just such an ideal moderate priced car.

Here they are; you've never seen such high grade quality at this price.

Full floating type rear axle on imported annular ball bearings—high grade. Same quality as used by high priced cars generally.

Body designed by Rothschild of New York—high grade. The hit of the Paris show.

Leather universal between clutch and transmission—high grade.

Vanadium steel springs and front axle—high grade.

Rayfield carburetor—high grade.

Left drive and center control.

Pressure feed gasoline tank in rear and pump operated through cam shaft—high grade.

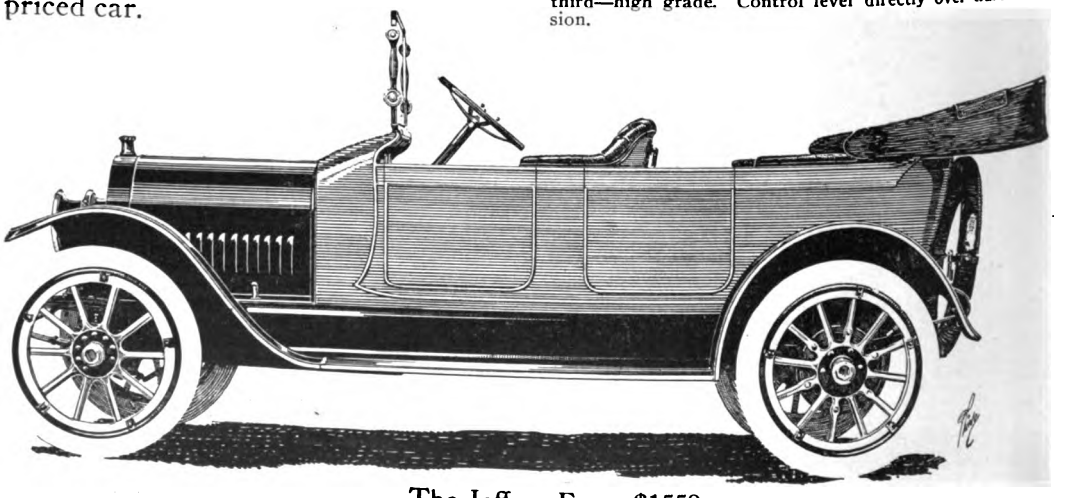
Bosch Duplex ignition—high grade.

Solar lamps with dimmer—high grade. Operated by four-position switch—the simplest ever made.

Wheelbase 116 inches—Turning radius 42 feet. Demountable rims with 34x4 tires.

High speed, L head mono-bloc motor, European type. Designed and built in Jeffery plant. Size 3¼"x5¼".

Horsepower 22½ which develops to 40 H. P. at 2000 revolutions per minute. From nothing to forty miles in twenty seconds—high grade.



U. S. L. starting and lighting system—high grade and simple.

Imported annular ball bearings throughout—high grade. Standard on the world's best cars.

Spicer universal joints—high grade. Ask any mechanic.

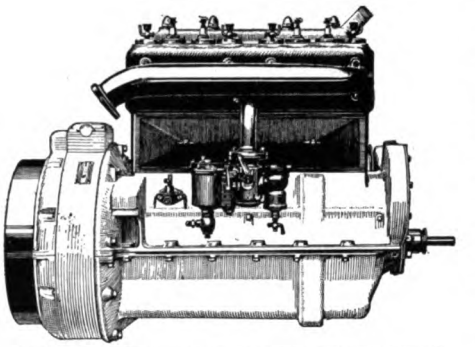
Combination force feed and splash oiling system—high grade. The most economical we know.

Four forward speed transmission with direct drive on third—high grade. Control lever directly over transmission.

The Jeffery Four, $1550

Digitized by Google

Big Motors Don't Mean Big Power



The average man thinks a motor must be a great big heavy motor, or it hasn't the power, won't drive its car as fast as he wants—up hills, through heavy roads. He's been fooled into considering bore and stroke without considering the weight to be carried. He's been sold cars too heavy for his needs; paid the price in gasoline, tires and upkeep.

In the Jeffery Four, with its high speed mono-bloc motor, we've accomplished what other builders have overlooked or failed to produce. This is it:

A light, high grade car without the sacrifice of quality, strength, sturdiness, power, and above all, comfort.

American and foreign engineers have discovered the fallacy of excessive car weight and consequent cumbersome power plant. Most of the cars at this year's Paris Show carried motors of actually less bore and stroke than the Jeffery Four.

Dealers who are to be successful must tie up with a financially strong and successful organization. Furthermore, such a high grade car, built in such a plant and of such materials has never before been offered anywhere near this price. Big dealers in big cities all over the country are dropping other lines and organizing new companies to take on the Jeffery line. They are quick to recognize in this car a wonderful opportunity.

Note the compact, simple and light construction of the Jeffery high speed mono-bloc motor

Equipment of Jeffery Four

The equipment includes top of finest material, rain vision wind shield, Stewart-Warner speedometer, ammeter, extra demountable rim with brackets, electrically lighted dash, Klaxet horn, Solar electric lamps and complete tool equipment.

Prices of Jeffery Four

Built in five body styles. Five passenger touring, $1550. Two passenger roadster, $1550. Two passenger Coupelette, enclosed, inside drive, $1950. Four passenger Sedan, enclosed, inside drive, $2350. Five passenger limousine, $3000.

Study the Packing Used in All

JEFFERY-DEWITT CO.
DETROIT, MICH.

Spark Plugs

¶ Outside the quality of materials used, the merit of any plug rests largely upon the method of supporting the porcelain and the method of packing to prevent leaking; for the bane of the ordinary plug is its leaky construction. In this particular, *J-D* spark plugs are faultless. Upon our radically different and superior method we lay as great stress as we do upon the high quality of our materials.

¶ Continued experiments and tests have shown that a permanently tight joint is impossible when the common method of packing with gaskets and asbestos is employed; for when the plug becomes heated there is an uneven expansion and contraction between the porcelain and the packing or support; while under heat the asbestos shrinks materially. After patient investigation, we have produced an alloy which has the same expansion and contraction as porcelain. This alloy is used in every *J-D* plug with the result that compression leakage is entirely eliminated.

¶ The mechanical construction of the *J-D* packing is as follows: The porcelains are formed with a shoulder in the shape of a double cone, ground to a true and perfect surface. A packing collar with a flanged end made of the special alloy mentioned above is forced on each one of the cones until the two flanges meet. This collar, which is fitted with a copper gasket, supports the porcelain in the shell and takes all the strain of tightening the bushing. This form of packing affords a ground joint and greatly increases the effective strength of the porcelain, both through the elimination of any unnecessary strain and through the reinforcement afforded by the extension of the packing collar above and below the points of support in the shell.

¶ The packing forms a component part of the porcelains, and facilitates their removal for examination, cleaning and replacing.

American Axles

Supply the Most Efficient Type of the Silent Worm Drive: The Lanchester-Daimler

The above statement is not offered as an argument; it is simply the consensus of leading automobile engineers on both sides of the Atlantic.

While America discussed the worm drive, England tested it. While Americans theorized as to whether its acknowledged advantages could be extended to electric and gasoline pleasure cars, foreign motorists were already enjoying its wonderful efficiency.

For more than two years we have regularly mounted the Lanchester-Daimler—the accepted leader among worm drives—in a full floating *American* Axle fitted throughout with the finest of foreign ball bearings.

We count ourselves fortunate in holding the sole American rights as axle manufacturers to the use of this drive.

Automobile manufacturers who have adopted our axles are equally fortunate; they offer in this worm drive a known quality, together with a mounting that represents the highest ideals of American manufacturing.

The adjusting and full-floating features of *American* Axles are fully covered by our own patents and by shop rights from other patentees.

SAFETY FIRST

"Safety First" is the slogan of the great railways

You see it painted on every pillar and post and building along their lines.

And on the boulevard, the street, the country road—wherever you see the trail of the Goodrich Safety Tread you see another "Safety First" slogan.

Goodrich experience, Goodrich knowledge, Goodrich skill and Goodrich methods have put "Safety First" in every thread of fabric and every atom of rubber in

GOODRICH SAFETY TREAD TIRES

The anti-skid feature (the safety tread) is great in itself. The thick, tough rubber fingers clean and grip the roadway and hold your car to its course.

We have literally put brakes in the tire for you.

You get constant control of your car—starting, steering, turning, stopping, slowing up or speeding up.

You get lower-cost mileage all the time. The extra thickness of specially compounded, wear-resisting Goodrich rubber in the safety treads means longer wear, longer life and longer service in your tires.

Don't take a chance. Make "Safety First" *your* slogan—and *get it* in Goodrich Safety Tread Tires.

A "Six" of unsurpassed ability elegance and comfort

THE seven-passenger KisselKar 60 "Six" easily maintains its leadership as the conspicuous value among big "Sixes." In quality, appointments and performance it is unsurpassed. Only a few of the very highest priced cars can equal the extreme comfort of the big KisselKar 60 "Six." When you ride in it, you experience for the first time the fullest possibilities of balanced automobile construction and the capabilities of a real motor.

KISSELKAR 60 "Six"

A car of remarkably attractive personality. You can't look at this striking "Big Six" without being strongly impressed with its thoroughbred quality. Even when standing quiet at the curb, you feel its power and "sense" its potential ability as a car of the highest type.

The price of the KisselKar 60 "Six" is $3150, fully equipped. Golde patent "one-man" top, Warner Speedometer, Klaxon Horn and many other earmarks of de luxe cars are all found in the powerful, silent, smooth-running KisselKar 60 "Six."

The new KisselKar 48 "Six" at $2350 makes a worthy running mate to the "Big Six" and the 40 "Four" at $1850 is a distinct leader in its class.

All KisselKars are fully equipped—electric lighted and started, and have left hand drive, center control. Catalog on request.

KISSELKAR SERVICE CONTRACT

KisselKars are sold under a specific guarantee of service to owners—a written contract that stipulates in detail the mechanical care that forestalls trouble and retards depreciation. The unusual facilities at our Service Stations are always at your disposal.

KisselKar Trucks—six sizes, 1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Ask for Truck Catalog.

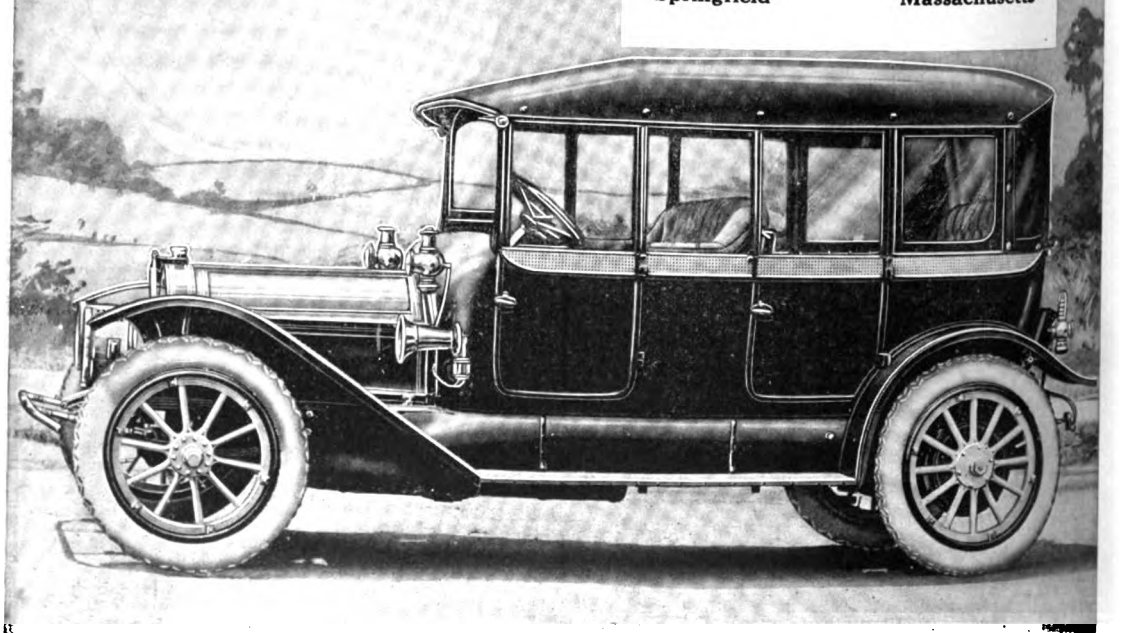
SPRINGFIELD CONVERTIBLE BODIES

With a Springfield Convertible Body, a few minutes work will turn the open touring car into a handsome luxurious closed car.

This radical departure from the unsightly, uncomfortable, ordinary top, is the final result of three years' development and it is today the ***only*** practical all-year-round body on the market.

When open, there are no signs calling attention to the fact that the body can be entirely enclosed in glass—just an ordinary closed top is visible.

When in position, the Springfield Convertible Body gives a beautiful glass enclosed, weather proof car with wide doors free from obstructions—in every way equal to the permanently closed car in appearance and comfort.



The transformation can be worked in remarkably short time through the simple operation of raising the top and adjusting the glass windows which are contained in a box back of the front seat when the car is open.

The Convertible Top feature is exclusive on Springfield Metal Bodies. It will not fit any other body, but we are prepared to make prompt deliveries on all designs from the little runabout to the largest limousine or landaulet.

Further information is at your command. Write for it.

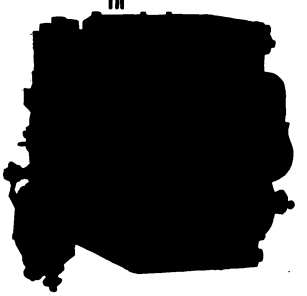
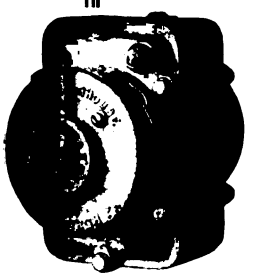
Self Regulating Without Adjustment

That's a feature every car owner appreciates in any device. It's what they get with the—

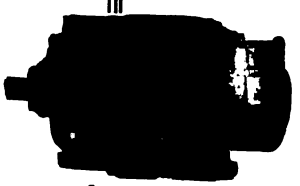


Westinghouse Electric

Starting, Lighting and Ignition System



"The Systems Using a Single Wire"



Lighting Generator

Combined Lighting and Ignition Generator

Starting Motor

Starting Motor

THE public recognizes that Westinghouse Electric Quality guarantees the equipment in design, in construction, in operation.

The Lighting Generators automatically charge the battery without the use of any relays or solenoid-operated regulators. There are no adjustments to be made. The battery is at no time charged at an excessive rate.

A high power, single unit Spark Coil, acting in conjunction with timing and distributing parts on the generator, furnishes high voltage for the spark. The battery operating alone, or with the generator, supplies continuous power. The interrupter gives **automatic spark advance.** The spark is uniform regardless of speed.

Minimum weight of motor, minimum discharge of the battery, are features of the starting motors, with maximum initial effort for positive starting. A Westinghouse starting motor means less weight to carry, and battery economy.

Why 400,000 cars are equipped with the J-M (Mezger) SOOT-PROOF Spark Plug

When 400,000 car owners choose this plug in preference to all others, **there must be a reason!**

And here it is, in a nutshell.

This is the **only plug that can't short-circuit**—because it is the only plug that is **absolutely soot-proof.**

It is impossible for soot to collect at the firing point, as the intense heat of the porcelain "petticoat" burns up the carbon as fast as it is formed. This is due to the fact that the "petticoat" extends to the **end of the outer shell,** where it is exposed to the heat of combustion.

We control the basic patents for this form of construction.

The porcelain used in this plug is not affected by sudden changes of temperature. It is made of special clays tempered by a process of our own.

Millions of J-M (Mezger) Soot-Proof Plugs have been sold since they were put on the market, over 12 years ago. Many that have been in use over 8 years are as good as new.

If any "J-M" (Mezger) Soot-Proof Plug fails to give satisfactory service we will supply a new one or refund purchase price.

Order from your dealer. Shipped direct from our nearest Branch if not at your dealer's. Price, $1.00.

Write Nearest Branch for Booklet.

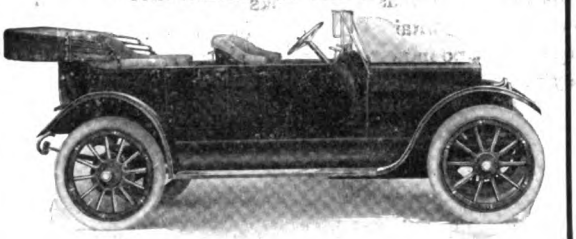
Cooperative Dealer Agreement Most Liberal Ever Offered

¶ Ever try to sell a second-hand car that wasn't made any more?

¶ It is some job.



¶ We won't attempt to give here the varied collection of objections the prospective buyer offers but—

¶ They can and will be raised against any car whose maker is now in financial difficulty or regarding which there is the slightest whisper of impending trouble.

¶ The Apperson Brothers have been making the

Famous Apperson "Jack Rabbit"

"THE WIZARD OF THE HILLS"

Four Forty-Five Touring, $1785.00

at Kokomo, Indiana, continuously since 1893.

¶ Think it over.

¶ Now and then a good territory open for a business-man dealer.

Fedders Manufacturing Works
57-67 Tonawanda St., BUFFALO, N. Y.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to *prevent* accidents.

"I can't afford to take *any chances.* We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of *Weed Chains* and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—*Life Insurance* and *Accident Insurance Companies* strongly endorse them and recommend their use. *Taxicab Companies,* for their own protection, *insist* that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the ***most profitable*** Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

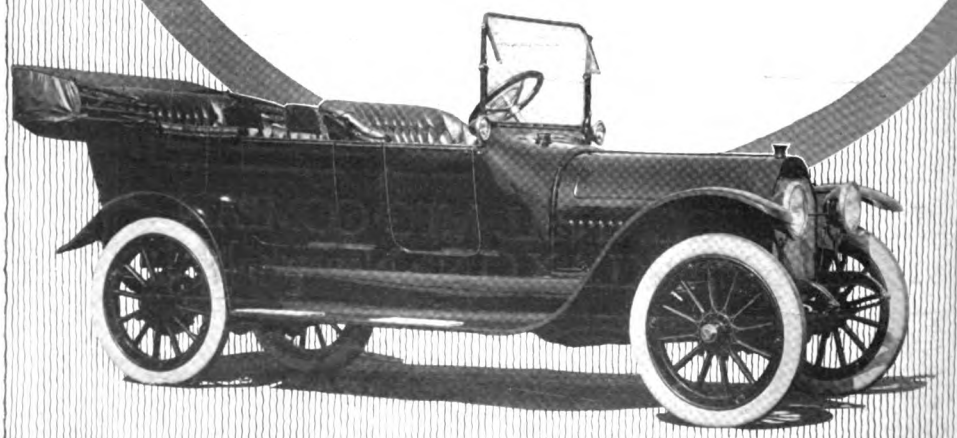
Studebaker

"SIX"
$1575

There is a name that stands for something in the manufacturing world. That name is "Studebaker."

Attach it to two motor car values like the new "FOUR" at $1050 and the new "SIX" at $1575, and what have you?

You have a combination of influences that are well-nigh irresistible.



And that is the way Studebaker dealers feel about it. They are taking orders from no man, from no car.

They have the same faith in Studebaker that the buyer has—interpret that for yourself.

Do Your Own Welding!

Save Time and Money on Repair Jobs!

Every garage and every owner of taxicabs and motor trucks has an ***actual and frequent need*** for a good, simple welding outfit. Don't send out such repair work. You can now ***do it yourself***---and save a lot of time for your customers and money for yourself!

Don't buy and wait for new parts! You can ***make old parts as good as new*** by using the

Cox Welding Outfit

For Welding and Carbon Removing

Complete in every detail. Will do every possible welding job. Unlike others, it is ***very simple in construction.*** Any average mechanic can become adept in its use in a short time. We furnish complete instructions with each outfit. Can be used on parts of iron, steel, brass, bronze and aluminum. It is ***safe*** and ***sure.***

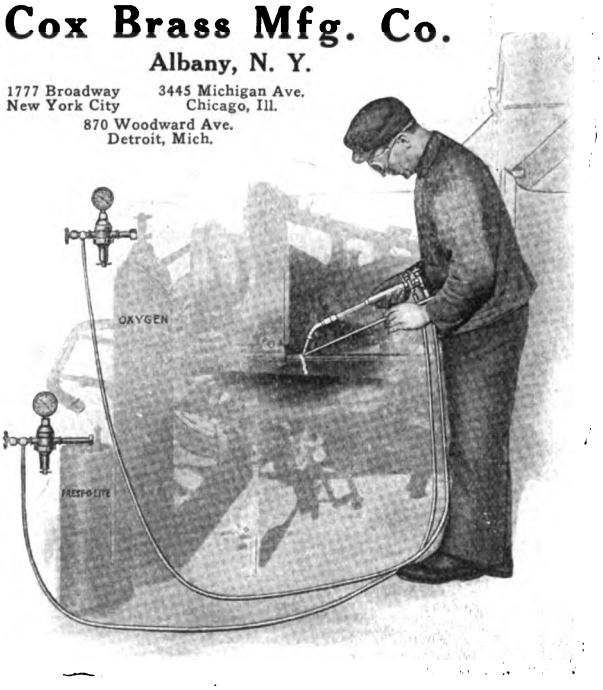
Every job you do means

Extra Profit for YOU

The outfit will pay for itself many times over. It means quick repair work—and ***all of it done in your shop!***

The Cox Outfit is not only excellent for welding, but it can also be used to

Quickly and Completely Remove Carbon from Cylinders



Thus you have a dual outfit—a profit maker in two ways! Its use is doubled. It saves time in two ways—and produces two profits! Its possession indicates progressiveness—up-to-date in shop equipment.

Vol. XXXVII New York, U. S. A., Thursday, December 4, 1913 No. 11

LONG HORN NOW A MEMBER OF JOHNS-MANVILLE FAMILY

Distribution of Piel Product Taken Over by Big Asbestos Products Company—Piel also Takes Corporation Form.

Gradually it is being made plain how far-reaching are the intentions of the H. W. Johns-Manville Co., of New York, in respect to automobile accessories, and what is the real meaning of the organization of an accessory department with Edward A. Cassidy at the head.

Having already taken over the sale of the outputs of Mezger Soot Proof spark plugs and Jones speedometers, the big New York corporation on Monday last, 1st inst., assumed control of the sale of Long horns, made by the G. Piel interests in Long Island City.

As is the case with the Soot Proof plug and Jones speedometer, the Long horn hereafter will be marketed through the 50-odd Johns-Manville branches located in the United States and Canada. The Piel factory in Long Island City will, however, continue to operate under Piel auspices, the transaction with the Johns-Manville people being in the nature of a selling arrangement only.

Incidentally, the Piel business, which heretofore has been conducted by the G. Piel Co., a registered trade name, has just been taken over by G. Piel & Co., a corporation organized under the laws of New York with an authorized capital of $100,000. Gottfried Piel, however, remains the dominant factor.

Ricker to Represent Big British House.

E. de Rodakowski, who arrived in this country two weeks since, heralded chiefly as the designer of the famous Brooklands track in England, came over with more than speedways in his mind. He proved to be also the managing director of the United Motors Industries, Ltd., of London, which is claimed to be the largest accessory house in Europe, and while here lost no time in appointing Chester S. Ricker, of Indianapolis, as his company's American representative and buyer. Ricker is best known as a consulting engineer and as the designer of the Henderson car. The head of the United Motors Industries is S. F. Edge, former managing director of the Napier Motor Co., and holder of a long string of world's records made on the track which de Dodakowski designed, and a past-master in the art of obtaining publicity.

Splitdorf and Apple Effect Arrangement.

Having discontinued the manufacture of the Splitdorflite, the Splitdorf Electrical Co., of Newark, N. J., has effected a "working arrangement" with the Apple Electric Co., of Dayton, O., whereby the Aplco lighting system will be sold and installed at all of the Splitdorf branches and service stations.

When General Manager Curtiss, of the Splitdorf company, was asked whether this unlooked for arrangement indicated that Splitdorf had taken out a license under Aplco patents, or would manufacture the Aplco device, he responded significantly, "Not yet." Pressed for more information, he admitted that "developments were possible" but he resolutely declined to be more specific.

Chalmers Adds Light "Six" at $1,800.

Following the trend of the times, the Chalmers Motor Co., of Detroit, has added a light "six" to its line. It will be known as the "six-48" and will utilize a 3½ x 5½-inch motor which, on a dynamometer test, has developed 54 horsepower, and will list at $1,800. Its wheelbase is 126 inches and it will be furnished in two body styles—a five-passenger touring car and a coupelette, the latter a two-passenger vehicle of the roadster type distinguished by a landaulet top which can be raised or lowered, thereby practically converting the car into a coupe when the top is up.

GERBER'S PLANS REACHING INTO SEVERAL DIRECTIONS

Abbott's Purchaser May Build Trucks in New Castle, Pa.—Talks Also of Bids for Alco and R. C. H. Property.

If even a part of the plans revolving in the brain of Edward F. Gerber, of Pittsburgh, Pa., come to a head, he sooner or later may prove one of the big men of the industry.

As is well known, Gerber, who attained recent prominence as a $400,000 creditor of the bankrupt Michigan Buggy Co., of Kalamazoo, last month asquired control of the Abbott Motor Co., of Detroit, since which time he has been busy not only outlining other plans but signing up former Michigan agents located in the extensive territory in the East which he tilled for the Michigan Buggy Co.

During the present week, A. C. Schafer, president and general manager of the Abbott Motor Co., and Leslie Sanders, its sales manager, retired from office, but their retirement has not served to affect the other lines of endeavor which Gerber has marked out for himself.

In the course of interviews with his dealers, he has let it be known that, among other things, he is behind the scenes in one of the bids for the R. C. H. factory in Detroit, and that he has acquired the former Penn Motor Car Co.'s plant in New Castle, Pa., which he says will be devoted to the production of commercial vehicles. As a short cut in that direction, he stated he had made an offer for the Alco business, but only yesterday, Leigh Best, vice-president of the American Locomotive Co., and as such in charge of the Alco department, declared that he had never heard of Gerber or his offer.

On the other hand, Gerber is credited with having stated that when, in the guise of a prospective purchaser, he sought to

Digitized by Google

inspect the Alco books and inspection was refused, he attained his purpose by promptly purchasing four shares of American Locomotive stock.

In Detroit, the bidder whose name was associated with Gerber in the R. C. H. matter is reported to have declared that while Gerber had approached him nothing had come of it.

Gerber's purchase of the Abbott Motor Co. itself was brought about in somewhat unusual fashion. When he was negotiating for that property, there was pending against him in the Federal court in Pittsburgh a suit instituted by the Detroit Trust Co., as receivers for the Michigan Buggy Co., who were seeking payment for 325 Michigan cars and $40,000 worth of parts, which suit against him, on the bankrupt's books represented a value, in round figures, of $400,000.

Pending trial of the case on its merits, the Federal court granted an injunction restraining Gerber himself, E. F. Gerber & Co., the Pennsylvania Sales Corporation, Pennsylvania Vehicle Co., Pennsylvania Carriage Co., and all his other enterprises, from disposing of any cars, parts or property he owned or controlled into which went any moneys derived from the sale of the Michigan cars or parts.

This injunction was served on Gerber the day he was due to close the deal for the Abbott property and served to place him in a peculiar position. He had agreed to pay for the Abbott assets $237,500, of which he had already paid $25,000 in cash, but with all his possessions tied up by the injunction Gerber was put to it to obtain the necessary money, which he had planned to raise by selling some of his Pittsburgh real estate.

Gerber called the Abbott banking and merchandise creditors to his aid, and through their influence the Detroit Trust Co. consented to Gerber's disposition of the Pittsburgh property in question, but only in consideration of an agreement that of the money derived from the sale $160,000 be used to pay for the Abbott property, on which a mortgage to that amount was given the Trust company, which mortgage is now in force, as is also the injunction.

Gerber made an effort to have the injunction dissolved but his application was denied by the court; nor can he appeal from this denial as his agreement with the Detroit Trust Co., made when the mortgage was executed, stipulated that no appeal shall be made.

Auto Parts Leases Seven-Story Plant.

The Auto Parts Co., of Chicago, now located at 517 West Jackson Boulevard, has leased the seven-story double building at 737-739 on the same thoroughfare and will take possession immediately.

TRUCKS AND CARS COVERED IN NEW STANDARD WARRANTY

Chamber of Commerce Adopts Simplified Guarantee But Makes Few Changes—Hand-Book Specifications Also Standardized.

By way of simplifying adjustments and rendering plainer its meaning to the layman, the Automobile Chamber of Commerce, at its regular monthly meeting, held at the headquarters of the organization in New York City yesterday (Wednesday), revised its standard warranty, which, in the new form that has been adopted now covers both pleasure and commercial vehicles; at the same time, a standardized method of listing the specifications in its yearly handbook also was adopted, these two items constituting the principal elements of business, other than mere routine matters, which came before the meeting.

The change that has been made in the standard form of warranty, has the effect of making unnecessary the separate forms of guarantee which heretofore have been applied to pleasure and commercial vehicles. The warranty is essentially a revision of the old one with very little alteration in the wording except that a number of words considered to be superfluous and more or less confusing to persons not acquainted with the written language of lawyers have been eliminated; it will not be made public, however, until finally approved by the Chamber's counsel.

The standard specification blank that has been adopted for use in compiling the handbook is practically the same as its predecessor, except that it has been made slightly more elaborate.

It was the sense of the meeting that the Chamber should be represented at the forthcoming Panama-Pacific Exposition, but just how the matter will be arranged still is as much in doubt as when the subject was previously discussed; no definite action resulted from the discussion of the question.

Creditors' Objections Check R. C. H. Sale.

The sale of the R. C. H. Corporation's property in Detroit, which several times for the past two weeks has seemed on the point of consummation, is still "in the air." Two bids—one of $255,100 for all of the assets, and the other of $99,500 for the real estate and $184,000 for the physical assets—were made after the court gave Harris Bros. & Co. an opportunity to increase their bid, but acceptances of any sort have been checked by legal objections filed by the Kelsey Wheel Co., Herbert Mfg. Co. and one other R. C. H. creditor. It is now possible that the entire bidding may be reopened for a third time.

Studebaker Promotes Department Heads.

A. R. Erskine, who, as treasurer of the Studebaker Corporation, of Detroit, represents the New York interests, last week was elected first vice-president also, and henceforth will fill both offices. At the same time, the Studebaker people recognized the worth of a number of other department heads by advancing them to higher offices. James G. Heaslet, chief engineer, and Ernest R. Benson, sales manager, were both made vice-presidents, Heaslet remaining in charge of engineering production and Benson in charge of automobile distribution. Benson's elevation making it possible, A. I. Philp, assistant sales manager, was appointed sales manager of the automobile division, while Charles D. Fleming was appointed to the post of assistant treasurer, and H. E. Dalton to the position of chief auditor.

Michigan Property to be Auctioned.

Samuel L. Winternitz & Co., of Chicago, who bid in the property of the bankrupt Michigan Buggy Co., of Kalamazoo, by guaranteeing that not less than $225,000 would be netted by the auction sale they would conduct, will begin disposing of the property on Tuesday next, 9th inst. It is expected that the sale will continue at least one week and it is specifically stated that, notwithstanding reports to the contrary, all personal property will be sold in lots or parcels and not in bulk.

Jones Starter Sets Up Branch in Paris.

Its starter having been adopted for use on the Gregoire car, the Jones Electric Starter Co., of Chicago, has considered the French market sufficiently promising to justify the establishment of a branch in Paris. It is being operated under the title Societe Jesco at 35 Rue de Villejust.

Louis Hupp Goes to Briggs-Detroiter.

Louis G. Hupp, who, after retiring from the R. C. H. Corporation, organized the Tribune Motor Car Co., in Detroit, has relinquished that venture and joined the staff of the Briggs-Detroiter Co. The Tribune factory has been taken over by the recently organized Mercury Cyclecar Co.

Remy, too, Seeks Openings in Europe.

W. O. Kennington, of the engineering department of the Remy Electric Co., is now in Europe, where he will spend two months. He is visiting the manufacturers on the other side with a view of interesting them in the Remy starting and lighting and ignition apparatus.

TEN PLUG MAKERS BOW TO CANFIELD PATENT HOLDER

Leaders in Trade Quick to Recognize Force of Court's Upholding of Mosler's Claim—Lump Sum Payments Preferred to Royalty.

Spark plug manufacturers have not been dilatory in recognizing the force of the United States Court of Appeals decision sustaining the Canfield patent, No. 612,701. During the past two weeks, nearly all of the more prominent ones have "stepped up to the captain's office" and obtained the necessary license from A. R. Mosler & Co., which owns the patent.

To date, and excepting Mosler himself and the Champion Ignition Co., of Flint, Mich., which latter recognized the patent three years ago, manufacturers to whom licenses have been granted are as follows: Jeffery-DeWitt Co., Detroit, Mich.; Champion Spark Plug Co., Toledo, O.; C. A. Mezger, Inc., New York City; Rajah Auto Supply Co., Bloomfield, N. J.; Hartford Machine Screw Co., Hartford, Conn.; Benford Mfg. Co., Mt. Vernon, N. Y.; Frontier Specialty Co., Buffalo, N. Y.; New York Mica & Mfg. Co., Auburn, N. Y.; Auburn Ignition Co., Auburn, N. Y.; and the Silvex Co., New York City.

Except in one instance, all of the licenses have been granted on payment of a lump sum agreed on by the parties in interest and based on the volumes of their business during the past year. As the patent has slightly less than two years of life in it, this procedure was deemed more desirable and expeditious than would the naming of a royalty which would require all of the red tape which goes with an accounting.

The sole exception is a comparatively small spark plug maker who made peace on a royalty basis of four cents per plug.

Grant Purchases Factory in Findlay.

After negotiating with several other cities, the Grant Motor Co., of Detroit, finally has purchased the plant in Findlay, O., previously occupied by the defunct Findlay Motor Co., and will immediately proceed to the production of the appealing $495 light car which was developed and heralded several months ago and which, in the meantime, has been extensively tried out on the road. The Findlay factory affords approximately 50,000 square feet of floor space and is completely equipped.

The Grant company plans to produce 5,000 cars for the 1914 market, practically all of which already have been contracted for by some 200 dealers who have been appointed. The officers of the company are: George D. Grant, president; C. A. Grant, vice-president; H. J. Koehler, second vice-president; D. A. Shaw, secretary and treasurer; George S. White, sales manager.

Equipment Company Gets Weed Account.

After handling Weed tire chains for many years in a jobbing way and on a large scale, the Motor Car Equipment Co., of New York, has been appointed sole distributer of the Weed product in the metropolitan district, which comprises New York City, all of Long Island and Westchester County, and Jersey City and Newark in New Jersey. The arrangement went into effect December 1st. Stocks will be carried at both the Motor Car Equipment's headquarters, 55 Warren street, and at its uptown branch, 238-240 West 56th street. The Equipment company's Weed chain department, to which naturally much more importance hereafter will be attached, will be in charge of Gene Carbrey.

Pittsburghers Acquire Harroun Carburetter

Ray Harroun, of the Ray Harroun Co., and the Harroun carburetter have been absorbed by the Electric Renovator Mfg. Co., of Pittsburgh, Pa., which, it is stated, is controlled by a group of the largest independent oil operators in America. For the time being, the Harroun factory will remain in Indianapolis, but ultimately will be removed to Pittsburgh. Harroun will go with it and will bend his efforts toward the development of the principles embodied in his carburetter, to the end that they may be applied to all forms of internal combustion motors.

Dealers Co-operate in Sale of Gasolene.

Rivals in the sale of cars, five of the best known dealers in Los Angeles have joined hands in the organization of the National Supply Co., the most immediate purpose of which is the establishment of a chain of gasolene supply stations in that California city. Eight of them already are in operation and about 20 others are in prospect. The company has been incorporated with an authorized capital of $25,000, the incorporators being H. L. Arnold, Hudson distributor; Don Lee, Cadillac; E. C. Anthony, Packard; Cuyler Lee and Phil Prather, Cadillac.

Willys Wants Times Square to Pay $5,000.

When John N. Willys recently took over a manufacturing plant—a habit he has—he sold part of the equipment or contents to the Times Square Automobile Co., of New York and Chicago, the "world's greatest price wreckers," and now a suit has resulted from the transaction; Willys this week instituted action in the Supreme Court for New York county for $5,000, the alleged purchase price of the goods.

ASSOCIATION OF NEW YORK STATE DEALERS COMPLETED

Organization Formally Launched and Officers Elected at Albany Meeting—Day, New York, President —Two Kinds of Membership.

It now truly may be said that the Automobile Trade Association of New York State is in being. Having laid the groundwork the previous week, the dealers interested again gathered in the Ten Eyck, in Albany, on Tuesday last, 2nd inst., and adopted that title for the organization and elected the following officers: Arthur M. Day, of New York Dealers' Association, president; C. D. Hakes, Albany Dealers' Association, treasurer; Charles A. Stewart, New York Association, secretary and general manager. These officers and Geo. H. Norris, Syracuse Association; Thomas Northway, Rochester Association; H. L. Carpenter, Brooklyn Association, and E. Lascaris, Importers' Alliance, comprise the board of directors.

Although a New York body, the association will be incorporated under the laws of Connecticut, which offer certain advantages, but the real headquarters will be in Hotel Woodward, in New York City, where the New York Dealers' Association has its office, of which General Manager Stewart is in charge.

While local associations only had to do with the formation of the State organization, unaffiliated car dealers, supplymen, garagemen and importers will be welcomed and will be given a voice and vote, two forms of membership being provided for, in each of which the dues are $5 per member. The two classes, as defined by the bylaws, are as follows:

"Corporation or Association Membership —Any automobile trade association, corporation or club in any part of the State of New York, including motor truck clubs, garage associations, automobile importers' salons, and such associations and corporations composed of those dealing in or having to do with accessories or parts or equipment of automobiles, and any association or corporation operating in the State of New York, the membership of which is made up exclusively of those engaged in the business of dealing in motor vehicles, or their accessories, parts or equipment.

"Individual members. Persons or individuals that are engaged in and have capital invested in the automobile trade in the State of New York, which shall be taken to include garage owners or persons or individuals who partially or exclusively are engaged in the business of dealing in auto-

Digitized by Google

mobiles, motor vehicles or their accessories, and have capital invested therein, including garage owners or importers or dealers in accessories, who are not members of any organization or association member, shall be eligible to membership as individual members; such individual membership shall be at an end on such member becoming a member of any corporation, association, club or other body which is a member of this corporation."

The balance of power will at all times rest with the corporation or association membership, which must be represented by at least six of the ten directors who will constitute the board, and all of whom will hold office for one year only.

The directors may appoint such committees as they deem necessary, but the by-laws themselves provide only for an executive committee consisting of five members, not less than three of whom shall be representatives of the corporation or association membership, and this committee will have all the powers of directors when the board is not in session.

Monthly meetings will be held except during the months of May, June, July and August.

Votes by proxy are restricted to the "corporation or association members," which will have as many votes as each has members for whom it pays dues. Each individual member will, of course, have one vote.

Times Square Treasurer Goes Abroad.

Louis Mansbach, treasurer of the Times Square Automobile Co., of New York, sailed yesterday to Europe where, he has let it be known, he will visit the "various agents handling their automobiles and automobile accessories and establish others." Until this announcement was made, and as the Times Square business was largely of a cut-price jobbing nature, it was not known that the company had developed an agency system abroad.

Court Refuses to Order Walpole Sale.

Until the receivers render their report, at least, the plant of the Walpole Tire & Rubber Co., of Walpole, Mass., will not be disposed of. The petition of the creditors, representing approximately $1,000,000 of the liabilities, asking that the property be sold, was denied by the Federal court in Boston on Monday last, 1st inst.

Federal to Build Branch in 'Frisco.

The Federal Rubber Mfg. Co., of Milwaukee, has let contracts for the erection of a new building in San Francisco. It will be occupied by its Pacific Coast branch, which will be located on the southwest corner of Van Ness avenue and Sutter street and will be completed by February 1st.

REDUCTION OF TIRE PRICES MADE ALL ALONG THE LINE

Two Makers Meet Goodrich Cut on Plain Treads but Not on Non-Skids—All Others Reduce Proportionately.

Following the Goodrich-Diamond reduction of approximately 18 per cent., the prices of all other tire manufacturers, as expected, have been tumbling during the past week. In but two instances, however, have the Goodrich-Diamond prices been met, and then only so far as plain treads are concerned.

Those who met the Goodrich figures in this regard are the United States Tire Co. and the Goodyear Tire & Rubber Co., the prices of whose 34 x 4 plain tread casings, to cite the most popular size as an example, were lowered from $29.80 to $24.50. Neither the United States nor the Goodyear companies, however, have met the Goodrich quotations on non-skids. Goodyear has cut, but the new figure still rules about 10 per cent. higher than the Goodrich price, while the United States has not only made no reduction whatever but is inclined to stand pat and maintain its present non-skid prices, the nobby tread at $38.45 and the chain tread at $35.30 for the 34 x 4 size; whereas the Goodrich non-skid price is $26.05, a reduction of $5.45.

So great was the diversity of prices that existed that the reductions of the past week have not served to make them equal, although practically all of them are within a few cents of each other. Thus, Firestone 34 x 4 plain treads are now $26.20, as against $31.35; Fisks are $26.35, instead of $32, and Ajaxes $26.30 as compared with the old price of $32. Firestone 34 x 4 non-skids have been reduced from $36.05 to $30.50, and Fisk non-skids from $36.65 to $31.65.

Firestone and Fisk tubes, which always have been quoted at higher prices than the others, have also felt the pruning knife, but in the case of the latter a correspondingly higher scale is maintained. Whereas Goodrich reduced 34 x 4 tubes from $5.65 to $4.90, Fisks are reduced from $6.20 to $5.60; Firestone, however, reduced tubes from $5.95 to $4.90, thereby meeting the Goodrich cut.

Because of change and changing conditions in the automobile manufacturing end of the industry, there are those who have assumed that the reduction in tire prices was at least to some extent influenced thereby and that the effects will be seen in future balance sheets of the tire companies.

Horace DeLisser, of the Ajax-Grieb Rubber Co., however, points out that there is no reason why this should be the case. He figures that it will be necessary for tire makers to account for a decrease of about $40,000,000 in revenues, occasioned by the reduced prices, but he is confident that the loss will be made up by a greater market for tires during 1914. This, he declares, can be determined by simple reasoning.

"Put the car output of 1913 conservatively at 400,000 cars," he says. "This meant 400,000 sets in 1913. For 1914 it will mean six tires to a car, for these new sets wear out and must be replaced and spares must be carried. Then, again, as I figure it, the average life of an automobile is about five years. At that rate, there are about 150,000 cars annually that go to the scrap heap.

"They are replaced, because motorists keep right on using cars. Therefore, at the very least there is a demand for 150,000 sets additional for 1914, not to mention the many cars already in use that have not yet reached the end of 'life.' It can be seen that each year, as long as any new cars at all are made, means more tires called for than in the preceding year."

More Crude Rubber in Tire Trade Law.

Crude rubber again has appeared as a cause of litigation within the tire trade; this time the Frontier Tire & Rubber Co. of Buffalo, is the defendant, being sued by Charles T. Wilson in the Supreme Court for New York county. He charges that he sold to the Frontier company and delivered to it September 27 last 1,365 pounds of Prime Manicoba Plantation Crepe rubber at $1.11 a pound, and that September 29 the Frontier company said it didn't want the rubber and asked him to sell it.

Wilson sold it, he states, October 18 at 48 cents a pound, a loss to him of $859.95 in profits he would have secured had the sale gone through at $1.11. Besides this sum there is a note for $510.50 dated September 25 and payable November 15 which went to protest with a fee of $1.35, making a total of $1,371.80.

Service on Mansfield Tire Not Allowed.

Because George W. Henne, of the Mansfield Tire & Rubber Co., was in New York City as a witness in a lawsuit when he was served by the Automobile Tire Co. in actions against him and the Mansfield company, the Supreme Court for New York county has set aside the service as improper; further progress in these cases will be impossible unless other service is secured. The Automobile Tire Co. claims damages growing out of tire manufacturing contracts, but the Mansfield company declares that it is unworried by the suits and is confident of the outcome.

The Week's Incorporations

Detroit, Mich.—Ontario Motor Co., under Michigan laws; authorized capital, $10,000; to deal in motor cars.

Detroit, Mich.—United States Auto Supply Co., under Michigan laws; authorized capital, $10,000; to deal in motor cars.

Birmingham, Ala.—Airless Tire Filler Co, under Alabama laws; authorized capital, $2,000. Corporators—J. D. Smith, W. E. Oldham and others.

Toledo, O.—Toledo Auto Cycle Car Co., under Ohio laws; authorized capital, $20,000. Corporators—A. L. Mayer, Thad S. Powell and John J. Keil.

Detroit, Mich.—Saxon Motor Co., under Michigan laws; authorized capital, $250,000; to manufacture motor cars. Corporators—H. M. Wirth, R. E. Cole and others.

Milwaukee, Wis.—Cycle Car Sales Co., under Wisconsin laws; authorized capital, $5,000. Corporators—Ray J. Everhardt, Geo. W. Kliegel and Alex C. Templeton.

Cleveland, O.—Knight Motor Repair & Garage Co., under Ohio laws; authorized capital, $5,000. Corporators—Arthur House, Frank Kyle, Frank K. Schaut and others.

Birmingham, Ala.—Automobile Remodeling Works, under Alabama laws; authorized capital $5,000. Corporators—C. S. Sibley, Kenneth Underwood and Frank B. Cornell.

Lima, O.—Lima Motor Transit Co., under Ohio laws; authorized capital, $10,000; to operate a motor transit. Corporators—W. S. Pierce, Fred K. Cook and W. E. Berryman.

Detroit, Mich.—Transportation Engineering Co., under Michigan laws; authorized capital, $1,200; to manufacture motor equipment. Corporators—R. J. Macklin and R. F. Beach.

Muncie, Ind.—Ross Motors Co., under Indiana laws; authorized capital, $25,000; to manufacture motor car accessories. Corporators—H. V. Hancock, V. H. Hancock and E. T. Ross.

Memphis, Tenn.—Tri-State Auto Co., under Tennessee laws; authorized capital, $15,000. Corporators—W. H. Court, R. F. Chew, Jr., J. H. Poston, Jr., D. H. Crump and R. T. Crenshaw.

Detroit, Mich.—Headlight Support Co., under Michigan laws; authorized capital, $50,000; to manufacture automobile accessories. Corporators—A. A. Caille, Charles R. Chisholm and others.

Syracuse, N. Y.—Sagamore Motors Corporation, under New York laws; authorized capital, $75,000. Corporators—Julian S. Brown, Charles G. Hanna and Ernest W. Lawton, all of Syracuse.

North Yakima, Wash.—Johns-Tucker Co., under Washington laws; authorized capital, $5,000; to conduct a retail sales business and machine shop. Corporators—A. A. Johns and Bismark Tucker.

New York, N. Y.—Roland Gas-Electric Vehicle Corporation, under New York laws; authorized capital, $200,000. Corporators—Percy K. Hexter, Roland R. Conklin and Stanley L. Conklin, all of 1 Wall street.

Chicago, Ill.—Silent Flyer Motor Co., under Illinois laws; authorized capital, $15,000; to manufacture motorcycles and accessories. Corporators—William M. Melling, A. H. Doorfler and Frank Doorfler.

Indianapolis, Ind.—Central Prest-O-Ceal Co., under Indiana laws; authorized capital, $50,000; to manufacture accessories and supplies for motor cars. Corporators—H. L. Archey, F. K. Gardner and G. C. Grimes.

Rochester, N. Y.—H. L. F. Trebert Rotary Motor Co., under New York laws; authorized capital, $200,000. Corporators—Henry L. F. Trebert and Martin J. Shrag, both of Rochester; L. Gerome Ogden, Penn Yan.

Chicago, Ill.—Petschel Storage & Battery Co., under Illinois laws; authorized capital, $31,000; to manufacture electrical novelties. Corporators—R. A. Heisch, G. M. Merker and H. L. Wuerffel, all of Chicago.

Seattle, Wash.—Seattle Motor Speedway Corporation, under Washington laws; authorized capital, $200,000. Corporators—J. C. Hayward, Harry W. Doherty, A. B. Simmernacher, Howard S. Amon and R. G. Dennev.

Brooklyn, N. Y.—De Luxe Garage Co., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—Frank Staendel and Katherine Staendel, both of 149 Rodney street; Harry B. Potter, 1321 Avenue O.

Chicago, Ill.—LeRoy Franz Mfg. Co., under Illinois laws; authorized capital, $10,000; to manufacture and sell automatic transmissions, fillers, motor car accessories, etc. Corporators—Calvin H. Burks, Earner Franz and LeRoy E. Franz.

Indianapolis, Ind.—National Automobile Equipment Co., under Indiana laws; authorized capital, $10,000; to manufacture electrical and mechanical devices for motor cars. Corporators—N. Burnham, J. A. Martz and G. B. Martz.

New York, N. Y.—Broadway Auto Sales Co., under New York laws; authorized capital, $2,000. Corporators—Benjamin F. Thomas and Richette G. Randolph, both of 213 West 53d street; Louise E. Jeter, 3140 Heath avenue, Kingsbridge.

Brooklyn, N. Y.—Eero Motor Vehicle Corporation, under New York laws; authorized capital, $10,000. Corporators—Adelbert E. Parke, 476 Sixth avenue; Eero W. Halin, 850 Gion place; Herbert Lovinger, 789 Elsmere place, Bronx.

Wheeling, W. Va.—Tristate Motor Car Co., under West Virginia laws; authorized capital, $10,000; to deal in motor cars. Corporators—Louis P. Frobe, Triadelphia; G. E. Griffith, Morris Jacobs, S. K. Johnson and Thomas Halpin, all of Wheeling.

Brooklyn, N. Y.—Bedford Auto Painting & Repairing Co., under New York laws; authorized capital, $1,000. Corporators—John Sargh, 312 East Houston street, New York; Joe Kaufman, 128 Allen street, New York; Abraham Rosenblatt, 136 Stockton street.

Canisteo, N. Y.—Automobile Machine Co., under New York laws; authorized capital, $300; to manufacture springs and other parts for motor cars. Corporators—Charles B. Schaumberg, Joseph L. Schaumberg and William F. McGreevy, all of Hornell, N. Y.; Charles L. Thomas, Canisteo.

Changes in Capitalization.

Cincinnati, O.—Nyberg Auto Sales Co., from $25,000 to $7,500.

Chicago, Ill.—Century Rubber Works, from $50,000 to $100,000.

Milwaukee, Wis.—Feilbach Motor Co., from $50,000 to $100,000.

Cleveland, O.—Standard Motor Truck Co., from $5,000 to $50,000.

Indianapolis, Ind.—Premier Motor Mfg. Co., from $200,000 to $700,00.

Dayton, O.—Automatic Lamp Control Co, from $30,000 to $100,000.

AND NOW TWO PRIMING PLUG PATENTS ENTER THE ARENA

Buffalo Companies Warn Trade of Basic Right to Priming Device—Grossman Sees Merit in Claims and Takes Out Licenses.

Apart from the recent court decision sustaining the Canfield patent, which gave to A. R. Mosler & Co., of New York, the rights to all chambered types of spark plugs, the makers of those very necessary articles are being called upon to meet still another patent situation, one involving the use of priming plugs or other priming devices which form a part of their respective plugs.

The two patents which are claimed to cover such priming devices are: No. 642,167, granted January 30, 1900, to Frederick R. Sims, of London, England, and covering an "Electric Sparking Plug for Explosion Engines"; and No. 915,896, granted June 13, to John G. Shea, of Detroit, covering a "Spark Plug." Sims is the inventor of the well known magneto bearing his name.

Both patents are owned jointly by the Frontier Specialty Co. and the Czar Ignition Co., both of Buffalo, and as owners of these grants they have circulated warnings to the trade, asserting that the patents are basic so far as priming plugs are concerned and that prosecution is likely to follow failure to take out licenses.

So far as known, neither patent has been litigated, but the Emil Grossman Mfg. Co., maker of the Red Hed spark plugs, upon advice of its legal counsel, has taken out licenses; they bear date of November 22 and are so inclusive as to cover not only all future production of the Grossman company but all its past manufactures. The action of the Grossman company is regarded by the owners of the patents as a recognition of their strength and it is stated that more may be heard of the Buffalo companies and their newly heralded possessions.

The patents, while covering a priming device, are different. The Sims patent is designed as a part of an existing type of plug, the object of the patented part being to deposit the priming liquid at the point of spark. The sketch of the device shows a valve at the top of the plug, a priming cup and a small hole leading down through the center of the plug to the points. The Shea patent claims to cover a whole plug of which a priming arrangement is a part.

This is the second time within a month that the Grossman company has bowed before a patent holder. Late in October it purchased a controlling interest in the William Barber spark plug patent, No. 732,032, after Barber had filed an infringement suit. The Barber patent claims to cover two-piece insulation.

Court Takes Chains Away from Junk Man.

Those old Atlas and Premier tire chains which Robert T. Gray, a New York City junk man, bought last month with a possible expectation that he was getting a bargain, have developed into a "dead horse" or a "white elephant," whichever nomenclature Gray prefers.

The Weed Chain Tire Grip Co., after filing suit against him for infringing the Parsons patent, No. 723,299, this week secured an order of sequestration from Judge Lacombe in the United States District Court for the Southern District of New York. This means that the chains will be taken possession of by a United States marshall and held until the termination of the suit, and if the Weed company wins, as it generally does, the chains may find their way to the bottom of New York Bay. The chains are the product of companies which the Weed company enjoined some time ago.

In connection with the same matter the Weed company this week filed suit in the same court against Samuel Hollander, Morris Benjamin, Herbert I. Segal and Ephriam Nobel, second-hand machinery dealers with offices at 30 Church street.

Texaco Oil Makes Change of Presidents.

Despite opposition, the Eastern men who control the Texas (Oil) Co. dominated the annual meeting, which occurred last week in Houston, Tex. They elected three new directors, who in turn elected E. C. Lufkin president, in place of J. S. Cullinan; Arnold Schlaet, T. J. Donoghue, R. C. Holmes, G. L. Noble and W. A. Thompson, Jr., were elected vice-presidents. C. P. Dodge was elected secretary to succeed J. L. Austry. A. L. Beaty, formerly associate general attorney, was elected general attorney to succeed J. L. Autry.

The new directors elected were: J. N. Hill, to succeed the late Charles G. Gates; A. L. Beaty, W. A. Thompson, Jr., and J. H. Lapham, succeeding J. S. Cullinan, J. L. Autry and W. C. Hogg.

Another Disputed Repair Bill in Suit.

Another instance of the necessity or advisability of previous agreements concerning repair work is apparently indicated by a suit instituted last week in Council Bluffs, Ia., where D. E. Butler filed suit against the Raapke Motor Co. because of a disputed repair bill. The company demands $300 and he declares the job is worth but $200. He is suing for the possession of his car and $100 damages for its alleged wrongful detention.

AMERICAN POSSESSIONS BUY BETTER CARS IN SEPTEMBER

Pay $1,561 as Compared with $1,149 a Year Ago—Total of Cars Less, Value Greater—More Tires to Porto Rico and Hawaii.

Even though the non-contiguous American possessions—Hawaii, Porto Rico, the Philippines and Alaska—decreased by $21 the average price of cars bought during the first nine months of the present year, they deviated from the average during September last and increased the average value by $412, as compared with September, 1912. As was the case in August, the possessions bought fewer cars for more money, the number being 27, or 23 per cent., less, and the value $6,048, or 4 per cent., greater.

The average price per car in September, 1912, was $1,149 and in September, 1913, $1,561, a gain of 36 per cent. The only real gain was made by Hawaii, which bought three, or 8 per cent., more cars and paid $8,670, or 16 per cent., more for them. In September, 1912, it paid $1,469 and in that month of this year $1,575, a gain of $106, or 7 per cent. The average prices paid by Porto Rico were: September, 1912, $801; September, 1913, $1,104. By the Philippines: 1912, $1,098; 1912, $1,919. Parts lost by $949, or 6 per cent.

During the nine-month period ending with September of this year the purchases of the possessions increased by 57 cars, or 5 per cent., and $59,110, or 3 per cent. Parts lost by $7,009, or 3 per cent.

Tire shipments, so far as given by the Federal statisticians, were: Hawaii—September, 1912, $26,998; 1913, $36,420; gain, $9,428, or 35 per cent. Porto Rico—September, 1912, $28,082; 1913, $37,044; gain, $8,962, or 32 per cent. The figures follow:

	September 1912 No.	September 1912 Values.	September 1913 No.	September 1913 Values.
Hawaii—Cars	37	$54,339	40	$63,009

In the RETAIL WORLD

The Opper-Van Vleet Auto Co. has en-ered the trade in Omaha, Neb. It has pened salesrooms for Kissel and Krit ars at 12th and Farnam streets, in the uarters formerly occupied by the United fotor Omaha Co. J. M. Opper formerly as a district manager for the Maxwell fotor Co. and Charles Van Vleet, his pres-nt business associate, was his assistant. oth men have been connected with the ade for everal years, having been located York, Lincoln and Omaha. They plan erect a new building in the spring.

The Reliance Automobile Co., of San rancisco, of which Samuel M. Crim is the ead, has taken over the Auto Sales Co., hich handled the Velie car in that city. reviously the Reliance company handled lco trucks only, and following their dis-ontinuance the Knox commercials were aken on, which, with Velie cars, will here-fter constitute the Reliance representation.

The Resthaven Garage, located in Wau-esha, Wis., at Hartwell and Arcadian ave-ues, has been leased by the Spring City uto Co. The latter consists of E. A. Spin-er, of Milwaukee, and P. J. Wolf and W. I. Evans, of Menomonee Falls, Ford deal-rs in that town. The Resthaven Garage is ear the Resthaven Hotel, a summer and inter resort.

W. W. Garabrant, formerly district man-ger for the Franklin Automobile Co. in ie Kansas City terrirtory, and for a num-er of years a traveling engineer for the ame company, has entered the trade as a ranklin dealer in Utica, N. Y. He will ade under the style Franklin Motor Car o.

Reif & Leinbach, of Reading, Pa., are recting a two-story garage, on Madison venue, between Walnut and Elm streets; ie repair department will be located at the ar of the second floor. The equipment cludes a 20-foot turntable on the ground oor and an electric elevator.

Fleming & Brown, of Kankakee, Ill., have old their Reo agency to Gray & Swanell, lso of Kankakee; the business is located t 224-26 Station street. Fleming will re-re from the trade to look after his farm-ng interests, while Brown may reenter the ade later.

The Cyclecar Sales Co. has been formed Milwaukee, Wis., and will distribute Imp cyclecars; the members of the company are A. C. Templeton, former sales manager of the Kissel agency, and George W. Kliegel, secretary and treasurer of the Davis Mfg. Co.

Harry Roose and C. E. Lane have organized the Roose-Lane Auto Co. in Kalispell, Mont. They will operate a garage and handle Apperson, Buick and Chalmers cars at 16 1st avenue west. They formerly operated a garage on 1st avenue east, but sold it.

The Automobile Co. of Philadelphia has opened a new service station at 222-26 North 21st street, Philadelphia, Pa. The company handles Cole and Marmon cars. The company recently took possession of new salesrooms at 2037-39 Market street.

B. L. Losey, formerly of Charlotte, Mich., has purchased the Tracy Garage in Elkhart, Ind., located at 117 Harrison street; he will add equipment and operate the business. W. J. Tracy, the former owner, may locate in Chicago.

Charles E. Lair and Mortimer J. Everet, proprietors of the Gloversville Garage, located on Washington street, Gloversville, N. Y., plan to dissolve partnership; Lair will withdraw from the firm and enter business for himself.

Harvey R. Smith has sold the Fillmore Garage, in Fillmore, Cal., to K. Leegan, of Piru, in the same State; the bicycle repair-shop, operated in conjunction with the garage, was sold at the same time to Gardner Bookman.

H. P. Kinsella, formerly manager of the Commercial Motor Car Co., of Wilkes-Barre, Pa., has entered the trade for himself; he has secured the Velie agency and also stocks Fisk tires and a line of accessories.

The Washington Motor Car Co. has been formed in Seattle, Wash., to act as a used car agency in that city; C. R. Williams and William Matheson are among the principals. The company is located at 1409-13 Broadway.

Frank and Cyril Reed, T. P. Campbell and R. C. Ragon, of Oakesdale, Wash., have entered the garage trade; they have taken over a garage formerly operated by the Oakesdale Land Co.

Alva Jones & Son are about to enter the garage trade in Mansfield, Ill. They have purchased for $2,000 a Main street building formerly owned by Howard Nash, of Champaign, Ill.

William Paoge has purchased the interest of J. E. Mavginnes in the Sunset Rubber Co., in Santa Barbara, Cal. The company is a retailer of tires and rubber accessories.

I. Zabriskie, formerly of Stanley, Ia., has taken over the Peterson Garage in Cedar Falls, in the same State; Zabriskie will enlarge the business and secure a car agency.

William C. Thomas has purchased the interest of E. C. Williamson in the Thomas-Williamson Co., of Jacksonville, Fla. The company handles Haynes and American cars.

The Ensign Motor Co. has entered the trade in Springfield, O., at 205-7 South Fountain avenue; the company handles Cole, Stevens-Duryea and Oakland cars.

William H. Bradley, of Pulaski, N. Y., is about to become a garage man; he is remodeling his carriage and wagon plant on Jefferson avenue for this purpose.

Frank Kilgore and Samuel C. Sparger have formed the Bristol Auto Co., in Bristol, Tenn. They will open a garage in the James building, on Lee street.

A. E. Gray and Fred Swannell have purchased the Fleming & Brown Auto Sales Co. in Kankakee, Ill. The place of business is on Dearborn avenue.

H. P. Schamp and E. M. Petrie, of Eaton Rapids, Mich., have taken over the Minnie & Tubbs Garage; they will operate under the style Schamp & Petrie.

The Central Motors Co. has opened a garage and repair-shop in Owensboro, Ky. The principal stockholders are Elmer Little and William R. Cavin.

Roscoe Branch, of Port Jervis, N. Y., has purchased the Whipple Garage in Monticello, in the same State; he will take immediate possession.

William Moore, formerly of Colburn & Moore, of Oneonta, N. Y., has branched out for himself; he has opened a garage on Windsor avenue.

Mahlon Sweet and Rolo Drain have purchased the Mozach Garage, in Eugene, Ore. They will operate it under the style Sweet-Drain Auto Co.

Digitized by Google

H. B. Swalley, of Nebraska City, Neb., has sold his garage to Alexander W. Neihart, of Dunbar, in the same State; it is located on 10th street.

W. E. Anderson and Joseph Green have entered the trade in San Marcos, Tex. They have styled their business the Auto Sales & Supply Co.

Curtis B. Lyon, of Rochester, N. Y., has become a dealer; he has taken the Pathfinder agency and will locate on North East avenue.

Angus J. Crites, of Bakersfield, Cal., has sold his interest in the Ford Garage to his partners, George Haberfelde and E. A. Test.

Ellis Shoner has purchased the garage business of John A. Finnessey, of Morristown, N. J.; it is located on Pine street.

The Wallerboro Garage Co. has been formed in Wallerboro, S. C. The company will handle cars and operate a garage.

George A. Evans, of Advance, Mo., plans to enter the trade in Dexter, in the same State; he will handle Fords.

The Morgan Torrenge Automobile Co., of Lafayette, Ind., has changed its name to West Side Automobile Co.

Joseph H. Schroeder plans to open a garage and repair-shop in St. Louis; he will locate on North 12th street.

Erickson & Bastedo have opened a new garage in New Brunswick, N. J.; it is located at 127 Church street.

J. C. Stoebe and Ephriam Nelson, of Marion, Ind., have become dealers; they have the Maxwell line.

Kratochville & Nohring have opened a garage in Houston, Tex. It is located on West 4th street.

Elmer Denman, formerly of Bakersfield, Cal., has opened a garage in Meridian, in the same State.

Martin S. Lewis, Jr., of Los Angeles, has opened salesrooms in Colton, Cal. He has the Ford agency.

John G. and Robert Dorward have purchased the Alameda (Cal.) Garage; they will operate it.

Keir & McCourt, of Ida Grove, Ia., have sold their garage and salesrooms to Herman Mess.

The Rayfield Cycle Car Motor Co. has been formed in Rockford, Ill. It will handle cyclecars.

The Oswego County Auto Co. has been formed in Mexico, N. Y. It will stock Reo cars.

C. P. Hall, of Shelbyville, Ky., is erecting a garage; he will operate it himself.

J. D. Steiner has opened a garage in Greenville, Ala.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Forest H. Peabody has been appointed manager of the Ford branch in Louisville, Ky. Previously he was assistant manager of the Ford establishment in Boston.

J. F. Walsh, for several years manager of the Oakland branch in Boston, has been transferred to the factory in Pontiac, Mich., where he will be attached to the sales department.

W. P. Taylor has been appointed general manager of the Hess Spring & Axle Co., of Cincinnati. Previously he was factory manager of the Lewis Spring & Axle Co., of Jackson, Mich.

A. L. Longtin, for the past 11 years identified with the Knox Automobile Co., of Springfield, Mass., latterly as manager of production and costs, has resigned that post. He has not yet made a new connection.

A. J. Kleinmeyer, for the past year manager of the Jeffery branch in San Francisco, which recently was taken over by other interests, has been transferred to the Jeffery factory in Kenosha, Wis., of which the general manager is Lewis H. Bill, who himself for many years managed the San Francisco branch. Kleinmeyer will be attached to the sales department.

George V. Lyons, who served as manager of the King branch in New York until June last, when he removed to Los Angeles to become sales manager for the Alco Motor Sales Co., has resigned the latter connection to become the manager of the Lord Motor Car Co.'s truck department in that city. As such, he will have charge of the sale of Garfords, with which he was once identified while in the East.

R. E. Gerspacher, a former district manager of the Michelin Tire Co., has been elected secretary and treasurer of the Stoddard-Dayton-Maxwell Repair Co., of Dayton, O., to succeed Charles Shellman, resigned. He will assume his new duties January 1st. B. A. Rhoades and J. W. Glashy, who formed the company several months ago, will retain their interest in the business which, apart from general repair and machine work, included the manufacture of any part of any car.

W. E. Cameron, former Western sales manager of the Motz Tire & Rubber Co., has been promoted to the office of assistant sales manager with headquarters at the factory in Akron. R. O. Brinker, who has previously manager of the Motz branch in Washington, D. C., also has been advanced—to the management of the company's commercial tire department.

M. A. Enders, manager of the Ford branch in Cincinnati, has been transferred to the management of the larger distributing branch in Fargo, North Dakota. He changes places with G. W. Reynolds, who, of course, will hereafter serve the Cincinnati establishment.

Recent Losses by Fire.

Milwaukee, Wis. — Hickman-Lauson-Diener Co., 135-43 8th street; salesrooms and garage destroyed, 38 Fords damaged. Loss, $120,000.

Baltimore, Md.—F. W. Sandruck & Sons, North Howard street; salesrooms, garage, 11 cars, motorcycles and 25 bicycles practically destroyed. Loss, $75,000.

Chadds Ford, Pa.—Preston B. Lee; garage, tank house and barn destroyed. Loss $10,000.

Long Island City, N. Y.—Standard Oil Co., Devoe yard, East River; oil can factory destroyed. Loss, $150,000.

Hillsdale, N. J.—Ira Durie; garage, two cars and residence destroyed. Loss, $4,000.

Dunmore, Pa.—T. B. McClintock, Jefferson avenue; garage and three cars destroyed. Loss, $5,000.

Durant, Ia.—H. F. Bierkamp; garage, salesrooms and implement store destroyed. Loss, $12,000.

Worcester, Mass.—Edward A. Rider, 341 Pleasant avenue; garage and five cars damaged. Loss, $2,000.

Minor Business Troubles.

Six accident damage claims aggregating $60,000 against F. H. Anger, of 3414 West Fullerton avenue, Chicago, are the principal portion of his liabilities in a bankruptcy petition he has filed in the Federal court; the total is $69,049.30. His assets are $3,034.12. He operated an automobile delivery.

James B. Archer, copartner with Fred Turner, a former St. Paul detective, in the National Motor Car Co., of that city, has brought suit for a dissolution and an accounting; Archer claims that since the formation of the company—October 1, 1912—Turner has impeded its development, has caused it to operate at a loss, has tried to intimidate Archer into transferring part of his interest to Turner, has withdrawn $1,300 of the company's bank account and has taken possession of an automobile which was valued at $2,500, the property of the firm.

NEW YORK, DECEMBER 4, 1913

REDUCING THE PERILS OF THE HIGHWAY.

Periodically, as in New York this week, the police are prodded into uncommon activity and, in the interests of public safety, raids are made on automobilists. Great numbers of them are haled to court and punished; the public prints applaud, the man who makes his living chiefly by exploiting automobile accidents, thereby inflaming the populace, interviews himself approvingly, and probably all save the arrested drivers agree that if the raids are continued, the highways will be rendered safer.

Popular notion to the contrary notwithstanding, all motorists seek to avoid accidents, and while they may wonder why the unlighted tail light of an automobile should constitute more of an offense than an unlighted side light on a horse-drawn buggy, few of them will rail loudly at the punishment of offenders of whatever sort; but they have every right to expect that the laws shall be enforced without favor and that they shall not be singled out and made the "goats."

Periodical arrests of automobilists, however, will not wholly serve the end in view. If they are not over-regulated, certainly they are not under-regulated, but that other persons and other things that use the highways are greatly under-regulated does not admit of argument, and until the fact is recognized by the authorities the maximum of earthly safety will not be realized.

The small boy, the sprinkling cart and the horse driver must all receive attention. If boys must play base ball, foot ball, hockey and other games on the public streets, and must use them as skating rinks—for which purpose they never were designed—surely when the youngsters deliberately place themselves in the way of automobiles, or when roller skaters "hitch on" behind them and perform similar stunts, it is not asking too much that they be "shooed" away, or warned or admonished by the police. But can anyone recall when a policeman has attempted even that mild regulation, which of itself would reduce the peril and thereby the number of accidents?

As for the sprinkling cart, the danger that it invites has rarely, if ever, been remarked, and yet the danger is very real and often present. No vehicle shod with rubber tires is safe on a smooth and wetted surface; not even the most skillful control and the most powerful brakes will render it safe. Indeed, applying the brake is in itself the element of greatest danger and yet, times without number, it must be done. The wonder is, when the fearful skidding results, that serious accidents are not more numerous. And yet the sprinkler is permitted to ply his vocation and streets are washed by city authorities at all hours and despite whatever may be the condition of traffic. Even congested Broadway often is sprinkled when traffic is at its height, and what is true of Broadway is true of many streets in many places.

The unlighted horse-drawn vehicle is with us every night in the year, but so keen are the eyes of the police for unlighted motor cars that the other offender is rarely, if ever, seen; and yet it is no small element of danger, and one akin to the too numerous sleeping truck driver who permits his horses to make their own way. He, too, is seldom, if ever, disturbed by so much as the lifting of a finger of the man clothed with the brass buttons of authority.

Far more numerous, however, is the driver of the horse-drawn vehicle who turns corners or who cuts diagonally across streets without regard for approaching traffic, and, indeed, without regard for anything—not even himself. He is the sort of man who will turn abruptly from left to right without so much as a glance behind or the raising of a warning hand. He is to be seen everywhere, every day, and the number of accidents for which he has been responsible, to say nothing of the even greater number of narrow escapes, is beyond reckoning. Of all "full grown" road evils he is the worst, as nearly every motorist will testify. Yet is he ever raided or arrested or even warned by the police?

Everyone knows the answer, and while he is permitted to roam the highways without let or hindrance, and the small boy and the sprinkling cart are similarly permitted to add their shares to the common danger, the public highways will never be as safe as might be.

Regulation is wise and proper and, if arrests are necessary to regulation, raids on automobilists may be worth all they cost: but until the authorities regulate the other evils the slogan "Safety First" will remain largely a mockery and the authorities themselves will be in part responsible for many of the lives that are lost and many of the limbs that are broken.

REGINA OPPOSES DELIVERY SUPERVISION'S BANKRUPTCY

Denies Insolvency and Claims Move Was Taken to "Hinder and Defraud"—Charges Against American Taximeter Company.

When the Delivery Supervision Co., of New York City, was made the object of a petition in bankruptcy a month ago, with the American Taximeter Co. the principal creditor, it was supposed that it was no more than an act of the latter to help its protege to retire gracefully; but a different light was thrown upon the situation this week when the Regina Co., of Rahway, N. J., entered the United States District Court for the Southern District of New York with a demand that the bankruptcy proceedings be stopped and that the American Taximeter Co. be enjoined from taking further part in the matter.

The Regina Co. made meters for the Delivery Supervision Co. and claims the bankruptcy action was instituted for the purpose of "hindering, delaying and defrauding" the Rahway concern in its manufacturing contracts with the Delivery company. It is alleged that the American Taximeter Co. is sponsor for the debts of the Delivery company and that this has its part in the matter.

The Regina company claims it would realize $70,000 profits on the contracts in the future and asks that matters be so adjusted that it can continue this business. It denies that the Delivery Supervision Co. is insolvent and charges that the receiver, Wm. M. Lybrand, is a copartner of the Delivery's treasurer, R. H. Montgomery.

The Delivery Supervision Co. succeeded to the business of the International Delivery Supervision Co. January 1, 1913, and in April the American Taximeter Co. assumed a majority control. For this purpose it is charged it entered into a contract with Walter H. Seely, of Suffern, N. Y., and Edward A. Henkle, of Rydal, Jenkinstown, Pa., whereby they put their majority holdings into a five-year voting trust, the officers during the trust to be: President, T. Ducasse; vice-president and general manager, Seely; treasurer, Montgomery. The voting trust was to be controlled by the taximeter company.

Prior to the entry of the latter the Regina Co. claims it was a creditor of the delivery company to the extent of $21,508.19 and that there was an additional credit of $13,044.87. At this time the taximeter company, it is claimed, agreed to back the Delivery-Regina contracts if they were made for two instead of for five years, and the minimum of 300 meters a month waived. This was agreed to.

The Regina Co. states that at the date of the bankruptcy petition it was owed $51,016.47 by the Delivery company and that if the bankruptcy goes through it will be a staggering blow. It is further alleged that the Knickerbocker Trust Co. holds a mortgage on the Delivery company's property and that delay is sought in order that this may be foreclosed. The suit is against the American Taximeter, Seely and Kenkle

* Indicates Sanction by A. A. A.

Dec. 3-4-5, New York City—Motor Dealers' Contest Association's 500-mile reliability contest.

Dec. 6-13, Toledo, O.—Toledo Automobile Show Co.'s show in the Toledo Factories building.

THREE DRIVERS PENALIZED IN NEW YORK RELIABILITY

Eight of Eleven Starters Finish First Day with Clean Scores—Lamp Bulb Costs Six Demerits—Four Drivers Arrested.

In a lifting morning haze, the 11 contesting cars in the Motor Dealers' Contest Association's three-day 500-mile reliability tour slid away from the starting line in front of the Manhattan Automobile Club in 62d street, near Broadway, New York City, at 7 o'clock on Tuesday morning, 3d inst., and before any of them, including the five cars that carried the officials, the confetti throwers and the newspaper men recrossed the starting line the same evening only eight unsullied scores remained. Those who started, together with their scores at the end of the first day, are as follows:

TOURING CARS—UNDER 230 INCHES.

No.	Driver and car.	Penalty.
1	E. Woodruff, Buick	0
2	A. A. Guilford, Buick	0

RUNABOUTS—UNDER 230 INCHES.

3	C. Jones, Buick	0
4	J. D. Coote, Buick	0

TOURING CARS—231-300 INCHES

5	J. Brietenbach, Chandler	0
6	B. Bornish, Oakland	1

TOURING CARS—OVER 301 INCHES.

7	T. Speer, Oldsmobile	0
8	E. Cordier, De Dion	9
9	S. Casey, National	0
10	A. W. Harman, Hudson	6
11	W. Smith, Buick	0

The three penalties that were meted out are for troubles that might occur to any car almost at any time and none is of really serious consequence. Thus, for instance, one of the brakes on Bornish's Oakland seized; the driver freed it in one minute with one blow of a hammer, but the work cost him one point penalty. Harman's trouble was of even less consequence—a burned-out tail lamp electric light bulb—but it cost him six points. Cordier in the De Dion, which, by the way, has eight cylinders and, curiously enough, carries the number "8" as a distinguishing mark, if one is needed, had more trouble than any one else. Three times dirt clogged his carburetter and three times it had to be cleaned out, the work costing the driver his nine points penalty.

During the day, 174.9 miles were covered, all of them over the smooth, rolling roads of Long Island—probably a good deal smoother than those that will be encountered on either of the subsequent days of the run—with the noonday stop and luncheon rest at Riverhead, L. I., and the finish line the same as the starting line. From the starting point, the route led through Flushing, Roslyn, East Norwich, Huntington, Smithtown, Port Jefferson and Wading River to Riverhead, the whole journey being made via the north short of the island. On the return journey the south shore was covered, the roads leading through Quogue, Eastport, East Moriches, Bellport, Patchogue, Sayville, Bayshore, Merrick, Rockville Center, Valley Stream and Jamaica to the finish line.

Although the roads were smooth and the "going mighty good," no one took any chances of getting into controls later than their respective specified times. Almost before the leaders were fairly out of the Metropolitan traffic area, toes pressed throttle levers and the pace commenced to increase. And by the time the cars were well out on Long Island the pace became altogether too swift for the ordinarily slumbering consciences of Long Island constables. Suffice it to say that no fewer than four drivers were stopped by the long arm of the law and charged with exceeding the legal speed limit, before the noon stop was reached. And one driver was unlucky enough, or careless enough, to be arrested both going and coming. Despite the arrests, however, all of the drivers checked into both noon and night controls on time—all of them got in considerably ahead of time, as a matter of fact.

Needless to point out, none of the drivers attempted to adhere to the schedule of speeds laid down in the book of rules; the rules do not specify the maximum speed permissable. According to the rules, which were drawn up principally by David Beecroft, who, with Geo. H. Robertson and E. Lascaris, form the Contest Committee of the association, the running schedule was laid down according to the piston displacement of the cars, which is one of the principal differences between the governing rules of the run and any other reliability contest rules, and represents a radical departure in such matters. The specific minimum speeds follow: Under 230 inches, 16 miles an hour; 231-330 inches, 18 miles an hour; over 300 inches, 20 miles an hour.

Classification of the cars in this way, however, is not the only radical feature of the rules, as was made plain last week in Motor World. For in addition to the usual penalties for time lost on the road and for work done, the rules also provide penalties for even the slightest derangement in any part of any car and cover, for the first time, every item of equipment including all the accessories. In this respect, it is worthy of more than passing note that though it was expected that cars would be entered carrying the equipment with which they are sold, nothing in the rules makes the carrying of the equipment compulsory. None of the Buicks have tops or windshields, these having been removed prior to the preliminary examination. So that their removal might not be construed as an unfair advantage, Beecroft ruled that others might follow suit if they so desired. None did so, however, though the De Dion has neither of these items of equipment.

Prior to the start, all 11 cars were garaged on the sixth floor of the Mitchell-Edmonston garage in 62d street, where the technical committee went over each with a fine-toothed comb, measured springs and axles, tested batteries and starters and generators and sealed hoods, radiator caps and gasolene tanks. The seals were expected to be intact when the cars pulled into the garage at the finish of the day's run to be placed under lock and key until the start the next morning. As each car checked in, the driver was permitted 45 minutes in which to replenish oil, gasolene and water before the seals again were placed on his car.

Today (Thursday) will see the finish of the second day's section of the run—a 178-mile jaunt to New Haven, Conn., and return, over the Boston Post Road going out and back by way of Danbury, Conn. The principal towns through which the route leads are New Rochelle, Mamaroneck, Portchester, Stamford, Darien, Norwalk, Fairfield, Stratford and Milford to New Haven. On the way back, the route leads through Derby, Huntington, Dodgingtown, Danbury, Wilton and thence over the same roads as those traversed on the outbound journey.

Friday's run is the shortest of the three and leads through Yonkers and Hastings, where a detour is taken to include Briarcliffe, Croton Lake and Yorktown, where the main road to Poughkeepsie again is picked up. Coming back, the route leads straight on past Peekskill to Croton, Harmon, Ossining, Tarrytown, Irvington and Dobbs Ferry and thence in to the starting point over the same roads as those covered going out.

Succeeding the checking-in process at the end of the third day's run, the cars again will be subjected to a rigid examination at the hands and eyes and measuring instruments of the technical committee, and all loose bolts, lost grease cups and every other defect, great or small, noted down on score cards for comparison with the cards made in the preliminary examination. Discrepancies will draw forth penalties. After the technical examination, the outdoor operative tests will be completed and more penalties meted out to the drivers of cars which fail to come up to the requirements of the rules. The tests include engine starters and batteries, motor, running gear, clutch and brakes.

WIDE-AWAKE MERCHANDISING In the Motor Trade

SELLING THE "UNSALABLE" CAR

Factory Salesman Showed Dealer His Hard Luck Was Largely Imaginative—Sold Car Where Dealer Had Sold None in Two Months.

The salesman for a popular priced line of cars stepped into the store of a dealer in a small Middle West town where two months ago he had sold two cars to the proprietor. Before he had crossed the threshold he saw the two cars he had shipped the dealer, standing exactly where they had been placed when they first came into the store. After waiting patiently for a few moments, the salesman strolled out to the garage at the back, where he found the proprietor at work, covered with dirt and grime.

"I see you still have the two cars I shipped you two months ago," remarked the salesman. "Yes, they're still here," echoed the dealer. "What's the trouble?" ventured the salesman. "Oh, I don't know; people 'round here don't seem to take to the car, that's all, I guess; I've tried hard, but I can't sell 'em."

Salesman Gave a Real Demonstration.

While the salesman was turning this over in his mind, the two men were making their way toward the salesroom. As luck would have it, in came a man and his wife. "Let me wait on them," whispered the salesman to the dealer. "Sure! Go to it!" answered the dealer, disappearing into his small office.

Leaving his hat on the desk, the salesman moved swiftly to the front of the store, where he greeted the pair with a cheery "Good morning. I am glad to see you are thinking of buying a car," he added, "because we have something here that I think you will like much better than anything else you have seen."

Excusing himself for a minute, he brought the lady a chair and placed it right in front of the model he intended selling to them.

Then he warmed to his selling talk, explaining things in language that the lady clearly understood and emphasizing the various points he thought would interest her by practical demonstrations. He pointed out the luxury of the tonneau, the roominess, the style, the upholstery, etc.; showed her how easy it was to operate the gear shift; asked her to take a seat by the steering wheel and see how easily the brake pedals worked, explained all the points necessary for operation. After half an hour spent this way—the husband meanwhile scrutinizing every feature carefully—the salesman turned to the wife and said: "I am somewhat of a mind reader; I believe I know what you are thinking about. You are wondering what fun it would be if you could learn to drive that car and use it during the afternoon and then drive down and call at the office for your husband at night."

The Move that Pushed the Sale Over.

"You haven't hit it exactly, but do you really think I could learn to drive that car? How long would it take?"

"Madam," responded the salesman, "in fifteen minutes this car will be all ready and I will guarantee to teach you this afternoon, so that by nightfall you can drive it yourself."

Some way or other the salesman had struck exactly the right note, and in fifteen minutes he presented the dealer with a signed order and a check for the car, with instructions to have the machine ready for the road by noon.

You can call it luck, nerve, or anything you please, but in the last analysis it was salesmanship—and it was a revelation for the dealer who took it all in. Seeing how easily it was done—he screwed up courage sufficiently to give shipping instructions for two more cars—and thus a quick-witted salesman turned what looked like a most discouraging situation into a glorious victory.

MAKING GOODS MOVE DURING PERIODS OF UNUSUAL DULLNESS

When times are dull, then is when the real merchandiser is conspicuous by his activity. He realizes that the goods on the shelves are worthless to him unless he can turn them into cash. Bills must be paid and credit preserved intact. How to get the people to buy when they do not seem to feel like buying; how to get the cash back so that goods coming in can be paid for promptly—those are problems that require thought and action.

A Western dealer in supplies found on October 20 that his total sales for the month were 45 per cent. less than a year ago. To meet the situation by admitting that things were dull anyway was not his style. He wanted to meet, and if possible beat, last year's record. He had to do some tall figuring. But he solved the problem. His store needed some remodeling. He decided to have it done at once. He got busy and let the contracts and had the work started within two days. Then he put up big signs reading "Remodeling Sale," exactly the same as he had seen done in other businesses. He advertised in the local papers, using moderate space but featuring a few reductions, and boosted the sale for all he was worth. The sale lasted the better part of two weeks.

At the end of that time he had come within 5 per cent. of what his previous year's record had been. Of course, he did not make so much money on each article as if he had sold it at regular list price; but he moved the goods, and cash was what he needed more than goods. Incidentally he taught himself a lesson—namely, that there were numberless ideas in the way of special sales that he could profitably adopt from other lines of business.

NO FEAR IN REAL SALESMAN

Dread of "Difficult" Men and Habit of Imagining Possible Failure Harms Sales, Says Successful Man—How He Acquired Courage.

"If you would be a real salesman and carry home the bacon you must banish fear," said a salesman who is noted for his brilliant work.

"I have seen more men fall down from fear than from any other cause. Some men fear the 'boss' to begin with; that puts a damper on their enthusiasm; everything they do is tinged with this fear. Nine cases out of ten there is no actual ground for it. If they would look the matter squarely in the face they would see how very foolish they are.

Losing "Pep" Through Long Waits.

"Again, I have known a man to lose all his 'pep' and confidence while waiting outside an office for an interview. His imagination has run riot and pictured all sorts of unfavorable conditions. The result is that when he does get the interview he is not himself and he does not inspire that feeling of sureness and confidence that a salesman must beget to win the order.

"I could cite you case after case where I know I lost sales myself in the early days simply because this demon fear possessed me. One day someone handed me a book he had been reading. It was James Lane Allen's 'As a Man Thinketh.' I read that book over and over again till I knew almost every word by heart. I began to see a light. I got fresh courage. I kept renewing it by going back to the book and by getting hold of others along the same line. Frankly, it changed my whole attitude mentally; and it has paid me in dollars and cents. But that is only the least part of it. The real thing is that I have managed to develop a sort of optimistic courage that makes me really enjoy every moment of my work. I used to dread calling on a new customer. I delight in it now. If a man was crusty and stand-offish I used to avoid him. Today I cultivate him, look for his good qualities and make myself as pleasant as I know how. I used to hate to take up matters with the 'boss'; I feared his criticism; today we are like brothers. I talk just as frankly and fearlessly to him as I would to my own brother, and he likes it. The other day he told a friend of mine that he liked me and respected me because I was one of the few men of his staff who talked right up to him and wouldn't let him do the wrong thing if he wanted to.

"There is never any real reason for fear and I would urge every salesman to banish it completely. Any time you fear anything go right up to it, metaphorically speaking, grab hold of it and turn it over and look at it. You will find that there is absolutely nothing to it."

HONOR AMONG SALESMEN AND THE LACK OF IT; AN INSTANCE

While waiting outside the office for a big dealer to see him, a certain accessory jobber's salesman encountered another salesman. They had never met before, but in a few moments were in close conversation. The accessory salesman kept quiet about his business and learned that the other man was selling hood covers. He inquired his price and got all the information he could. Things had just reached this point when the dealer sent word requesting the accessory man to come in. After writing up an order, the salesman was leaving when the dealer turned to him and said: "By the way, do you sell hood covers?" "You bet, we do," said the salesman, "but frankly, while I would like to sell you I prefer not to quote you any prices. There is a gentleman outside who has come to see you specially on hood covers. He did not know who I was, but he has given me his prices and all information about his stuff. That information gives me an unfair advantage over him. It was gained accidentally and I don't wish to avail myself of it."

"As you like," said the dealer. That appeared to be the end of it, but it wasn't. A month later the salesman was making his usual round and once more called on the big dealer around whom the story is centered. "What about those hood covers you sell? Will you quote me on them today?" asked the dealer. "That man you were so particular about protecting came in after you did and didn't do a thing but rip your house up the back. He went for your house right and left and he didn't spare any of your competitors. When he got through I told him we would not do business with him under any circumstances. If your prices are right you can have a nice order for hood covers." The salesman did not go away empty handed.

MOTTOS THAT GIVE A TOUCH OF DIFFERENCE TO LETTERS

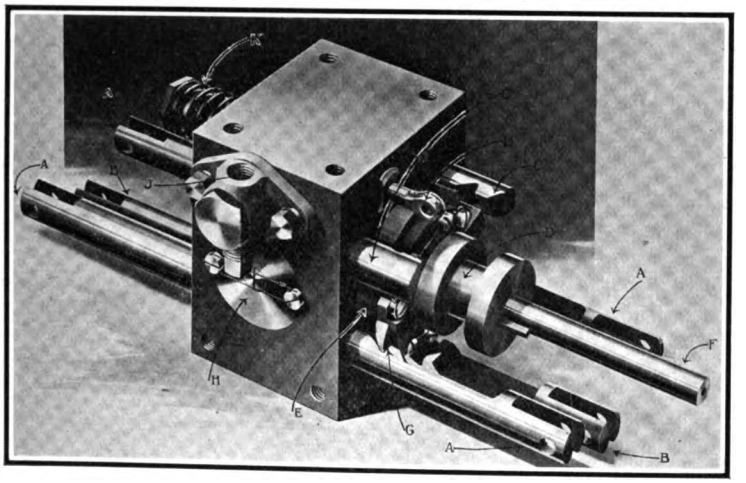
Once in a while someone hits upon a motto which is particularly good and hitches it onto the bottom of his business letter paper; when the motto is just right it causes a trace of a smile or at least a deviation in thought from the sometimes dull routine of reading the mail.

The R-D Motor Parts Co., of 713 Ford building, Detroit, evidently intended to disseminate an uplift thought when it used a little red ink on the bottom of its business paper, saying:

Stand up, the Ceiling is High.

In New Rochelle, N. Y., G. O. Reynolds, Inc., aimed to describe his business well when he pinned this motto on his letters:

The Garage that is Different—Not Indifferent.



No matter what other attribute attaches to this pair, they at least indicate that the man behind the letter has originality.

GRAY PNEUMATIC SHIFT UNDERGOES REFINEMENT

Simplicity and Positiveness Increased Though Working Principle Remains Unchanged—Operation Described in Detail.

Marking an epoch in automobile construction, the formal adoption of the Gray pneumatic gear shifting and engine starting system by the McFarlan Motor Co. for incorporation in some of its models, has served to draw attention anew to the Gray apparatus, first mention of which was made in Motor World under date of May 22 last. Since then, however, a number of refinements and improvements have been made in the mechanism by way of making it still simpler and rendering its action still more positive. In its present improved form, the apparatus does not differ in principal from the form in which it first made its appearance, the changes that have been made being more or less minor in nature.

GRAY PNEUMATIC SHIFT COMPLETE SHOWING OPERATING MECHANISM

It is one of the advantages of the Gray system, which is produced and marketed by the Gray Pnaumatic Gear Shift Co., of Chicago, Ill., that it may be readily placed on existing cars and, unlike other systems which are calculated to ease the operator's burden by taking out of his hands the actual work of shifting gears, does not require to be built into place at the factory of the car builder. Installation of the compressor and motor starter, one connection to the air supply, a rod or cable to the clutch pedal and a connection with the selector mechanism at the top of the steering wheel make the installation complete.

In its entirety, the Gray system consists of three units, of which the air compressor probably is the most important, for upon it the operation of the other two depends. The compressor is a double-acting two-cylinder pump and is built integral with the starting motor and mounted at the front extension of the crankshaft, preferably in front of the radiator, where it is instantly "getatable" and where a free circulation of air assists in keeping down its temperature under long pumping spells. Air is stored in a steel container mounted at any convenient place on the chassis and the pressure automatically is maintained at any degree up to 300 pounds. The engine starting motor is of the reciprocating type and is designed to "spin" the average sized engine at approximately 300 revolutions a minute. Auxiliary apparatus, consisting of gauge, compressor control, starter valve, shut-off and connection for tire inflation, is mounted on a plate on the dash.

The gear shifting apparatus itself is shown by the accompanying illustration which makes plain its relative smallness, its external simplicity and the compactness of the mechanism. The two main shifting racks which are attached to the gear shifting rods of the gearset are designated AA; these racks are forced forward by means of the selector latch (G) which is operated by a double-acting piston working in a cylinder bored out of the center of the main casting and make the two forward shifts on the ordinary three-speed forward and reverse gearset. The two backward shifts are made by engaging the selector latch with the idler shifting racks (CC) which, when forced forward by the admission of air into the cylinder, drive the main shifting racks backward by means of a pinion gear protected and enclosed by the cover plate (H).

The selector shaft (F) is connected to the selector quadrant which is mounted at the top of the steering column above the steering wheel. The desired gear is selected by turning the selector quadrant until the latch (G) engages the rack operating the particular gear selected. Air is admitted to the intake (J) and enters the cylinder through a valve operated by cams on the distributing valve (K). This sliding valve is drawn forward by depressing the clutch pedal to which it is attached by means of either a rod or a cable at the point marked (L). A half depression of the clutch pedal —enough to disengage the clutch—admits air to the selector end of the cylinder and at the instant the clutch is fully disengaged forces all gears to the neutral by means of the selector disk (E).

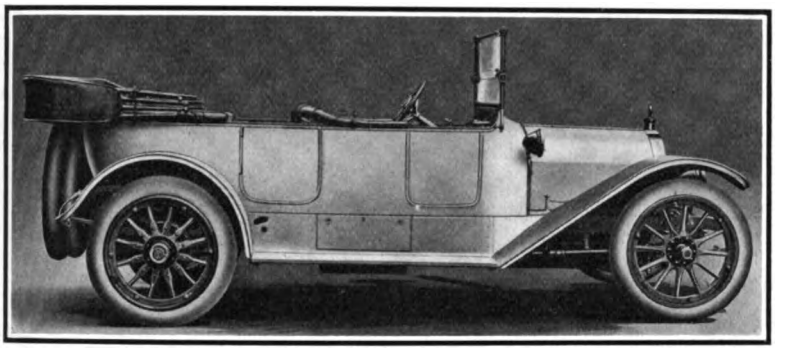
Both shifter racks and idler racks are made with a shoulder which engages the selector disk on the return movement of the piston and thus all gears are disengaged. The selector disk (E) is attached to the outer shouldered end of the piston rod by means of a threaded locking collar so that it can be rotated freely by the selector shaft (F) to which it is keyed and on which it slides in consonance with the movement of the piston.

The full depression of the clutch pedal exhausts the air and at the same time admits air into the outer end of the cylinder, forcing forward the selector mechanism with the particular shifting or idler rack engaged by the selector latch. In the illustration the position of the racks indicates that all the gears are in neutral with the selector latch (G) engaged in one of the shifter racks ready for a shift.

When the shifter is to be used for four-speed gears, the shifting rack (B) is used and no idler rack is necessary, as the rack operates in only one direction in addition to the neutral movement controlled by the selector disk (E). So that the gears can be shifted by hand in the good old way in the event of derangement of the system, the collar (D) is provided and into it a supplementary lever, to be carried ordinarily in the seclusion of the tool kit for emergency, is fitted.

Half Taxes for Four-Year-Old Cars.

In Iowa a car which has been in service four years need pay but half the regular State automobile license tax, according to an opinion handed down last week by Attorney General George Cosson. He ruled that the tax on cars is the same for the first four years, but thereafter is but half the original sum.



A more or less similar arrangement is arrived at in the case of cars which have been used part of the four years outside of Iowa. In case a car is not in service it is subject to a personal tax but not to the State automobile tax.

BRACE OF MERCER MODELS MAKES LINE MORE COMPLETE

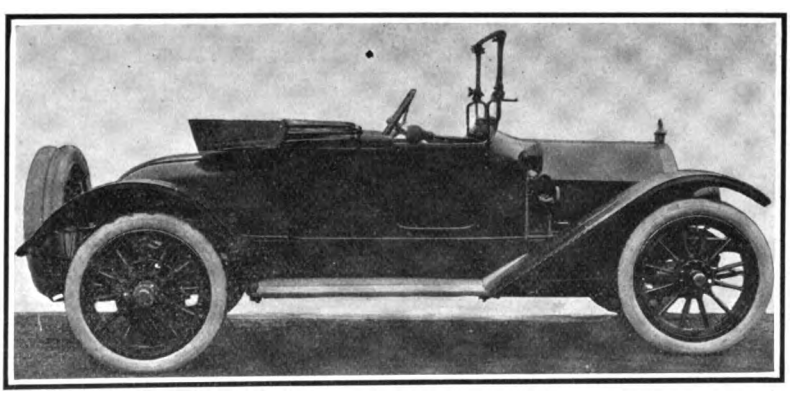
Mechanical Changes Conspicuously Absent—Speed Model Practically Unaltered Since 1910—Mechanical Details of Motors.

Making extensive mechanical changes in its cars long ago ceased to be a practice with the Mercer Automobile Co., of Trenton, N. J. On the contrary, the Mercer cars have become standardized to an unusual degree, and it is quite in keeping with this

MERCER TOURING MODEL SHOWING ITS "CLEANNESS" OF LINE

state of affairs that in making its line of cars longer by two models the Mercer people have not departed from the practices that have given such excellent results in the past. Moreover, the two existing models have been retained exactly as they are—a "close-coupled" five-passenger touring car with a wheelbase of 118 inches and a raceabout or high-speed stock car with a wheelbase of 108 inches. This latter model was introduced in 1910 and since then has been changed but little. Perhaps its most prominent characteristic is its speed; it is guaranteed to cover a mile in 51 seconds.

The two new models can be called new only insofar as wheelbase lengths and bodies are concerned. One is a five-passenger touring car having a longer wheelbase than the older touring car—124 inches—and the same motor. The other is a runabout mounted on the same 118-inch chassis as that of the old touring car, and is designed to meet the demand for a big, comfortable machine of its type, with an easy action on all sorts of roads. In all four machines the motors are much alike. In fact, the only substantial difference is that in the raceabout the bore and stroke are 4⅜ and 5 inches, respectively, while in all the other models the corresponding measurements are 4½ and 5 inches. According to the formula rating the raceabout motor is of 30.6 horsepower and the larger engine 32.4 horsepower. On the dynamometer, however, each motor is required to develop 58 horsepower at a speed of 1,700 revolutions per minute.



The high power of the motor is, of course, a governing factor in the speed of the raceabout and the all-round ability of the other models, and most of the credit is given by the Mercer engineers to the valves, which are no less than 2¼ inches in diameter with a lift of 7/16 inch. Of course, other features must be in keeping with the valves, and the performance of the motors indicates quite clearly that such is the case. The valves are of Tungsten steel, which admirably resists the highest cylinder temperatures.

All the motors are of similar general design. The cylinders have T-heads with the intake valves on the right, and are cast in pairs with integral jackets, and the bores are finished in the modern way—by grinding. Pistons are of the same material as the cylinders, and depart from conventional practice in that but two rings are fitted, and they are of the concentric type peined on the inside to give an even tension at all points. The piston pins are clamped in the connecting rods and have their bearings in the piston bosses. Pistons and rods are weighed and balanced, so that there will be no variation in the weights of the reciprocating parts in a motor. The manufacturers claim that much of the lack of vibration of the Mercer motors is due to the fact that the connecting rods are unusually long and that the cylinders are not offset.

The crankshaft runs in three bronze-backed bearings filled with special alloyed bearing babbit. The crankshaft is 2 inches in diameter; the bearings are 3½, 3 and 4 inches long, respectively, the short bearing being in the middle and the longest at the flywheel end. A shaft balancing machine is employed to get the shafts in perfect running balance at speeds up to 1,800 revolutions per minute. Camshafts are made with integral cams and though housed in the crankcase are easily removed; the front bearings are annular balls and the other bearings plain. The shaft gears are spiral, of bronze, 1¼-inch face.

Lubrication is by pressure feed and splash, the splash level being maintained constant by a gear-driven pump located in the oil reservoir. The pump has but one moving part. The oil pumped passes through a sight feed on the dash. Overflow dams in the crankcase keep the splash level at the proper point. The capacity of the oil reservoir is 1.75 gallons, and an indicator shows the level at all times. A Flechter carburetter is fitted.

Ignition is effected by a Z-R-4 independent two-spark Bosch magneto of the enclosed waterproof type; there are two sets of plugs, one set over the intake valves and the other over the exhaust valves, and sparks are produced simultaneously in the two plugs of a cylinder. A two-point switch permits the use of either one or two sets, as may be desired. The pump, electric generator and fan all are operated from the same shaft system and any one may be dismounted without interfering with the others.

NEWEST MERCER ROADSTER WITH HOOD, AND REAR DECK "LINED UP"

The gearset provides four speeds selectively controlled, and is hung in a sub-frame by the upper part of the case, the arrangement being such that the lower part of the case can be removed without disturbing the alignment of the gearset. Annular ball bearings are fitted throughout the transmission system. The clutch has no less

Digitized by Google

than 44 steel disks, is housed in a casing integral with the gearcase, and runs in oil.

Final drive is by shaft to the full-floating rear axle. The axle housing is of pressed steel and the gears are readily accessible through an inspection opening. The pressed steel frame, which has a narrowed front, has a rear kick-up of 3¼ inches, which helps greatly in bringing down the center of gravity. In the matter of springs there is a little difference between the cars, the raceabout having semi-elliptics all around and the other cars semi-elliptics in front and three-quarter elliptics in the rear.

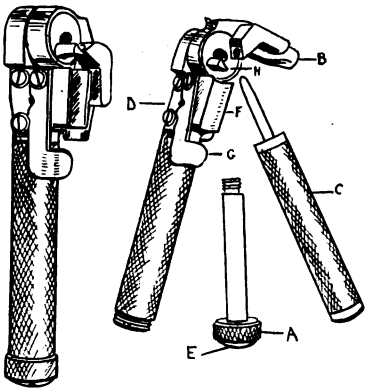
Right-hand control is standard on all models. In all models four-inch tires are fitted all round, with the exception of the new touring car, which has 4½-inch tires in the rear and 4-inch front. Electric lighting and starting systems are installed in all the cars except the raceabout.

Harry Knox Patents Sleeve Valve Motor.

Whether or not patent No. 1,075,580, issued to Harry A. Knox on October 14, 1913, is to have any significance as regards the motor of the Lyons-Knight car, built by the Lyons Atlas Co., of Indianapolis, Ind., remains to be seen. At any rate, it would appear from the wording of the patent that Knox, who is manager of the Atlas Lyons automobile department, considers the device an improvement on the double sleeve valve system of the Knight engine that the company is licensed to build.

Briefly, the patent covers a motor which retains the inner sleeve of the Knight type, but discards the outer sleeve and in its place puts a valve "concavo-convex in cross section, the concave part of which bears against the outer convex surface of the valve sleeve, said bearing surface having the same radius," while the outer surface of the new valve is of much shorter radius, forming, in fact, approximately a half-circle. This valve reciprocates in a groove which extends vertically the entire length of the cylinder and is actuated by an eccentric, just as is the sleeve valve.

According to the patent, the object of the invention is to reduce the friction occasioned by the lateral thrust of the piston against the sleeves and to reduce the amount of dead gas trapped in the ports and carried back into the combustion chamber at each intake stroke. This is believed to be accomplished by the combination of a single sleeve with a single port and the new slide-valve with two ports.



Little Things that Help Tires.

One of the little things that ought to be done but usually is neglected is the sealing up of the hole in a casing after a tire has been punctured. The hole in the shoe permits the entrance of moisture and grit.

TOOL TO FORM TERMINALS IS BROUGHT OUT BY BOSCH

Ingenious Device Which Strips Wires, Fits a Brass Tube and Forms Looped End—For Low and High Tension Wires.

As a chain is no stronger than its weakest link, so is an ignition system no more reliable than its terminals. And the significance of this is that if the terminals let go the rest of the ignition system may be the best in the world or the worst—it will make no difference so far as igniting the vapor is concerned. Apropos of which the Bosch Magneto Co. has been working on the terminal question for years, and now makes the statement that it has solved the problem

BOSCH TERMINAL TOOL

of producing a terminal for stranded conductors that not only is entirely satisfactory as a terminal, but is easy to make and withal comparatively cheap.

Briefly, the Bosch method consists of stripping the end of the cable, slipping a brass tube over the bare wire and pushing it into the insulation, and then bending the tube and the enclosed wire into a loop, at the same time slightly flattening the tube so that the wire is nipped and securely held. For cables with heavy insulation the little tubes are made with beveled edges at one end so as to enter the insulation easily, while for cables with insulation that does not permit this the end of the tube is expanded to form a ferrule to fit snugly over the insulation. The embedded end of the tube or the ferrule, as the case may be, reenforces the cable at what otherwise would be a weak point and prevents the too common breakage that results from bending and vibration at this place.

While it is possible to strip a cable with a jackknife and form the loop with the aid of a pair of round-nosed pliers, the Bosch people do not believe this to be an entirely satisfactory method, and therefore they have designed a special tool, shown in the accompanying illustration both folded for carrying and open for use. The tool is about five inches long and so is readily carried in the pocket. When the knurled button (A) is unscrewed from the handle it carries with it an extension which is screwed into a tapped hole in the second leg B of the tool. The handle also gives up a pin (C) which is used in the loop-forming operation. The stripper (D) neatly and expeditiously takes the insulation off the cable, which has been marked in a gauge formed by the groove (F). Then the tube is slipped over the wire and the end inserted in a hole (E) in the extension handle, and pressure applied until the tube has gone as far into the insulation as it should—which is easily determined because when the proper point is reached it cannot go any further.

The last operation consists in placing the cable again in the groove (F) with the tube pointing upward, as the tool stands in the picture, and inserting the pin in the end of the part C in the hole in the middle of the joint of the tool. This necessitates bending the tube to one side, which forms the first part of the loop. The work is completed by swinging the handles, which have been separated as widely as they will go, until they are closed as far as possible. This bends the terminal into a perfect loop and simultaneously gives it the requisite flattening—just enough and no more. The terminal is electrically and mechanically perfect without soldering and the attendant danger of corrosion from acid, and is so small that connections can be made close together without danger of short-circuiting. To cap the climax, the terminal is a permanent thing—one more part of the equipment of the car that may safely be forgotten.

A. C. A. to Test Moline-Knight Motor.

The mettle of the latest member of the sleeve-valve family — the Moline-Knight motor—will be tried out in a non-stop run conducted by the Automobile Club of America in its testing laboratory in New York. It is the intention to run the engine continuously for 336 hours, or 14 days, under the official rules of the A. C. A. The test will be commenced about December 15. The motor, which was described in detail in Motor World for November 20, has a bore and stroke of 4 and 6 inches, respectively, and a formula rating of 22.6 horsepower. It differs from the majority of Knight motors in that its four cylinders are cast in a single block, and cooling is effected by thermo-siphon or gravity circulation of the water.

KEEPING THE PROSPECT'S MIND ON ONE THING

Reilly's Protege Tries to Talk About Three Cars at the Same Time and is Criticized—Concentration on One Car Helps Buyer and Salesman, Reilly Says—Finding Which One to Talk About.

Tommy Trumbull wasn't so bad for a beginner. He left school with a determination to be a salesman and also with a semi-determination to make his start in Reilly's salesrooms, and his determined attitude had much to do with his progress.

Were he a captain of industry his determination to succeed would have been held up as an example to the youth of the land, but since he was only a youth who had yet to turn the world into a conflagration he had not attracted much attention; however, he had persistently and systematically attracted the attention of Reilly until he had been admitted as a neophyte at the shrine of the great god Automobile Selling. Also, Tommy had ideas as to what he was going to do to that god.

"WHAT YOU DID WAS TALK ABOUT THREE DIFFERENT CARS AT THE SAME TIME"

Danger Signal to Prevent Losing Sale.

This particular morning Tommy had been permitted to test his ability on a prospect; the prospect was a perfectly good one, so far as anyone knew, and if the amateur salesman "queered the game" it meant a nice commission lost, wherefore Reilly, according to a prearranged plan, walked across the floor at a critical moment, was introduced by Tommy and the latter was permitted to make a graceful getaway.

"Well," said Tommy, when the prospect had gone and Reilly had returned to the office, "how did I do? Also, what did I do?"

Reilly smiled at the lad's eagerness to get whatever criticism was coming.

"I might also add," supplied Tommy, "what didn't I do?"

"You made a fair beginning, Tommy, and I guess you'll get along all right if nothing happens. But I suppose you are anxious to know why I flashed the danger signal and helped you out; is that it?"

"I am just a bit curious on that point," smiled Tommy. "The minute you showed up I knew something wasn't just right and ever since I've been in here waiting for you to come back I've been trying to think what was the matter with my work."

"You scattered your fire; that's the main thing this morning. You used too many kinds of shot on the same bird."

"Now I am guessing. I wouldn't wonder but that I have a lot to learn."

"Everybody's got a lot to learn—although some of them don't know it—but what you did this morning was to talk about three different cars to one man at the same time."

"But isn't that right? He might want any one of the three, mightn't he?"

Too Many Choices Delays Selection.

"Yes, he might, but talking about all three at the same time isn't the way to get him to buy some one of the three."

"No? Why not?"

"Because, by doing that you are keeping the man from doing what you want him to do. You want him to decide to buy a car—some one of the three, a runabout, touring car or a limousine—and by juggling the three of them in front of his face all the time he doesn't know which one to grab. He might eventually decide on one of them, but keeping all three in front of him delays his decision. It sort of confuses him and makes it harder for him to decide."

"Well!" exclaimed Tommy. "Now I am guessing! How am I going to know which one to talk about? You say I mustn't talk about all of them at once."

"You have to be a mind reader."

"A mind reader!"

Salesman a Mind Reader, Says Reilly.

"Certainly," Reilly blandly explained. "Didn't you know that all salesmen are mind readers—experts at it, too? You'll get so after a while that you can look at a man and tell how much money he's got and whether he's paid this month's house rent."

"I'm afraid you're kidding me," said Tommy, as he noticed a peculiar smile upon the face of Nellie, who appeared to be very busily engaged in her little cubbyhole office adjoining.

"You have to feel your man out, that's all," replied Reilly. "It may seem a bit difficult at first, but you'll soon see the why and the how of it. Really, what you do is to let your man decide which car he is interested in before you begin your real selling effort. Just how you do it can't be explained in few words and I don't know that I could explain if I used all the words in the dictionary. It's something that comes under the head of instinct to a certain extent and the better you are in that respect the better you will get along.

Not Always Necessary to "Feel" Way.

"Of course, this doesn't always apply. If it is necessary to handle a prospect carefully for fear he will duck and run like a scared rabbit, it is well to feel him out, but in a great many, probably in a majority of cases, you can ask the man point blank what size or style of car he is interested in. Generally, if he wants a car, he will have no hesitation in answering the question and will still remain just as good a prospect."

"Suppose I have found out what he is interested in; isn't there a possibility that he may like to know about the rest of our cars?"

Digitized by Google

"There is a possibility, but it is well to overlook it. If you believe you have discovered what particular car of your line the prospect would like it is best to try to sell him that car—not try to sell him one of several. Act just as if you had no other car to sell him and try to make the sale on that one model. If he subsequently develops interest in another style of car you, of course, can't prevent him buying that one, but so long as he is content to stand an argument on the car you believe he wants, keep after him on that.

Inadvisability of Conflicting Lines.

"This morning, for instance, you kept putting in a word here and there for each of the cars, just as if you were afraid the rest of them would feel slighted if you didn't. That didn't permit the man to concentrate his attention on any one car, and a man can best decide to buy when he is helped to concentrate his interest.

"We have only one line of cars and they are medium in price. Some dealers carry several lines and some of them make mistakes in doing so. Messick has three lines—which may be all right, but I doubt it. Two of his lines are much the same in price, and if a prospect comes in to buy a car Messick has to be careful how he handles the situation. If the prospect knows that the two lines are about the same in price and if Messick persists in trying to sell him on one of them the prospect is likely to wonder whether Messick hasn't some motive. And if Messick says one is as good as the other it leaves the prospect confused."

"How about his third line?"

"That isn't so bad," replied Reilly. "It is one station down the scale in price and doesn't conflict with either of the others. Messick would do better, I believe, if he dropped one of the higher-priced cars and stuck to the low- and medium-priced ones. Then he would have an offering for anyone and could concentrate his own efforts. This selecting one car and trying to sell it helps the salesman even more than it does the prospect, for the salesman then can center his energy on one point."

Little Tricks of Other Businesses.

"I'll do that hereafter," agreed Tommy.

"You just keep your eyes open and see how much that is done in all lines of selling. The next time you buy a pair of gloves go to a good store where you are fairly certain of encountering a good salesman and watch him work. He will show you a few gloves, perhaps, but he won't take down all he has in the store if he discovers that you have a particular preference. Once he finds what you fancy he will try to make a sale of that style unless I miss my guess.

"Did you ever wonder whether a life insurance agent had more than one kind of policy? He has—but he doesn't say so. You listen to a warm argument on some particular policy and maybe you take it. He has any number of policies, but he knows that if he brings them all out you are likely to become confused and undecided, so he just hammers away at you on one policy

"ONCE HE FINDS WHAT YOU FANCY HE WILL TRY TO SELL THAT STYLE"

and does his best to help you decide to buy."

"I have noticed that, now that you speak of it."

Separating New and Used Car Selling.

"The same principle is important in selling used cars and is one reason why it is advisable to separate your new and used car departments if your business is big enough. If a salesman has nothing to sell but used cars he is able to concentrate on selling used cars; he doesn't have to worry about the new car sales and he, in a way, becomes a used car specialist. The prospect who meets this salesman knows the salesman has used cars and nothing else and is therefore precluded from trying to switch the conversation to a new car.

"IF HE KEPT SHOWING HIM EVERYTHING IT MIGHT KILL THE SALE"

"On the other hand, it relieves the new car salesmen of worrying about the used cars. They don't have to keep an eye open for a chance to work off a used car; they can concentrate on new cars and do better work. But even the used car salesman can do his best if he makes up his mind that the prospect needs a certain car in his assortment and does his best to make the sale of that particular car. If he walked the prospect around the shop and kept showing him everything and then left it to the prospect to decide what he wanted it would set the sale back some distance if not kill it."

"But suppose a prospect in this salesroom fancies an enclosed car."

"No prospect, Tommy, who can afford but one car is going to buy an enclosed car. If he can buy but one car he ought to have a touring car, and it wouldn't be right to try to sell him anything else. But if he has bought the touring car there is nothing to prevent his having an extra limousine body if you can make him think he can afford it. But until you get to be pretty skillful it is just as well to stick to one thing—sell him a touring car; that's the safest.

"I nearly lost a sale once myself by misjudging my man and monkeying with too many cars. It was old MacFarlane—"

"Oh, yes! That fellow with the Appollinaris nose."

"Appollinaris!" exclaimed Reilly.

"Well, it's Grecian or Appollinaris. I don't know which," said Tommy, who reached for his hat with one hand and felt with the other to see if he had enough money to pay for his lunch.

Price-Cutting Again Sustained by Court.

Bearing out the United States Supreme Court's policy, expressed in its opinion in the Sanatogen case, this same tribunal this week supplemented its disapproval of price licensing under patents by rendering a similar decision in regard to price maintenance under a copyright. It was held that the holder of a copyright cannot compel a dealer to sell the copyrighted article for a fixed price.

The suit was brought by R. H. Macy & Co., one of New York City's largest department stores, against the American Publishers' Association, which comprises about 75 per cent. of the publishers and about 90 per cent. of the wholesale and retail book dealers in the United States. The association sought to prevent Macy's from cutting prices on copyrighted books.

Moline Also Adopts a Knight Trade Mark.

Having espoused the cause of the Knight engine in no uncertain fashion, the Moline Automobile Co. has adopted a new trade mark to better fit the Moline-Knight car. It comprises a combination of gold and royal blue colors, the color scheme of King Arthur's knights, the central figure being a reproduction of the famous painting of Sir Galahad on a shield-shaped medallion of gold. On one side of Sir Galahad is the name Moline and on the other the name Knight, printed in white with a backing of blue enamel. Sir Galahad, it is pointed out, was the most perfect of King Arthur's Knights of the Round Table.

"LIE" AND "TREASON" HEARD AT A. A. A. ANNUAL MEETING

Ohio Delegate Arouses Mighty Storm and Is Promptly "Called"—Wilson, of Pennsylvania, is Chosen President.

Ohio, as has been the case for the past several years, supplied the fireworks at the annual meeting of the American Automobile Association, which occurred in Richmond, Va., on Tuesday last, 2d inst. Dr. Bonifield, of Cincinnati, did not make himself heard but his former clubmate and fellow pyrotechnist, Dr. A. B. Heyl, was there and touched off the display. He did so not by word of mouth but by word of pen, and what he wrote was of a character sufficient to cause R. P. Hooper, former president of the A. A. A., twice to denounce it as an "infamous lie," and for Delegate Hawkins, who, like Hooper, comes from Pennsylvania, to propose a resolution charging Heyl with "treason" and providing for the appointment of a committee of five to try him on that accusation.

Heyl's sky-rockets, pin wheels and aerial bombs first appeared in a Cincinnati paper; they occupied nearly two columns and were of a really amazing nature. In a loosely-knit denouncement he alleged that the organization was in the hands of an "inner ring" and that practically nothing it has done, or is trying to do, amounts to a row of pins, or is free of taint of some description.

When former President Hooper denounced the Heyl article as an "infamous lie," a great uproar resulted. Heyl himself was not present. He was hunted up, however, and brought into the room and, in his presence, Hooper repeated what he had said. As Heyl previously had been elected a member of the board of directors, it was then that Hawkins roared out his charge of "treason," which later he put in writing and offered as a formal resolution. Strange to say, Heyl, the man of so many written words, had nothing to say in his own defense and the resolution was unanimously adopted.

John A. Wilson, of Pennsylvania, the newly elected president, was in the chair and when written charges were handed up he slipped the document into his pocket.

"They are going to be tried," he remarked. "I am very tired of it all. Mr. Heyl's charges are either true or they are lies, and the burden of proof is on the man who preferred them."

Delegates Vaile and Gordon, of Ohio, took occasion to disclaim sympathy with the statements made by Heyl and to add that they did not reflect the views of a majority of the Ohio members.

Before the uproar arose, most of the business of the meeting had been disposed of, officers elected being as follows:

President, John A. Wilson, of Pennsylvania; first vice-president, Dr. H. M. Rowe, of Baltimore; second vice-president, Ralph W. Smith, of Colorado; third vice-president, F. L. Baker, of Colorado; fourth vice-president, J. H. Clarke, of Minnesota; fifth vice-president, Preston Belvin, of Virginia; chairman of the executive committee, A. G. Batchelder, of New Jersey; treasurer, H. A. Bonnell, of New Jersey; secretary, J. M. Brooks, of Connecticut. The rules were suspended and the secretary was instructed to cast the ballot of the convention for the nominees.

Executive Committee: Alabama, Dr. G. J. Griel; Arizona, George Purdy Bullard; California, F. L. Baker and P. J. Walker; Colorado, Ralph W. Smith; Connecticut, F. T. Staples; Delaware, John Bancroft; Georgia, F. C. Battey; Idaho, Theo. Turner; Illinois, Allen S. Ray and Henry Paulman; Indiana, P. C. Rubush; Iowa, G. Decker French; Kansas, C. W. Barnes; Louisiana, P. M. Milner; Maine, John C. Scates; Maryland, Dr. H. M. Rowe; Massachusetts, J. P. Coghlin; Michigan, W. E. Metzger; Minnesota, Asa Paine; Missouri, Roy D. Britton and H. D. Train; Montana, E. P. Mathewson; Nebraska, Harry Lowrie; Nevada, C. G. Patrick; New Hampshire, J. A. Reynolds; New Jersey, Dr. J. M. Faulkner; New Mexico, J. S. Mactavish; New York, Dr. H. Lewis and F. S. Webb; North Dakota, S. W. Richardson; North Carolina, Col. Beneham Cameron; Ohio, Harry Gordon and Harry Vaile; Oregon, W. J. Clemens; Pennsylvania, Stedman Bent and Paul C. Wolff; Rhode Island, C. N. Doe; South Carolina, Albert S. Farmer; Texas, C. H. Verschoyle; Vermont, E. C. Smith; Virginia, Preston Belvin; Washington, A. G. Pritchard; West Virginia, Elmer Hough; Wisconsin, J. L. Drought.

Later, President Wilson announced the reappointment of George C. Diehl, of Buffalo, N. Y., to the chairmanship of the Good Roads Board; Howard Longstreet, of Philadelphia, Pa., to the chairmanship of the Tourists' Information Bureau, and William Schimpf, of Brooklyn, N. Y., to the chairmanship of the Contest Board, though it is understood that Schimpf will decline to serve; Charles C. James, of Ohio, takes the place of Charles Thaddeus Terry as chairman of the Legislative Committee.

The business was forwarded with such dispatch that, although two days had been fixed for the meeting, but one day (Tuesday) was required.

Much time was devoted to the discussion of the financial situation of the organization, particularly its official organ, the American Motorist. In an effort to obtain more revenue, a motion was offered to change the flat membership fee to a graded scale based on the membership of each club, but the proposal met with opposition and the matter was referred to the executive committee.

It was also brought out that the New York State Association had refused to pay its per capita dues to the national organization, and that all was not peaceful between the Ohio State organization and the clubs which compose it. Delegate Vaile, of Ohio, said, however, that Ohio would work out its own problems, but a motion was offered that New York be dropped from the national organization if the proper amount of dues was not forthcoming. The motion was amended so as to include any State which failed to pay the required amount of dues, but, after much discussion, in which the situations were frequently explained, the chair refused to entertain the motion or the amended motion and the matter went by in default of action.

Four resolutions reported by the committee on resolutions were adopted without dissent.

The first expressed the A. A. A.'s appreciation of Franklin K. Lane, Secretary of the Interior, and Adolph C. Miller, Assistant Secretary, for their work in developing the national reservations and making them easy of access to tourists. The resolutions also advocated increased appropriations for such parks.

The second resolution reiterated the A. A. A.'s attitude toward Federal aid in road building and favored the enactment of a law which shall obligate the States to expend an amount of money proportionate to that spent by the Federal Government for roads which directly concern the farm population.

The third resolution favored the enactment of the Adamson bill, a substitute for the original so-called Federal registration bill, and which proposes that any automobile owner having registered his car in his own State shall be privileged to go anywhere in the United States without additional registration.

The fourth resolution again placed the association on record as being opposed to the registration tax on automobiles unless it shall be in lieu of all other taxes, and the money thus raised be expended for road maintenance, and that where the constitution of a State does not admit of the registration tax being in lieu of the personal property tax, there shall be appropriated annually from funds from the State a sum equal to that accruing to the State treasury from the taxation of automobiles. The resolutions were adopted singly and in toto.

In the light of unlooked-for developments was a communication from the Union Pacific Railway urging the A. A. A. to lend its assistance to a movement having for its object the changing of the rear lights on automobiles from red to some other color. The railway company's letter stated that many accidents had been caused by confusion of automobile rear lights with railroad signals, and that more would occur when the Lincoln Highway is built.

Before adjournment, Boston was selected for the 1914 meeting.

Dr. Heyl's charges, which caused the uproar, allege, among many other things, that the A. A. A. is controlled by an "inner ring" and that it is "conducted in the interests of manufacturers of automobiles, automobile accessories, road machinery and big road contractors."

He suggested that the A. A. A. corporation consists of "Messrs. Terry, Batchelder, Diehl and the manufacturers." He describes those three men as the "active officials of the A. A. A." Attorney Charles Thaddeus Terry, of New York, chairman of the A. A. A. legislative board, without salary, he declared is likewise attorney for the National Association of Automobile Manufacturers, which is out of business, and also of the association of accessory manufacturers, and for the Weed Chain Tire Grip Co. and the Klaxon horn people," all of which will give pain to at least three other attorneys, as Terry is the legal representative for none of those named, although Heyl declared that, "on good authority," Terry's "retainers from these people amount to $20,000 a year.

George C. Diehl, chairman of the A. A. A. good roads board, Heyl styled a "professional politician," and Heyl could not understand why he could run all over the United States in the interests of good roads without compensation.

A. G. Batchelder, chairman of the executive board, draws a salary of $6,000 a year and expenses, but Heyl says what he does for the amateur automobilist is an "unknown quantity, while what he does for the manufacturers and road builders is quite apparent."

The Cincinnati man hinted broadly that the bylaws had been juggled or altered to perpetuate the "inner ring," and poohpoohed the good roads work and practically every other field of A. A. A. endeavor. He wrote of "colonization schemes of new directors," of "sand bagging" which would be performed at the Richmond meeting and predicted that at least eight of the States of the Middle West would withdraw from the A. A. A. and form a "national association which will stand for the interests of the amateur automobilist and for the protection of the general public only."

DASH CLOCK TRADE MEETS TREND TOWARD FLUSHNESS

Disappearing Winding and Setting Keys Features of New Waltham Model—Another Attaches to Dash Without Screws.

The trend toward flush surfaces in automobile construction, which has made its greatest progress in the smoothing out of body side surfaces, has been felt even further, it having now reached the accessory field; **the popularity of flush surfaces** has

WALTHAM TELESCOPING CLOCK

led the Waltham Watch Co., of Waltham, Mass., to incorporate this feature in two of its new models of automobile dash clocks, the flushness being accomplished by a new and special case construction.

The objects which have been accomplished are: An entirely smooth surface of the clock; and the projecting of the clock but a small distance from the surface of the dash. Clocks of this construction are set

WALTHAM "FLUSH MOUNT" TYPE

into a hole in the dash, and, whereas this would be possible with many other types of clock, the new Waltham, known as Model M, contains no fastening screws. So far as the driver of the car is concerned, the clock appears to be stuck to the dash.

This is achieved by means of two flanges, both shown in an accompanying illustratiton. One is in contact with the bezel of the clock and rests against the face of the dash; the other turns on a threaded surface back of the first flange, so that when the clock is inserted in the hole in the dash from the front the rear flange may be turned up and the dash clamped tightly between the two flanges. A small setscrew holds the rear flange in a tight position.

Model W achieves flushness at a different point. As shown in the illustration, the winding key and setting devices are raised up out of the case at the top of the bezel and are in position for use. When the winding and setting are completed the keys may be tipped over into the bezel and the bezel is pushed back into its telescoping case and fastened with a bayonet lock. A spring pushes the bezel out when the bayonet device is unlocked for winding.

The Waltham company also has introduced a new feature in the lettering of its dials; instead of placing white letters upon a black surface with the possibility that black will work through and the white lose its purity, the whole design is produced by a photographic process.

S. A. E. Lengthens its Winter Program.

Several additional papers have been scheduled for presentation at the annual winter meeting of the Society of Automobile Engineers which is to be held in Grand Central Palace during January 6 and 8 next. These include "The Need for Dissemination of Electric Vehicle Data," by W. J. B. Thomas, Chief Engineer of the Century Electric Car Co., of Chicago, Ill., which will be read January 6th at the afternoon session; and "Automobile Effectiveness," by D. L. Gallup, assistant professor of gas and engineering of the Worcester Polytechnic Institute, to be read at the same session; "Taxicab Design," by L. P. Prossen, for the evening session the same day; "Electric Gear Shifting," by Frank N. Nutt, chief engineer Haynes Automobile Co., which is to be read during the morning session on Jan. 8th; "The Possibilities of the Cyclecar," by Wm. B. Stout; "Radiators," by J. W. Cain, chief engineer McCord Mfg. Co., both for the same session; "An Electrically Controlled Dynamometer for Testing Gas Engines," by N. C. Johnson; "The Exhaust Discharge and the Utilization of its Energy," by F. C. Mock, engineer Stromberg Motor Devices Co., both for the afternoon session on January 8th.

Apperson Establishes Branch in Seattle.

The Apperson Bros. Automobile Co., of Kokomo, has established a branch in Seattle, Wash., at 907 East Pike street. It is in charge of D. C. Guichard, who at one time was associated with the Apperson agency in Seattle.

SELECTION OF SALESMEN AND TRAINING THEM

Budlong Instructively Discusses Vital Subject from Several Angles—Parts the Sales Manager Should Play—Dummy Sales as Stimulant of Wits—Ideal Sales Department and Methods Outlined.

By M. J. BUDLONG, President Packard Motor Car Co. of New York.

The wise selection and proper development of salesmen are two of the most important functions connected with the successful marketing of any product. The need for them in the motor vehicle industry was never greater than in the present cut-throat era. Quality of product will always count, of course, but proper presentation and energetic pushing are absolutely essential in any organization that is to keep its head above water.

In the matter of selection, one has always the alternative of filling new sales positions with men trained in one's own organization and without sales experience, or experienced salesmen trained elsewhere.

Why Use of Home Material Is Best.

In general, the arguments are all in favor of home-made material, first in recognition of good service among one's own employes, and to give them one and all an incentive for better work, and, second, because their previous experience has grounded them in the traditions and policies of the business, a thorough knowledge of which is so essential to the proper equipment of the salesman.

In securing men for the selling force from one's own organization, none should be considered who have not made good in every duty assigned to them. Hard and unremitting work alone will bring success to a salesman, and one who has not proven elsewhere his capacity for such work is not a suitable candidate.

Besides a successful record, an enthusiastic disposition is an important qualification. To become a good salesman one must be a natural student and a natural booster, and the born enthusiast is both of these. Such a man will have been studying out of hours the things he hasn't had time to learn during the business day; he will have been prying into matters which the drudge would overlook. Thus, when called on, he will be ready.

The same disposition will carry him rapidly forward, once launched on the firing line. He will instinctively note the shortcomings in his own equipment, and will struggle day and night to eradicate them. Each time he finds himself deficient in his technical knowledge or method of approaching a prospect, he will profit by it and learn as he goes. Often enthusiasm with sufficient knowledge to back it up, will win over customers by its force alone.

Ability to talk convincingly is another prime requisite; a good salesman must bring his arguments home, and if his own confidence in the article he is selling is sufficiently great, and his knowledge sufficiently broad, he will have the right foundation. Add to these assets the capacity for forceful expression and your salesman becomes nearly irresistible.

Pleasing personality and good address, which are almost entirely natural gifts, are, of course, practically indispensable. It is assumed that no candidate who does not possess these attributes, at least partially, will be considered. While they can be developed to a certain extent and while a man who does not possess them conspicuously may, with perseverance and stick-to-itiveness, advance to a degree, no two characteristics will go so far in themselves, and added to the others previously enumerated will push him so far ahead.

Past Records a First Consideration.

When it becomes necessary, as it sometimes does, to abandon the civil service policy and select experienced men from the outside, the first consideration in every case is the candidates' past records. While they may not have been in surroundings most harmonious to their development, yet there is usually some indication of their ability which will be helpful in eliminating those who would not prove worth developing. Naturally, the first interest in any man's record is his personal standing with former employers as to habits, personality and character. Other indications of value are the changes he has made and the results he has secured in each connection. It is usually safe to assume that one who has changed persistently, no matter how good his results have been, is a rover and will probably never take root anywhere.

A first impression of an experienced man counts for much, for it may be inferred that his habits are pretty well fixed and that he is too old a dog to learn many new tricks. Therefore, the impression he makes on you is likely to be duplicated on your customers. If he is neat, well groomed, magnetic and convincing without being egotistical, he is worth considering at least. Right here a clear distinction should be made between costly or loud dressing and the sort of neatness which indicates refinement.

The value he places upon his services must necessarily be taken into consideration, as it may be prohibitive. If he is the right man, he will be willing to prove his worth. His temperament, too, is extremely important. If he will not fit harmoniously into the existing organization he is not the man to select.

Requisites for Field Work Salesmen.

It is taken for granted that an experienced motor car salesman is thoroughly familiar with automobile construction, and is possessed of sufficient technical knowledge both as to mechanical and coach work. If he appears deficient in these particulars it may be inferred that he has wasted his opportunities and will not fill the bill.

In choosing salesmen to represent the company in territory remote from the central organization, absolute reliability is essential. Such men must be capable of implicit trust, both as to business ability and personal habits. They must also have discretion and good judgment, for their bearing and reputation in the community will determine in a measure the respect in which the company is held.

Competition in the commercial field is so fierce and the knowledge required to meet it successfully so exact that forceful men are needed, with both experience and business training. Its prospects take nothing for granted. Handsome lines, soft cushions, pretty colors and the like, are utterly minus in their bearing on sales. Every prospect is strictly "from Missouri" and is interested solely in what your proposition means to him in dollars and cents. Your salesman, therefore must have knowledge of competitive hauling cost at his finger tips. Problems of maintenance and upkeep must be of the kind he "eats alive." Pleasing personality and magnetism play their part in securing this business, of course,

Digitized by Google

but the first requirements are knowledge and force—the ability to meet business men as a business man and give them the kind of arguments they can't refute or afford to disregard.

These remarks on the important characteristics to find or develop in salesmen of all classes lead naturally to a description of the methods whereby the successful sales manager trains his force.

A sales organization is like any working aggregation in a competitive field. Well led, it is an army—an efficient fighting machine; poorly led, it is a mob, with some individual excellences and many individual faults. The prime requisites for the best results are (1) capable salesmen, (2) a sound policy, (3) individual training, to improve each unit to the uttermost, and (4) collective training, to promote "team work" and departmental efficiency.

Individual excellence is essential to collective results and to mold his force as a whole the sales manager must know his men and dwell long and faithfully upon their separate development. Patient coaching, carefully applied encouragement, the tempering of criticism with judgment so that loss of confidence and enthusiasm will not result, are all necessary to the training of the selling force as a whole.

Technical Training Prime Essential.

Much time is saved at the outset if men chosen for the sales force are all so well grounded technically that extensive teaching in regard to the product itself is unnecessary. A man thus equipped will absorb, from personal observation, the characteristic features and advantages of each new model as it appears. He will be able also to acquaint himself readily with the essential features of competitive products, and will thus shortly possess himself of the kind of knowledge that is power in the work of selling motor vehicles. The sales manager's first duty is to so direct this power that its full value will be realized, and restrain absolutely that blighting tendency to "knock" others' products, which is so often its accompaniment.

The influence of the sales manager must also be felt in the matter of training his subordinates to tactful alertness on the floor. Nothing gives a customer so favorable a first impression as to be immediately and pleasantly met as he enters the salesroom by a wide awake salesman, with apparently nothing he so greatly desires to do as sell that particular customer the finest car on earth. Many a sale is made on the strength of the customer's first reception, and not a few are lost.

Finesse in working a prospect is properly the next subject of instruction. Different customers require wholly different methods and the successful salesman must learn to study human nature and to size up his prospects almost instinctively. He must become a quick thinker, and meet each phase of his dealings with every prospect much as a physician meets the changed conditions of his cases. He must know when to persist in the line he is following and when not—when to shift his ground and when to stick to his point. He must learn to attack where the defense is most vulnerable, and must acquire aptitude for changing argument or subject to fit the customer's mood or ideas.

Knowing When to Appear Aggressive.

Discretion and good judgment are necessary to know when to be aggressive and when not to be so, which can only be learned by experience, but the salesman can and should always keep a customer interested by explaining to him the fine points of the car, by offering to show him the buildings or equipment, by talking Service to him, and by making him feel at all times that it is a pleasure, not a duty, to talk with him.

Where true salesmanship also shines is in keeping a customer satisfied, whose requests must in some particulars be refused. Such refusals require most diplomatic presentation and should never be curt or blunt. The policy of the company, which makes special concessions impossible, should be explained in such terms that any broad-minded man may see its force and understand its application to his particular case.

Salesmen often feel unduly discouraged over the loss of sales upon which their finest art and utmost efforts have been expended, and feel that the limits of their ability have been reached. It is the sales manager's duty to keep his men cheered up under such circumstances, and prevent loss of confidence. The lost sales should be analyzed and the causes established.

Leaving Sweet Taste After the Sale.

Every salesman should be impressed with the absolute necessity of closing his sales in such clean fashion that "comebacks" will be impossible—which is simply a matter of straight talk to each customer from the outset. It requires considerable strength of mind at times to keep absolutely on the safe side of false impressions, but the salesman who cannot do it will never make good in a reputable organization. Each contract should be thoroughly understood, as to all its terms, before the sale is closed, and all disputes thrashed out before delivery, so that the customer may know just what he is going to get and have no basis for subsequent claims.

Training of the sales organization as a body must be carried on at times when no interference with its regular work will result, which means, of course, before or after business hours. In a well drilled organization, short meetings are held several times a week in the early morning before the time of customers' arrival in the salesroom, and once each week evening meetings of greater length comprising the entire force, as a regular part of each member's duty, should bring out thorough discussion of all subjects of common interest such as are foremost at the time. The daily sessions, because of their brevity, necessarily deal with matters of immediate importance. In them lists of immediate live prospects should be discussed, with a view to closing as many as possible during the day. Each salesman should report the result of his previous day's calls. Lists of lost sales should also be handed in, with the reasons for each loss—which it is sometimes profitable to discuss.

These occasions should also be utilized to keep the enthusiasm of the organization at concert pitch. No element is quite so valuable to the organization as a whole, and it is the sales manager's business to see that it is constantly infused. On such occasions it is also possible to drop many useful hints by way of indicating the errors of their ways to the men who have noticeably been tending toward careless habits of any kind, such as tardiness of morning arrival, unpunctuality in the keeping of appointments, lack of dignity in conduct on the sales floor, etc.

Learn Greatest Obstacle and Meet It.

It is very helpful, too, to secure from each salesman a statement as to his greatest obstacle in making sales, so that it may be discussed for the benefit of all. One can thus fight back constantly all adverse conditions and frame up a campaign, each week, to combat all present hindrances to the increase of business.

Dummy sales are fruitful sources of suggestion and tend to stimulate the wits of all concerned. The buyer brings to bear all the methods he can think of to make himself a difficult prospect and the "salesman" is extended to his uttermost to convince him, and the audience, that there is logically but one car to buy.

It is important also to coach the force on the proper method of presenting service advantages to customers, so as to lay the right foundation for their appreciation of the service department after delivery.

All other things being equal, the greatest success will be achieved by the organization which is composed of the most carefully selected material, captained by the most thoroughgoing organizer, and coached without ceasing, both individually and as a unit, in every refinement of the art.

PACKARD "SIX" ROAD TEST SHOWS DYNAMO FUEL COST

Cost of Electric Lighting, in Terms of Fuel, Scientifically Determined—How the A. C. A. Conducted the Elaborate Tests.

The electric lighting generator on an automobile equipped with a complete electric lighting and starting system is not a big machine—in fact, as dynamos go it is a small one, and the energy required to drive it is quite insignificant by comparison with the rated power of the engine from which it is driven. Nevertheless a certain amount of power is required all the time the generator is running, and the production of this power necessitates the consumption of a certain amount of fuel in excess of what is required for the propulsion of the car. Just what this extra fuel consumption amounts to is a question that has been bobbing up persistently since car-lighting generators came into use, and while the manufacturers of the little dynamos can tell to a nicety the power their own machines will absorb, under given load conditions, the real question is: How much will the use of the electric lighting system increase gasolene consumption under actual running conditions?

Manifestly the answer will vary with different combinations of cars and lighting systems, and the figures applying to one car might have no bearing on others. So when the Packard Motor Car Co. became curious as to what electric lights were costing their owners they went directly to the task of finding out by the simple expedient of turning a car over to the Automobile Club of America to be given an official test under actual road conditions. The car was a model 2-38 "six" with five-passenger body, and not only was the car fully equipped, but it carried a not inconsiderable overload of spare tires, tools, chains, etc., in addition to the auxiliary gasolene tank for testing, the tank supports and the various electrical measuring instruments. With everything on, but without passengers, the car weighed 4,862 pounds; on all the test runs the full complement of five passengers was carried. The car was driven with the top, windshield, and all side curtains up.

The generator, a Bijur machine, delivered its current to a Willard 120 ampere-hour storage battery. The dual unit system is employed, the starting motor being a separate machine. The illuminating equipment consists of ten lamps—two head lights, two side lights, two tail lights, two speedometer lights and one each dash and tonneau lights. The testing equipment consisted of a special gasolene tank accurately calibrated to hold one gallon of gasolene and fitted with a sight-reading tube so that the exact moment when the gallon was consumed could be observed; electric measuring instruments for indicating current flow; and the speedometer and odometer of the car. The speedometer was used in gauging the speed of the car and the odometer in determining the distance covered. The latter instrument was checked constantly by milestones known to be accurate, and found to tally exactly.

As the car was driven throughout the test with more than full weight load, with top and windshield offering maximum air resistance, with all lamps burning and the battery charging, it is clear that the test could not give average running results, but indicated almost maximum generator power consumption—in fact, it would seem that the only way of increasing the power absorbed by the generator would be to further discharge the battery—which, again, would by no means represent an average condition.

Five test runs were made, each run being continued until precisely a gallon of fuel had been consumed. The trials were carried out on the Long Island Motor Parkway, starting at a point near the Garden City lodge and running east until about half a gallon of gasolene had been consumed and then turning and running back until the fuel was gone. No ignition, carburetter or other adjustments were made. Speed was maintained as nearly constant as possible by the use of the throttle. Brakes were used only when stopping to make the turn for the run back. Two runs were made with the generator in action, one at 20 miles an hour and the other at 40 miles an hour; two with the generator removed from the car and its place taken by a plain shaft running in ball bearings, also at 20 miles an hour and 40 miles an hour; and one extra check run at 20 miles an hour with the generator running. Just previous to each of the runs with the generator working the starting motor was run for several minutes, turning over the engine and drawing current from the battery until it was so far discharged that the total output of the dynamo, for supplying current to the lamps and at the same time charging the battery, averaged 17 amperes. The lamps alone drew approximately 10 amperes. The difference in potential across the generator terminals was 7 volts. The results are given in the following table:

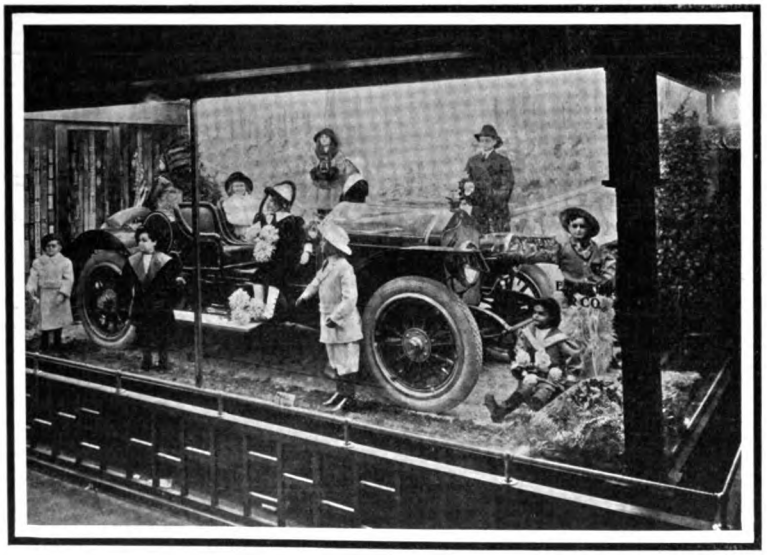
Run No.	Average speed M. P. H.	Miles on one gallon gasolene.	Ampere output of generator
1	20.8	13.0	18.0
2	40.6	11.0	15.5
3	20.2	13.7	Generator off
4	40.6	11.4	Generator off
5	20.8	13.2	16.8

Spark about ¼ advanced runs 1, 3 and 5.
Spark full advanced runs 2 and 4.
Gravity of gasolene 61.1 Beaume at 60 deg. F.

The figures are interesting. No. 1 and No. 5, the latter the check run, were made at 20.8 miles an hour with the generator working and delivering 18 amperes and 16.8 amperes, respectively, for the two runs; the mileages were 13 and 13.2, respectively. No. 3 at 20.2 miles an hour with the generator removed gave a mileage of 13.7. This indicates a difference of 4.6 per cent. in the gasolene consumption due to the runing of the generator.

The two runs made at 40.6 miles an hour showed, as of course was anticipated, a higher gasolene consumption due to the less economical speed of the car. With the generator running and delivering 15.5 amperes the mileage was 11 flat; with the generator removed the mileage was increased to 11.4, a difference of a shade less than 3.7 per cent.

These figures indicate, obviously, that at about 20 miles an hour the generator reduced the mileage on one gallon by .6 of a mile and at about 40 miles an hour by .4 of a mile. In other words, the mileage that could be covered on 100 gallons of gasolene with the generator removed would require 104.6 gallons at a 20-mile rate and 103.7 gallons at the 40-mile rate with generator running. Figuring still another way, it works out that while 7.3 gallons would drive the car 100 miles at about 20 miles an hour without the generator, it would require 7.6 gallons to drive the car the same distance at the same speed with the generator working. At the 40-mile rate the gasolene consumption for 100 miles without and with the generator would be 8.7 gallons and 9 gallons, respectively. Averaging the results at both speeds and figuring gasolene at 20 cents a gallon, it cost $1.60 per 100 miles to run the car without the generator and $1.66 per 100 miles with the generator working, the generator making an almost insignificant difference of 6 cents per 100 miles.



The conditions of the test were such that the results obtained probably are as accurate as it is possible to get them under the conditions. The arrangements were made and the testing equipment installed under the supervision of Herbert Chase, A. C. A. laboratory engineer, who personally conducted the tests and took the readings. The results indicated, however, are by no means average results—that is, such results as would be obtained in ordinary running, day in and day out, for it is obvious that in ordinary running the lamps are not burning all the time, nor is the battery being charged all the time. On the contrary, the only current consumption during the day is that which is required for replenishing the battery to replace current used for starting, while at night the generator ordinarily would have to furnish but little current in excess of the 10 amperes or thereabouts needed for the burning of the lamps.

GETTING PUBLICITY OUT OF DRYGOODS WINDOW SETTING

Dallas Dealer Makes His Car the Center Piece in an Attractive Display —Realistic Wax Figures Suggest Great Possibilities.

Utilizing the windows of a drygoods store to show off a car would probably be regarded as very expensive or as an impossibility by many a dealer, but that it is not so difficult as it might seem to arrange for this scheme was demonstrated by the National dealer in Dallas, Tex. Both he and the firm of E. M. Kahn & Co. attracted considerable attention by the "stunt."

DALLAS (TEX.) DEALER'S EFFECTIVE DISPLAY IN A DRYGOODS STORE WINDOW

The dealer arranged with the Kahn company to put a semi-racing National in one of Kahn's best windows and the drygoods house peopled the window with wax figures, showing off their latest wearing apparel. The attractiveness of the clothes was emphasized and the car stood out well.

Although the use of wax figures seems to have been monopolized by dealers in clothing, there seems no reason why the automobile dealer could not introduce an innovation by utilizing "dummies."

Will Call Itself Parcel Post Company.

Parcel Post Equipment Co. will be the name of the reorganized Grand Rapids (Mich.) Motor Truck Co., which, as Motor World stated last week, will produce a light, 500-pound parcel delivery wagon with the receptacle in front and the driver at the rear. Although the new company has not yet been incorporated, work on the parcel wagon is in progress at the Grand Rapids plant. The men concerned in the enterprise are Frank T. Hulswit, E. Alfred Clements, Carroll F. Sweet, William F. McKnight, L. W. Coppeck and John I. Taylor, the latter of Boston.

Eau Claire Company to Build Engines.

Kim Rosholt, T. W. Rosholt and R. P. Rosholt, principal stockholders in the Northwestern Mfg. Co., of Eau Claire, Wis., whose industrial activities heretofore have consisted mainly of the manufacture of log haulers and lumbering machinery, have entered the gasolene engine manufacturing field; they have formed the Northwestern Motor Co., with headquarters in Eau Claire, and plan to produce for the automobile and tractor trade. The capitalization is $25,000.

Waverley Makes Known Its Profits.

According to reports submitted at its annual meeting last week, the total business of the Waverley Co., of Indianapolis, during its last fiscal year, amounted to $1,312,815.94. Its capital surplus and undivided profits amount to $590,000. The officers elected at the meeting are as follows: Wm. B. Cooley, president; Herbert H. Rice, vice-president; Wilbur C. Johnson, secretary; William Kothe, treasurer; Hugh Daugherty, Joseph C. Schaf, Alexander C. Ayres and Hugh M. Love, directors.

Golden West Factory Actually Building.

The Golden West Motors Co., which was organized at Sacramento, Cal., several months ago, has completed one of its factory buildings and work is in progress on a second one. When the plant begins operation, it will make a four-wheel drive car.

BRITAIN'S EXPORTS GAIN $4,000,000 IN TEN MONTHS

Shipments During First Ten Months of Present Year Total $18,000,000 —Value of Imports Increases to $30,000,000.

The exportation of automobiles and allied products from England during the first ten months of 1913 amounted to £3,612,326, or in round numbers $18,000,000, of which £1,957,934 represents 6,221 cars, £403,572 1,046 chassis, £591,118 tires and £659,702 parts. This compares with a total value of £2,908,416, or roundly $14,000,000, in the first 10 months of 1912, of which figure £1,563,962 represents 4,083 cars, £351,713 959 chassis and £992,741 tires and parts. In October, 1913, the exports were valued at £445,022, or about $2,000,000, and in that month of 1912 £375,843, or about $1,800,000.

The products imported by Great Britain in the first 10 months of 1913 were valued at £6,169,550, or about $30,000,000, of which £1,451,989 represents 5,814 cars, £1,580,731 6,706 chassis, £2,166,732 tires and £970,098 parts; during the same period of last year the value was £5,985,744, or about $29,000,000, made up as follows: 6,621 cars, £1,595,409; 6,492 chassis, £1,638,152; tires and parts, £2,752,183.

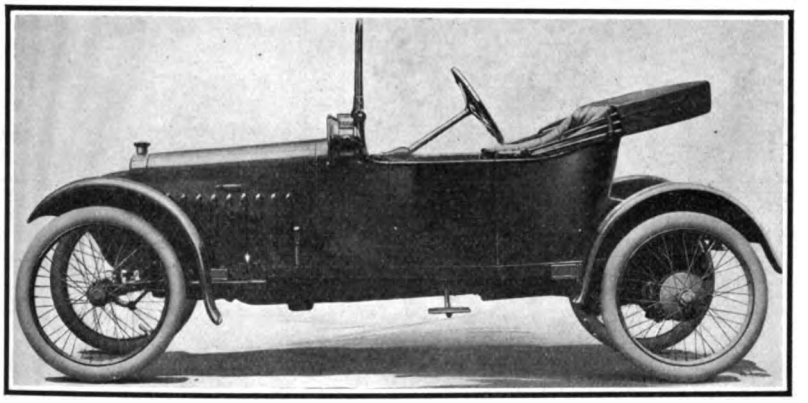
The imports of these products during October, 1913, were valued at £494,208, or about $2,400,000, of which £110,834 is the value of 523 cars, £142,501 the value of 596 chassis, £108,042 the price of tires and £132,831 the cost of parts.

In October, 1912, the value of automobile imports was £533,059, or about $1,600,000, made up as follows: 403 cars, £117,012; 586 chassis, £147,426; tires and parts, £268,621.

Ward Adds Electric Coupe to Commercials.

Marking a radical departure from the past practice of the company, which heretofore has devoted its energies exclusively to the production of electric commercial vehicles, the Ward Motor Vehicle Co., of New York City, has quietly developed and is preparing to place on the market a coupe model. The first one will be exhibited at the New York show in Grand Central Palace.

Franklin Sales Show Heavy Increase.



For the 10-month period ending October 31st last, it is officially stated that the sale of Franklin cars showed an increase of 76 per cent. over the corresponding period of 1912. The sales during September and October doubled those of last year and this notwithstanding the existence of widespread pessimism.

FIRST SAXON LIGHT CAR REVEALS BIG CAR PRACTICE

First of 10,000 to be Built by Company of Chalmers Officals Has no Cyclecar Features—Roadster Priced at Less Than $400.

Although it was not wholly a state secret that officials of the Chalmers Motor Co., of Detroit, Mich., were behind the organization of the $350,000 Saxon Motor Co., of Detroit, which purposes producing a light two-passenger car designed to sell for less than $400, the fact was not authoritatively announced until this week, when the vehicle itself also was formally introduced; it proves to have nothing in common with that type of vehicle which is known by the designation cyclecar, being in fact a miniature automobile.

SAXON RUNABOUT, WEIGHING 900 POUNDS AND SELLING FOR ABOUT $400

The company which is to produce it is separate and distinct from the Chalmers company itself, despite the fact that all of its officials are prominently connected with Chalmers affairs. Its head is Harry W. Ford, who for the past two years has been a director, and general manager of, the Chalmers company, in which he will retain his directorship and act in an advisory capacity regarding advertising and sales policies. Associated with Ford are G. W. Dunham, who is vice-president of the new company and who is second vice-president and consulting engineer in the Chalmers company; L. R. Scafe, secretary and treasurer; these men, together with Hugh Chalmers, who, though a stockholder, will take no active part in the management of the new company, Lee Counselman, C. A. Pfeffer, C. A. Woodruff, H. H. Pinney, C. C. Hinkley and Percy Owen, form the board of directors. Although the organization of the Saxon company just has been completed, preliminary organization was effected some time ago and the first of the company's cars has been on the road for the past three months. Deliveries will be commenced about March 1st.

The runabout which is to be produced is not a cyclecar in any sense of the word; as the accompanying illustration makes plain, it is a veritable small automobile, retaining the automobile's distinctive attribute, which is its standard 56-inch wheeltrack. The wheelbase is 96 inches, leaving little room for doubt regarding the actual size of the car, and the body has been designed along streamline principles to give plenty of leg and elbow room to the two occupants. The seat is 40 inches in width and 16 inches deep and there is 30 inches of open space between the heel board and the dash; the door is 18 inches in width.

The weight of the car complete is 800 pounds, a factor which contributes in no small way to the unusually low gasolene consumption. It is claimed that the car will run from 28 to 30 miles on one gallon of the needful, oil consumption being correspondingly low. The fuel tank is located in the deep skuttle dash and holds six gallons. In conformity to now standard practice, the steering wheel is at the left side, with the control levers in the center; the throttle control is by pedal and the spark advance lever is placed on the dash.

For power, reliance is placed upon a four-cylinder water-cooled motor with its cylinders cast in a block and produced by the Continental Motor Mfg. Co., from which company 10,000 already have been ordered; valves are of generous size, have steel stems and iron heads and are provided with adjustable tappets; a detachable head covers the four cylinders, which measure 2⅝ x 4½ inches, the rated horsepower being 11.23 according to the A. L. A. M. formula. Both crankshaft and camshaft are drop forgings, the former being mounted in two babbitt-lined bronze bearings and the latter having its cams formed integral; the camshaft is driven by helical gears.

Ignition, cooling and lubrication are effected by notably simple means. For sparks, current is supplied by six dry cells and passed through an Atwater Kent sparker; the cooling water is circulated by thermo-siphonic action through a tubular radiator with a fan whirling behind it by way of creating a positive draft. The motor is lubricated by a vacuum feeding oiling system with the main distribution of the lubricating medium by splash from the connecting rods big end bearings.

Further along in the chassis, a dry disk clutch with three plates, some of which are faced with Raybestos, transmits the power, through a shaft contained in a concentric steel torque tube, to the gearset which is mounted integral with the differential housing. The gearset is of the progressive type and provides two speeds forward and reverse. The rear axle is of the semi-floating type contained in a pressed steel housing and the front axle—both are produced by the Metal Products company—is of the orthodox I-beam section. The outer ends of the driving shafts rotate in Hyatt roller bearings. There are two sets of brakes, both on the rear wheels and operating on drums measuring 8 x 1¼ inches.

The frame of the car is of pressed steel in channel section and is mounted both front and rear on what may be termed quarter-elliptic springs. Wheels measure 28 inches in diameter, are of wire and are shod with 3-inch clincher tires. The road clearance, loaded, is 8½ inches. The equipment is complete, and includes a top with boot, windshield, two gas head lamps, acetylene generator, tail lamp, bulb horn and the usual complement of tools and so forth.

Rural Show to "Keep Trade at Home."

A rural town of 3,000 inhabiltants may not have enough dealers to hold an automobile show, but to the people of Elkhorn, Wis., this does not mean that their town, with a population of 3,250, is not large enough for a show; they are going to have one and expect that about 50 cars will be displayed.

The plan is innovative—at least so far as the Badger State is concerned—and is fostered by Elkhorn motorists who have leased a hall and have begun renting space to the dealers throughout Walworth county, in which Elkhorn is located. The show will be held January 4-10, the week before the show in Milwaukee, about 40 miles distant.

How to Mend Celluloid Windows.

The celluloid windows of side curtains and the like, or, for that matter, anything that is made of celluloid, can be mended and patched by dissolving bits of celluloid in acetone and using the solution exactly as if it were glue. The cement sets in about 15 minutes.

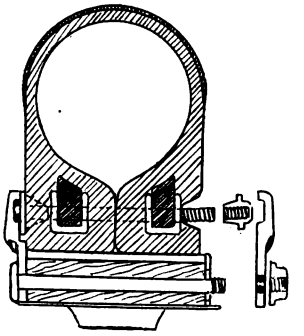
LICENSING PLAN THAT AIMS TO STOP THE PRICE-CUTTER

Talking Machine Company Does Not Sell, But "Licenses to Use"—Royalty and Retaking Scheme and Novel Insurance Point.

Following the recent decision of the United States Supreme Court to the effect that it is illegal for manufacturers of any article to set a retail selling price for it, one of the prominent talking machine companies has adopted a new selling scheme. The idea of the new plan is apparently to maintain retail selling prices by a license arrangement with dealers and consumers.

Under this plan both the dealer and the ultimate user are licensed only to use the company's products, under title remaining permanently with the company. The agreement gives the company "the right to repossess and retake at any time the patented goods upon the payment to the user of the royalty paid for the use of these goods, less 5 per cent. per annum of the list royalty as to machines, and 10 per cent. per annum of the list royalty as to records, for each year or fraction of a year the user shall have had the use thereof."

The use of other supplies with the products patented by the company in question constitutes an infringement of the patents and a violation of the agreement. Dealers are required to keep complete lists of patented goods in the hands of users.



An interesting question, however, has been raised apropos the licensing plan. In the opinion of certain business men it seems that, under such a plan, unless the producer issued a perpetual fire insurance policy to go with his product as a permanent protection, no fire insurance company would be held liable for the loss of such property after distribution occurred.

It is assumed, of course, that the distributor does not part with his merchandise unless the customer pays an amount equal to its value, plus a profit. While the consumer has thus parted with his money, he really does not become the owner of the property, and, consequently, cannot insure it. It must then remain for the producer, it is contended, to protect his product against the risk of fire.

Low Inflation in Rimless Tire.

Working on the theory that the part of a pneumatic tire adjacent to the bead is the weakest part and that its strengthening means improvement of the tire as a whole, a Berlin inventor has devised a tire in which the ordinary form of beading gives way to something entirely different, as the accompanying illustration shows. The sides of the tire, considering the cross-section, are brought down to a square base split in the center, and in each half of the base there is a ring of channel section with a filling of hard rubber; the ring is of bronze so there can be no rusting.

The base of the tire is bolted up independently—that is, without attachment to or connection with any part of the wheel or rim; the bronze channel rings give the bolts a bearing and the hard rubber filling prevents their collapsing under the pressure. The tire, of course, carries the usual inner tube. When bolted up with the tube in place the tire is slipped onto a plain, flat rim, and a retaining ring on each side holds it in place so far as lateral movement is concerned. The heads of the bolts in the

"RIMLESS" PNEUMATIC TIRE

base of the tire are covered by lugs extending radially from the retaining rings, and these lugs, fitting tightly over the heads, effectually prevent circumferential movement, or creeping.

One of the advantages claimed for the rimless tire, as it is called by its German inventor, is that as its attachment to the wheel is not dependent in any degree upon the pressure of inflation, and as there are no beads, the pressure of inflation may be considerably less than with tires of the usual construction. In fact, the pressure recommended for a 120-millimeter tire (approximately 4¾ inches) is but 28 pounds to the square inch. A deflated tire, it is claimed, cannot come off the wheel under any circumstances.

The tire is said to have passed the paper stage and to have been quite thoroughly tested on the road, with satisfactory results. An indication that the inventor's claims are taken seriously in his own country is contained in the fact that the German war office is making experiments with the tire with the object of determining its relative efficiency as compared with the ordinary pneumatic types.

NEW OAKLAND "LIGHT SIX" IS LARGE FOR ITS CLASS

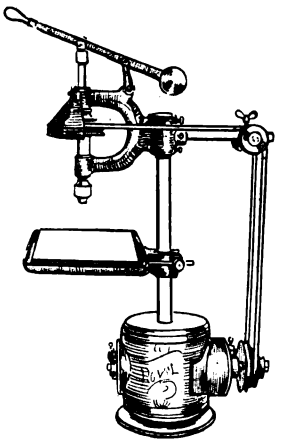
Block Motor with Detachable Head, and Left Side Control, Chief Deviations from Past Practice—Ingenious Brake Adjustment.

Describing its latest model as "the largest car built that comes in the 'light six' classification," the Oakland Motor Car Co. of Pontiac, Mich., has given sufficient information regarding the machine to show clearly that it is the direct descendant of older Oaklands, embodying the Oakland unit power plant system, V-shaped German silver radiator and other features. It departs, however, from former practice in that it embodies left steer. The addition to the line was announced some time ago, but no details were given.

The latest model is designated as model 6-48 and has a motor of the long-stroke type with the cylinders cast in a single block. The cylinder heads are detachable and are held in place by nine bolts. The lubrication system is of the splash type, and is similar to the lubrication systems in use in other cars of the Oakland line. The gear control lever is mounted on the rear of the gearcase, has no bearings to bind and is entirely unaffected by distortion of the running gear.

The equipment of the machine is complete and includes a Delco six-volt electric lighting and starting system with side lights of a new type, no wires being exposed. The electric lighting and starting controls, the speedometer and the oil and air gauges are grouped on the dash and illuminated by an electric light. Tire carriers of new design make it possible to remove a spare tire without moving the top, should the top be folded.

One other improvement consists in the employment of a service brake adjustment that is worked by hand and can be reached without the unpleasant necessity for getting under the car. The gasolene tank is carried low down at the rear, the fuel being fed to the carburetter by air pressure.



The car is clean in outward appearance, the stowing of the battery box under the front seat leaving the aluminum-covered running-boards free of encumbrances. The fenders are crowned. The lines of the body combine with the sloping hood and the V-shaped radiator in producing a stream-line effect. In addition to other details worked out with a view to the comfort of the occupants, the doors have been made of extra width to permit easy ingress and exit of passengers.

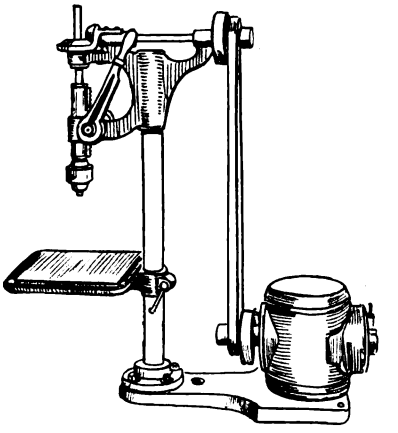
POWER DRILLS THAT FACILITATE REPAIR WORK

Three Types of Portable and Non-Portable Drilling Tools for Both Light and Heavy Garage Work—Wherein the Electrically-Operated Drill Scores Over Others—Purchasing Suggestions.

In comparatively large garages or in repair-shops where a considerable amount of overhauling work is done, it is probable that something with a greater range of adaptability than the small portable electrically operated drills illustrated and described in Motor World last week will be required; the advantage of being able to drill one hole or several holes without the necessity for dismantling an engine, or any other part of the car, is too apparent to require enlargement; hence tools of the kind find ready use in the average shop. But where, in the course of overhaul work, the chassis requires to be dismantled, it may be more advantageous, after all, to take the work



ROYAL BENCH DRILL

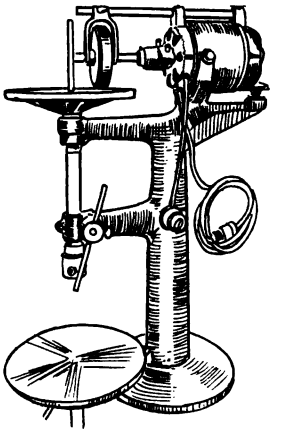
to the tool, rather than to take the tool to the work. Incidentally, it is not always possible to do much of the heavier work required in overhauling with a small portable drill of the kind described.

Not to take the place of the small portable tool, but rather to supplement it, there is the bench, or floor, electrically operated drill, which is capable of a considerably greater range of work in that it will handle—depending upon its size, of course—nearly everything from the lightest drilling to the heaviest boring ordinarily required by the automobile repairman. And in this type of modern, labor-saving device there is scarcely less variety than there is in hand tools designed for the same kind of work.

Broadly, tools of the kind can be divided into three general classes, the first class including those that are intended to stand on the work bench, and the second class including those that have a base of their own and therefore are more or less independent of existing shop equipment. The third class is made to include tools which are portable in the sense that they may be moved about

ROYAL SEMI-PORTABLE

the shop; in them the drill spindle is driven by an electric motor through the intermediary of a long, flexible shaft, and they are not, therefore, drill presses, like the others.



Among the devices in the first class, the Royal, which is made by the A. J. Deer Co., of Hornell, N. Y., is, strictly speaking, a portable drill press, though at the same time it is a bench tool. In other words, though it is intended to stand on a bench, or on any other substantial and convenient base, it is not intended to be fastened down permanently in place. The tool itself is illustrated herewith and, as may be seen by the picture, it has a number of distinctive features.

Designed Only for Light Work.

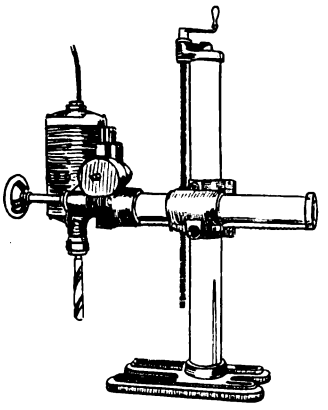
In the first place, it is essentially a tool for light work and is not well adapted for the heavier drilling that some operations entail; the drill capacity is one-quarter inch. The greatest distance from the chuck to the drill table is 8¾ inches; from the center of the spindle to the column, 5¼ inches; vertical movement of the spindle, 2¼ inches; vertical adjustment of the table, 8¾ inches; dimensions of the table, 8¼ x 10¼ inches; and the net weight of the tool is 120 pounds.

As the illustration makes plain, the driving motor serves as the base for the tool, the drive being transmitted through a continuous round belt running over pulleys which permit five changes in speed of the drill spindle without altering the speed of the motor. The motor is wound for either 110 or 220 volts alternating current of 60 cycles, or 110-220 volts direct current. The drill manifestly is a "sensitive" one, which is to say, for light drilling work, the belt would slip should the drill become jammed and therefore would not be broken.

In a slightly heavier model of the Royal

W. S. FRICTION DRIVE DRILL

drill, the motor is mounted on an extension of the base and drives through a flat belt, the arrangement of the parts being shown by the picture. In this drill the drill table measures 10 x 12 inches, is adjustable vertically 15½ inches, and the distance from the center of the drill spindle to the column is six inches. The vertical movement of the drill spindle is four inches and the drill capacity one-half inch; the net weight is 210 pounds.



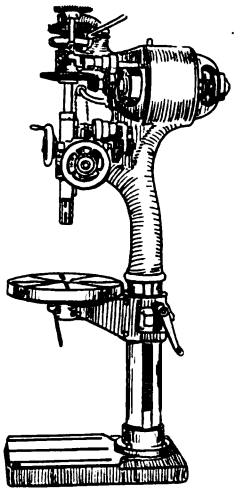
Friction drive for small, sensitive bench drills has been adopted by quite a number of makers of such apparatus, among them the United States Electrical Tool Co., of Cincinnati, O., whose type S tool is illustrated herewith. The design has a number of individualities, not the least important of which is the means of automatically

Digitized by Google

compensating for wear in the friction members. The driving motor is pivotally mounted, as shown, and the driving disk is held against the driven member by means of a spring under a foot cast on the motor casing. Speed changes are obtained by the simple expedient of moving the driving disk axially, the range of speeds being from 390 revolutions to 950 a minute.

Specifications of U. S. Drill.

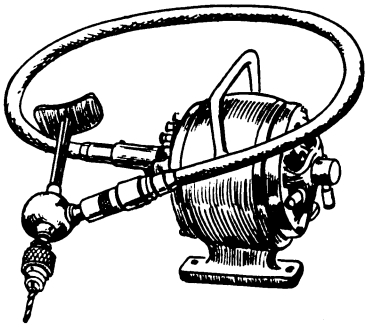
Another individuality of the tool is that the table can be tilted to any angle required by the work. The capacity of the drill is ½ inch, and the principal dimensions are as follows: Height over all, 32 inches; spindle to table, 10½ inches; diameter of table, 12 inches; weight, 112 pounds; travel of the spindle, 8 inches; distance between drill spindle and column, 12 inches. The



CINCINNATI RADIAL DRILL

motor is wound for either alternating or direct current, according to the voltage specified by the purchaser.

For really heavy work, which includes all operations requiring the drilling of holes more than ½ inch in diameter in metal, a bench drill scarcely is suitable, and for work of the kind the heavy radial drill that stands firmly on its own base on the floor is necessary. In this respect, the electrically operated drill has a distinct advantage over the ordinary drill operated by belting from an overhead shaft in that it can be placed anywhere in the shop where it is most convenient or where the exigencies of space require that it be placed. It is not necessary to govern its location by the position of the shop shafting for the current that operates it will traverse a long wire just as quickly and just as surely as it will traverse a short one; incidentally, the power required to operate the electric tool is considerably less than that required to operate the one driven by belt, for in the case of the former the friction in shaft journals and the transmission loss in the belting is eliminated. Also, it is needless to point out, when the particular job in hand has been finished, the power is shut off and the expense stops at the time of the stopping of the drill.

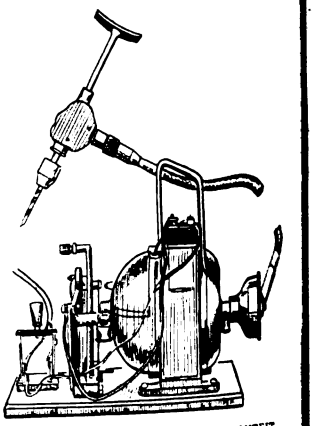


In the purchase of a drill of the kind, he is a wise man who looks ahead with dis-

WILLEY HEAVY DRILL PRESS

cernment; who realizes that though a large drill will do light, small work, a small drill cannot be expected to do very heavy work.

Hence it often is the better part of wisdom to increase the expected initial outlay by a small amount in purchasing a slightly larger sized drill than is actually necessary at the time, than to put in a drill to handle work of the maximum size at the time, and dis-



COATES PORTABLE DRILL

cover later that with an increase in business, the size of the work handled also has increased.

Among the larger Scotch type radial drills—radial because they can be operated at any point in a complete circle about the supporting column—the Cincinnati, which is produced by the Cincinnati Electrical Tool Co., of the Ohio city for which it is named, has been designed for the heaviest kind of heavy work and is made in a variety of sizes ranging in capacity from ⅞ of an inch to 2½ inches. All of these various sizes are exactly like the illustration with the difference that the three sizes between ⅞ of an inch and 1¼ inches are fitted with two-speed gears.

The motor in the Cincinnati is mounted directly over the drill spindle at the end of the radial arm. The drill motor can be set at any desired angle and a radius of 2[illegible] inches in any direction; the vertical adjustment, obtained through the lead screw shown in the picture, is 34 inches, the normal feed being by means of a 10-inch hand wheel with quick return. The hand wheel and worm box are adjustable to drill in either a vertical or a horizontal position, thus allowing the operator to work up close

SCHOFF FLEXIBLE SHAFT OUTFIT

into corners. The capacities and weights of the five sizes are as follows: ⅞-inch, 160 pounds; 1-inch, 190 pounds; 1¼-inch, 225 pounds; 2-inch, 270 pounds; 2½-inch, 390 pounds. The motors are wound for either alternating or direct current and the drills are supplied complete with taper socket and length of flexible wiring with the necessary socket to fit any lamp receptacle.

Motor Solid in Support Column.

The Willey 22½-inch electric drill which is illustrated herewith and which is manufactured by the Jas. Clark, Jr., Electrical Co, of Louisville, Ky., is not a radial drill, though it is a most complete tool in every other respect. Its greatest capacity in steel is a hole two inches in diameter, and the speed of the spindle can be varied through a series of gears and back gears from 24 revolutions a minute by geometrical progression to 440 revolutions a minute. As the picture makes plain, the driving motor and the controller are solidly built into the supporting column of the machine, the motor casing, or frame, the controller case and the spindle bearings being in a single piece

Digitized by Google

For high speed, the motor is geared direct to the spindle and for low speeds the drive is through back gears which may be thrown into operation without stopping the machine. The power feed is fitted with an automatic stop and has three speed changes by conveniently located cone pulleys and belt. The drill table is raised and lowered by worm gearing and therefore will "stay put" in any position without the necessity for locking it.

The capacity of the drill is holes up to two inches in diameter in the center of a 22½-inch circle, the other principal dimensions being as follows: Greatest distance from spindle to table, 28 inches; greatest distance from spindle to base, 42 inches; vertical traverse of spindle, 10 inches; diameter of table, 20 inches; maximum height of drill with spindle up, 84¾ inches; weight 1,200 pounds; maximum horsepower of motor, 1½; floor space, 20 x 40. The motor is wound for either 110 or 220 volts and will operate only on direct current.

Devices, or rather tools, which fall naturally into the third class—those that are operated by small electric motors through flexible shafts—have a wide field of applicability in the average shop whether much work or little is done.

The Coates Clipper Mfg. Co., of Worcester, Mass., long has been known as the producer of flexible shafts and flexible shaft outfits for a variety of uses and the drill that is illustrated herewith forms only one item in its long list of products. With an outfit of the kind, the motor is placed on the floor, out of the way, leaving the operator's two hands free to guide and hold the drill spindle or the emery wheel or the buffer, as the case may be. Two sizes are made, the first accommodating drills up to 21/64ths of an inch in diameter, or carrying a buff or emery wheel four inches in diameter, and the second accommodating drills up to ½ inch in diameter with buff or emery wheels measuring six inches in diameter. So that the drill can be stopped without the necessity for stopping the motor, there is a clutch incorporated in the end of the flexible shaft and operated by turning the end of the shaft sleeve one-quarter revolution. Motors are wound for any voltage up to 500 either alternating or direct and each outfit includes the motor, flexible shaft, breast drill, clamp spindle, wire and plug, buffs and tripoli.

Schoff's "handy drilling, reaming, tapping and grinding outfit," as it is styled by its makers, the Stowe Flexible Shaft Co., of Philadelphia, Pa., is perhaps a little more elaborate than the Coates apparatus; in addition to emery and buff wheels and the drill spindle, it also includes a wire scratch brush and a wood auger chuck. It differs from the Coates outfit, too, in that the motor is mounted on a wood base together with the starting and speed controlling rheostat and cut-out switch. As the motor is rated at but ¼ horsepower, it is evident that the outfit is intended only for comparatively light work such as the drilling of small holes in metal and wood, the polishing of brass, light reaming, etc. The usual wiring and lamp socket plug go with the outfit, which is ready for use instantly the plug is inserted in a lamp receptacle.

Push-Button that Operates Hand Horn.

Heretofore it has been the rule that hand-operated, or mechanical, horns must be placed within reach of the driver for the simple reason that the operating lever or crank or whatever it might be usually is mounted directly on the instrument. But due to an ingenious scheme worked out by the Automobile Supply Mfg. Co., of Brooklyn, N. Y., it has been made possible to operate a mechanical horn at a distance—or at any rate, the Motophone horn, made by that company.

MOTOPHONE "PUSH BUTTON" HORN

The horn is placed wherever desired, and a push-button is put in a convenient position for the driver. The connection between the button and the horn is through a Bowden wire, which transmits the "push" of the button to the "works" of the horn, with the desired result—that is to say, the horn is sounded. Before extending the guarantee of two years which goes with the horn and its attachment, the company states that a test was made during which the huge number of 5,000,000 signals were sounded, after which no adjustments were required and no loose parts were observed. The prices of Motophone horns with the Bowden wire control mechanism range from $8, at which price a horn suitable for bicycles and motorcycles is sold, to $15, which is the price of a full sized and full-voiced automobile signal.

Claims an Industructible Gasket.

To take the place of the usual paper gasket, which always causes more or less trouble in the cutting, the Fibre Finishing Co. of Boston, Mass., recently has placed on the market a new fiber material for the purpose which possesses a number of unusual and useful attributes. The material itself is described by the producers as a "material consisting of a closely formed sheet of vegetable fibers treated by a patented process which renders it oil, grease, air and waterproof and exceedingly tough, like leather." In its material aspects, Vellumoid, as it is styled by the makers, is very light in weight and very flexible, though it it is exceedingly tough withal and withstands considerable tearing strain without rupturing; it contains no rubber nor rubber substitute, and is devoid of mineral matter or chemicals, such as sometimes are employed for the purpose of obtaining water and oil-proof material. Vellumoid is stocked in rolls and sheets of the following thicknesses: .008 inch, .010 inch, 0.15 inch, 0.21 inch, .032 inch. It is also supplied as finished gaskets.

Results Obtained with Stellite Tools.

The fact that Elwood Haynes, president of the Haynes Automobile Co., not long ago obtained patents on a non-corroding alloy has made known to the public the existence of the composition, which is called by its inventor "stellite"; it was not known, however, that the metal was in daily use in the factory until Haynes said so at a meeting of the Engineers' Club in Cincinnati.

According to Haynes, "stellite" will do many things that steel will not do, because steel is more sensitive to temperature changes under friction than is the new alloy. And Haynes knows, because in his own factory in Kokomo, Ind., he has been testing the comparative values of steel and "stellite." The particular instance cited is that of a certain drilling operation. With steel drills the best that could be done was 26 pieces a day, which netted the company $1 per day after deducting all costs. By using "stellite," however, production in this detail was increased to from 60 to 70 pieces a day and without any increase in overhead expense the profit on the work of the drilling machine has been increased $6 a day.

May Increase Parcel Post Weight Limit.

Postmaster General Burleson has recommended to the Interstate Commerce Commision that the maximum weight limit of parcel post packages be raised from 20 to 50 pounds for all distances. The law requires that the commission approve of the recommendation, which it is expected to do.

"SILENT" CHAIN GEARBOXES BUILT SIXTEEN YEARS AGO

Other Facts About Chains Brought Out at Meeting of Metropolitan Section of S. A. E.—Intake Manifolds also Discussed.

That "silent" chains as substitutes for meshing gears in change-speed mechanisms are not altogether modern developments, but are almost as old as "silent" chains themselves; that history is repeating itself in the construction of chains; and that tightening devices should never be used on the backs of "silent" chains are three of the sharp points brought out in a paper read by John R. Gautley on "Roller and Silent Chains; Their History, Manufacture, Design and Use," at a meeting of the Metropolitan Section of the S. A. E. in New York, Friday last, November 26. A paper was also read by Arthur B. Browne on "Intake Manifold Design," in which the fundamentals of the problem of making a manifold of maximum efficiency were clearly set forth and the pitfalls that render the work difficult were uncovered and made plain.

In introducing the subject of chains for power transmission Gautley brought out the importance of protecting chains, and brought it out in no uncertain terms.

"Many engineers have a distinct misconception as to all forms of driving chains," he said. "No roller or silent chain can be compared directly with belting. A driving chain is a piece of fine and highly accurate mechanism and should be treated as such. It will stand an amazing amount of abuse, but if properly installed and cared for it has an efficiency throughout its life which is hard to equal."

"Silent" chains have a considerably shorter history than other forms of transmission chains, having been introduced in 1895. It was only two years later that they were given their first trials for speed-changing service.

"The first 'silent' chain gear box was developed in England by T. W. Hampson in 1897. This was for machine tools and other purposes and included the self-propelled vehicle. In 1898 a silent chain driven gear box was actually fitted to a steam omnibus made by the Lancashire Steam Lurry Co. and this vehicle was put in use by the Dandee Corporation. Both these boxes were all indirect drive. Next came the roller chain gear box on the Brooks car. These, I understand, were fairly successful, but Brooks never made many cars, as his marine work proved more interesting. Finally came the L. G. O. box, which you have all either seen or heard of. Its main difference lay in the fact that it was a box with a direct drive."

Since its introduction in 1895 the "silent" chain has undergone but few changes, and they are changes in detail only.

"The original chain was formed with plain unhardened links assembled on hardened pins, and it is remarkable how some of these chains have worn. The next development was the introduction of a hardened steel bushing into the links to provide a better bearing surface. This again was superseded by a chain made up with link blocks sawn off a form bar, drilled and hardened. Finally came the split bush or liner for larger chains and a return to the circular bushed chains for pitches below 1 inch."

Gautley's remarks on the use and care of chains are interesting, to say the least, in view of his long connection with the chain-making industry and his unusual opportunities for observing the results of chain operation under all sorts of conditions.

"Never use a tightening device on the back of a 'silent' chain. I know of no really satisfactory installations of this character.

"An idler sprocket may be used, but must start with at least three teeth in engagement. This is owing to the difference in gearing with the chain running as a rack, and when running over sprockets.

"If the chain runs over three wheels for any purpose adjustment must be provided. Accuracy of chain and sprockets and mounting is just as necessary with both silent and roller chains as with gears, but this is easier to obtain with chains.

"Adjustment is always advisable for both kinds of chain and is often imperative. Proper cases improve the running of chains. You would not get good results from open gears, so why force the chain to run at a disadvantage?"

In conclusion Gautley maintained that even poorly set up chains would retain their initial efficiency for remarkably long periods, transmitting power with comparatively slight loss until worn out.

In his paper on intake manifold design Browne stated that there were two main problems to be solved. First, each cylinder should receive the same quantity of mixture as the other cylinders; second, the mixture received by all the cylinders should possess the same chemical and physical characteristics. The difficulties of proper design are increased by the lowering of the volatility of the fuel. Pockets where fuel can be deposited and accumulated should be avoided, as well as short curves, which cause excessive friction and deposition of fuel through centrifugal action. Manifolds that are too large in cross section reduce the velocity of the gas and so encourage fuel deposition. Heating the manifold effectually disposes of fuel deposition, and in the absence of heating, according to Browne, the only practical method of securing comparative ease of starting is to so design the manifold that the greatest amount of fuel mist may be delivered to the cylinders, and this entails powerful atomization in the carburetter, because the smaller particles are more easily entrained at low velocities; the least possible manifold diameter consistent with volumetric efficiency at subsequent high speeds, insuring a more thorough entrainment of the fuel mist; smooth interior surfaces, reducing skin friction and absence of enlargements of cross-sectional area, as maintaining the velocity already acquired; and minimum length of manifold passage.

Disapprove Fenders as Bundle Carriers.

If the operators of commercial vehicles in Detroit had known what handy little things truck fenders were they probably would have put them on long before the city compelled their installation; they have been in use but a short time and already the drivers of delivery cars have discovered that the fender is an ideal place to carry a few extra packages when the load is unusually bulky.

Using the fenders for an excess load is but half the story, however, for the city government doesn't intend that the fenders shall be put to any such use. The authorities contend that the fender is designed to save life and that loading it with bundles reduces its efficiency, wherefore the police have ordered all bundles off the fenders.

Poetry, Used Car and Many Aliases.

"Nothing But Leaves," a poem—real or alleged—was part of the evidence in the trial of George L. Lewis, alias several things, in New York City this week on a charge of securing an automobile fraudulently from Mrs. George H. Barrett. He was found guilty. She claimed he paid $100 on her used car and failed to show up with further payments, although he was given possession of the car. The poetry figured in Lewis's story that he became acquainted with the Barretts through their mutual love for poetry and "Nothing But Leaves" was, he said, a product of Mrs. Barrett's which she had sent to him. She expressed her opinion of the situation by tearing up the poem in court.

Lincoln Club Offers Reward for Thieves.

The Lincoln Automobile Club, of Lincoln, Neb., has offered a reward of $50 for information which will lead to the arrest and conviction of any person stealing an automobile; the reward is to be paid by the club's treasurer upon a certificate issued by the county judge.

SALESMAN A SUPPLYER OF NEEDS, NOT MERE SELLER

Idea of Service to Self, Customer and Employer Essential to True Salesmanship, Says Phelps—Plain Selling Antiquated.

Salesmanship, someone said, is selling goods at a profit, which probably is a fair definition of the term, but that it may be given a less sordid shade of meaning is stated by George H. Phelps, head of the newly organized Phelps Motor Sales Corporation, of New York City. In preaching the doctrine to his fellow Studebaker dealers, Phelps maintains that selling is nothing but supplying needs, and he goes further and declares that the salesman should supply the needs of his employer, the needs of the prospect and that everyone in every walk of life is supplying someone's needs.

"The other day I heard what seemed to me to be a brand new definition of salesmanship," says Phelps. "It went like this: 'The science of salesmanship is the science of supplying needs.' That got a half-nelson on my mind in a second, and I am frank in confessing that nothing I have learned since has taught me to break that hold.

"There was a time, and that wasn't so almighty long ago, when I thought that salesmanship was just the art of selling things. I had a hunch that if I jumped right in and sold cars to every man, woman and child, black and white, pink and yellow, nursing children and tottering oldsters, I would get a laurel wreath placed on my brow and eventually might boss the rest of the fellows.

"It didn't take me long to see that this old, antiquated, moss-grown notion carried with it a lack of confidence in the company. Out there in Detroit they are making somewhere about fifty thousand cars per year. Why? Because they figured that there were fifty thousand persons in the world who needed cars of that particular make, brand and style. Fifty thousand prospective customers who could afford to buy a car of that kind!

"It came to me like a flash that the company might want to stay in business more than a year or two. I could see without a microscope that the only way they could continue in business year after year was through giving each customer absolute satisfaction—by supplying each customer's needs.

"A whole lot of people can sell cars, but it takes brains to sell satisfaction. Once we get the notion into our heads that if we concentrate on thinking about the needs and wants of our customers, they will have more time to spend thinking about the things we want and need.

"If we expect to get the punch into our selling, we must hit the prospective buyer in the eye at the first glance with the blazing truth that what we have to sell is service—that we can supply his needs. We must make him feel that beneath and back of the luster of a matchless exterior is the hard, close-knit and durable quality; that bound up in every polished gearing is the highest efficiency; that what we have to sell is built on honor—the honor of sixty years' growth.

"We must realize that the first rule of the game is fairness. Next to this comes earnestness, and last, though not least, should be manifested the spirit of cooperation: the desire to make sure that the purchaser shall receive what he needs to give him the best service.

"I sometimes think that the salesman is considered simply as a dray to be loaded up with as many 'prospects' as possible and then to be given a shove and a kick and told to go out and sell them—somehow. Brother manager and dealer, I want to tell you that often we are spending too much time crowding our salesmen to bring back the orders, regardless of how they get the business.

"We ought to put reverse English on our methods of supplying the needs of our salesmen. We should not hesitate to study each of his particular problems. We should learn wherein he fails to use the code of successful salesmanship. We should make him feel that failing to sell his quota is personal with him—a personal failure—a failure in service to his firm—a failure to supply your needs. We should show him how, by having a clearly defined program, carried forward in a systematic way, rather than a haphazard, go-as-you-please apology for method, he will multiply his efficiency and greatly increase his sales. Inspire him with the truth that he is selling something not only built by men, but built of men, to be sold to men by a man; that it is a man's proposition, a man's work, this selling of a machine built of wood and steel and character; that he is supplying the needs of his firm—his customers—his own equipment for success.

"Build his inspiration about the shining idea of service, and he'll get moving—then keep him moving."

Two Philadelphia Jobbers Amalgamate.

James E. Baum, formerly of Omaha, who several months ago acquired control of the Supplee Hardware Co., of Philadelphia, has brought about its merger with the Biddle Hardware Co., of the same city. The consolidated company will be styled the Supplee-Biddle Hardware Co. and will be incorporated under the laws of Pennsylvania with an authorized capital of $1,000,000. Both concerns are among the oldest and best known jobbers in the East and the Supplee company, particularly, has dealt with automobile and bicycle accessories. As Baum handled automobile supplies on a considerable scale while in business in Omaha, he is likely to cut a bigger figure than ever in his new enterprise, of which he will be president. The other officers will be as follows: Charles M. Biddle, chairman of the board; Charles M. Biddle, Jr., vice-president; Alfred Klein, vice-president; J. S. Bonbright, vice-president; Robert Biddle, second general manager; E. S. Fogg, treasurer; Edward Knight, secretary; Richard T. Baum, auditor; George S. Spence, assistant secretary and assistant treasurer.

Flyer May Locate in Mount Clemens.

The Flyer Automobile Co., of Detroit, which is to produce a $495 car to be marketed by the Thomas Howard Co., of Brooklyn, N. Y., has practically completed negotiations to locate in Mount Clemens, Mich. The negotiations are being conducted with the Business Men's Association of that city, which will bind itself to supply a factory building, free of rent, before January 1st next. The officers of the Flyer company are Henry W. Campbell, president; George M. Milne, treasurer; A. A. Gloetzer, secretary and general manager.

High Wheel Buggy Maker "Goes Beyond."

Charles H. Stratton, who owned the Stratton Automobile Works in Muncie, Ind., in which was produced a high-wheel buggy, died suddenly in that city Friday last, 28th ult., from the effects of a stroke of paralysis. In addition to his high-wheel buggy, Stratton had invented several other automobile contrivances but, despite the fact, never figured prominently in the industry.

Lyons-Atlas Man Returns from Europe.

Jules Haltenberger, of the engineering staff of the Lyons-Atlas Co., of Indianapolis, returned last week after an extensive tour of Europe. He visited both the Paris and London shows, and also all of the automobile factories producing cars using Knight engines. According to Haltenberger, the American cars were the centers of attraction at both the big shows.

More Room for Johns-Manville in Canada.

The Toronto branch of the Canadian H. W. Johns-Manville Co., Ltd., has been removed to 19 Front street, East, where a new store and warehouse will afford a floor area of approximately 35,000 square feet. In addition to the J-M asbestos products, the branch will also stock the automobile accessories handled by the Johns-Manville Co.

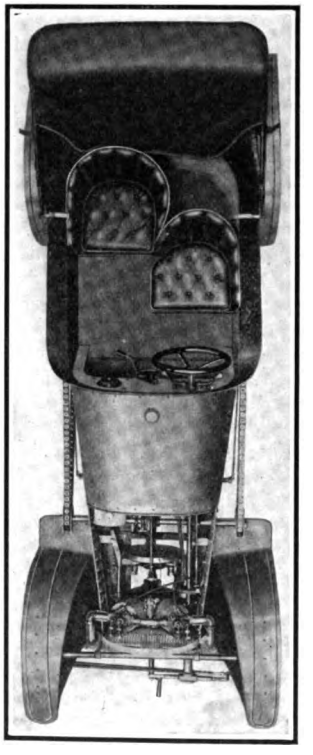
TYPICAL CYCLECAR DESIGN IN PIONEER $385 MACHINE



Air-Cooled Motor Drives Through Friction Transmission—Long Belts for Final Drive—Equipment Includes Electric Lights.

For some time past the cyclecar has been more or less sequestered in drafting offices and experimental departments, so far as this country as concerned, and has been heard of a good deal more than it has been seen. Recently, however, it seems to have made some progress in getting from drawing-boards and floor-boards to actual roads and running under its own power, and one of the most recent arrivals upon the highway is the Pioneer Cyclecar, the product of the American Mfg. Co., of Chicago. This little machine, which is said to have passed through the experimental stage, is now ready for demonstration and shortly will be ready for delivery.

None of the characteristics that are considered "de rigeur" for a real cyclecar are missing; the price is $385, the weight is 500 pounds, the tread is 40 inches and the final drive is by long belts. The passenger is almost, but not quite, beside the driver, which means that the second seat is a little back of the first to keep down the width of the body. The wire wheels, which are 28 inches in diameter and have 2½-inch clincher tires, are well mud-guarded. Incidentally, the little machine is well provided for in the way of equipment, low though the price is, a top with side curtains being among the standard fittings.

The entire power plant and change-speed mechanism are grouped under the hood in front; even the mufflers, of which there are two, one for each cylinder of the motor, are in front, outside the hood and low down. The engine is an air-cooled twin, designed for cyclecar service and developing 12-15 horsepower. The cylinders are set at an angle of 45 degrees close to the netting-covered hood opening, with the shaft running fore and aft and driving to a friction wheel on a transverse shaft, the ends of which carry the pulleys for the V-belts, which are of the riveted block type. The motor has a dual ignition system, with a Briggs high-tension magneto. Lubrication is effected by a force-feed system having a mechanically driven piston pump which supplies oil in quantities exactly proportioned to the engine speed. The motor is said to consume a gallon of gasolene for every 35 miles of road covered.

The friction transmission is mounted on ball bearings throughout, so that there is but little bearing friction. The pressure between the friction disk and wheel is automatically controlled. The speed control is so arranged that it is impossible to shift from neutral to any speed without first throwing out the clutch — that is to say, shifting the driven friction wheel away from the driving disk on the crankshaft. There are four forward speeds and one reverse; the speed changing lever is mounted on the dash, together with the throttle and spark levers. The clutching action is under pedal control, and the brakes, which act on the pulleys on the rear wheels, also are pedal-operated.

PIONEER CYCLECAR

The spring suspension consists of two semi-elliptic springs transversely mounted, one at each end of the little car; both axles are held in position by radius rods and both are slightly dropped to keep the center of gravity low. The springs are shackled at both ends to afford the greatest freedom of action. The steering gear is of the rack-and-pinion type and is mounted in front and outside, where it is readily accessible. The wheel is mounted on the left side, in accordance with the modern trend in big car building, and is of ample diameter for the size of the machine.

The horsepower in proportion to weight is high. Figuring on the maximum rated power of the engine—15 horsepower—and allowing 300 pounds for the weight of two passengers, there is one horsepower for every 53 pounds car weight. It is not surprising, then, that the makers claim a maximum speed of 50 miles an hour, and it is reasonably clear that the machine should have no difficulty in getting up almost any sort of grade with both its passengers on board.

So far as equipment is concerned, the Pioneer cyclecar is as well fitted out as many a full-sized automobile. The folding top has a neat boot and a full complement of side curtains for stormy weather. Other items included are windshield, horn, two large headlights of the bullet type, gas or electric, oil-burning tail light and the customary set of tools and tire repair outfit. For starting the motor there is a mechanically operated device that not only is convenient to use, but also leaves the front of the car clean and crankless.

Garage that Proved a Gold Mine.

That a garage should be a gold mine is not impossible, figuratively, but garagemen say it is not probable, yet A. B. Snyder, of Grass Valley, Cal., has a garage which is a gold mine in every sense of the words. He is making money above and below ground, and there is every likelihood that he will make more

Snyder had a paying little business in the middle of Nevada county and was doing so well that he decided last week to put in an underground gasolene storage tank, so press dispatches state. He employed men to sink a hole for the tank and got the equipment ready to hitch up to the receptable when it was completed.

The workmen, who knew something about mining, dug down a few feet and then noticed that the rock they were taking out seemed to contain gold; an investigation revealed the fact that it was real, yellow gold, and Snyder forthwith directed the men to forget about the gasolene tank but to keep on digging, which, needless to say, they did.

Further excavation disclosed a rich ledge of ore underneath the garage, and Snyder is considering giving up the worries of a garage and picking wealth out of the ground. He, however, has a modern, up-to-date little business and, if his discovery causes an influx of prospectors and visitors the "strike" may make his above-ground revenues something not to be despised. Grass Valley has a population of about 5,000 souls.

Milwaukee to Require Truck Fenders.

Milwaukee has fallen into line with Detroit and Chicago in requiring fenders on motor trucks; an ordinance requiring this equipment has been introduced in the Common Council by Alderman W. C. Wehe

EFFICIENCY EXPERT TELLS HOW TO GET MORE SALARY

Not the Undone Things but the Poorly Done Tasks That Hold the Worker Down—Urges Cooperative Effort and Real Interest.

"How to raise my salary" is a vital question with everyone. Maybe it sometimes is what may be called income instead of salary, but those who do not want more money than they now have are few.

Especially is this true with the man whose income is a "salary." He wants more, and he knows that to get more he must earn more, but just how to do it is the problem. There are many things—most of them apparently little things—which have to do with this question, according to J. W. Amrath, a western efficiency engineer, who discusses the matter in the current number of the Bulletin of the National Retail Dry Goods Association.

Amrath aimed primarily at store clerks, but he hit a far wider mark, and if his advice were taken by workers in every trade and adapted to meet existing conditions it might go far to solve that vexing question.

Things Poorly Done Tip Balance.

"It may surprise you to realize that it is not the things undone, but the things done and done poorly, which tip the balance toward inefficiency," said Amrath. "Perhaps you do not stop to think that it is only a question of doing your work more carefully, by giving attention to little things. You ought to realize that by care and attention you can make any customer a permanent customer, double the sales, and increase your wages. Here is something to think about.

"Remember that everything you do in the store, and outside of it, for that matter, has some influence on making a customer decide either to come again or go elsewhere to trade. The size of the pay envelope depends upon this decision, and the satisfaction you give to the customer depends upon your attention to all the seemingly little things in the daily routine.

"You may feel that your home life and your free time have nothing to do with your duties at the store. You may feel that it is your own affair as to what you read or how long you dance, or whether you conduct yourselves in an orderly manner—and so it is. Yet you ought to use every minute of your time to benefit and to advance yourselves. If you are disorderly in your habits at home you will be disorderly and inattentive at the store. If you stay out late at night habitually you cannot work efficiently. If you do not read good books you cannot learn the good things that advance your thoughts, and so advance you.

"When you try to think how you can lighten the work of others by working with them you will lessen your own task and find it a pleasure instead of a burden. By right thinking you can brighten your future, the future of others, and the community in which you live. Remember that mistakes and misfortunes are the result of wrong thinking. If you do things because you have to, instead of because you want to for your own sake, you will find the store routine irksome and harsh. It is because you do not understand that store routine is nothing but service to yourselves by service to the customer. It is because you fail to see that the satisfied customer pays your wages; that your service to the customer regulates your living.

Efficiency of One Affects the Whole.

"Some of you seem to have failed to appreciate heretofore that the efficiency of any one of you is increased or decreased according to the degree of efficiency of the rest. Boys and girls enter business without an adequate realization that on their individual action depends in a great measure the success of their employer. Do you realize that the success of this concern is the very means of paying your compensation, and that it is gauged accordingly? Do you realize that keeping your minds on your present work is the basis of your own success in the future?

"The better use you make of your time and the less you idle, the more the wages will be. When you loiter you are thieving from yourselves and one another. When you waste five minutes here and ten there and think nothing of it, you are putting your hands into your own and one another's pay envelope, because the store expense becomes greater than it ought to be. You may think that you have cleverly cheated your employer, but you have really cheated yourselves out of pay and increased opportunity.

Employer Does Not Pay for Failings.

"The employer does not pay for your failings if he can help it. He saddles your shortcomings on yourselves in smaller wages than he would pay if you were more efficient. You will be surprised to know that measuring tests in certain stores disclosed overmeasurements in cutting that amounted to thousands of dollars.

"You must realize that when numbers of people are banded together, it is necessary, for the comfort of all, to observe certain regulations. For instance, the office, which is your servant in keeping your pay roll records, must be in some way informed of your presence. This information should be given in the shortest and cheapest manner, cheapest because the size of the expense account affects your wages. If the store had to employ clerks to keep your time there would be more clerks earning wages, but each person's wages would be less. Now, the shortest and cheapest way to let the office know that you are present is the time clock. When your time record shows you frequently behind time without good reason. It also shows that your mind is not on your work, and that you are not helping yourselves as much as you ought. When you are not on time, your work is left for some one else to do until you come, which often means that the work is undone. Thus you may upset the entire day's routine. When you fail to punch your time, or punch another number than your own, some one has to straighten out your mistake. When you try to deceive the house by punching for some one else, you lower the standard of honor among the whole force, causing it to pay indirectly for that person's time.

Why Employer Helps the Employed.

"During the past year the house has doubtless expended a good many dollars in improvements. Do you know why this great amount was put back into the business instead of being paid out to the stockholders in dividends? It is because the house realized that it owed a dividend to you and to the customer. It is because it has become plainly understood in recent years that the employer incurs a responsibility toward his employes, which he must discharge by helping with all his might to provide better living, working, and educational conditions.

"There is no good reason, since a clear understanding has been given to the house and to you of the common interest relations of employer and employe, why both sides should not benefit. There is no good reason why the earnings of both should not be doubled. It rests with yourselves, with the vim and enthusiasm you put into your work. It is not more labor, but efficient labor, that is required. You will find your wages regulated automatically and absolutely by the efforts and the earnestness which you put into your work.

"If we all try to conserve a part of the enormous waste caused by indifference to our daily pursuit, we will then turn the most effective weapon we have on the high cost of living. We will have greater comforts, derived from greater earnings, and great content from tasks well done. Then let us resolve, each of us, to enlist with hearty cooperation under the flag of 'Efficiency.'"

National

Buy Service, Not Specifications

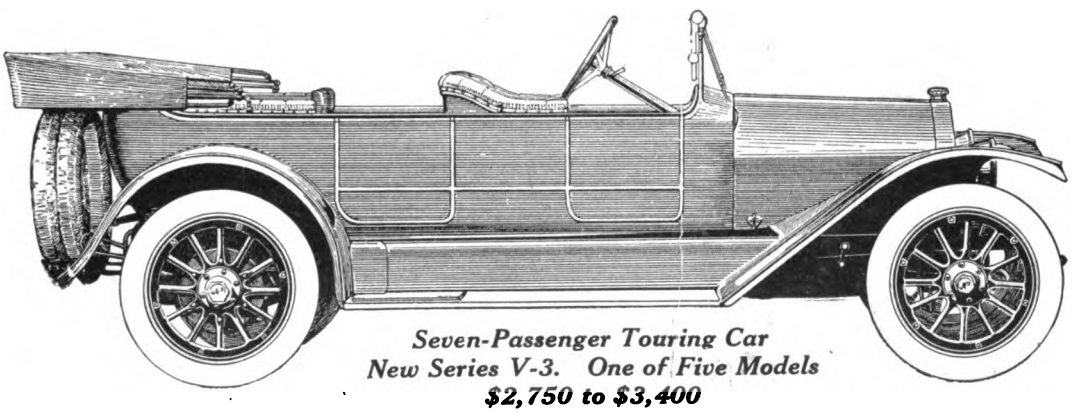
OUR Policy makes it possible to buy a National car as you do a reliable Watch, or a high-grade Piano. You want a watch to give accurate Time, and a piano because of its Quality. In other words, you buy a Watch and a Piano for Results—and not because of the particular individual parts that enter into their construction. You leave that to the makers.

OUR ambition is Quality. We take the responsibility for what enters into the car's makeup, while you need think only of its Performance.

JUDGE the National by what it can actually Do; how adequately and comfortably it Performs; **and** the Longevity of its efficient Service.

WE offer you a Whole Car where every mechanical part operates harmoniously to produce a Unit of satisfactory Results.

SPECIFICATIONS alone are misleading. An inferior car may have similar specifications, or similar parts to a quality car.



WE put the Right material in the Right place. Our experts devote their lives to this Duty. We take that Responsibility. You enjoy the Results.

WE give you a car you can buy without having to raise the hood to investigate; without worrying about its Insides and without bothering to make a detailed analysis of its various component Parts or Specifications.

ONLY a company of unimpeachable reputation, of sound financial standing, of reliability built upon years of success can make you this most Liberal Offer ever made by any automobile builder.

SERVICE, with us, begins when the car is built. Service is put into your car. This is why the National requires the least attention afterwards.

AND freedom from faults and complete abandon of worry about the mechanical operations taking place beneath your seat, can not be bought for less than the National.

Storage Batteries Insure the Efficiency of Starting and Lighting Systems

The best electric equipment made would be worth but a few cents a pound without a dependable Storage Battery.

And, today, the car not equipped with electric starting and lighting is a back number.

To insure the utmost efficiency for their car owners, the L B A Storage Battery is furnished by the following manufacturers:

Adams-Bagnall Electric Co.....Cleveland, O.	Hartford Suspension Co.....Jersey City, N. J.
Adams & Westlake Co.....Chicago, Ill.	Holtzer-Cabot Electric Co.....Brookline, Mass.
Bailey Electric Co.....Grand Rapids, Mich.	Ide Engine Co.....Springfield, Ill.
Bijur Motor Lighting Co.....Hoboken, N. J.	Ignition Starter Co.....Detroit, Mich.
Briggs Magneto Co.....Elkhart, Ind	Jones Electric Starter Co.....Chicago, Ill.
Dayton-Dick Co.....Quincy, Ill.	Kemco Elec. Mfg. Co.....Cleveland, O.
Dean Electric Co.....Elyria, O.	Leece-Neville Co.....Cleveland, O.
Detroit Electric Appliance Co.....Detroit, Mich.	National Coil Co.....Lansing, Mich.
Diehl Mfg. Co.....Elizabethtown, N. J.	North-East Electric Co.....Rochester, N. Y.
Dyneto Electric Co.....Syracuse, N. Y.	Northwestern Mfg. Co.....Milwaukee, Wis.
Economy Mfg. Co.....York, Pa.	Remy Electric Co.....Anderson, Ind.
Electric Auto-Lite Co.....Toledo, O.	Rushmore Dynamo Works.....Plainfield, N. J.
Electro Light & Starter Co.....Indianapolis, Ind.	Splitdorf Electric Co.....Newark, N. J.
Emerson Electric Co.....St. Louis, Mo.	Wagner Electric Mfg. Co.....St. Louis, Mo.
Esterline Co.....Indianapolis, Ind.	Ward Leonard Electric Co.....Bronxville, N. Y.
Fisher Electrical Works.....Detroit, Mich.	R. C. Wells Mfg. Co.....Fond du Lac, Wis.
Gray & Davis.....Boston, Mass.	Westinghouse Elec. & Mfg. Co.....East Pittsburgh, Pa.

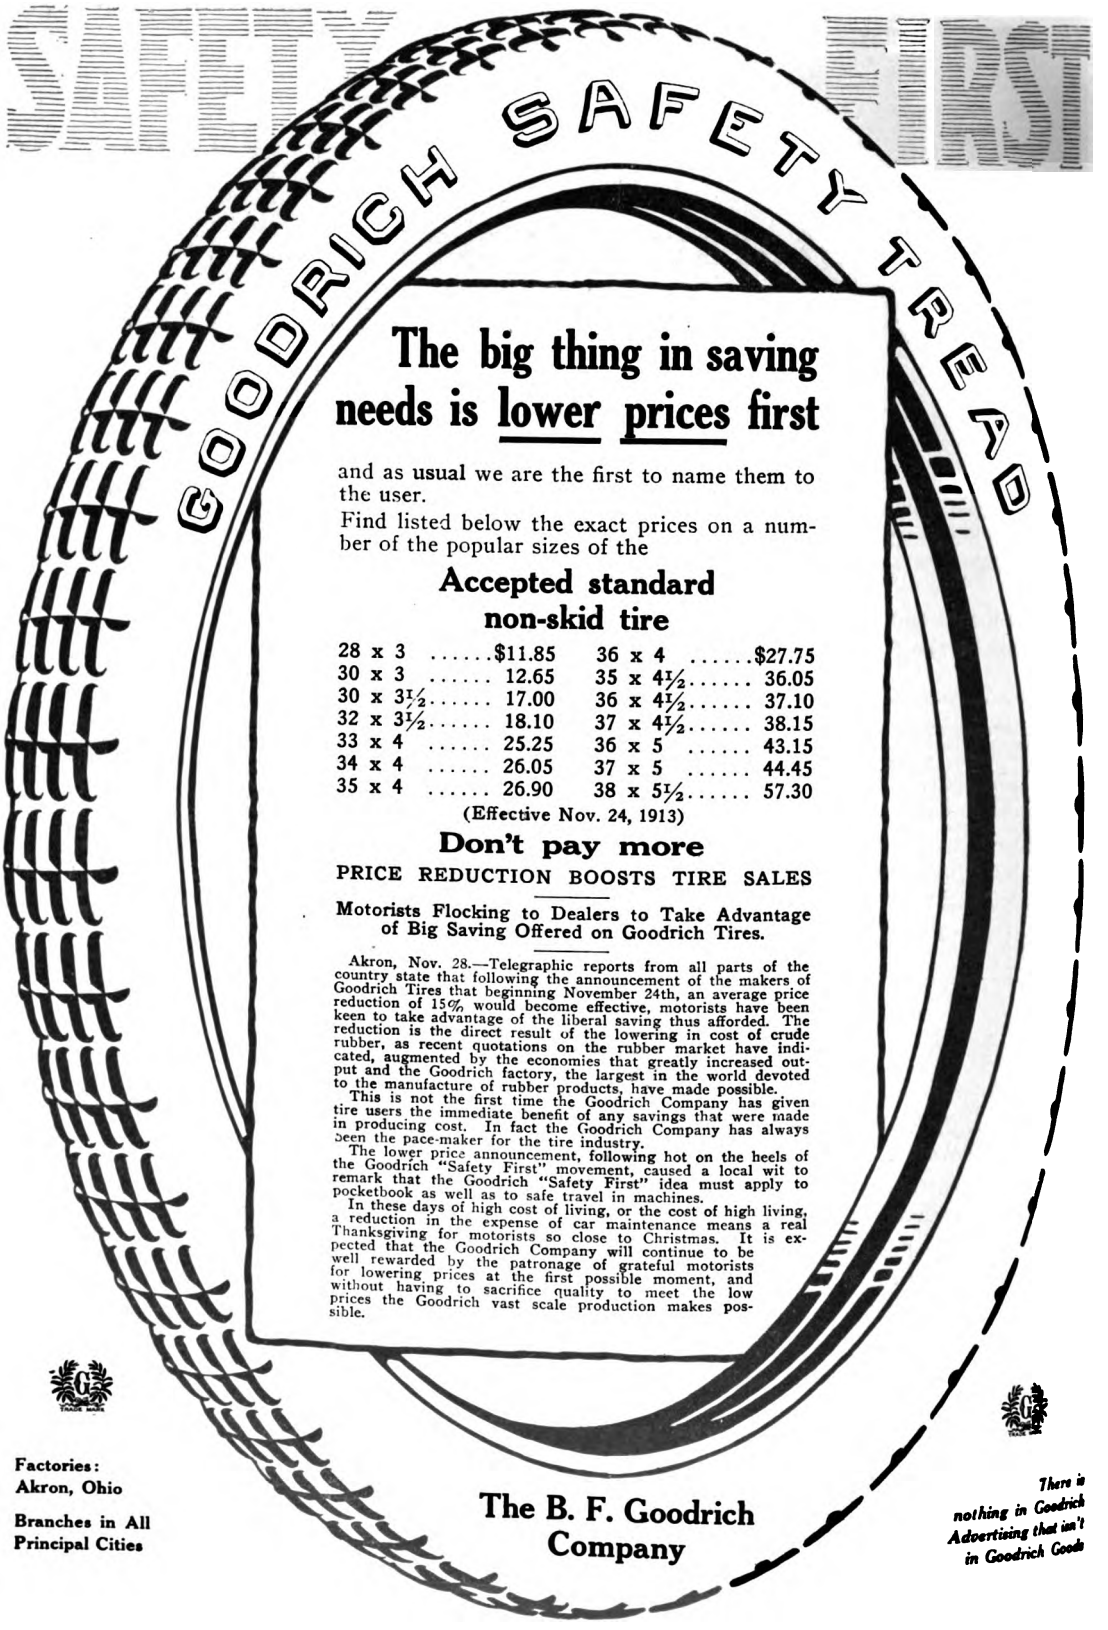
Count Them

and you'll see the L B A is the choice of the big majority.

Some of the VERY FEW manufacturers not in this list try to "put it over" on their customers by furnishing an imitation battery claimed to be "just as good" as the L B A.

Your electrical equipment is a highly important part of your car—on its successful operation depends your pleasure, your actual use of the car.

You cannot afford to buy a car whose manufacturers are willing to let you take a chance with any other battery than the L B A.



Five L B A Branches, factory owned and operated and 150 real Service Stations in the United States stand ready to assist you in time of need.

PRICE REDUCTION BOOSTS TIRE SALES

Motorists Flocking to Dealers to Take Advantage of Big Saving Offered on Goodrich Tires.

Akron, Nov. 28.—Telegraphic reports from all parts of the country state that following the announcement of the makers of Goodrich Tires that beginning November 24th, an average price reduction of 15% would become effective, motorists have been keen to take advantage of the liberal saving thus afforded. The reduction is the direct result of the lowering in cost of crude rubber, as recent quotations on the rubber market have indicated, augmented by the economies that greatly increased output and the Goodrich factory, the largest in the world devoted to the manufacture of rubber products, have made possible.

This is not the first time the Goodrich Company has given tire users the immediate benefit of any savings that were made in producing cost. In fact the Goodrich Company has always been the pace-maker for the tire industry.

The lower price announcement, following hot on the heels of the Goodrich "Safety First" movement, caused a local wit to remark that the Goodrich "Safety First" idea must apply to pocketbook as well as to safe travel in machines.

In these days of high cost of living, or the cost of high living, a reduction in the expense of car maintenance means a real Thanksgiving for motorists so close to Christmas. It is expected that the Goodrich Company will continue to be well rewarded by the patronage of grateful motorists for lowering prices at the first possible moment, and without having to sacrifice quality to meet the low prices the Goodrich vast scale production makes possible.

Look for the Gilt Edge!

The Sign of AMBESCO *Brake Lining*

Gilt Edge in All the Name Implies

In order to make the identification of Ambesco sure and easy, we have decided to gild the edges as indicated in the cut above on all Ambesco Brake Lining shipped from our factory hereafter.

To the casual observer most brake linings look alike. So to protect our customers against substitution and to insure their getting the real high grade article rather than inferior articles which look just like Ambesco, we have gone to this additional expense. Hereafter be sure that the Ambesco which you sell not only is stamped with our trade mark but that the edges are gilded. Remember that Ambesco is manufactured practically from the raw material to the finished product within our walls, and that it is the cheapest high quality brake lining on the market.

Also bear in mind the point that we made in our last advertisement that we will help you dealers and jobbers carry a complete stock of Ambesco. If you have not already done so, get in touch with us for this special proposition which insures the widest possible distribution of Ambesco Brake Lining throughout the country. Remember, we will not only help you carry the stock but we will help you sell it. Write today.

A·R·MOSLER & Co's SPARK PLUG PATENTS SUSTAINED

The United States Court of Appeals Upholds the Canfield Basic Patent

¶ The Canfield Patent, which we own, covers practically every brand of spark plug made and marketed today.

¶ Since the Court of Appeals confirmed the validity of this patent we have given a great deal of thought and consideration to the future of this business as our ownership of this patent may affect it.

¶ The keynote of our policy and attitude with respect to the manufacturers and dealers in spark plugs is detailed on the following pages.

Read A·R·Mosler's own story on following pages

Digitized by Google

Mosler Spit Fire Plugs

The Spark Plug Situation

THE sustaining of the Canfield Patent through the efforts of our counsel, Mr. William A. Redding and its resulting effect on the trade necessitates at this time an explanation and a statement from us.

Ever since we have been engaged in the manufacture of spark plugs we have adhered to one principle upon which to build them. Our motto has always been "QUALITY," "WORKMANSHIP" and "MATERIAL" and the best was none too good.

The development of the SPIT-FIRE closed end and the TRIUMPH open end, of the CONICAL of our MOSLER JUNIOR and last but not least our VESUVIUS plugs, has convinced us that the correct principle and design which we have adopted were absolutely indispensable to the perfect construction of the right type of spark plug.

It was not long before we were advised of the existence of the Canfield Patent and after a most careful investigation, concluded that it was necessary to protect ourselves thereunder.

We have always believed and contended that the Canfield Patent was valid. This belief was not shared by any other spark plug manufacturer. As soon as we could secure the ownership of the Canfield Patent we put this validity to a test. It was a bitter fight.

Our opponents won in the lower courts but in the recent decision the United States Circuit Court of Appeals rendered an opinion vindicating Mr. Redding's judgment completely.

This decision practically vests in us and our licensees the control of the spark plug industry, as practically all spark plugs today are made with their recess deeper than its width, because it gives the results claimed by Canfield. But we are not going to abuse our position. Our policy will be broad and un-

Digitized by Google

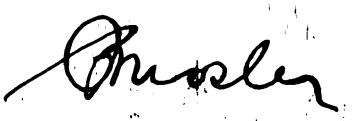
Mosler Spit Fire Plugs

selfish, but in return we expect the co-operation of every legitimate manufacturer of spark plugs.

We are perfectly willing to take our chances in getting our share of the spark plug business on the virtue and the merit of our product. But we will also be vigorous in protecting our rights under the recent decision.

This, broadly, will be the governing policies of the affairs of our Company. All Spark Plug manufacturers should appreciate our position in view of the new condition which results from the decision of the Circuit Court of Appeals.

The Spark Plug business is not a grab. It is one of the basic units of the automobile industry. The performance of a car depends to such an extent upon the perfection of its ignition system that we cannot afford to slight a single detail. The parts maker has a moral responsibility to produce efficient goods and those who sell or are in any way connected with the marketing of such goods have the same moral responsibility of keeping the spark plug portion of the industry on a businesslike plane.



There is room for every maker of good spark plugs in the industry. The maker of an inferior product will sooner or later find that his goods cannot compete with the more meritorious spark plugs.

Our attitude is one of "live and let live" and we will be the last to use the power with which the Canfield Patents have invested us for anything except to stimulate business-like co-operation on the part of all.

It gives us pleasure finally to state that licenses have been granted to the following spark plug manufacturers.

A. R. Mosler & Co.
Auburn Ignition Co.
Benford Mfg. Co.
Champion Ignition Co.
Champion Spark Plug Co.
Frontier Specialty Co.
Hartford Machine Screw Co.

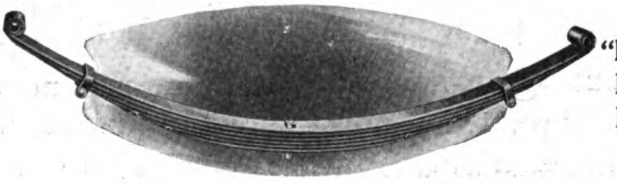
ngs That ıst Your Car

Cleveland-Canton Automobile Springs

That make the car itself last longer, that give you the utmost in service and satisfaction to the last day you use them.



Cleveland - Canton Chrome - Vanadium Springs are unique, because they not only wear amazingly, but add immeasurably to the life of the car, as well.

They mean a smooth-running engine, a protection against sudden shocks and jars, increased comfort to the occupants, **real** pleasure and profit in motoring.

The most drastic conditions leave this spring unaffected. Where ordinary springs lose life, the properties of Cleveland-Canton Chrome-Vanadium Springs remain as resilient, as elastic, as "springy" as ever.

Cross-Rolled Chrome-Vanadium

"Not a Bump In One of Them"

"Built for Life-Long Endurance"

The reason for this amazing superiority is the way these springs are made.

First, we use Chrome-Vanadium steel, a material infinitely stronger, tougher than ordinary carbon steel.

Then we **cross-roll** it. And this means that instead of rolling it longitudinally only, we roll it both longitudinally and transversely. The metal is knit tightly together. There are no blow-holes, no flaws, no defects.

Instead of flashing in oil, we temper these springs by a special process—heat-treating them carefully.

And all of this care in making means that in five years not ONE Cleveland-Canton Chrome-Vanadium Spring was returned because of breakage or settling. Specify Cleveland-Canton Springs on your next cars.

Best Grade—Chrome-Vanadium

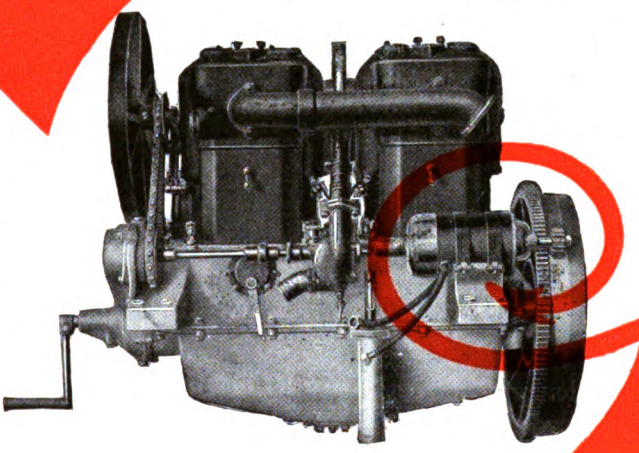
To start an ice-cold engine instantly

simply spin it with a rush

Simplex

Lancia

Knox



Does that sound fantastic? Listen!

Air at **zero** Fahrenheit, if compressed to only 75 lbs. gauge pressure without loss of heat to the cylinder walls, would have a compression temperature of 315 degrees. If compressed to 90 lbs. gauge, the temperature would be 350 degrees.

The quicker the engine turns, the less heat will be lost and the nearer right will be the quantity of liquid gasoline sucked into the cylinders.

Spin the engine with a rush, and the liquid gasoline will at once be evaporated by the heat of compression:—the engine will start instantly.

Turn the engine slowly, and it will start, indeed, —but only after the cylinder walls have themselves been warmed enough to evaporate the gasoline. And leakage will prolong the process still further. In the end, the battery will have several times as much work to do as it would if a quick start were made.

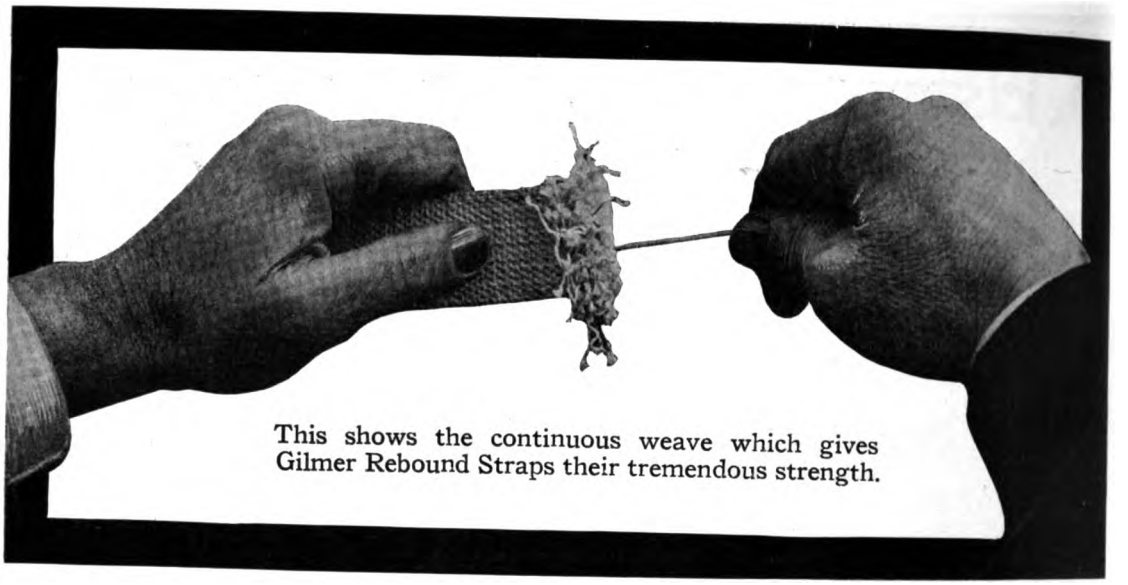
Simplex "38," 4⅞ x 6½ inches, with Rushmore Model C Starter

The Starter that starts with a rush is

The RUSHMORE STARTER

Regal

Mercer



Kline

The Model C, weighing only 30 lbs., spins a six-cylinder 4½ x 5½ engine at 100 r.p.m., using 100 amperes at 5.6 volts. It spins smaller engines at speeds up to 200 r.p.m. or faster. For spinning speed with equal current it is in a class absolutely alone. Yet it costs the car manufacturer from $25 to $50 less than any other starter of equal power.

The Rushmore Starting and Lighting System is used on the above-named cars. Several manufacturers, now using other and less perfect systems, will announce next season the adoption of Rushmore equipment.

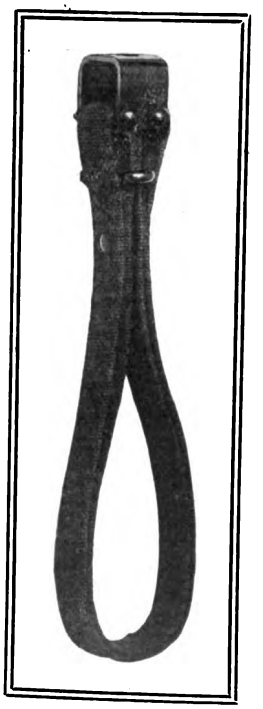
This shows the continuous weave which gives Gilmer Rebound Straps their tremendous strength.



Gilmer Rebound Straps—What Work They Do and Why They Do It Better Than Any Other

WHEN automobile springs are depressed sharply by the weight of the car passing over a rough place in the roadway, they tend to return to their normal shape, and such a tendency causes the car to rebound upwards.

When this happens the rear springs have to meet a very strenuous situation — that of the body pulling upward and the weight of the rear axle pulling downward.

This is a condition which causes a great percentage of broken springs. This is a situation shock absorbers do not seem adequate to meet.

This is why every car should be equipped with rebound straps to prevent the car pulling one way and the rear axle pulling the other way on the rear springs.

The heavier the car or the heavier the rear axle construction the greater the stress on the springs and the greater the need for strength in the rebound straps used.

Gilmer Rebound Straps are made of the best grade of material obtainable, woven to secure the greatest strength and treated to resist the deterioration of every element they may be subjected to.

Gilmer Rebound Straps are tested to stand a large percentage of overload. They are used on the finest of American made cars.

This shows the Thurber Rotary Starter. Operates by compressed air. Pump and starter built as a unit. Has no belts nor chains. Noiseless, sure, reliable; can't wear out.

This starter can be applied to any car. Requires no special lay-out. Goes on front of the car in place of crank. Installed without touching the engine. Is neat, compact, easily understood.

Here Is the Simplest and Surest "Starter" in the World

We expect to get challenged on that statement; but we are ready with our proof. We ask no odds of anyone. We invite you to make your own comparative tests. We are prepared to have the validity of our assertion stand or fall on what the Thurber Rotary Starter actually does when tested on your motor. "Deeds not words" is our motto.

Two years ago we placed the Thurber Rotary Starter on the market. We knew we were right in principle; a year in service under many different conditions showed us many details that could be improved. The Thurber Rotary Starter of today is offered as a finished product. There is not an experimental feature about it. It is right—and it stays right in service.

The Ultimate Starter

There is a growing conviction that compressed **air** is the **ultimate starting** energy. This conviction is based upon several well-known facts, viz:

Simplicity, in which it excels.

Efficiency, meaning ample **power** plus **reliability** under every condition.

Economy. No cost of operation.

Ease of installation and adaptability to any motor.

Reasonableness of price.

Spins Motor Any Weather

The "Thurber" is easy to operate. Press foot on button which operates the patented double-action valve and this admits **air** to the starter which instantly **spins** the motor. It doesn't just **turn** it over but **spins** it every time. Why have manufacturers of fire trucks welcomed the Thurber? All of them use large, high compression motors. All demand reliability above everything. Think it over.

E. R. Thomas Motor Co. Builders of Fire Trucks Write:

"The starter has worked successfully every time. A test was made spinning the motor for a fire truck chassis (6 cyl. 5¾ x 5½). With 150 lbs. compressed air in tank 7" x 48", ten consecutive starts were made with an intermission of thirty seconds and only reduced the pressure to 100 lbs., averaging 5 lbs. to the start. Tried it twenty-seven times and it worked successfully each time."

D. Rosenbach, Sales Manager Rayfield Carburetors, Writes:

"I have been thoroughly satisfied with the action of the Thurber Rotary Starter and have no fault to find with it at all. Have driven the car 12,000 miles this year, the starter being used under all conditions and never found wanting."

There you have the results of two different kinds of tests. In our files are many more letters just as convincing.

Will you let us send you a book that tells you all about the Thurber Rotary Starter?

The Thurber Rotary Starter Co.

687 Atwater Street East, Detroit, Mich.

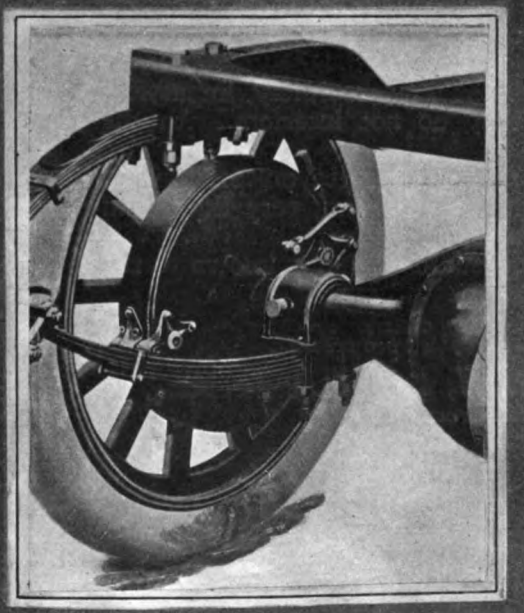
QUALITY

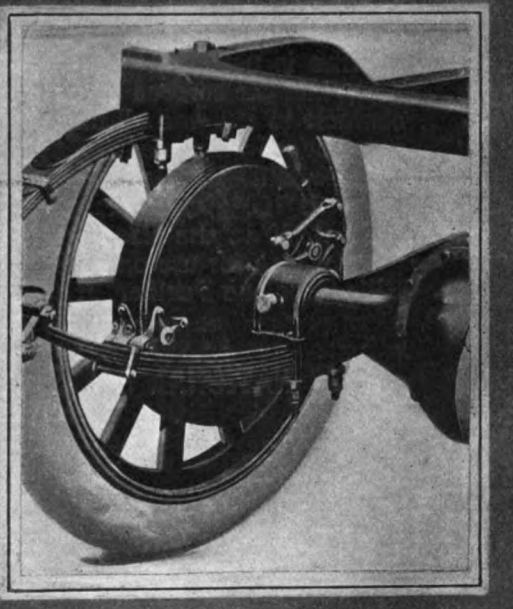
The quality of Booth Felt Washers and the wisdom of using them is apparent, especially when considered in connection with a rear axle assembly.

Shoddy washers, which readily grind to pieces, are wholly inadequate to keep lubricants in the differentials and to protect the brake bands from getting saturated with oil.



Booth Quality Washers are made of the best grade of wool felt, and while they cost a little more than shoddy washers, their use is true economy.

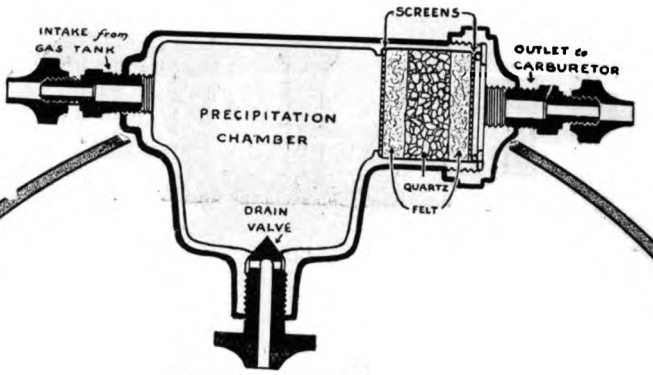
Booth TRADE MARK **FELT WASHERS**



Manufactured by

N. E. BOOTH, 642-644 Pacific St. Brooklyn, N. Y.

Canadian Office and Factory:
The Booth Felt Co., Ltd., Gananoque, Ontario



Shoddy

Booth Quality

The essential requirements of rear axles constitute a supreme test of a washer's qualifications. Booth Quality Washers meet all such situations perfectly while shoddy washers fail utterly—with the result that the rear axle lubricants ooze out, get into the brake linings and onto the rear wheel tires, defeating the purpose of one and shortening the life of the other.

Digitized by Google

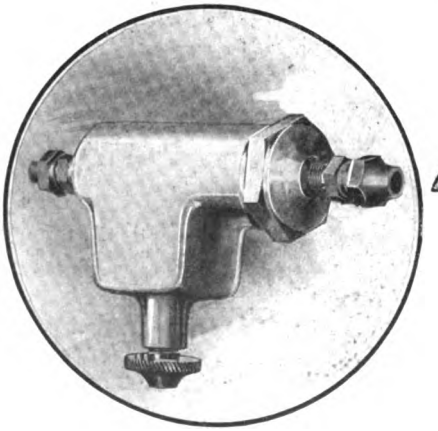
Simple, isn't it?

It is not enough that gasolene be run through a strainer. Merely straining the fuel is only a part of what is necessary before a carburetor can do its work efficiently. Commercial gasolene needs to be strained and FILTERED before it is free from particles of dirt and grit.

The Ellis Gasolene Purifier

strains and filters out every particle of solid substance, however small, from gasolene, and by reason of the fact that water is heavier than gasolene, traps that troublesome element in its precipitation chamber.

The diagram shows clearly how impossible it is for anything but the pure gasolene to get to the carburetor if an Ellis Gasolene Purifier is used.



While the screens and filters impose an absolutely impassible obstacle to any and all impurities, they do not interfere with the free flow of gasolene.

The Ellis Gasolene Purifier is the only device on the market which is 100% efficient. It is made of aluminum, very light, and costs $3.50 in the size applicable for automobiles.

The size for use on motorcycles costs $2.50 and is known as the Ellis Gasolene Purifier, Jr.

Send for particulars and discounts to dealers. Specify the outside diameter of fuel feed pipe when ordering.

Can a Pleasure Car Dealer Sell Delivery Cars?

PERHAPS. But, at least, there is some reason to believe that he can.

Selling Pleasure cars and selling Delivery cars require entirely different methods.

That is precisely the reason that we want, as distributors of the Commerce Car, pleasure car dealers who can and will consider the selling of delivery cars as a distinct selling operation, a distinct department and a distinct business undertaking.

Can the successful pleasure car dealer be equally successful selling delivery cars?

Most certainly he can.

Provided, first, that he has the vision to see the fruitful field for delivery cars and his own inviting opportunity therein as clearly as he has seen the pleasure car field.

Provided, second, that he is a business man with energy, convictions and a clear head.

Provided, third, that he can disassociate the delivery car field from the truck field and realize that five delivery cars can be sold where one truck of a ton or more can be sold; that delivery cars are bought for different reasons and different purposes; that delivery cars are more easily sold and the profits are proportionately higher, because the service costs proportionately less.

Provided, fourth, that he has the imagination to grasp the tremendous possibilities of a delivery car that has actually been proved a substantial and practical success.

Here is the fundamental difference.

The delivery car prospect doesn't often walk into the salesroom—as the pleasure car prospect does.

But that doesn't prove that there is no demand for delivery cars. We have proved there is a demand.

We want dealers who have the business intelligence to grasp that fact.

There is already a demand for delivery cars—particularly Commerce Cars—a real and awakening demand—and the successful dealer is he who directs and stimulates and cashes in on that already existing demand.

Demand is merely the willingness of people in unconscious need of a thing to buy it. Demand merely represents the field and the delivery car field today offers the largest opportunities and most permanent and profitable business that this magical automobile industry has ever offered.

We prophesy that within three years the delivery car business is going to be the rock-bottom commercial foundation of the automobile business.

Is your business vision broader than pleasure cars?

Are your eyes on profits, substantial and increasing, and are you in business to endure and grow and prosper and build for your future with us?

We are making and selling business machinery, more essential and much more profitable than mowing machines.

And we can't—and you can't—use pleasure car selling methods.

We want dealers who are business men first and automobile men afterwards.

Write for details or come to Detroit and see for yourself what the Commerce Car is doing and has done in "The City Motor-wise."

The Commerce Motor Car Company

Administration Dept., 625-639 Penobscot Bldg., Detroit, Mich.

SPECIFICATIONS

1,000-pound capacity, 25 per cent. overload, guaranteed.

Equipment, including electric horn, complete.

32 x 3½ Goodyear pneumatic tire.

Express, full panel, or canopy top.

Clear floor space—64 inches long; 42 inches wide; 52½ inches high.

Gear ratio—6 to 1 on high; 20 to 1 on low.

Friction drive.

Wheelbase—102 in.

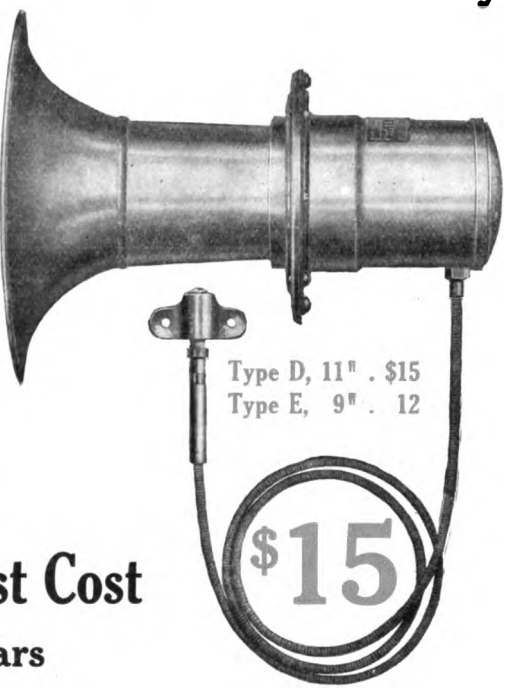
Push Button and Cable Attachment

MOTOPHONE

Mechanically Operated



The Greatest Sensation in Auto-Horn Industry

Operated exactly the same as an Electric Horn EXCEPT

NO Adjustments Motor Troubles

NO Battery Expense Electrical Wiring

Just push the button (the same as in a Motor Horn) and a loud, continuous blast is emitted—as powerful as any warning signal made.

REMEMBER

The First Cost is The Last Cost

Guaranteed for *Two* Years

The **Cable Attachment** of the Motophone has been devised and perfected to offer to the trade a mechanical horn having all the characteristics of motor driven (electrical) horns **without** the care of the electric motor, the cost of maintenance, adjustments and the numerous petty annoyances to which the user of the motor horn is subjected.

Its Action is Positive, Instantaneous, Certain at All Times

The Motophone is made in five models as follows:

Type A (Torpedo), 11" $12
Type B (with Oval Bell), 9" . . . 10
Type C (for Motorcycles) $8.00
Type D (with Cable Attachment), 11" $15
Type E (with Cable Attachment), 9" 12

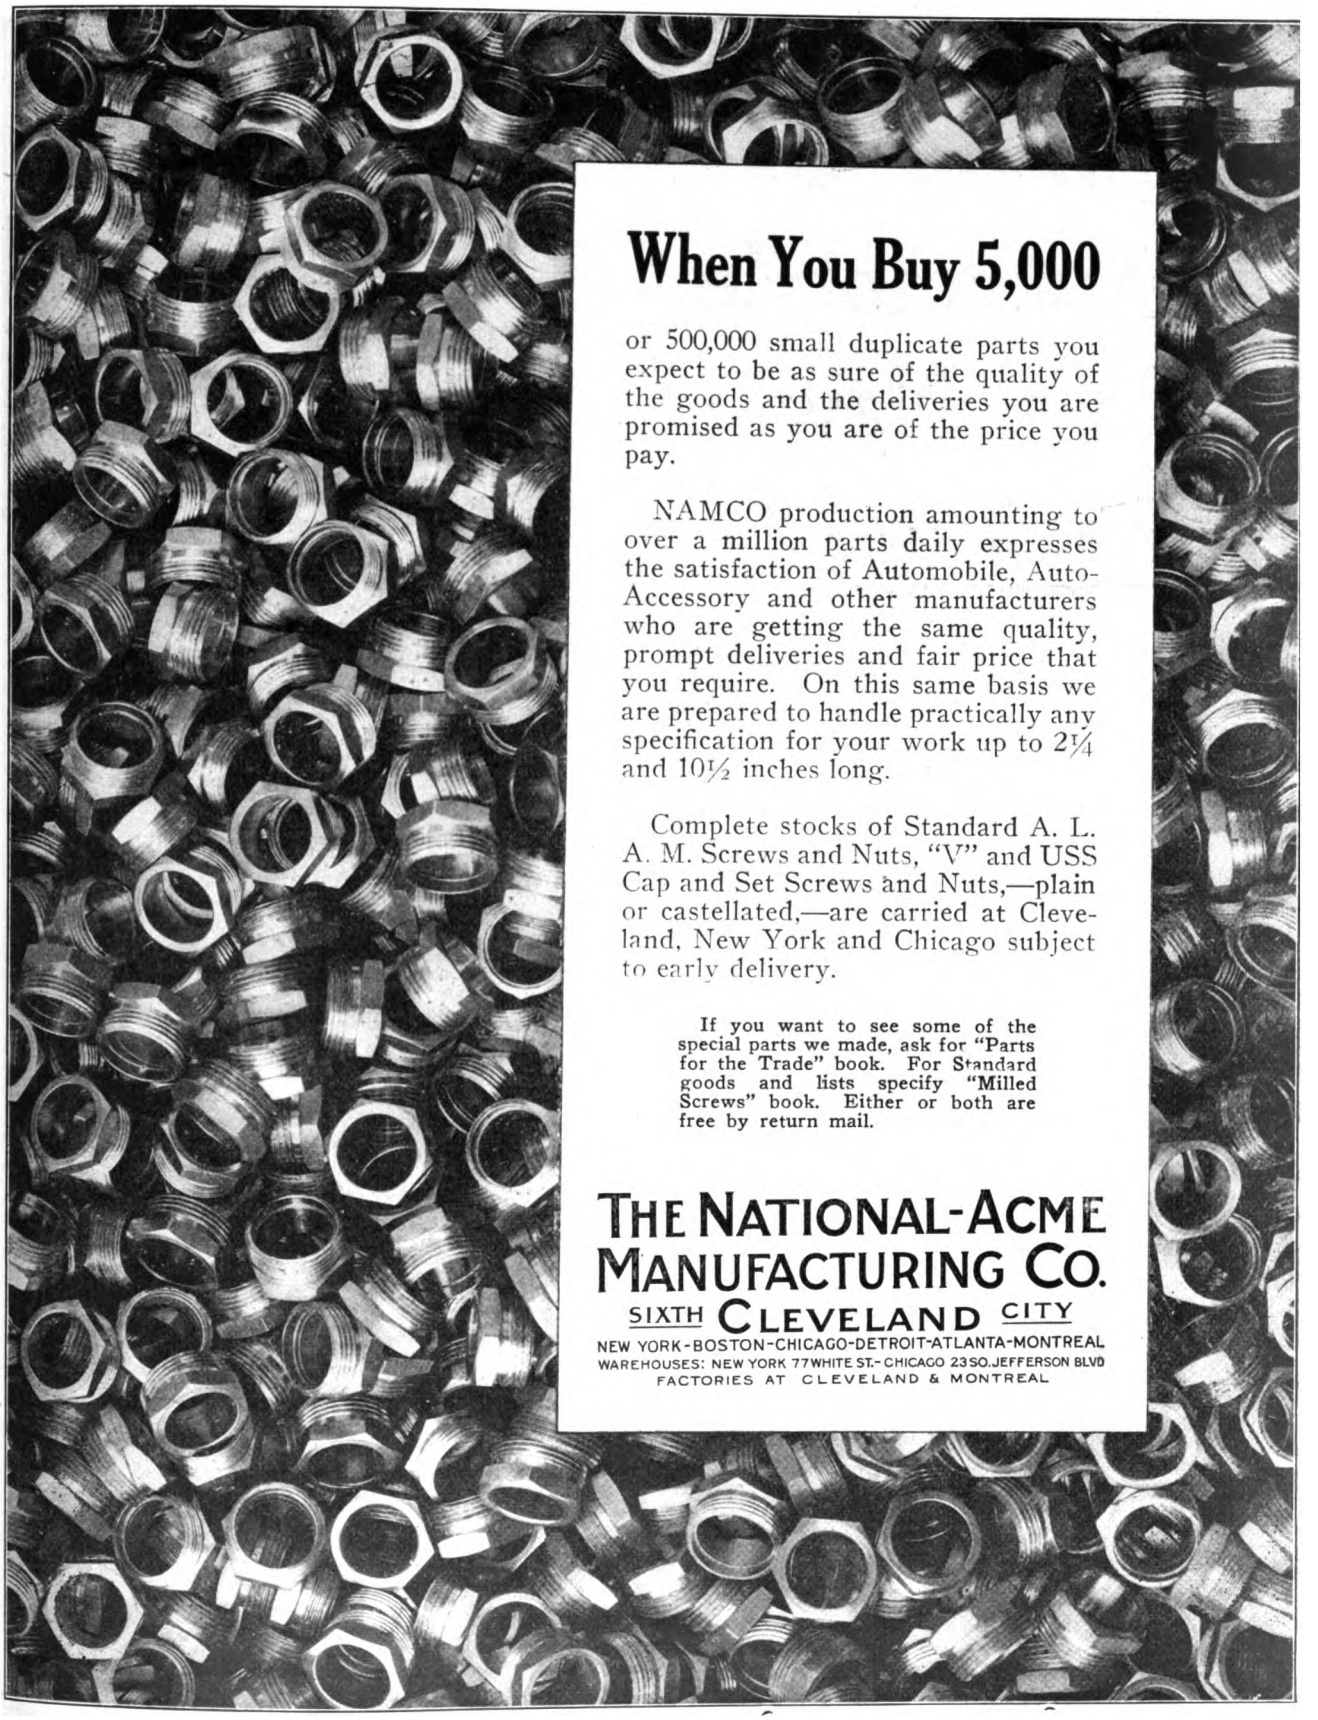
CAPACITY
GURNEY
ENDURANCE

Speaking of Trials—

of tests—in the tests to which engineers subject ball bearings they find it almost impossible to break down a Gurney Bearing. Why is this? Why does a ball or a raceway in a Gurney Bearing stand up better than in any other ball bearing? It is due more than to any other single cause to the greater closeness and exactness of our RACE CONTOUR. Granting, for the sake of the argument, that in other respects other bearings are as good as ours, the difference in the contour of our raceways alone would ensure for our bearings greater capacity and endurance.

¶ When a load is imposed upon a ball bearing the steel of both balls and raceways yields and the area of contact between ball and raceway increases. As the area of contact increases the resistance to further distortion increases, and so the supporting capacity is increased. Under load the steel yields until with the increasing contacting or supporting surfaces the resistence to further distortion equals the load.



¶ Now, the closer the race contour is to ball contour the less yield or springing of the steel is required to get a given area of contact and support. When a ball is running in a raceway of 4% greater contour the steel is distorted less than when the contour is 7% or 10% greater.

¶ This, then, is the simple explanation for the much greater capacity and endurance of the Gurney Bearings. With our 4% raceways a given load distorts the steel of both balls and raceways less than in any other bearings made. CLOSER RACE CONTOUR, LESS DISTORTION, GREATER CAPACITY, AND LONGER LIFE. That is the race contour argument in a nutshell.

When You Buy 5,000

or 500,000 small duplicate parts you expect to be as sure of the quality of the goods and the deliveries you are promised as you are of the price you pay.

NAMCO production amounting to over a million parts daily expresses the satisfaction of Automobile, Auto-Accessory and other manufacturers who are getting the same quality, prompt deliveries and fair price that you require. On this same basis we are prepared to handle practically any specification for your work up to 2¼ and 10½ inches long.

Complete stocks of Standard A. L. A. M. Screws and Nuts, "V" and USS Cap and Set Screws and Nuts,—plain or castellated,—are carried at Cleveland, New York and Chicago subject to early delivery.

If you want to see some of the special parts we made, ask for "Parts for the Trade" book. For Standard goods and lists specify "Milled Screws" book. Either or both are free by return mail.

Tire Insurance for $1.00

The New Positive Lock Stop Twitchell Air Gauge

The demand for Twitchells this year was in excess of our ability to satisfy it. Next year it promises to be even greater. Be ready to meet it.

INSIST upon getting the NEW Twitchell. It possesses a positive lock stop feature that renders absolutely impossible the registration of any but the exact air pressure in your tires. This construction permits the use of the gauge no matter in what position the tire valve rests. You no longer have to turn the wheel around until the valve is at the bottom. Another improvement to be found in the NEW Twitchell is the lengthened base which permits of an airtight connection being made with the valve no matter how small the space between the rim and hub. The NEW Twitchell is accurate, simple, durable, easily applied and easily read.

For the holidays we put up the NEW Twitchell in special Xmas boxes.

Make a present of a NEW Twitchell to your motoring friend.

Factory Insured

GENTLEMEN: If a tire is to give long service and mileage, it must be "BUILT IN" at the factory. There is no question about that. And you know it as well as we do.

The reason why so very few tires give over 4,000 miles service is because only that much service is "BUILT INTO" them by the maker.

THE MARATHON TIRE IS POSITIVELY "FACTORY INSURED." We "BUILD INTO" Marathon the utmost quality—the utmost service. That's why we can guarantee Marathon for 4,000 miles. That's why the major average is far above 4,000.

Read How We Do It!

Finest—Sea Island—Fabric

We use absolutely nothing but Sea Island. That's the best fabric we can buy—the best that's made—highest in tensile strength. It costs us more but it insures greatest possible service to tire users.

Best Rubber That Grows

None but the *Best Rubber* goes into Marathon Tires. That also costs *us* more, but it's an immense saving to *users* of Marathon tires. We spare no expense in materials.

Very Slow, Very Careful Building

To insure absolutely *perfect* construction, we build every Marathon tire by hand. Expert tire builders do the work—very slowly. Hurrying is not permitted.

This very slow, very careful hand building also costs us more—reduces our profit—but it safeguards Marathon *users* against faulty construction, blow outs and short service.

Wrapped Tread, Open Steam Single Cure

Finally we use a special wrapped tread process and single cure in open steam. That gives unitized construction—makes all parts one. It also intensifies the wear resistance.

Factory Insured 4,000 Miles

That's how we "*Factory Insure*" Marathon tires—why we can rigidly guarantee them for 4,000 miles. Yet that is the minimum Marathan service. The major average is way above 4,000.

You Can sell this Tire with Entire Satisfaction and make a better profit.

Ask for our exclusive dealers' proposition.

THE STURDY STUTZ

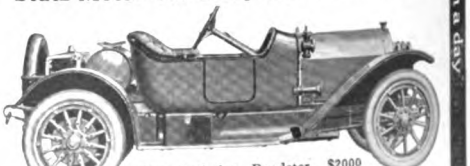
MADE GOOD IN A DAY

Stutz Owners Never Say "I Drive a Car"---they Always Say---

"I drive a Stutz"

If you are a Stutz owner you know this to be true. When you get your Stutz, if you do not own one now, you will say it, too.

Stutz Owners Are Stutz Boosters



You will never live to see the day when a Stutz owner will apologize because he drives a Stutz—he needs no excuse. In buying a car, don't do yourself the injustice of making a selection without first seeing the four and six cylinder Stutz in the new models.

You won't find any radical mechanical changes—they were not necessary. Just a few touches here and there have been added—more generous upholstery, springs a little longer, with greater service and power.

Write for our new illustrated catalog No. 4-15

Dealers: We still have a little desirable territory open. Write or wire quick.

Power Pump Pointers

A four-cylinder pump requires a steady, even draw on the motor. One-cylinder pumps are destructive to the quietness of half-time gears of the motor. Spark plug pumps produce an unbalanced motor and unnecessary wear on the bearings, because the pump delivers air once with every fourth cycle of the motor. This necessitates a high rate of speed with one cylinder dead, to get the pressure up in time.

Four Cylinder KELLOGG Tire Pump

Has the correct principle and many practical advantages to increase its all around durability and efficiency over all other tire pumps. It has been generally adopted as standard equipment by makers of the better cars.

To eliminate most tire trouble you want the best tire pump made, and this means the Kellogg every time. Attachments are supplied for installing the Kellogg in practically any model of any car now in use or announced for 1914. The motorist, the manufacturer and the dealer are equally interested in our booklet, "Air on Tap." Write for it. It means money to all.

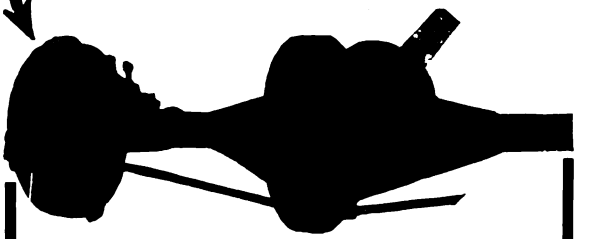
Dixon's Graphite Automobile Lubricants

The Highest Priced Because They Are The Best

The Best For You, Even Though The Highest Priced

Send for "Lubricating the Motor," No. 23



Made in JERSEY CITY, N. J. by the

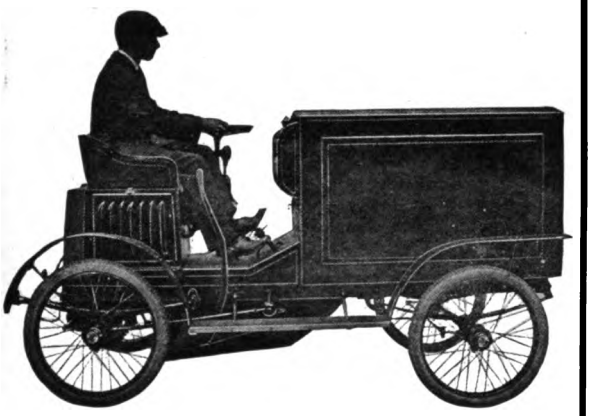
Joseph Dixon Crucible Co.

Established 1827

A CAR IS ONLY AS SAFE AS ITS BRAKE LINING

No matter how costly or well constructed, your car will be hopelessly wrecked and the occupants perhaps seriously injured or killed if the brake lining fails at a critical time. Accidents reported daily in the newspapers prove this a fact.

J-M NON-BURN Brake Lining



never fails. It locks wheels almost instantly, or gradually, as required. It never burns, chars, slips, ravels or rots out. It wears down slowly, outlasting twelve ordinary linings. It is made of pure Asbestos interwoven with strong brass wires, producing maximum braking efficiency with minimum wear and expense. Name on every piece—look for it. Sold by most dealers..

Write for Sample and Booklet.

THE B. & W. CRANK LOCK

Investigate the B. & W. before your customer's car is stolen. Every motor car owner needs constant and complete protection against the thief and joy rider.

The only Positive Crank Lock manufactured that absolutely locks the crank in engagement with crank shaft, making it an impossibility to start motor by pushing car, towing or by jacking up the rear wheels.

It is a Positive Locking Device and can be attached by anyone in ten minute's time.

The B. & W. Lock is finished in black enamel and provided with a strong lock and two keys. To be attached to the front axle as shown in cut.

Saved!

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.

Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

At all dealers selling Auto Supplies

Every motorist is a live prospect for a good vulcanizer

What This $2.00 Vul-Kit Will Do

Actually vulcanizes any tube puncture as well as the most elaborate plant could. Burns alcohol—or gasoline may be used for roadside repairs. No experience required to operate it.

SHALER Vulcanizers

Every motorist needs one. While the sale of most accessories is limited by the fact that they are furnished with the car, no car is equipped with a vulcanizer. No accessory has as little competition. The motorist must buy it from his dealer.

There are steam, electric and gasoline heated Shalers for every requirement—the only complete line in the world. Automatic temperature control on every model.

Diamond

Vitalized Rubber Squeegee Tread Tires

Outside bars never wear off

Look at any Diamond Squeegee Tread Tire—no matter how much mileage it has delivered—and you will find that the *outside* Squeegee Bars are never more than slightly worn. They don't seem to be in use.

The Squeegee Bars on a Diamond Squeegee Tread are there to prevent skidding—and the extra thickness at the point of contact insures *more mileage.*

Brought into use for safety

The middle Squeegee Bars deliver the extra mileage for which Diamond Tires are noted

The outside Squeegee Bars are only brought into play at the extreme moment—but that's when they are needed.

Then there is a possibility of skidding against a truck, a curbstone or over an embankment, the outside Squeegee Bars come into immediate action and stop the skid before it gets under way.

Extra tough Vitalized Rubber Tread

The extra tough, thick tread will not break or chip off, because it is made of Vitalized Rubber—a rubber that is better for the purpose than Nature made it.

The Squeegee Bars stay firm, full shaped and ready for duty for a long time to come.

Diamond Squeegee Treads have solved the skidding problem for thousands of motorists—why not for you?

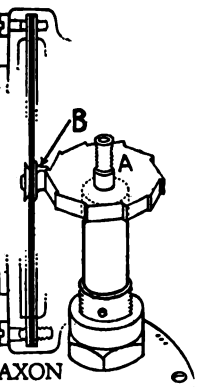
The difference between an "ELECTRIC HORN" and a KLAXON

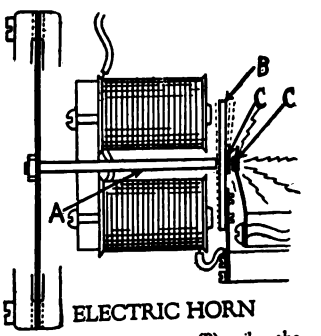
for the guidance of car-buyers



THE KLAXON is not an "electric horn." It is distinctly different both in principle of operation and in the character of its note.

The Klaxon is a noise machine. Its diaphragm is vibrated by a toothed wheel. This wheel is rotated by an electric motor; or, in the case of the Hand Klaxon, by a train of gears attaining high speed under pressure on the push-rod.

The diaphragm of the "electric horn" is vibrated by a "buzzer"—the same as that used for door bells and in pantries and offices. Each double vibration means a spark between two points. Unless these points are made of platinum irridium, the cost of which is prohibitive, they quickly wear off and the buzzer is useless.



In the Klaxon, on the other hand, each double vibration means that one tooth of the glass-hard steel wheel slips past the glass-hard steel button on the diaphragm. The wear is too small to measure. The stability of the mechanism makes possible the Klaxon guarantee of permanently satisfactory service.

The Klaxon note is loud. It is sharp and clean-cut—totally unlike the nasal buzz of the "electric horn." One Klaxon "tiger" (a short abrupt note made by lightly touching the Klaxon push button) is more effective than a dozen "buzzes;" yet it makes less actual noise. Klaxon noise is concentrated—not drawn out.

KLAXON

The glass-hard toothed wheel (A) strikes the glass-hard button (B) on the diaphragm.

ELECTRIC HORN

The vibrating-armature (B) strikes the adjustable rod (A) which is attached to diaphragm, and breaks contact at points (C-C). Unless these points are made of platinum irridium, they soon wear down and the mechanism becomes inoperative

STABILITY

When purchasing motor trucks, look for stability in the vehicles and in the maker. Bargain trucks mean something off in quality, service or design.

Packard truck prices are the fair prices that will insure the quality you want, the service you must have and the stability necessary to protect your investment.

Packard trucks are built in five sizes to suit the needs of any line of trade

Chassis—F. O. B. Detroit

2-ton	$2800	4-ton	$3550
3-ton	$3400	5-ton	$4500
6-ton	$4650		

We built and sold $4,000,000 worth of Packard trucks in the last year—the world's record for truck manufacture and truck sales

The maximum service quality is built into Packard cars and trucks

Lionoil, Black

A New Use For Lionoil—a Body Coat As Well As Rust Preventive

THE scope of Berry Brothers' Lionoil has been broadened to include new uses, besides being the ideal rust preventive for metal bodies and metal parts of all kinds.

We are now able to mix pigments with this oil which give it definite color and body and permit its use as a preliminary coat. Thus it serves not only to keep metal parts free from rust or corrosion, but it acts as an excellent primer or first coat, thus saving the time and materials ordinarily needed for this operation.

Three Ways to Use Lionoil

The illustrations show how Lionoil can be used on automobile bodies—(1) In the first picture the plain, transparent oil is put on simply as a rust preventive. This is the simplest use of Lionoil. (2) The middle picture shows a body coated with Lionoil of a French gray color. This can be considered a priming coat as well as a protection from rust. (3) The third illustration shows the effect produced when Lionoil is mixed with black pigment. This serves as an efficient first coat and is the most economical way to use Lionoil.

BERRY BROTHERS VARNISHES

Write us for particulars regarding this unusual rust preventive. We may help you find a way to improve your product and cut your finishing costs.

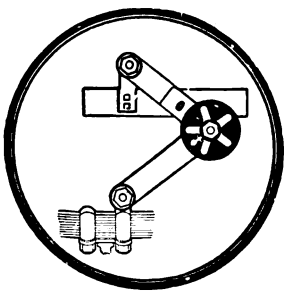
A Shock Absorber that Automatically Gauges its Control to Meet Each Road Condition Separately



Graduated friction—the principle of the New Automatic Truffault-Hartford Stock Absorber—demonstrates its superiority over all other forms of shock absorption by supplying the correct proportion of control needed for each type of road.

Instead of exerting a constant resistance that is frequently either too strong or not strong enough, the New Automatic offers the exact resistance called for by the road over which the car is passing.

On smooth roads the New Automatic supplies just enough resistance to take care of the slight spring oscillation, generated mainly by the car's speed.

When a road of moderate roughness is encountered, the resistance is automatically increased to the amount accurately calculated to give absolute immunity from jar and vibration under this new condition.

And finally when the road becomes extremely bad or when ruts, bumps and other pronounced inequalities invite excessive spring jolts, the New Automatic responds with still greater resistance, insuring absolute comfort in spite of these drawbacks.

In all there are three separate and distinct controls or frictional tensions in the New Automatic Truffault-Hartford, each with an individual function to perform, and for this reason the amount of resistance is never more and never less than is actually called for.

The New Automatic embodies the only real improvement made in shock absorbers since the original Truffault-Hartford was introduced. It is simply a broader and better application of the proven Truffault-Hartford principle of frictional resistance, which has resulted not only in greater efficiency but in adaptibility to all types of springs. Whatever your car suspension, maximum comfort is assured by equipping with the

Business Building hangs on haulage, and the bigger your business the greater your need of Firestone Truck Service.

When your trucks have the benefit of Firestone Truck Tire Service your hauling problems are most scientifically and economically managed.

Special Firestone service stations are at the command of motor truck users in all the large cities of America. But the supremacy of Firestone is largely due to the fact that the Firestone Removable Equipment makes every driver *independent* of service to a very large extent.

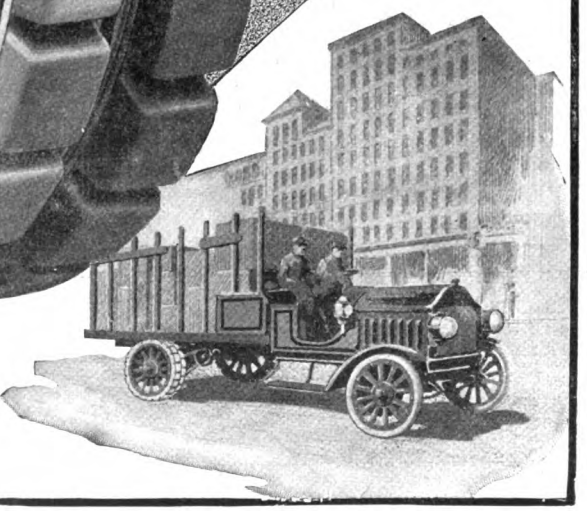
This equipment is built to S. A. E. standard with interchangeable parts —all at your service instantly, insuring against truck troubles.

Firestone

TRUCK TIRES

Most Miles per Dollar

Are Made in Many Types



There is one for your truck, your loads, roads and special conditions of service.

The continuous base, notched tread tire, as shown here, is unrivalled for mileage and truck protection in general service for heavy duty.

Your requirements may be best met by an entirely different type. You may need the Channel Type, Hard Rubber Base, also shown here, or your requirements may call for the Special Electric Truck Tire, built for light battery efficiency.

In any case you need Firestone Quick Removable Rims. You need also the Firestone sureness and security in suiting the equipment to your special requirements.

Write for Truck Tire Catalog. Then call a Firestone man and let him advise with you.

WHY MONOGRAM OIL Is *Always* Best For *Your* Engine

Pennsylvania CRUDE oil sells in bulk for approximately six cents per gallon.

In the production of our automobile oil—MONOGRAM—only 4½ gallons of it, or 4½ per cent, is obtained from every lot of 100 gallons of Pennsylvania crude.

Therefore it takes over 21 gallons of Pennsylvania crude to make 1 gallon of MONOGRAM.

If there were no by-products, it would COST one dollar and twenty-six cents, plus the cost of refining, to produce one gallon of MONOGRAM OIL.

This 4½ per cent, is the very marrow of the crude with all its remarkable wearing and lubricating qualities and the other 95½ per cent, can only be used for such by-products as gasolene, kerosene, ordinary engine and machine oils, and black oils.

This is one reason why MONOGRAM OIL has been continually successful under that one brand name from the very start of the automobile industry.

Remember this when unscrupulous dealers try to hand you oil that costs them 15 cents a gallon (or less) as a "just as good" substitute for MONOGRAM at the SAME price for which MONOGRAM can be purchased.

MOTOR WORLD

Vol. XXXVII New York, U. S. A., Thursday, December 11, 1913 No. 12

GERBER ASSUMES PRESIDENCY OF ABBOTT AND SEEKS MORE

Despite Repeated Rebuffs, Pittsburgher Still Hopes to Secure Michigan Buggy Plant—Change in Abbott Name and Car.

Following the retirement of A. C. Shafer as president and general manager of the Abbott Motor Co., of Detroit, and Leslie Sanders as sales manager, Edward F. Gerber, the Pittsburgher who purchased the Abbott property, has assumed all of those offices and hereafter will be superactive in the affairs of the company, the name of which has been changed to Abbott Motor Car Co. It is Gerber's intention to spend at least four days out of each week in Detroit.

When interviewed in Detroit, Gerber reiterated what was stated in Motor World last week—i. e., that although his name does not appear, he is interested in one of the bids for the R. C. H. plant in Detroit and, what is even more surprising, he added that, despite repeated rebuffs and the rejection of his several bids, he is still endeavoring to acquire the plant of the Michigan Buggy Co. in Kalamazoo, whose cars and buggies he handled in several States in the East and in whose affairs he figured as one of the largest debtors. He stated that a number of Kalamazoo bankers are working with him to that end.

Gerber also stated that he had signed up 305 of the former Michigan agents who hereafter will handle the Abbott, their orders accounting for 1,400 cars which, with 2,000 already contracted for by Abbott agents, will assure a production of not less than 3,500 Abbott cars for the market during the 1914 season.

While no mechanical changes have been made in the Abbott "four," a new and more attractive body has been adopted and several items of equipment added. It is expected that the Abbott "six" will be ready in the spring. M. J. Hammers will have charge of the production end of the business.

Henderson Tire Has Shares for Dealers.

Others having tried it and made no great progress has not served to dissuade the Henderson Tire Co., of Buffalo, N. Y., from believing that selling stock to dealers is one way of reducing the price of tires and solving other problems. At any rate, the company, which was incorporated last week with an authorized capital of $400,000, proposes to give automobile dealers a chance to invest in its shares and to "sell tires at lower prices than ever have been sold before," or something to that effect. Such Henderson tires as have been purchased to date have been manufactured under contract by the Northland Rubber Co., of Buffalo, which, however, is in no way identified with the Henderson enterprise. The latter is casting around for a factory of its own.

Benz-Froehlich Suits Reach Far South.

Although Walter Maas, who at one time was secretary of the Benz Auto Import Co., is in Buenos Aires, he is to be called on to testify in the fraud actions which Benz & Cie., of Mannheim, Germany, filed a year ago in the Supreme Court for New York county against Jesse Froehlich and David and Oscar Weingarten; Maas was secretary at the time Froelich and the Weingartens owned the company and before they sold out to the Germany Benz concern. The fraud charges grew out of this sale. The court this week granted an order for a commission to take testimony in Buenos Aires and it is probable that a Buenos Aires attorney will be engaged by the Benz interests to handle the matter there.

Canfield License for Red Head Plugs.

The Emil Grossman Mfg. Co., of Brooklyn, N. Y., maker of Red Head plugs, has been granted a license under the Canfield patent. This brings the number of plug manufacturers licensed by A. R. Mosler & Co., owners of the patent, to 11.

COURTS DISAGREE REGARDING NUMBER OF POPE RECEIVERS

Federal Judge in Massachusetts Names a Third Man—Connecticut Court Says One, Colonel George Pope, Is Sufficient.

Despite opposition, Charles A. Persons, head of a Worcester bicycle saddle company which bears his name, is now a co-receiver of the Pope Mfg. Co., so far as its Massachusetts assets are concerned. He was named by Judge Aldrich in the Federal court in Boston on Thursday last, 4th inst., and will act with Col. George Pope and Charles A. Morss in the administration of Pope affairs in the Bay State.

Persons's appointment was urged by the Massachusetts stockholders' protective committee, which has obtained control of more than 50 per cent. of the Pope stock, and what is expected of Persons was indicated by the committee's counsel, who declared "we want a receiver who will find out what conditions are at the property and just what the stockholders ought to do."

Two days later, in the Connecticut Superior Court in Hartford, the effort to have Morss and Persons appointed coreceivers in that State was renewed, but, after hearing all sides, Judge Case reserved decision, and after long consideration he yesterday refused to appoint them, thereby leaving Col. Pope in sole charge in Connecticut.

Col. George Pope believes he is capable of filling the office of receiver without assistance, and his counsel, A. L. Shipman, opposed the appointment of Morss and Persons. Among other things, he stated that Col. Pope had been ordered to advance funds for the operation of the plant in Westfield, Mass., and that later the Massachusetts people obtained an injunction preventing the Connecticut receiver taking anything from Westfield, to which some Connecticut property had been removed.

Col. Pope desires, said Mr. Shipman, to

Digitized by Google

be confirmed alone as temporary receiver and to be allowed to conduct the plant in Hartford and not interfere with any reorganization of the company.

Shipman said that the monthly report of Receiver Pope showed that the Connecticut receivership is $43,000 better off than when he was appointed.

Shipman's attitude was supported by Judge Henney, representing the merchandise creditors' committee, of which Clarence E. Whitney is chairman, and who maintained that it is an unnecessary expense to have three receivers in Connecticut; if there is to be a "board of receivers," Judge Henny thought the merchandise creditors are entitled to one member. Lucius F. Robinson, representing a party of Connecticut stockholders, also deprecated the appointment of two co-receivers and in doing so pointed out that two of the men know nothing of the automobile business.

On the other hand, Edward E. Blodgett, of Boston, who said he represented more than half of the Pope creditors, in urging the appointment of three receivers, declared that the banking creditors did not believe that Col. Pope alone could make the automobile business pay. He declared there are two questions involved—one as to whether the automobile business in Hartford, which has not paid, can be made to pay, and whether the bicycle business at Westfield, which has paid, can be made to pay more, and whether the company shall be reorganized.

C. C. Barton, of Boston, representing a second Massachusetts stockholders' protective committee, headed by Allen Forbes, spoke for three Connecticut receivers, and pointed out that Judge Aldrich of the Federal court in Massachusetts was desirous that the Connecticut court take the same view of the matter that he had and that three stockholders be appointed in Connecticut and the receiverships be conducted in harmony. No objection, he said, could be offered except the matter of expense, and in a business of this size that should not be considered.

Incidentally, in the proceedings in the Federal court in Boston it was brought out that the Pope company has enough money to pay all creditors and have something left for the stockholders, also that a reorganization of the company is likely.

The Massachusetts receivers already have filed their first report, in which they say the Westfield business appears to be profitable and the plant in good condition, but that they have not yet arrived at the liabilities. They have asked the court for authority to issue receivers' certificates to the sum of $150,000 to meet the costs of materials and manufacture until April 1st, when the returns from sales come in.

BROKEN FAITH AND BROKEN CONTRACT CHARGED IN SUIT

Lichtenstein Demands $17,000 for Regals That Were Not Delivered—Regal Claims Injurious Advertising and Rumor-Starting.

The differences of Julius Lichtenstein, of New York City, and the Regal Motor Car Co., of Detroit, may appear of small proportions to the litigants, but the Supreme Court for New York county evidently failed to believe the dispute could be crowded into two hours and this week, therefore, declined to permit the action brought by Lichtenstein to be set down for the short cause calendar.

The trouble grew out of a contract made by Lichtenstein December 18, 1912, with the Regal company whereby he was to buy 275 cars, which were to have been delivered at the rate of 75 cars a month, beginning January 1, 1913, certain restrictions concerning the manner of advertising the cars also being imposed.

Lichtenstein put up a deposit of $5,000 and claims that when the company had delivered 225 cars it stopped deliveries, which damaged him, he states, to the extent of $16,250, to which he adds $1,000 of the deposit that he says was not returned, making a total of $17,250.

In answer, the Regal company states that Lichtenstein disregarded the stipulation as to the way he was to advertise the cars, that he advertised and disposed of them in a manner injurious to the Regal company and circulated reports derogatory to the financial standing of the Regal company. It claims, also, that the shipments were stopped in accordance with a supplementary contract.

Jesco Starter "Invades" the East.

The Jesco Equipment Co., which was incorporated several weeks since under the laws of New York and of which F. E. Moskovics is president, has leased the eighth floor of the new building 245 West 55th street, where a complete plant for the installation of Jesco starters has been set up. George W. Wacker, formerly of the Sims Magneto Co., is general manager of the establishment, which is, in fact, the Eastern branch of the Jones Electric Starter Co., of Chicago, of which Moskovics is secretary.

Daimler-Repairman Suit is Discontinued.

That long-standing suit of the Daimler Motoren Gesellshaft, of Unterturkheim, Germany, in the Supreme Court for New York county, to restrain the Mercedes Repair Co., of New York City, from using the name Mercedes in connection with the business has been discontinued; the Daimler company, which manufactures Mercedes cars, effected an arrangement whereby it will permit the repair company to continue to use the Mercedes name.

Moore Truck Gets Plant in Delaware.

The Moore Motor Truck Co., which has been doing business in a small way in Philadelphia, has leased a former cement products plant in Wilmington, Del., and will take possession at once. It plans to produce 350 trucks for the 1914 market. The officers of the company are: Thomas E. Moore, former vice-president and general manager of the Bowling Green (O.) Motor Co., president; Samuel L. Dillon, of the Wilmington Sash, Door & Blind Co, vice-president; Frank B. Adams, an officer of the Kratzer Steel Co., of Pittsburgh, treasurer; George W. Brewer, secretary and assistant treasurer; C. L. Dambler, sales manager.

Avery Begins Making "Disappearing" Tops

The Automobile Roll Top Co., recently organized in Milwaukee by Percy C. Avery to manufacture and market a "disappearing" top, has established headquarters in the new Overland building at 510-516 Broadway, Milwaukee. Officers have been elected as follows: President, George W. Browne; vice-president, August A. Jonas; secretary-treasurer, P. C. Avery. Browne is state distributor for the Overland and Stutz and Jonas is well known as Cadillac agent. Avery himself is the man who originated the Prest-O-Lite system. The new company is capitalized at $50,000.

Packard Authorized to Sell Stock Issue.

The Packard Motor Car Co., of Detroit, has been authorized by the Michigan Securities Commission to dispose of $1,000,000 of its common stock and $3,000,000 of its preferred. These amounts represent two-thirds of the $6,000,000 which the Packard company added to its $10,000,000 capitalization in October last. At that time $2,000,000 of the new common was given to the stockholders in the form of a stock dividend and the remaining $4,000,000, the sale of which just has been authorized, was retained as treasury stock "to be placed with selected purchasers not identified with the company."

Rowe Finds More Room in Downington.

The Rowe Motor Mfg. Co., which produced the truck of that name in Coatesville, Pa., has removed to Downington in the same State. It has acquired a larger factory in the latter place, where all business is now being conducted.

JOHNS-MANVILLE ACQUIRES CONTROL OF MORE PRODUCTS

Takes Over Sale of Spark-No Lock and Arnold's Electric Wares—Former a Dash Alarm Against Motor Car Thieves.

Further indication that the automobile accessory department recently established by the big H. W. Johns-Manville Co., of New York, is to deal with practically all items of equipment, was made even plainer this week, when it became known that the company had acquired control of the outputs of Spark-No locks, made by the Swyers & Lorch Mfg. Co., of Pittsburgh, Pa., and the electric heating plugs and electric vaporizers made by the Arnold Electric Co., of Boston, Mass.

While the Arnold products are not unknown to the trade, the Spark-No Lock is a recent development, and is probably the most remarkable of the many devices designed to prevent the theft of cars. As its title indicates, its purpose is to lock the ignition system, with which, of course, it is connected. It is affixed to the dash of a car and is of clock-like appearance—indeed, it is substantially an alarm clock capable of many combinations. When tampered with by anyone not knowing the combination, a bell alarm is immediately sounded.

Of the Arnold devices, the electric heating plug, or, rather, plugs—for two are required—are designed to be set in the gas manifold and connected with a battery and a special resistance coil which develops a very high degree of heat in a very short space of time, the heat more readily vaporizing the gasolene and thereby permitting motors to be started quickly in cold weather. The Arnold electric vaporizer is designed for the same purpose, but it consists of a hollow electric heating coil connected to the carburetter intake.

R. C. H. Sale Postponed Once More.

Final disposition of the bankrupt R. C. H. Corporation's plant in Detroit has been postponed by the trustee until Saturday, 20th inst. Harris Bros. & Co., of Chicago, have let it be known that they are ready to increase by $5,000 the separate bids of the Lincoln Realty Co., of $105,000, for the real estate, and C. J. O'Hara and W. J. Baird, of $190,000, for the personal property. These three bidders, however, in order to meet objections presented by the creditors who, as stated in last week's Motor World, checked the sale, have pooled issues and formed the Todd-Frank-Friedburg Co., which has or will submit a single bid for both the personal property and real estate, but, as stated, the trustee will make no decision until the 20th inst.

Name Committee in Dean Reorganization.

Growing out of the call issued by A. L. Garford for a meeting of the creditors of the Dean Electric Co., of Elyria, Ohio, a committee representing both the bond holders and general creditors, was appointed on Friday last to cooperate with the Dean management in the reorganization of the company. Garford will represent the banking creditors, E. F. Allen the bond holders and J. M. Lenz, of Rinzel, Lenz & Co., Chicago, the merchandise creditors.

Gets Judgment Against Inter-State.

Judgment for $3,461.28 was taken this week in the Supreme Court for New York county by Col. Kirby C. Pardee, former Inter-State dealer in the metropolitan district, against the Inter-State Automobile Co., of Muncie, Ind. Col. Pardee claimed this amount as commissions on cars sold in his territory by the manufacturer. The sales consisted of cars tendered New York creditors in payment of claims prior to the failure of the Inter-State company.

Page Relinquishes Stevens-Duryea Office.

I. H. Page, who two years since relinquished the presidency of the Stevens-Duryea Co., of Chicopee Falls, Mass., to W. H. Whiteside, whilst retaining the office of treasurer, retired from the latter also at the annual meeting of the company held last week. His successor, apparently, has not yet been named. President Whiteside and the other officers were reelected. They are J. Frank Duryea, vice-president, and W. M. Remington, clerk.

C. P. Henderson Joins Regal Staff.

Rumors which were afloat at the time of the semi-reorganization of the Henderson Motor Car Co., of Indianapolis, two months ago, to the effect that Charles P. Henderson would quit the presidency and join a Detroit company, have rather tardily come true. Henderson made the change this week when he was elected vice-president of the Regal Motor Car Co., of Detroit, and assumed charge of the sales department.

Junkman Buys Parts for Michigan Cars.

Nathan Gumbinsky, a Kalamazoo junkman, purchased the parts on hand and goodwill of the Michigan Motor Car Co., when that portion of the Michigan Buggy Co.'s assets were auctioned on Tuesday last. He paid $10,500 for the stuff and may or may not continue the sale of the parts for the convenience of Michigan car owners. All bids for the real estate were rejected because they were too low.

ST. LOUIS MEN AT HEAD OF REORGANIZED WAHL COMPANY

Root, Former Southern Distributer, is President—Hazard Motor Man a Director—Car to be Continued at Former Price of $890.

Reorganization of the Wahl Motor Co., of Detroit, which has been in progress since the tragic death of its manager, George J, Wahl, October 5th last, finally has been effected, St. Louis men largely being the responsible parties. One of them, G. A. Root, who had the distribution of Wahl cars for practically all of the Southern States, has been elected president of the new corporation, which is capitalized at $85,000; J. K. Nulson and A. G. Nulson, Jr., also of St. Louis, are, respectively, vice-president and secretary-treasurer. The former is the head of the Nulson-Klein-Kraus Mfg. Co., of St. Louis. M. B. Lahey, former Michigan branch manager for the Ford Motor Co., is sales manager of the new Wahl company and Frank Rose superintendent; the latter had experience with the Lozier Motor Co. but latterly has been acting as superintendent of the Federal Motor Truck Co., of Detroit.

In addition to Root and the Messrs. Nulson, the board of directors consists of O. L. Barger, of the Hazard Motor Co., of Rochester, N. Y., and E. L. Beebe, of St. Louis, Barger being the chairman of the board.

The Wahl company next week will take possession of the factory building on North Grand Boulevard, East, near Viaduct, which wes previously occupied by the Warren Capsul Co. There will be few, if any, changes made in the Wahl car, as designed by the former regime; it will continue to list at $890. Contracts already are in hand for 4,750 cars.

Flyer and Howard Discontinue Relations.

Having completed arrangements for the acquirement of a factory in Mount Clemens, Mich., the Flyer Motor Car Co., of Detroit, has discontinued relations with the Thomas Howard Co., of Brooklyn, N. Y., which, several months ago, it was authoritatively stated, would market the Flyer output. Instead, the company itself will handle the production from the factory in Mount Clemens.

Reports that the price of the Flyer car would be increased from $495 to $550 are officially denied. The $495 price will include electric lights, storage battery and speedometer, and for an additional $100 a complete Ward-Leonard electric lighting and starting system will be supplied.

McKINLEY BOYLE FOLLOWS HIS COMPANY TO FAILURE

Head of Atlantic Vehicle Files Petition in Bankruptcy—Liabilities Nearly $100,000—$50,000 Note Held by Wall Street Men.

McKinley Boyle, president of the Atlantic Vehicle Co., of New York, which went into the hands of a receiver a month ago, filed a personal petition in bankruptcy Saturday, 6th inst., in the Federal court in New York City; his liabilities are $94,951.41 and his assets, aside from stock and paper of nominal value, $875. When he came to New York he was president of the Louisville, New Albany & Corydon Railroad, which figures in his schedules.

Among the secured creditors are: J. P. Morgan & Co., $25,235, note given September 1, 1913, due March 1, 1914, secured by Atlantic Vehicle stock; Corydon National Bank, of Corydon, Ind., $8,065; Commercial Bank & Trust Co., of Louisville, Ky., $2,514; Powhattan Woolridge, Louisville, $2,000. He lists as a creditor the F. R. Wood-W. H. Dolson Co. for $525.54, the rent of his apartment in the Belnord for November and December of this year.

His unsecured creditors have claims totaling $1,914.29 and include such as: Mme. Irene, corsets, $30; A. Nihlen, shoes, $16; Mason-Seaman Transportation Co., cab service, $24.50; Momas Laundry Co., $16.04; Dr. Harry D. Johnson, medical service, $68; William Knudson, eyeglasses, $15; and Metropolitan Dye Works, cleaning, $9.15.

He endorsed a note of the Atlantic Vehicle Co., $50,000, held by the Harriman National Bank, H. S. Vanderbilt, W. Earl Dodge and Ralph Sanger, the latter an officer of the Atlantic Vehicle Co. His assets, aside from $740 worth of stock in the Louisville, New Albany & Corydon Railroad and the Continental Can Equipment Co., consist of: Clothing, underclothing, etc., $75; watch and chain, $20; three stick pins, $15; studs, $10, and cuff buttons, $15.

Bankrupt's Vice-President Saves $14,000.

The alleged fraudulent bankruptcy of the Auto Specialty Co., of Kansas City, whose president was sentenced to three years in jail last week, was given a further airing when Trustee in Bankruptcy J. M. Jones sought unsuccessfully to make Alfred Wendover, the former vice-president, pay over to him $14,000; the trustee claimed this amount was paid to the Southwest National Bank of Commerce as a preferential payment. Wendover endorsed the note, and had the case gone against him he would have been obliged to repay the $14,000 and take his chances with the rest of the creditors. The court, however, decided that the evidence was not sufficient to be presented to the jury.

Indian's Comptroller Wants His Salary.

Just why he didn't get the money is not made clear in a suit which Marshall Lapham, former comptroller of the Indian Refining Co., filed this week in the Supreme Court for New York county against that corporation; he demands $9,583.34. He states that he contracted November 15, 1911, as comptroller at a salary of $10,000 a year and that the contract was continued for the year beginning November 15, 1912. However, he claims that of his 1912-1913 salary he was paid but $416.66, his salary for the last half of November, 1912.

Saunders's English Company "Goes Broke."

Leslie R. Saunders Co., Ltd., of London, which was organized by Leslie R. Saunders, of Detroit, twelve months ago, is being wound up by a receiver. Its liabilities are $6,600 and its assets, after deducting preferential claims, $3,500. The company was formed to manufacture Saunders's gasolene saving device, for the English rights to which the London company gave $13,000 and 2,149 paid up shares for services rendered.

Voorhees in Pursuit of Corning Man.

An action for $66.40 was filed this week in the Supreme Court for New York county by the Voorhees Rubber Mfg. Co., of Jersey City, against T. E. O'Brien, of 64 West Market street, Corning, N. Y. It is charged that goods to the value of $129.80 were supplied between June 15 and August 21, 1913, and that but $63.40 has been paid.

McGuinness Wins Standard Oil Attention.

Joseph McGuinness, of Laurel Hill, N. Y., is the defendant in an action brought this week in the Supreme Court for New York county by the Standard Oil Co. It demands $574.16 for goods supplied between July 2 and October 3, of this year. The amount originally was $577.26, but McGuinness paid $3.10.

Another Dividend for Warren Creditors.

In addition to the 10 per cent. it has already paid, creditors of the Warren Motor Car Co., of Detroit, will receive an additional dividend of 5 per cent., the receiver having on hand $63,376 for the purposes of distribution. The Warren property brought $135,088.40, which is $11,000 more than its appraised value.

The Detroit Steering Wheel & Wind Shield Co. has changed its name to the Metalwood Mfg. Co.

GOODYEAR'S 1913 BUSINESS SHOWS GAIN OF $7,000,000

Total is $32,000,000, but Strike and Flood Make Earnings $1,000,000 Less—Nearly a Million Goes to Surplus—Officers Reelected.

During the fiscal year ending October 31st last, the gross business of the Goodyear Tire & Rubber Co., of Akron, O., amounted to $32,500,000, as against $25,232,000 during the preceding twelve months. The net earnings, although in excess of $2,000,000, did not equal the profits of the 1912 year, which were $3,001,000, the reduction in tire prices and the effects of the fierce strike of the rubber workers, to say nothing of the disastrous spring flood, naturally showing their effects. These facts and figures were brought out at the annual meeting of the company last week, when all of the officers and directors were reelected.

Apart from its profits, the Goodyear company was shown to be in good condition, $963,182 having been added to its surplus account, and its total assets standing at $18,858,251, an increase of $5,040,037. The balance sheet for the fiscal year, and how it compares with the report of the previous fiscal year, is as follows:

Assets.

	1913.	Increase.
Real estate and buildings	$3,493,536	*$362,833
Machinery and fixtures	2,857,714	2,857,714

Surplus	2,820,071	963,182
Totals	$18,858,251	$5,040,037

*Decrease.

The officers reelected were: F. A. Seiberling, president; C. W. Seiberling, vice-president; G. M. Stadelman, secretary; F. H. Adams, treasurer.

Texas and Albany Concern in Litigation.

The Northern Motor Car Co., of 78 Central avenue, Albany, N. Y., is claimed by the Texas Co. to be a debtor to the extent of $801.94; suit for this amount was filed this week in the Supreme Court in New York

Digitized by Google

The Week's Incorporations

Reading, Pa.—Dile Motor Car Co., under Pennsylvania laws; authorized capital, $20,000.

Niles, O.—Niles Auto & Machine Co., under Ohio laws; to repair and build motor cars. Corporators—H. A. Wilson and R. G. Adams.

Detroit, Mich.—Redable Tire Co., under Michigan laws; authorized capital, $4,000. Corporators—L. A. Shapiro, W. F. Furney and others.

Houston, Tex.—Carr Motor Co., under Texas laws; authorized capital, $10,000. Corporators—Robert C. Carr, Robert E. Goree and A. G. Ruggles.

Detroit, Mich.—Automobile Specialties Co., under Michigan laws; authorized capital, $2,000. Corporators—Elliott B. Joy, Paul H. Beese and others.

Eau Clair, Mich.—Northwestern Motor Co., under Michigan laws; authorized capital, $25,000. Corporators—Kim Rosholt, T. W. Rosholt and R. R. Rosholt.

Hartford, Conn.—Brassil Auto Service Co., under Connecticut laws; authorized capital, $1,500. Corporators—Lewis Morgan, Frank A. Brassil and Mary Brassil.

Oshkosh, Wis.—Winnebago County Auto Co., under Wisconsin laws; authorized capital, $8,000. Corporators—F. C. Behlendorf, G. E. Steiner and Mary Behlendorf.

Huntington, Cal.—Huntington Hotel Garage Co., under California laws; authorized capital, $25,000. Corporators—W. R. Covington, C. A. Bonyun and C. L. Goodman.

Albany, N. Y.—Mack Motor Truck Co., under New York laws; authorized capital, $10,000. Corporators—Arthur J. Cook, Wm. A. Hamilton and Mae C. Fitzgerald, all of Albany.

Boston ,Mass.—Shawmut Electrical Signal Co., under Massachusetts laws; authorized capital, $300,000. Corporators—J. B. Clogher, J. M. West and E. L. Parsons, all of Boston.

Renton, Wash.—Renton Auto Tire Co., under Washington laws; authorized capital, $4,000. Corporators—Hugh B. Campbell, James L. Morfoot, Jesse F. Spurfeon and Joe Wood.

Lansing, Mich.—Lansing Rubber Co., under Michigan laws; authorized capital, $75,000. Corporators—W. M. Shepherd, Detroit; Arthur C. Haite and Frank Preuss, both of Lansing.

Ft. Wayne, Ind.—Ft. Wayne Auto Supply Co., under Indiana laws; authorized capital, $50,000; to conduct a general motor vehicle business. Corporators—J. M. Carmer, J. A. Brewer and H. H. Criswell.

Chicago, Ill.—Mackey-Culehen Motor Co., under Illinois laws; authorized capital, $5,000; to deal in motor cars and accessories. Corporators—N. W. Mackey, J. Max Culehen and F. De Young.

North Vernon, Ind.—Robinson Machine Co., under Indiana laws; authorized capital, $3,000; to deal in motor car accessories. Corporators—Thomas A. Robinson, Martin W. Brogan and Ida M. Brogan.

Manchester, N. H.—Aalding Supply Co., under New Hampshire laws; authorized capital, $15,000; to deal in motor vehicles of all kinds. Corporators—Carl D. Johnston, Hugh D. O'Dowd and others.

Brooklyn, N. Y.—Borough Park Taxi Co., under New York laws; authorized capital, $5,100. Corporators—Stefano and Diego Chiarello, both of 1528 42nd street; Joseph Greenberg, 1353 40th street.

South Bend, Ind.—Coliseum Garage & Machine Co., under Indiana laws; authorized capital, $10,000; to conduct a general automobile business. Corporators—John Walz, W. P. Furey and J. E. Peak.

Pierre, So. Dak.—Vaughan-Harris Co., under South Dakota laws; authorized capital, $25,000; to manufacture a radius rod truss for motor cars. Corporators—M. A. and R. E. Vaughan and George O. Harris.

Schenectady, N. Y.—MacDonald Garage Co., under New York laws; authorized capital, $10,000; to operate a garage. Corporators—Robt. MacDonald, Pliny Spaulding and Arthur D. Atwood, all of Schenectady.

Gloversville, N. Y.—Gloversville Motor Car Co., under New York laws; authorized capital, $15,000. Corporators—Mortimer B. Everest, 41 Grand street; John W. Sisson and Lillian B. Sisson, both of 5 Division street.

New York, N. Y.—Puncture-proof Double Tire Co., under New York laws; authorized capital, $500. Corporators—Max D. Ancel, 944 Kelly street; Nathan Cranston, 3 West 113th street; Joseph Siskind, 77 East 119th street.

New York, N. Y.—Pennsylvania Taxi Co., under New York laws; authorized capital, $14,000. Corporators—Pancrazio Grassi, 1170 Broadway; Pasquale Coviello, 504 West 39th street; John E. Mona, 189 9th avenue.

New York, N. Y.—Convertible Automobile Body Corporation, under New York laws; authorized capital, $250,000. Corporators—Ladis Lewkowitz, 19 East 48th street; Eugene L. Gottlieb, 140 Nassau street; Mary Kaplan, 229 Third avenue.

Buffalo, N. Y.—Henderson Tire Co., under New York laws; authorized capital, $400,000; to manufacture tires, tubes, etc. Corporators—Chester O. Henderson, 133 Kingston avenue; Ralph R. Hillman, Ellicott square; Alfred L. Lyth, 48 West Eagle street.

Elmhurst, N. Y.—Lemmey Garage, under New York laws; authorized capital, $2,000; to operate a garage. Corporators—Charles A. Burr, 261 Broadway, New York; Emma A. Dietze, 325 East 52nd street, New York; John J. Phelan, 11 West 106th street, New York.

Ossining, N. Y.—Higrade Body Building Co., under New York laws; authorized capital, $5,000; to build automobile bodies, etc. Corporators—J. Banks Tillottson, Todd place; James A. Cuff, 508 W. 132nd street, New York; R. W. Yates, 519 West 137th street, New York.

ized capital, $10,000; to deal in parts for motor cars. Corporators—Leon Kauffman, 54 West 157th street, New York; Stewart M. Kohn, 17 Battery place, New York; Albert Strauss, New York.

Changes Among Prominent Tradesmen.

W. S. Parrish, for the past three years factory manager of the Kirkham Motor Mfg. Co., of Bath, N. Y., has resigned that post. He has not yet made a new connection.

G. O. Bristol has been appointed manager of the commercial tire department of the Motz Tire & Rubber Co., of Akron, O. Previously he was attached to the Motz branch in Chicago.

Earle Stone, chief engineer of the Wheeler & Schebler Co., of Indianapolis, has been transferred to Detroit, where he has assumed charge of the branch. He succeeds James Ryan, resigned.

F. E. Davis, for several years one of the Abbott Motor Co.'s engineers, has organized the F. E. Davis Engineering Co., in Detroit, and will handle several accessories. He already has secured the Detroit representation for the Kemco electric fan generator.

Edward McK. Hunt has been appointed Eastern district manager of the Stewart Motor Corporation, of Buffalo. He will travel the Eastern States in the interests of the Stewart truck, but will nevertheless retain his interests in the Ingels-Hunt Motor Co., of Newark, N. J.

C. W. Matheson, founder of the defunct Matheson Automobile Co., who several months since became Western manager of the Palmer & Singer Mfg. Co., with headquarters in Chicago, has been transferred to the factory in Long Island City, where he has assumed the duties of general sales and advertising manager. He thereby relieves S. P. Woodard, secretary of the company, of those duties.

Threatening to Build Tires in Texas.

Texas Climatic Tire Mfg. Co. is the style of a new enterprise which is being organized in San Antonio and which threatens to build a tire factory in that city. F. T. Parks is its chief sponsor.

To Make One-Man Tops in Detroit.

The Wiley-Postal Top Co. has been formed in Detroit with Harry W. Wiley as president and Charles Postal as secretary-treasurer. It will produce a one-man top.

Texas Oil Sues an Albany Garageman.

The Texas Co. this week filed suit in the Supreme Court for New York county against the Park Garage, of Albany, N. Y. It demands $104.90.

CINCINNATI SHOW DIVIDES DEALERS INTO RIVAL CAMPS

Objecting to Methods of Promoting Association, Dissenters Form Another Organization—Threaten to Stage a Rival Show.

Because, so they claim, non-members are made to pay the expenses of the annual automobile show promoted in Cincinnati by the Cincinnati Automobile Dealers' Association while members get free space, an insurgent movement in the trade in that city has been inaugurated and last week led to the formation of the Cincinnati Automobile Trades' Association; the new organization has a membership of 35, handling about 45 makes of cars and trucks, while the Cincinnati Automobile Dealers' Association has but about 16.

The dealers who flocked about the standard of the belligerents claim that the automobile shows which have been held in Cincinnati in the past have been promoted largely for the benefit of the Dealers' Association, which let its members in gratis and made non-members pay good rates for space; this, it is claimed, caused the non-members to pay all the expenses, while any surplus went into the treasury of the association.

Just what the new association will do remains to be seen, but it is stated by its leaders that unless their demand for reduced space rates is complied with they will hold a show in the Union Central Life Insurance Building, which they consider a much better location than the Music Hall, in which the Dealers' Association has held its shows and plans to hold this year's exhibition, February 21-28.

The new organization has chosen the following officers: President, Raymond Hendrickson, manager of Cincinnati Branch of the Peerless Motor Car Co.; vice-president, T. C. Dennison, of the Winton Motor Car Co.; secretary, Robert C. Crowthers, of the Cincinnati Howard Co., and treasurer, A. S. Pachoud, of the Pachoud Motor Car Co.

Bosch Sues Dealer and not Manufacturer.

Instead of directly suing the Splitdorf Electrical Co., of Newark, N. J., and the Hendee Mfg. Co., of Springfield, Mass., for infringement of the Bosch-Honold patent, No. 974,967, the Bosch Magneto Co. has instituted action against F. A. Baker & Co., of New York, who handle Hendee's Indian motorcycles, with which the alleged infringing magnetos were equipped. The Honold patent is claimed to control magneto ignition as applied to two-cylinder V-shaped motors and, though motorcycle manufacturers are most affected, several cyclecar makers also are involved and may not escape litigation which is threatened.

Searchlight Dealers Appeal Their Case.

Following the entry this week in the United States District Court in Cincinnati of a final decree in the action of the Prest-O-Lite Co. against Coughlin & Davis, the latter filed a bond of $500 to secure costs and took an appeal; the Prest-O-Lite was recently given a decision against Coughlin & Davis, restraining them from selling Prest-O-Lite tanks refilled with Searchlight gas. An accounting also was ordered. The defendant firm consists of Arthur C. Davis and Victor Gluchowsky.

Court Removes Crescent Truck's Receiver.

Dr. D. B. Bundy, who in August last was appointed receiver for the Crescent Motor Truck Co., of Middletown, O., has been removed by the court on petition of several creditors. Bundy was one of the company's stockholders and, therefore, interested, and it is on these grounds that his removal was asked; he had also joined in the petition for a receivership. The week previous the company assigned its property to him.

State Senator Named as Nyberg Trustee.

Frederick Van Nuys, a State senator, has been chosen trustee of the bankrupt Nyberg Automobile Works, of Anderson, Ind., his bond being fixed at $25,000. Van Nuys probably will shortly offer the property for sale. The total number of claims filed amount to $125,000, while the inventory of the provisional trustee showed assets of roughly $115,000.

Maccar Decides to Leave Allentown.

The Maccar Co., of Allentown, Pa., which is one of John M. Mack's projects, shortly will remove to Scranton, Pa. It has acquired a building on Cliff street, in the latter city, which is now being remodeled for its occupancy and in which the manufacture of Maccar trucks will be continued on a larger scale.

Grand Jury Delving into Michigan Failure.

The special grand jury appointed to inquire into the alleged criminal conditions existing in the bankrupt Michigan Buggy Co., of Kalamazoo, began its work last week. A number of witnesses have been examined, but nothing definite has as yet transpired.

American Motorette Becomes Lincoln Car.

The American Motorette Co., of Detroit, which was formed by officials of the Keeton Motor Co., has changed its name to the Lincoln Motor Car Co. Its first car will be styled the Highway model.

In the RETAIL WORLD

M. S. Bulkley & Co., of Los Angeles, Pacific Coast distributers of the Autocar and the Perfex, have established a branch in San Diego, where the company purchased the Standard Garage, at 821 2nd street, and will make this the headquarters of its business in the extreme southern part of the Bear State. Arthur Dakerman will be manager. The company has other branches in San Francisco, Sacramento, Stockton and Fresno.

The Symonds Motor Car Co., of Los Angeles, has been reorganized under the style C. & S. Auto Co. L. E. Crowe, who has been engaged in the trade on the Pacific Coast for some time, has joined with E. L. Symonds in the enterprise; the company will continue in its old location at 1228-30 South Flower street and, in addition to being Southern California distributer of Marion cars, has secured the Marathon agency.

The Aalding Supply Co. has been formed in Manchester, N. H., by Carl D. Johnston, of 240 Union street; Hugh O'Dowd, John Marston, Oscar Mills and Marshall C. Blanchard. Johnston, who has been in the machine-shop business in Manchester for 18 years, is president, treasurer and manager of the company, which is capitalized at $15,000. The business will be located at 501 Elm street, where the other incorporators have been in business since August.

The MacDonald Garage Co., Inc., which recently incorporated in Schenectady, N. Y., with a capitalization of $10,000, has completed a new two-story garage at 740 State street; it contains 10,000 feet of floor space. The officers are: President and manager, Robert MacDonald; secretary, P. P. Spaulding; treasurer, A. T. Atwood.

The Northwestern Automobile Co., of St. Paul, has secured permission to erect a two-story brick garage, 50 x 60 feet, on Exchange street between 4th and 7th streets; the estimated cost is $12,000. The upper floor will be occupied by the Northwestern Automobile Training School, now located at 199 West 6th street.

The Tiffany Garage, in Poughkeepsie, N. Y., has nearly completed a two-story steel and concrete garage, 174 x 53 feet, with a machine-shop, 75 x 53 feet, in the basement; the building has asbestos shingles and affords 10,000 feet of floor space. The salesrooms, for Hudsons and Hupmobiles, are 20 x 30 feet.

H. A. Wilson and R. G. Adams, formerly of Warren, O., have formed the Niles Auto & Machine Co. in Youngstown, in the same State. They have leased a building on Robbins avenue formerly occupied by the Sykes Metal Lath Roofing Co. and will operate a garage and machine-shop.

Louis Conne, for six years manager of the motor car and accessory department of the Philip Gross Hardware Co., of Milwaukee, has resigned to enter business for himself; January 1 he will open up at 430-32 Jefferson street, Milwaukee, under the style Western Motor Supply Co.

P. F. Betz, who formerly operated a garage in Sioux City, Ia., at 20th and Pierce streets, has reentered the trade in a new building at the same location; his new business will include an automobile livery service.

The Crown City Auto Radiator Works has been established in Pasadena, Cal., by Fred Niederwerfer; he is located at 115 East Union street and makes a specialty of repairing radiators, windshields, horns and other accessories.

The Winnebago County Auto Co. has been formed in Oshkosh, Wis., with $18,000 capitalization; the principal stockholders are George E. Steiner and F. C. and M. Behlendorf. The company will open a garage and salesrooms.

Albert Rentner and David Smith have organized the Rentner-Smith Co. in Milwaukee; they have located at Jackson and Mason streets and will operate a garage and repair-shop. They will specialize in the care of electric starters.

R. W. Prosser and E. R. Seymour have taken over the garage and machine-shop in Minneapolis, located at 1404-6 Hennepin avenue; they will style it the Square Deal Garage. Seymour has had several years' experience in Eastern automobile factories.

Ray Head, who has operated the Overland Garage in Chico, Cal., has sold his business to W. F. Gage and others; the name has been changed to Mission Garage. The new owners will continue Head's agencies in Ford, Overland and Garford cars.

E. S. DeTamble and Carl H. Pine, both well known to the trade in California, have formed the Golden State Motor Car Co. in Los Angeles and have opened salesrooms and a service station at 825-27 South Olive street; they have the Partin-Palmer agency.

R. H. and Ralph Schwetzberger, formerly of Bennett, Ia., have purchased and will operate a garage in Wilton, in the same State; they also will act as Ford sub-dealers under L. H. Dammann, of Bennett.

Following the entry of Leonard J. Field into the company, H. P. Baran & Co., of 1731-37 Broadway, New York City, has become the Field-Baran Co. The company deals in automobile supplies.

E. Campbell, of Audubon, Ia., is about to enter the trade in Manilla, in the same State; he has leased the T. C. Bock Implement building and will open a garage and salesrooms January 15th.

The Flannelly-Clarkson Auto Co., of Louisville, Ky., is equipping a garage and repair-shop at Jackson street and Broadway; the firm members are M. H. Flannelly and E. J. Clarkson.

P. E. Peterson and J. L. Johnson, of Eau Claire, Wis., are erecting a garage at 551 Franklin street; both have been engaged in mechanical work, Peterson for 20 years and Johnson for 12.

Gilbert Ungrodt, a travelling salesman, of Medford, Wis., is about to become a dealer in that town; he has secured the Studebaker agency and will also handle motorcycles and bicycles.

W. K. Partridge and Frank P. Anthony are about to open a garage in Everett, Mass. They will erect a concrete and stone building on Corey street at a cost of $10,000.

A. M. Harger plans to open a garage and salesrooms in Ripon, Wis. He has leased the Bishop building, a three-story structure, and will "open up" about February 1.

H. M. Freeman has "opened up" in Indianapolis at 516 North Capitol avenue; he stocks accessories, featuring Lee tires and the Boston starter for Ford cars.

Henry A. Burger, of St. Joseph, Mo., has purchased the interest of E. T. Rhodus in the Buchanan Auto Co. It is located at 17th street and Frederick avenue.

E. J. Reed is about to inaugurate an automobile passenger service between Pekin and South Pekin, Ill. His initial equipment will be a 16-passenger 'bus.

Charles L. Renz, of Philadelphia, has

Digitized by Google

been granted permission to erect a one-story garage and repair-shop; the site is at 7361 Ridge avenue.

S. V. Titus, of Clinton, Ia., is about to enter the garage trade in that town; he has leased a building which is being erected by W. B. Ebensberger.

C. E. Alford and E. Oderkirk, of Aberdeen, S. D., plan to open a garage and salesrooms in Redfield, in the same State; they will handle Fords.

Henry Dean Bourne and John Stone plan to open a garage in Manchester, N. H., on Hanover street; they also will handle Chevrolet cars.

John Esbeck, of Atlantic, Ia., plans to enter the garage trade in Elkhorn, in the same State; a new building is being erected for his use.

John and Menlo Wilson have formed the Wilson Auto Co. in Greenfield, Ia. They have secured the Ford agency for Adair county.

R. H. Knell has formed the King Motor Sales in Detroit and will operate at 603 Woodward avenue; he will handle King cars.

R. S. Harshaw, of Creston, Ia., is about to open a garage and machine-shop; he has leased a building on Montgomery street.

The Harris Hardware Co., of Washington, D. C., has opened a garage on Water street; C. E. Rixford is manager.

R. E. Dodson, of Gilmore City, Ia., has taken over the interest of John Rasmussen in the Ford Garage, in that town.

A. I. Strobel, of Albany, N. Y., has secured plans for a garage; he will build at Ontario street and Myrtle avenue.

Permission has been granted Fred Pueleke, of 9230 Houston avenue, Chicago, to erect a garage; it will cost $7,000.

Girdler, Donnelly & Higgins have opened a garage and repair-shop in Somerset, Ky.; it is styled Main Street Garage.

The Vaught Inspecting & Service Co. has been organized in St. Louis; it will operate a garage and sell automobiles.

The Forest City Auto Co. has been formed in Forest City, Ia. It will stock Buicks and Jacksons.

H. A. Dunlap has erected a new garage in Williamsburg, Ia. He deals in Ford cars and real estate.

Horst & Keppler, of Oakland, Cal., are about to build a new garage; it will cost $10,000.

Hobart Toler, of Loraine, Tex., has opened salesrooms; he has the Maxwell agency.

Henry Neverman has taken over the garage business of H. G. Nicholas in Waverly, Iowa.

WEED'S NEW CONTRACT ON PRICES PUZZLES DEALERS

Company Explains It Is But In Furtherance of Its Bag-Tag "License to Use"—Dealers' Views and What Contract Says.

Coming at a time when price maintenance is a matter of interest, price licensing having been overturned, the Weed Chain Tire Grip Co. has given a new turn to the situation by a subagency contract which was put into effect this month by the Motor Car Equipment Co., the metropolitan distributer of Weed chains.

While some of the subdealers under the Motor Car Equipment profess to be puzzled by the terms of the agreement which they sign when they buy grips, the Weed company states that it is but a furtherance of the company's policy of licensing its chains for use—by the jobber, the dealer and the ultimate consumer. The contract, standing alone, has a consignment flavor, but as the subdealers pay for the chains they get it is stated that to understand the document it is necessary to take into consideration the license tags which are attached to the bags containing the chains. The contract reads:

"1. In consideration of the agency herein granted, the agent agrees not to sell, or offer for sale, either directly or indirectly, the products covered by this contract, except at full net list prices as fixed by the distributor, and the agent further agrees not to offer any merchandise or other inducement with the products covered by this contract to induce their sale, and not to directly or indirectly employ any method which shall in any way violate the spirit and intent of this contract.

"2. The agent will truthfully and honestly account to the distributor for the proceeds of all of the products sold and distributed by it under this contract, less the commission herein specified to be paid to the agent as compensation for his services.

"3. The agent agrees that it shall not be entitled to, nor claim, any commission upon the sale of the products covered by this contract, except as specified by the terms hereof, nor at any time upon products covered by this contract, sold at prices less than the full list price.

"4. The agent agrees that it will not handle, sell or offer for sale, any other chain grips or any other non-skidding devices than those of the Weed Chain Tire Grip Company or the parts thereof resembling them in any way, or marked in any way similar to the product covered by this contract; the agent admits and concedes the validity of the patents of the Weed Chain Tire Grip Company under which the products covered by this contract are manufactured and sold, and will not at any time or under any circumstances contest the validity of said patent.

"5. In case of the violation of this contract by the agent herein, it is understood and agreed that said contract agency and employment immediately terminates and the distributor may retake for the manufacturer from the agent any of the products of the distributor or manufacturer covered by this contract and remaining in the hands of the agent unsold, and the agent by such violation forfeits any right to compensation hereunder, and all the benefits hereby conferred.

"6. The product covered by this contract and consigned to the agent hereunder is understood to be, and remains the property of the manufacturer until finally sold to an ultimate consumer, and the agent has no property right or title therein.

"7. The agreement hereunder may be cancelled on sixty days' notice by either party to the other and the employment of the agent hereunder if not previously terminated, terminates of its own limitation six months from the date hereof.

"8. The records of the distributor as to the amount of product distributed by the agent, shall in all cases be final in fixing the compensation of the agent for his services."

Hatfields Withdraw from Their Company.

C. B. Hatfield and his son, C. B., Jr., have withdrawn from the Hatfield Co., of Elmira, N. Y., which is engaged in the manufacture of commercial vehicles bearing their name. They have leased a machine shop in that city and, although it is rumored that they will manufacture a cyclecar, they decline either to confirm or deny the report.

Minor Business Troubles.

The M. & E. Electric Vehicle Co., of 534 Franklin street, Detroit, has filed a petition in bankruptcy, signed by Charles Pepper, its president; the liabilities are $30,524, and the assets $2,420.

The assets of the Barndt-Johnson Co., a supply house, on South High street, Columbus, O., was sold at a receiver's sale last week for $20,000; it was bought by W. H. English, trustee for a mortgage holder.

Recent Losses by Fire.

Hohokus, N. J.—Joseph F. Tout: garage destroyed. Loss, $2,000.

Johnstown, Pa.—United States Motor Sales Garage; damaged. Loss, $1,500.

Puyallup, Wash.—Herren (or Pierce County) Automobile Co.: garage and 12 cars destroyed. Loss, $20,000.

NEW YORK, DECEMBER 11, 1913

LAW THAT COMPLICATES CAR LIGHTING.

Just as it seemed that the more or less time honored side lamps were in a fair way of being replaced for all time by dash-imbedded lamps and extra bulbs placed within the headlights, someone has gone to the trouble of discovering that the ordinance enacted some two months ago by the New York Board of Aldermen almost specifically perpetuated the sidelights.

The ordinance in question requires that "every automobile shall exhibit two lamps showing white lights at a distance of 300 feet in the direction in which the automobile is proceeding, and shall also exhibit a red light visible in a reverse direction. The lamps shall be so placed as to be free from obstruction to light from other parts of said automobile."

Probably the New York aldermen knew nothing and cared nothing concerning the trend of the trade toward the elimination of sidelights, but the language of their ordinance, nevertheless, makes fairly clear that in the present inflamed state of public sentiment and in view of recent "raids," the motorist whose two white lights are not visible from the rear is liable to arrest wherever he may go in the big city after nightfall. The subject, however, is not wholly of local importance, as it bears directly on all car manufacturers who sell or seek to sell cars in New York, which is to say practically every manufacturer of cars in the United States.

Whether the aldermen were within their rights in passing the ordinance is a pretty question, for, while the State law permits New York City to make its own speed regulations, or "any traffic regulation with regard to the operation of motor vehicles," whether the sidelight requirement is properly a "traffic regulation" is a knot which must be unraveled by those whose business it is to unravel such legal knots.

The matter should not be permitted to escape the attention of those automobile associations which exist to promote and defend the interests of those who use and those who deal in automobiles.

WORDS AND DEEDS OF A SECRETARY.

New York motorists are entitled to a smile—a big, broad one reaching to the very corners of their mouths; and there is no reason why the motorists of other States should not share the smile. For the Hon. Mitchell May at last has an opportunity to put someone in jail and he need not go far from his own doorstep to find him.

For almost a year, or ever since he became Secretary of State and took the automobile bureau under his wing, the Hon. Mitchell has been interviewing himself and spreading broadcast his great desire to put motorists in jail; the desire burned so fiercely that more than once it is reported that had he not sat on a cake of ice and thereby avoided self-cremation, it might have been necessary to call out the fire engines; and now simply because a motor car skidded and injured a couple of people his heart's desire could be realized if he so desired. The car that skidded belongs to the State of New York and was driven by a chauffeur paid by the State of New York. When it performed its gyrations, was it on official business bent? Sure! It was en route to a funeral and was occupied by—whom do you guess? No; not by the Hon. Mitchell himself; but by a State chauffeur and some of his friends.

Do the taxpayers furnish cars and chauffeurs for private purposes—even for conveying employes or their friends to funerals? Ask Mr. May! He knows; and he knows his duty, too. If you doubt it, look up some of those interviews he so cheerfully handed out. Seriously, however, Mr. May's predicament serves to emphasize what nearly everyone knows, i. e., that if the law reached out without fear or favor for speed violators and joy riders and misusers of public property, the jails would be so full of public officials and public employes there would be no room for unofficial offenders.

Of course, Mr. May wants it known that the car that skidded was not engaged in a "joy ride" and few persons will be inclined to so charge. For even smiling New Yorkers realize that going to funerals even by proxy is one of the really grave duties of all title holders. It is much better to skid while performing such a duty than to be found in a taxpayers' car at a race track, which, before the May days and when the ponies used to prance, was where most of the taxpayers' cars could be found by any one who desired through necessity or any other motive to find them.

ATOMOBILES ARE AUCTIONED FROM THE OLD HORSE BLOCK

World's Largest Horse Dealers Inaugurate Weekly Sale of Motor Cars and Trucks — Interesting Results of Their First Efforts.

"And now, ladies and gentlemen, we have a Cadillac—a—a—I don't know when it was built or what model it is, but it's a good little car, as you can see for yourself"—someone tittered. "Cylinders?" The auctioneer looked under the front end. "One's all I can see—it must be a good one. What am I offered? Five! This gentleman bids five dollars! Ten, I hear; fifteen—who'll make it twenty? Twenty, twenty, who'll make it twenty-five, who'll make it twenty-five? Going at twenty, going—and sold! For twenty dollars!"

The Fiss, Doerr & Carroll Horse Co., which is located on East 24th street, New York City, between Third and Lexington avenues, after growing to the point where it ranks as one of the largest, if not the largest, horse dealer in the world, has gone into the automobile business; not as a dealer of any description but as an auctioneer, and at the first auction—last Thursday, 4th inst.—forty-seven cars were sold in the afternoon. The lowest-priced was an old-time Cadillac which the auctioneer couldn't make run. It brought $20, and the highest price paid was $1.050, for a 1910 Lozier.

No pretense is made of acting as a used car dealer; the horsemen take in the cars and sell them on commission—5 per cent for sales of more than $100 and a minimum of $5 for sales less than $100. There is no dickering, consignment or anything else; the cars are taken to the sales arena by their owners and the bidders buy them as they stand and take them away. It is a good chance to pick up a bargain, and it also is probably as good a way as any to get all a car is worth.

"We will accept them Wednesday afternoon," said E. T. Byrne, the company's advertising manager, "and will give the owners until Friday noon to take them away. They can be inspected between the time they are brought in and the time of the sale. Of course, we're horse people and don't know as much as we might about automobiles, but it seems a success.

"The average price was $325." Byrne turned to the record of sales. "Here's a 1906 Packard; it brought $310. A 1910 Selden taxicab brought $130; a 1910 Regal, $650; here's one of these one-horse, truck-like democrat wagon affairs that winds up with a crank like a sewing machine that brought $60. A Pierce-Arrow limousine, marked '4-40,' brought $375.

"Some of the regular used car dealers sent down a lot of junk that they had on their hands and thought it would be a fine time to get rid of it, but I guess they've changed their minds. When the cars didn't bring what they thought they should they bid them in themselves. But even at that it cost the used car men $5 for every car they bid in and we didn't lose anything."

The sales are held in what the company terms its main ring, a tanbark arena, 200 feet long and about 75 feet wide. A balcony surrounds the area, but more of the crowd was down on the floor where it could inspect the cars. The sales are scheduled to be held every Thursday afternoon at 3 o'clock, but the date may be changed, since this is the day of the weekly horse sales, and the two events running at the same time conflict slightly.

White's New Salesroom and Service Station in Boston

INTERIOR VIEW OF SALESROOM

STORE AS IT APPEARS AT NIGHT FROM COMMONWEALTH AVENUE

The visitor to Boston's "Automobile Row" may see bigger and more palatial structures in his ramble up and down Commonwealth avenue, but when he has seen them all—especially if at night—he is likely to remember the new salesrooms and service station which has just been opened by The White Co., at 930 Commonwealth avenue. With the interior illuminated by semi-indirect lighting, the ceiling throws down upon the array of cars a light which rivals daytime, and there is not a dark corner in the new and attractive interior.

The extent of the structure, which is largely one big story in height, is indicated by the statement that it affords 40,000 feet of floor space, touches on three streets and the salesroom for new cars will conveniently accommodate 12 cars and 10 trucks at the same time. At the time of the opening of the building to the public floral decorations served to render the salesroom unusually attractive.

The building, which is T-shaped, fronts on Commonwealth avenue and runs back with two entrances on Dummer street and one side entrance on Pleasant street. The entrance on Commonwealth avenue leads into a show room 93 feet 7 inches wide and 81 feet 8 inches deep, with space for 12 passenger cars on the left side and 10 standard trucks on the right side. There is a broad aisle in the center, along which salesmen's desks are placed, and two telephone booths are located at the rear.

Directly back of the show room is the used car department, 60 x 54 feet, in which 20 cars can be placed. To the right of this department and adjoining the show room are the general offices, and still further to the right is a long corridor, 13 feet 6 inches wide, running all the way through to Dummer street.

Directly at the rear of the used car department and the offices are the repair department and machine room, a location which makes it possible to keep the sales and service departments entirely separate. The repair shop is 120 feet wide and 93 feet 4 inches long, and from it a stairway leads to the washrooms of the workmen on the second floor. Another stairway on Dummer street makes it possible for the workmen to leave the building without going into the repair-shop again. The men enter on Dummer street, go upstairs to change their clothes and then go directly into the repair shop by the other stairway, punching their clocks on the way down. All waste of time is thus eliminated. Lighting in the repair-shop is by the overhead, saw-tooth system.

GUARANTEEING REPAIR WORK

Course of Action by Garageman or Dealer a Problem—Difficult Angles of the Situation—How One Garage man Worked it Out.

How far shall the dealer or garageman guarantee repair work? is a pretty question. It involves many angles, and therefore it is a question that is of peculiar interest to owners of cars. On how the repairman solves it depend much of his profit and much of his business.

A certain motorist took his car into a garage to have the motor and chassis thoroughly overhauled. The garageman was given carte blanche to do whatever was necessary to put the car into perfect condition. The motor was torn down and new connecting rod bearings installed, new piston rings on all four cylinders, new wrist pins; carbon was removed from cylinders, valves ground and other work not enumerated was done. The bill amounted to $45.75, which was paid spot cash.

Knock Developed After Car Left Shop.

The car was used for three days and then one of the cylinders developed a knock that was diagnosed as a result of either a loose piston ring or pin. If the owner continued to drive it he was liable to have a scored cylinder. He considered that it was distinctly up to the garageman to put the motor to rights, as he had contracted to do. The garageman contended that knocks are likely to develop for reasons beyond his control, though he did not say what those reasons were. To do the work over again and tear down the motor without charging the customer meant a loss of practically all his profit on the previous job. Not to do it meant a disgruntled customer and one who had been profitable to him.

In selling the customer he had distinctly stated that all his work was guaranteed. What value is a guarantee that does not mean instant willingness to make good?

This is the sort of question that the garageman is up against quite often. Whichever way he settles it someone is sure to be dissatisfied. But the simple answer is that when work is guaranteed it should be done over again if it was not done properly.

This dealer thought it over because he was conscientious about it. He wanted to be square to himself as well as to the customer. He therefore agreed to do the work again, the customer to pay half the actual cost of the labor. This minimized his loss and satisfied the customer.

Did he do the right thing? If not, what should he have done? Your views will be welcomed.

REFLECTIONS THAT INJURE OR SERVE TO AID THE "HOUSE"

Your employes reflect you. Perhaps they do not do it properly, but nevertheless they do it. The public knows it is your business, and they assume that things are being done the way you want them done. Are they being done the way you would have them done? It means big things for you to know that to a certainty.

When a lazy telephone operator tells an inquiring customer "He's out; I don't know when he'll be back," and in answer to the inquiry "Do you know where I can reach him?" simply hangs up the receiver and cuts off the conversation, it is not the sort of reflection you would desire for yourself. When any discourtesy, of whatever kind, is shown to customers or those who sell your institution, it is a poor reflection of you and your ideals.

The thought can be elaborated on. The significance of it all is that employes can be taught to be real and genuine reflections if your spirit is imparted to them. Nowadays ideals in business are definitely taught; those who would "know to a certainty" do not take chances. They teach and watch and make sure.

To a big garage or dealer this matter of "right reflections" is important because a large volume of business is necessary; every customer counts. To the small garage it is of equal importance because every customer counts double. Think it over; perhaps there is much to be done to have things where they should be.

DEALER GIVES THE PUBLIC UNUSUAL VIEW OF THE CAR

Showing the prospect the "insides" of a car probably never will cease to be a method of attracting interest, and various plans have been evolved by dealers for uncovering for the untechnical man the interior mechanism of the car. The "under side" probably is nearly as interesting as the "insides" since both are concealed from view, and Harry A. Lord, of the Lord Motor Car Co., of Los Angeles, has taken advantage of this curiosity in the prospective car buyer.

A prospect one day was looking over a Maxwell "25" in the Lord salesrooms and, like many another, he became curious as to what the bottom of a car looked like.

"Come back tomorrow and I'll show you," said Lord, who immediately put the idea into effect.

When the prospect returned on the following day Lord had a car turned up on one side. The wheels on one side rested on blocking on the floor and the whole lower side was revealed to the prospect. The car was in full view of passersby, has attracted considerable attention, and as a show window exhibit has served a useful purpose.

Lord states that it apparently has not injured the car at all. Before turning the vehicle over, the gasolene tank, radiator and oil reservoir were emptied to preclude spilling any of these liquids on the floor or over the brightly finished car.

PUTTING LIFE INTO WINDOWS

Necessity for Change and Originality to Get Value from Space—Ideas that May be Gleaned from Stores of Other Trades.

What are you doing with your window display that is different from what you did last year?—last month?—last week?

Are your windows cleaner and more attractive and therefore better salesmen for you than they were?

Have you tried the effect of special decorations to add interest and focus attention?

One dealer remarks that his show room and display windows, which in this case are one and the same thing, are his bread and butter. He says that if he once gets a man into the show room he can usually interest him.

Automobile Business Not "Different."

What are you doing to get men into your showroom other than the ordinary stunts everyone else is doing?

Just shoo away that idea that the automobile business is different. It is not. The man who tries to persuade himself that it is fundamentally any different from selling any other merchandise is due for a shock.

Of course, you don't go through precisely the same motions as the man who sells furniture. But nevertheless the transactions in the last analysis is exactly the same.

You have sold a man something. He pays for it. That's what constitutes a sale. You have convinced him that your particular product will satisfy him better than something else he has seen or has in mind.

There is illtle, if any, argument on this point in the automobile trade nowadays, but automobile dealers sometimes forget that the merchant dealing in staple lines of merchandise has a history of many years success in the face of just as strenuous competition as we face. He has learned many things of vital importance in interesting people. What can we learn from him? What from the jeweler? What from the furniture man? What from the dry goods merchant? Try and see.

SETTLING COMPLAINTS IN A WAY THAT SATISFIES AND BUILDS

"There are several ways that you can figure it when a man comes in with a complaint. He may be wrong and yet think he is right. Agan, he may be right and think he is right. And lastly, he may be wrong and know he is wrong, but be intent on 'putting it over.'

"Whatever may be the situation," said the president of a large corporation which has a great many customers, "we treat the customer as if he were right. We invite him to the office and discuss the matter as briefly as possible, without argument, and settle it to suit him.

"Analysis and our own complete records show us that the first named class is in the majority. But we settle just as cheerfully and gladly with them as we know how and we consider it the very best kind of advertising. On the other hand we are certain that each month a certain number of small claims are 'put over' on us, but they are paid just as quickly as the rest. It is rarely ever tried a second time. The cost of this quick, agreeable and satisfactory settlement of claims is not anywhere as large as one will naturally imagine. It would surprise most people to learn how low it really is.

"As a result of this plan, with several thousand customers and a large number of employes, we never hear an argument in our office. Voices are never raised, and when a customer goes out he goes out to boost. The great object that we have attained by this method is to have the public with us instead of against us. It lightens work all along the line, makes it easier for collectors, easier for salesmen, easier for the office force. It gives everybody a broad, square feeling that helps business and builds business. It makes for honesty and sincerity; both customers and the house profit by the plan."

SIDE LINES THAT LEFT THE REGULAR BUSINESS IN HOLE

One dealer who wound up the season with seven cars on hand was brought face to face with a condition in his business that resulted in considerable self examination as well as careful study of his books.

The upshot of his meditation and study was that he became plainly aware that he was devoting himself too much to outside matters. A little time taken here and there from the day's work seemed like nothing. But at the end of a season he was able to see that the expense was on him, and amounted to an alarmingly large item.

Very few businesses can run themselves. At no stage of the present is there any chance for a retail automobile business to run itself. Even competent lieutenants seem not enough. Stocks must be kept moving if money is to be made—and that's the only reason for investing.

DEALER HOLDS TRAP SHOOT FOR BENEFIT OF CUSTOMERS

The Overland Motor Co., of Philadelphia, Pa., has taken advantage of the sporting proclivities of its customers as a means of holding their good-will and tending to make them an "Overland family." Many of the Overland owners in the Quaker City are shooters, and this year the company held its second annual trap shoot.

While prizes were offered to be competed for only by Overland owners, the entries were not restricted and a number of gun lovers became acquainted with the Overland dealer through the "shoot fest." This year 91 shooters attended; last year 33. The prizes were silver spoons.

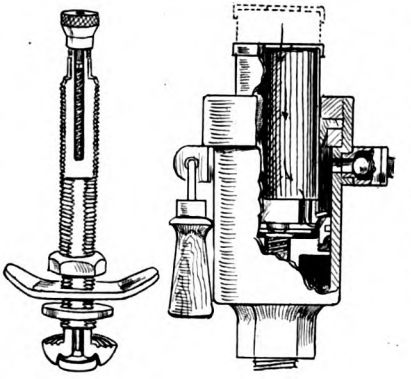
Recent Developments in Accessories

Making Valve Springs Easier of Removal.

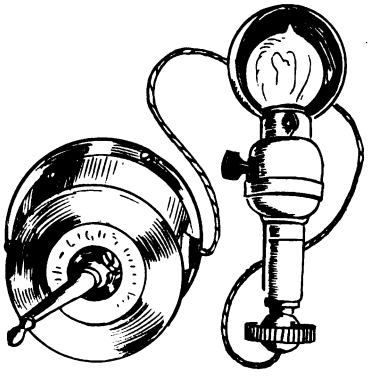


The comparatively heavy springs that are employed to bring down the valves of the modern motor are distinctly "mean"things to handle when they have to be removed and replaced—especially if there is not very much room around the springs for tools. Ergo, anything that will appreciably lessen that "meanness" should be regarded with an approving eye, and as the little device shown in the accompanying illustration and manufactured by the Hoban Valve Retainer Co., of 164 W. May street, Chicago, is designed to mitigate this particular form of worriment, obviously it merits attention.

The appliance is a valve-spring retainer, and is designed to take the place of the usual washer or disk held in place under the spring by a key passing through the valve stem, or whatever equivalent device is fitted. It consists of a disk large enough to support the valve spring, with a hole large enough to slip over the valve stem and, on the under side, a pair of hinged arms swinging from diametrically opposite points on the disk. The free ends of the arms are cut out to hug closely a groove cut in the valve stem when swung inward.

To remove, the spring is raised slightly by pressure on the retainer, when the arms will fall clear and let the spring down; pressure must, of course, be applied in such a way as to let the arms drop. In replacing the retainer the arms are simply held in against the valve stem until they drop into the groove, where they are retained by the pressure of the spring.

HOBAN SPRING RETAINER



ST. LOUIS VALVE NATIONAL PUMP

"Spark Plug" Tire Pump That's Different.

The small size, handiness and moderate price of the so-called "spark-plug" type of tire pump have made it deservedly popular, and not a few have been designed and marketed. Different from them all, however, is the "telescope" pump that is made by the National Motor Supply Co., of 5606 Euclid avenue, Cleveland, O. The accompanying picture shows the "works."

The pump screws into the spark plug hole, of course, a wood handle facilitating attachment and also helping greatly when the pump is hot, as it is sure to be after use. In the lower part of the cylinder bore is a steel piston with a packing ring, the piston being of the floating type, while attached to the top of the floating piston is a brass tube which moves in and out through the top of the pump cylinder and gives the device its name. The piston is moved by the alternate suction and compression in the motor cylinder, and the air is compressed in the space between the exterior of the brass tube and the pump cylinder walls. The air is taken in through a hole in the head of the brass tube and forced out through the ball valve.

UNIVERSAL REEL LAMP

Tire Valve Designed to Prevent Leakage.

Small as is the valve of a tire, it is a part that is of the utmost importance, for if it fails in its duty of holding the air that has been pumped into the tire it means trouble of several different kinds. Which is one of the reasons why the St. Louis Pneumatic Valve Co., of 4148 Olive street, St. Louis, Mo., has brought out its valve, with the statement that it is about as simple in construction as a valve can be.

The makers claim as the first feature of the valve is its freedom from leakage. Why this should be so is indicated by the fact that there is nothing to it but the outer part, with the usual means for making connections, and inside a long stem carrying on its inner end a shallow brass cap with a soft rubber gasket which, of course, comes between the cap and the valve seat, where it is normally held by the pressure of the air in the tire. The seat is corrugated to improve the air-retaining qualities of the device. A milled nut on the outer end of the stem is screwed up when the tire is inflated, thus drawing the gasket tighter.

Reducing Troubles of Trouble Lamps.

A trouble lamp with a long piece of flexible cable attached to it is not quite as troublesome as an unwound fishing line, maybe; but when it gets adrift and insists upon tying itself into strange knots and ensnaring everything within reach there is about as much similarity as is necessary. At any rate, this seems to have been the way that Cummings Bros., 903 Saginaw street, Flint, Mich., viewed the situation, when they evolved the Universal Reel-light shown in the accompanying illustration.

The reeling arrangement is so elementally simple that it is clear from a glance at the picture. The device has other features however. For instance, when the cable is all reeled up the lamp holder—which contains a key for turning the light on and off—is brought to a socket on the reel case and stands up and throws light on the dashboard, a ball joint in the holder permitting the light to be turned in any direction and a reflector concentrating the rays where they are needed. The reel holds 12 feet of cable and can be attached anywhere.

TWO BUICKS PERFECT IN NEW YORK RELIABILITY

Woodruff in a "Four" and Smith in a "Six" Only Ones to Finish 515-Mile Contest Without Penalization—Breitenbach (Chandler) Next with One Demerit—Electrical Equipment Causes Trouble.

Neither three days of very moderately strenuous going, nor rules stricter and a great deal more comprehensive than have been any previous rules for a contest of the kind, could keep all of the cars that were driven in the 500-mile New York Motor Dealers' Contest Association's reliability run which took place Wednesday, Thursday and Friday of last week out of the clean score class, though they came very near to doing so.

Of the 11 drivers who started—and finished—but two escaped penalization, and both of them are Buick pilots, one being E. Woodruff, who held the wheel of a four-cylinder touring car in the smallest piston displacement class, and the other being W.

WOODRUFF (UPPER) AND SMITH (LOWER) IN THE PERFECT SCORE BUICKS

Smith, who steered a six-cylinder touring car in the largest class. Hence, to the Buick Motor Co., which entered both cars, and three others besides, will go the trophy. J. M. Breitenbach finished with the next best score, though there is no second prize, his Chandler "six" going through with but one point charged against it, and that for a leaky water pump. The complete scores of all the contestants, together with the reasons for penalization, are shown by the accompanying tables.

In contrast to the unnatural hurry that marked the first day of the run, when no fewer than four of the drivers were summoned to appear before the minions of the law for infractions of the speed laws, the pace on the succeeding two days was comparatively moderate; probably most of the drivers remembered something of the old saw about being "once bit, twice shy." Be that as it may, there can be little doubt that the slower pace had more than a little to do with the scarcity of road penalizations. Steve Casey (National) was the only one to incur penalty during the last two days, 10 points being charged for a tire blow-out—a penalization which would not have occurred under any other rules.

The run during the first day, as stated in Motor World last week, took the contestants 83.3 miles out on Long Island, from the starting point in front of the Manhattan Automobile Club on 62d street, New York City, to Riverhead, L. I., and return, the total distance being 176.9 miles; the roads, on the whole, were good. The second day proved the longest and the hardest, the ronte taking the cars to New Haven, Conn., and return, the distance being 178.3 miles. It was during this part of the run that the only poor roads were encountered. Practically one-third of the distance was over mediocre dirt roads in Connecticut which previous rains had left rutty and hollowed out in spots. The last day was the easiest, insofar as the distance was concerned, the route leading to Poughkeepsie and return—161.8 miles—and the best considering the weather conditions, the temperature having moderated slightly over night.

The total distance of the run, therefore, was slightly over the originally proposed 500 miles, the figure being 515, to be exact. Inasmuch as the roads covered were such as might be encountered by anyone in the course of a day's riding, the gasolene and oil consumption figures are illuminating. It was to be expected, of course, that the lighter cars would cover the route on less fuel than did the heavier ones. The No. 3 Buick, driven by C. Jones, used less fuel than any of the others, the consumption figuring out at a fraction over 19 miles to the gallon. The eight-cylinder De Dion, on the other hand, burned the most fuel and covered but eight miles to the gallon. The average consumption of all the cars for the 515 miles was 43.9 gallons of fuel, which gives 11.5 miles to the gallon. The average oil consmuption figures out at 342 miles to the gallon. The figures for all the cars are as follows:

No.	Car and tires.	Gals. Fuel.	Qts. Oil.
	TOURING CARS—UNDER 230 INCHES.		
1	Buick, Goodyear	32½	6
2	Buick, Goodyear	30½	2
	RUNABOUTS—UNDER 230 INCHES.		
3	Buick, Goodyear	27	3½
4	Buick, Goodyear	31½	10½
	TOURING CARS—231-300 INCHES.		
5	Chandler, S & K	37	4
6	Oakland, Goodyear	56½	8
	TOURING CARS—OVER 301 INCHES.		
7	Oldsmobile, Fisk	56½	6
8	De Dion, Knight	63¾	..
9	National*	46½	8

9	National	Poertner Motor Car Co	Steve Casey	10	0	58	30	8	0	0	0	3	0	21
3	Buick	Buick Motor Co	C. Jones	0	0	29.5	26 5	0	0	0	0	30	None	30
4	Buick	Buick Motor Co	J. D. Coote	0	0	23.5	24	0	0	0	0	45	None	45
7	Oldsmobile	Oldsmobile Co., N. Y.	T. Speer	0	0	45	121.0	570	0	0	0	10	0	580

As was to be expected, and as usually is the case in reliability contests where a final technical examination is made under the rules, the technical committee found something or other wrong with five of the seven cars that finished the three-day run without road penalization. T. Spear's Oldsmobile drew the heaviest penalty of the lot, 570 points being added to its score for a defective foot brake. The brake tests were held on Saturday morning last on Dyckman street, just at the foot of the Fort George hill, the contest committee being in charge. In the tests, each car was paced by the pacemaking car at its contest speed, the foot brake being set as the car crossed a line and the distance required to bring the car to a stop measured; the emergency brake was separately tested in the same way; the penalties were one point for each foot or fraction over 50 feet required to stop the car; five points for each foot or fraction between 60 and 70 feet, and 10 points for each foot or fraction over 70 feet.

ON THE ROAD TO RIVERHEAD

FOUR-FIFTHS OF THE BUICK ENTRY NEAR PEEKSKILL ON LAST DAY

Spear's Oldsmobile slid 121 feet with the foot brake set, though the car stopped in 45 feet under the emergency brake. Casey's National was the only other car that drew brake penalization, the prescribed 50 feet being exceeded by eight, with the emergency brake set. The foot brake brought the car to a stop within the required distance, however.

By far the most important difference between the rules under which the contest was run and the regulation reliability rules of the American Automobile Association, as was made plain in Motor World last week, is that whereas no attention is paid to

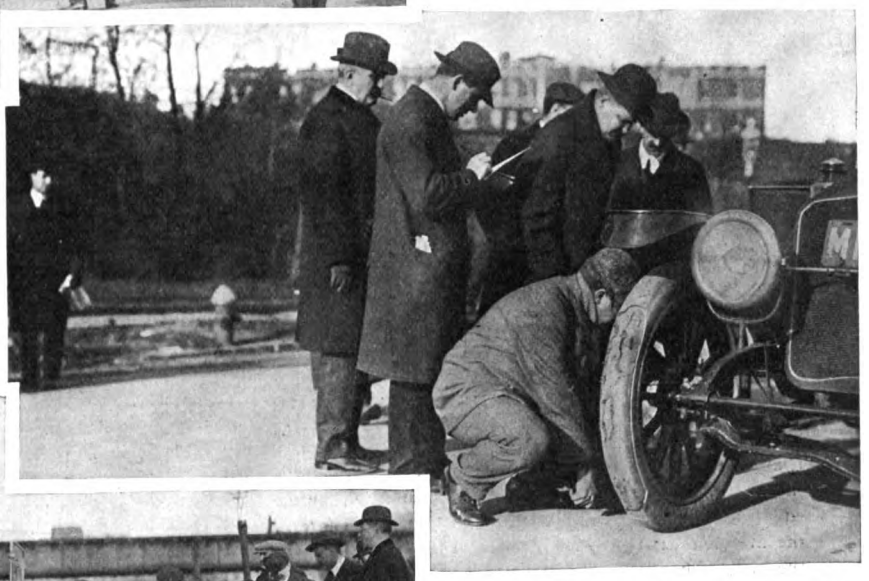
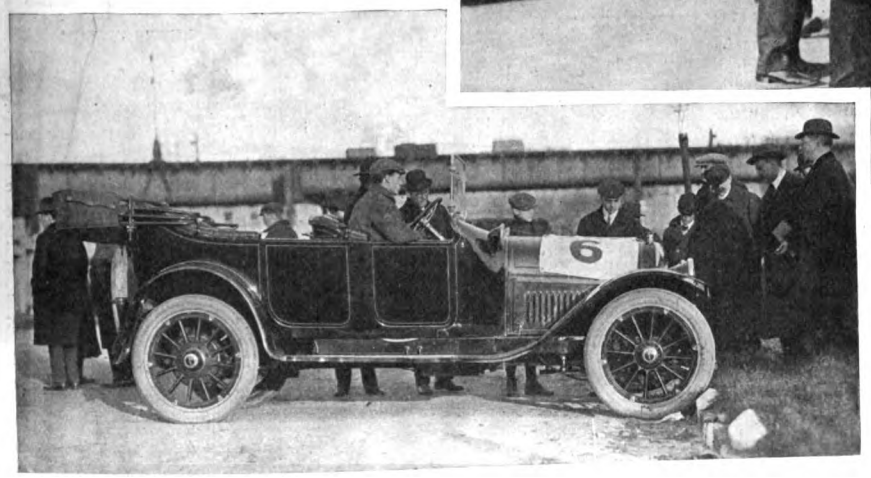
equipment in the A. A. A. rules, the new rules adopted by the M. D. C. A. contest cover everything in the equipment of a car except the clock—engine starters, tops, windshields, speedometers, tire and luggage carriers, foot and robe rails, upholstery, lamps, horn, bumpers and bodies included.

In the outdoor operative tests which were the ignition switch in one position, penalties were charged for the defect, though they would not have been charged under other rules. In one car—Coote's Buick—the starter failed to operate properly in the final test, for which 25 points were charged.



The particular component of the electrtic equipment that caused the most demerits ing on this account. In addition, Casey's National was debited three points for a faulty dash lamp and Guilford's Buick two points for a loose tail lamp bracket, all of them being new penalties under the new rules. Tops and windshields and speedometers and other items of regular equipment cost no one any demerits. With the exception of the De Dion and the National, which had no starters, all the cars were fitted with Delco electric lighting and engine starting systems.

Another feature for which the three day's run was quite out of the ordinary was the lack of tire trouble experienced by the contestants. Casey's National was the only one to suffer a blow-out—the car was traveling nearer to 40 than to 30 miles an hour at the time, and one of the wheels struck a rock the size of a derby hat—and there were only two punctures reported. Punctures cost the driver nothing, but blow-outs were



TESTING THE CHANDLER'S BRAKES

completed the day following the finish of the run, none of the cars was penalized for faulty clutches or defective gearsets. Which is to say that when each car had its front wheels placed against a six-inch curb, with the low gear engaged, the car either climbed the curb, the wheels slipped around or the motor was stalled. In the gearset

NATIONAL UNDERGOING INSPECTION

NEELY'S OAKLAND UNDERGOING THE OFFICIAL CLUTCH TEST

test each car was required to run on each of its gears. When it came to testing engines, however, a number of discrepancies were found, most of them being due to faulty electrical apparatus. Thus, for instance, four of the cars, as shown by the accompanying table, exhibited defective battery ignition, and though engines nevertheless would run and run well with was faulty lamps. Few entrants were thoughtful enough to replace bulbs that already had been in use for a considerable period with new ones for the run, and as the lamps were required to be kept lighted a specified number of hours each day, a number of bulbs already well used were unequal to the strain and flickered out. A burned-out bulb cost five points, four scores suffering against the offending machine at the rate of 10 points per blow-out.

Must Pay Damages for Bump in Road.

Because a bump in the road at a railroad crossing caused an injury to Mrs. Julius Hayman, of New York City, the Long Island Railroad Co. and the City of New York, jointly, must pay her $15,000; after four years the suit was this week decided in her favor by the Supreme Court in Brooklyn.

Mrs. Hayman was riding in a car June 24, 1909, when the car struck a depression in the road at Avenue U, caused by a change which was being made in the level of the railroad company's tracks. She was thrown to the floor of the tonneau; injury of the knee left her lame.

WATER COOLING ADOPTED FOR ALL CAMERON CARS

New Overhead Valve Block Motor Takes Place of Separately Cast Air-Cooled Cylinders—Electrical Equipment Added.

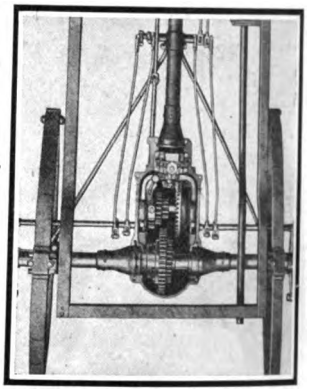
Having completed the preparation of its new factory in West Haven, Conn., the Cameron Mfg. Co., which was the Cameron Car Co., of Beverly, Mass., but which a year ago last September underwent reorganization and was rechristened, has recommenced manufacturing operations, and its first product, which now is practically ready for the market, reveals radical departure from previous practice.

Heretofore, the Cameron car has been distinguished by its separately cast air-cooled cylinders, but in its newer form it has a block motor cooled by water. This change, which manifestly has necessitated the addition of a radiator—a sharply pointed V-type has been adopted—constitutes the principal change that has been made in the single chassis.

WATER-COOLED CAMERON MODEL SHOWING POINTED RADIATOR

Quite as a matter of course, the Cameron patented transverse rear axle transmission system that has served to such good purpose in years gone by, has been retained with only minor alterations and improvements. The system, in fact, now serves as the chief distinguishing mark of the car, which has been brought thoroughly up to date in every respect, a feature which is made plain by the adoption of a complete electric lighting and engine starting system.

The transmission system is different from anything else of its kind, as is made plain by the accompanying picture, the principal advantage claimed for the construction by the makers being that it permits direct drive ahead on any of the four speeds and direct drive in reverse. It is pointed out that the arrangement of the gearing permits the transmission of the maximum amount of power with the minimum loss through friction and gear efficiency. Quietness in operation also is obtained as an equally important result of the somewhat radical construction.



In changing over from air cooling to water cooling, the Cameron company has not been content with any half-way measures and has developed a type of motor that has a number of noteworthy features, not the least important of which is that it is of the long-stroke high-speed type. As already has been made plain, its four cylinders form a rigid block supported at three points. Bore and stroke measure 3⅝ and 5 inches, respectively, the piston displacement therefore being 206.4 cubic inches and the horsepower rating according to the A. L. A. M. formula, 21.8.

By way of ensuring the generation of the maximum power, the valves have been located directly in the center of the combustion chamber, which is so shaped that the greatest force of the explosion comes over the center of the pistons. The valves are operated by enclosed rocker arms all arranged on the same side, along with the breaker end of the magneto, which is driven from a transverse shaft at the front, the carburetter and the openings to the water jacket and crankcase, a design feature which makes necessary the raising of only one side of the hood for all ordinary adjustments. The crankshaft is supported in three liberal bearings and great care has been taken to ensure quiet operation of the valve mechanism.

From the engine, power is transmitted through the intermediary of a large diameter, self-adjusting inverted cone clutch and a shaft enclosed in a substantial torque tube to which are hung the brake equalizers, to the rear axle transmission system. The rear axle itself is of the full-floating type and the front axle is of the distinctive Cameron tubular type. At front the chassis is supported on the regulation semi-elliptic spring members, the rear springs being full elliptic with scroll ends. Both sets of brakes are of the internal expanding type and operate in large rear wheel drums. The wheelbase is 115 inches and the wheels may be either wood or wire, with demountable and flush hubs and fitted with 32 x 3½-inch tires; provision is made for equipment with 33 x 4-inch tires, though their specification adds to the price of the car.

The lines of the touring body are modern in their tendency toward the elimination of curves; the gasolene tank, which holds 18 gallons of fuel, is stowed in the deep skuttle dash. Cushions are deep and are upholstered in hand-buffed leather. In conformity to what now has become standard practice, the steering wheel is located at the left side with the control levers in the center.

In addition to the standard five-passenger touring model, four other types of bodies also are mounted on the same chassis; they include a four-passenger touring model; a roadster, a special "featherweight" roadster which weighs but 1,975 pounds; a two-passenger coupe and a three-passenger sedan model. In each case, the equipment is the same and includes mohair top with boot and side curtains, windshield, speedometer, tool and tire repair kit; electric lighting and engine starting system; pump and jack. Deliveries will be commenced after January 15th.

DIRECT DRIVE REAR SYSTEM

Storage Batteries Not Easily Frozen.

It may allay the fears of owners of electrically-lighted automobiles that are kept in cold places and of battery-driven machines to know that the electrolyte in the cells is a good anti-freezing mixture and will stand a very low temperature before beginning to thicken up and get "slushy." It may be said that the same mixture in a radiator would eat away the metal in no time, so that it would be of no use in a cooling system. In the battery, however, it is safe, and there need be no fear of its freezing in any ordinary variety of winter weather.

SALESMAN WHO "KNOWS EVERYTHING" NOT BEST

Reilly's Protege Tells the Number of Teeth in a Gear He Never Heard of —Why an Admission of Ignorance Indicates Wisdom—Reilly Says Know-it-all is Not Likely to Learn Any More.

Tommy Trumbull was tickled to death—most. He had sold a car!

Scores of cars are sold every business ay in the year, so, in order to understand hy Tommy was barely able to smother all itward manifestations of his inward bubling, it may be necessary to explain that was the first car he had ever sold.

The mere fact that a sale meant something financially to him was not nearly so important as that he now would be able to vercome that hesitant I-hardly-believe-it-yself tone when he told his friends he was n automobile salesman. He tried hard not bubble.

"NEW SHOES! NEW SHOES! I JUST BOUGHT THESE!" EXCLAIMED TOMMY

"Oh, laugh right out loud, if you want o!" he exclaimed as he detected a subdued ort of smile on the faces of both Reilly nd Nellie, the chauffeur of the office typeyriter.

Tommy Has a Retrospective Flash.

"I suppose you can buy some winter hoes now," and Reilly glanced at the low, ummertime models that Tommy wore.

"New shoes! New shoes! I just bought hese!"

"You did?"

"Oh, I know what you mean, all right," eplied Tommy, "but low shoes are better or winter than high shoes. They——"

"Did you ever wear a pair all winter?"

"No, but——"

"Did any medical or shoe authority ever ecommend them?"

"No, but——"

"But what?"

"Lots of fellows wear them!"

"How many teeth are there in our differential master gear?"

Tommy's face reddened. As a life history is condensed into seconds in the mind of a drowning man, Tommy again saw himself out on the salesroom floor, leading his first buyer through a story of the good qualities of the car. He again heard the buyer ask that unexpected and darned-fool question, and he again heard himself answer promptly "Fifty-three."

One Man Can't Know Everything.

But when Reilly asked the question Tommy stammered, "I—I—I don't know."

"Neither do I," replied Reilly, "so on that point you're almost as good a salesman as I am——"

"Why—why—what——"

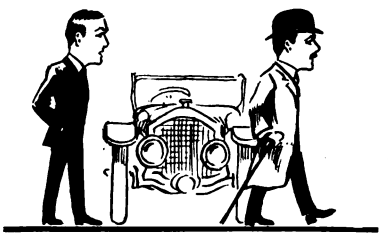
"And the reason I am a better salesman than you are right there is that instead of making a guess and saying 'fifty-three' I would have told the man I didn't know."

"But he asked me!"

"I know he did, but that's no reason you are supposed to know, is it? If the mere fact that someone asks you something makes it possible and necessary for you to know it, you have knocked the props from under all the schools, colleges and salesmanship courses in the world."

Tommy saw it coming, he knew he had it coming, he knew he couldn't stop it coming, so—due credit to Tommy—he kept still and let it come.

"It's poor policy, trying to be an Ever Ready Know-it-all Information Bureau; it can't be done. No one ever knew everything, although I believe it is claimed there are one or two exceptions. I know why you told the man there were fifty-three teeth in that gear, and perhaps you are not to be blamed too much, seeing that you haven't been selling things so very long. If I am not mistaken, you thought that admitting you didn't know something the man wanted to know was going to let you down in his estimation and render the sale less likely. Am I right?"



Get Information Before Giving it.

"Quite right," Tommy said—and no more.

"But you were wrong there, my boy. The man who doesn't know too much gets along better than the man who knows it all. There is a great deal of harm done by salesmen who try to know everything and who think they are weakening their case by admitting there is something they do not know. Right at the start, however, I want to impress upon you that you can't know too much about the car. Some salesmen believe they are better because they do not know too much of the technical side of the case, but I don't agree with them; but, at that, I'll wager the man who designed the car can't tell how many teeth there are in that gear. I can't conceive what led the man to ask that fool question."

"What should I have done."

"You should have told the man you didn't know, but that if he would wait a couple of seconds you would find out; you could have counted them from a catalog picture, perhaps, or could certainly have found out

"THE PROSPECT LEFT SHORTLY AFTERWARD WITHOUT BUYING A CAR"

by going to the repair shop. It isn't well to leave a prospect if you can avoid it, but the chances are he didn't care enough about knowing to let you go to the trouble of finding out. What I want to ask you is, what do you suppose the man will think of you if he ever counts those teeth himself?"

Knew Too Much and Lost His Sale.

"Well," was the resigned reply, "he'll probably think I'm an awful liar or don't know much about the car."

"Take your choice; one's as good as the other." Reilly turned in his chair and looked straight at Tommy. "You made your sale," and Reilly gesticulated with a finger, "but I know a man who lost a sale by 'knowing' something he didn't know."

"Is that so?"

"It is. The prospect in that case had had one car and it hadn't been satisfactory. It had a splash oiling system and it gave him so much trouble he vowed he never would have another car with a splash system. He went to a certain dealer here in town because he had heard tney had a different and a good oiling system. He looked the car

Digitized by Google

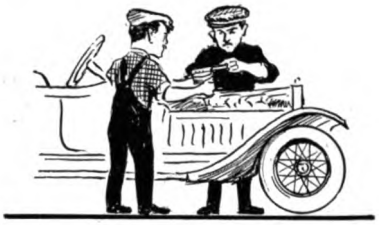
over and was well impressed with it. Then he asked about certain mechanical features, and when he touched on lubrication the salesman promptly answered, 'It's a splash.'

"'Splash?' said the prospect. 'I thought you did away with that.' 'Oh, no,' replied the salesman, 'we didn't do away with it; we improved it.' The prospect left shortly afterward without buying a car. The salesman didn't know the reason he lost the sale and doesn't know yet, but the prospect went out and bought a car which had a force-feed system. As a matter of fact, the car he didn't buy had almost the same identical system."

"That's a pretty big point to go wrong on, isn't it?" asked Tommy.

Should Know the Technical Side.

"It certainly is. Had I been that salesman I would have been tempted to make a guess at it rather than admit I was ignorant on so important a point, but the point is that he should not have been ignorant. He should have known enough of the technical side of the car to be able to answer questions intelligently. But such things as that man asked you aren't expected of anyone but an engineer, and the engineer who built the gear, at that."



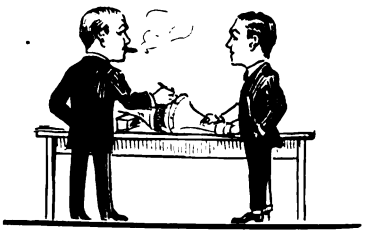
"I thought he was getting in pretty deep," commented Tommy, who was becoming convinced that there was a more or less bright side to the situation.

"It isn't treating the prospect right," continued Reilly. "If he asks a question it is safe to assume that he has a reason for wanting to know that particular thing, and it isn't right to give him false information. A friend of mine had decided that when he bought his second car he would try out a brand of carburetter which he thought was pretty good. He asked the salesman of whom he was buying the car if this particular carburetter would fit. The salesman, anxious to make the sale, said 'Yes, yes; certainly,' and the man bought the car. Several weeks later he found himself in a predicament when he tried to make that carburetter fit. When he went back at the salesman about it the salesman apologized profusely and said he undoubtedly had made a mistake. That made the car owner sore, all of which was uncalled for.

False Information Caused Trouble.

"Another car owner dropped in at the salesroom where he bought his car and asked if the pistons were the same as the year before. 'Just the same, just the same,' said the salesman. Whereupon the owner took his car to the garage and told them to put in a new piston, they having told him one of them apparently was cracked. But when they came to put in an old piston from stock it wouldn't fit, and the owner was held up while they monkeyed around getting one of the new ones.

"Hang it, Tommy!" Reilly exclaimed, "it isn't fair to yourself. A man who knows it all isn't in a position to learn any more, and stands still or goes backward rather than forward. If a salesman is of the type who answers any question whether he knows it or not, he never is going to learn



"WHEN THEY CAME TO PUT IN THE PISTON IT WOULDN'T FIT"

the right answer to the questions to which he doesn't know the answer. He gets to be a surface skimmer and doesn't get a hold on the roots of the business.

Too Much Information Confusing.

"Take yourself in this particular instance. Of course, knowing how many teeth there are in all the different gears in a car isn't at all necessary, and trotting out that information in selling a car to the average man would serve only to mix him up; but, assuming that knowing this is essential, you have guessed at it, and, having guessed at it and disposed of the question for the one occasion, it passes from your mind and you pay no further attention to it until it comes up again. Then you make the same old guess, or a different one.

"Now, had you told the man you didn't know and volunteered to find out, and had you actually ascertained the correct number, the probability is that you would al-

REILLY LOOKED QUIZZICALLY AT TOMMY. "FIFTY-THREE," HE SAID

ways remember it; anyway, the chances are there would be more likelihood of your remembering it. It would be good discipline, too, for yourself; it's like reading with a dictitonary at your elbow. Whenever you sit down to read anything at all you are almost sure to run across a word the meaning of which is not exactly clear to you; the average man makes a guess by hitching the word up with the context.

"But if you want a tip that will prove interesting and which will help increase your vocabulary, just plant a little dictionary alongside yourself when you sit down to read and whenever you run across a word that isn't clear, look it up. You'll be surprised at what you don't know; also, you'll be surprised how much you'll learn. As for that salesman who didn't know what kind of oiling system his car had, he never should have undertaken to sell a car without knowing so essential a fact. That was pure shiftlessness. He's the kind of man who would dust up a room and sweep the dirt under the rug."

Tommy Was Right—but Accidentally.

"What do you suppose that man wanted to know about those teeth for, anyway?" asked Tommy.

"Maybe he had counted them up himself and wanted to see if you knew," replied Reilly, "and just to satisfy my curiosity I'm going to find out myself. Come on."

In the repair-shop Reilly flicked at the teeth of a big gear with his pencil and counted. Then he said "Huh!" and counted them again.

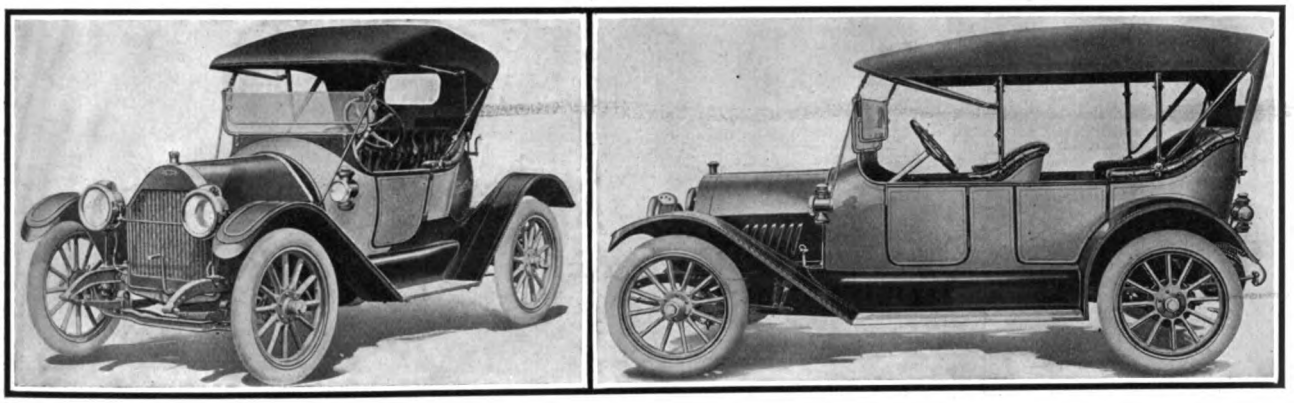
"How many?" asked Tommy.

Reilly looked quizzically at Tommy and shook his head in mystification.

"Fifty-three," he said.

To Prevent Frosting of Show Windows.

Cold weather brings with it certain troubles for the man who has a show window, and the finer and bigger the window the more aggravating the troubles are likely to be. Which is as much as to say that a big sheet of plate glass covered with frost or with moisture from "sweating" is about as good as no window at all. It isn't a window at all, in fact, but a first-class screen. Of course the real, rock-bottom way to keep windows from "sweating" and frosting is to provide such ventilation and circulation of air that there will not be an excessive difference between the temperature of the glass and that of the air in contact with it. In the absence of such ventilation, however, there are other things that can be done and that will help out to some extent, at least.



For instance, an electric fan, or several of them, can be put in the window and made to deliver air directly on the glass. This is by no means an uncommon expedient, and usually has the desired effect. And a still simpler way is to rub the glass with a solution of equal parts of alcohol and glycerine and let the stuff stay on. Incidentally, the same scheme is a good one to prevent the accumulation of moisture on windshields.

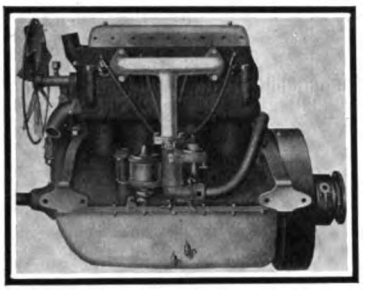
CHEVROLET "FOUR" CHASSIS MOUNTS TWO TYPES OF BODY

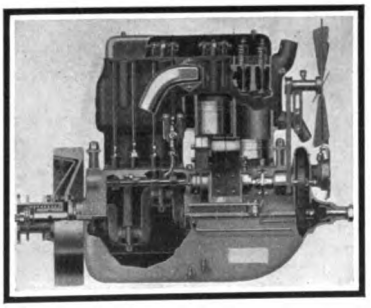
Considerably Bigger than Its "Little" Predecessor—Overhead Valve Gear Completely Enclosed and Cylinder Heads Removable.

Whether or not there is any connection between the size of a car and the length of its name, it is a fact that the Chevrolet "four" is a considerably bigger car, any way it is viewed, than the Little, the place of which it takes. The engine is bigger, the wheelbase is bigger, the body is bigger—in short, it is bigger in every detail, not even excepting the price. The Chevrolet Motor Co., of Flint, Mich., which took over the Little company, has brought out an entirely new car that is reminiscent of the prototype only in certain indefinable attractiveness in appearance—a combined sturdiness and gracefulness, if such a term can fittingly be applied to a car, that is by no means as easily incorporated in a design as most people probably imagine is the case.



CHEVROLET ROADSTER SELLING FOR $750

TOURING MODEL WHICH IS LISTED AT $875



To bring out the extent of the differences between the old and the new cars, it may be said that the Chevrolet has a wheelbase of 104 inches as against 90 inches for the Little, while the motor has a bore and stroke of 3 11/16 inches and 4 inches, respectively, as against 3½ and 3⅜ inches bore and stroke of its predecessor. Moreover, while the Little was supplied as a runabout only, the Chevrolet "four" may be had with either runabout or touring bodies, the prices being $750 and $875, respectively. The chassis is the same in both cases, the only difference being that with the runabout body the tires are 30 x 3½ while with the touring body they are 32 x 3½. The tires are straight side Q. D. clinchers.

The Chevrolet motor is of the valve-in-the- head type and the cylinders are cast in a single block with the usual accompaniment of three-bearing crankshaft. The valve mechanism—that is, the overhead part—is enclosed by a detachable cover which

INTAKE SIDE OF MOTOR

makes an exceedingly neat finish and keeps the dirt out and the slight valve noises in and can be removed by taking out two bolts. A feature that is very convenient in a motor with valves in the head is that the heads are removable, the combination giving a most accessible motor, for of course the valves are readily gotten at, while the pistons and connecting rods can be removed through the tops of the cylinders. The cleanness of the motor is not a little enhanced by the fact that the exhaust manifold is cast integral with the head casting; the intake manifold, which is bolted to the head casting, is a simple affair with but two branches. The valves are 1½ inches in diameter, affording ample area for the passage of gases.

PART SECTION SHOWING VALVES

The crankpins all are 1½ inches in diameter and the bearing surfaces 2⅛ inches long. In the main bearings of the crankshaft the practice is followed of making the bearings of greater diameter at the rear than at the front. The front bearing is of the same diameter as the crankpins—1½ inches—while the middle bearing is 1 31/32 inches in diameter and the rear bearing a full 2 inches; the bearing lengths are 2¾, 2 and 3½ inches long, the longest bearing, of course, being at the flywheel end.

The motor is lubricated by splash, the oil being circulated by a positive pump and passed through a sight-glass on the dash, so that the driver can see how the system is working at all times. The carburetter is of the double jet type and ignition current is generated by a high-tension magneto. Gravity is relied upon to circulate the cooling water, the usual fan back of the radiator ensuring a draught of air.

The clutch is a leather-faced cone, with compensating springs to give easy engagement, and the gearset provides three forward speeds, selectively controlled by a centrally-located lever; the steering wheel is on the left side. The gearset is mounted separately from the motor. Semi-floating construction is embodied in the rear axle. Both sets of brakes are on rear wheel drums, the service brakes being external contracting and the emergency brakes internal expanding. The front wheels run on ball bearings.

The bodies are extremely clean and neat in design, the absence of external encumbrances being particularly noticeable. Door handles and hinges are on the inside. The dashboards are surmounted by cowls of moderate depth with a slope that harmonizes well with the body lines. In the front semi-elliptic springs are fitted, while in the rear the springs are three-quarter elliptics.

In the runabout the gasolene tank is of

Digitized by Google

oval cross-section with a capacity of 20 gallons and is placed behind the seat on the rear deck. The touring car has a 16-gallon tank hung under the body at the rear. The weights of the two types are 1,975 pounds for the runabout and 2,200 pounds for the touring car, in both cases full equipment, oil, gasolene and water being included in the weights.

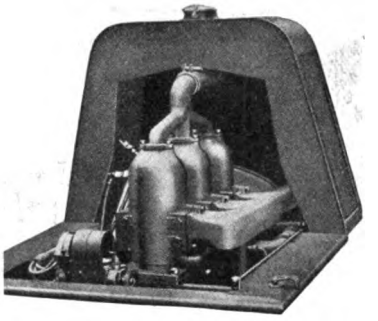
Both models are sold with an equipment list that includes mohair top with cover and side curtains, windshield, five lamps, Prest-O-Lite tank, horn, speedometer, tools, jack, pump and tire outfit. For an additional consideration of $125 either model will be equipped with electric lighting and starting system, in which case the magneto will be omitted and a coil and distrtibuter used for the ignition.

Why Spark Advance Causes Knock.

Notwithstanding the glibness with which the knocking of a motor with an excessive spark advance is referred to, there are many who would be sadly at a loss to explain why such knocking occurs. The fact of the matter is that when a motor is running at high speed and ignition occurs just before the piston reaches the top of its stroke, the pressure of the explosion does not reach maximum until the piston has started on its downward stroke and is running away from the blow, so to speak, lessening the impact much as the impact of a baseball is lessened by drawing back the hands just as the ball strikes. If the speed of the motor is decreased, however, without retarding the time of ignition, the explosion occurs either as the piston is still rising or while it is at the dead center, so that there is a sharp rap without any piston movement to ease its impact.

North East Ford Unit Direct Connected.

In the description of the North East Electric Co.'s latest adaption of its electric lighting and engine starting system for application to Ford cars, which appeared in the issue of Motor World bearing date of November 27th, the basis of the equipment is the new "gearless" unit just developed; it is direct connected to the crankshaft of the engine through chain and sprockets and does not, as inadvertently was stated, incorporate the automatically shifted gears that form one of the distinguishing features of other forms of the North East company's lighting and starting apparatus.



Good Lifting Jacks and Bad Ones.

It is an unfortunate thing that there are in existence so many automobile jacks that are miserable, trappy affairs, when really good jacks are comparatively inexpensive. Besides being a nuisance, a poor jack is a menace to the car and to the operator.

PALMER-MOORE TRUCK MOTOR COOLED BY AIR OR WATER

But no Other Changes Made in Three-Cylinder Two-Cycle Engine — Speed Regulation by Rotary Shutters in Gas Ports.

When it comes to a question of cooling systems, there are persons who like air-cooled motors and there are others who don't and who refuse to consider an engine, however good it may be, if it is not water-cooled. And as the Palmer-Moore Co., of Syracuse, N. Y., is perfectly willing to sell persons what they want, as long as they want something good, a water-cooled motor has been designed and will be installed in Palmer-Moore trucks instead of the air-cooled motor, for anyone who has a preference for water.

PALMER-MOORE WATER COOLED

The Palmer-Moore 1,600 pound capacity truck and its two-cycle air-cooled motor were described in detail in Motor World of April 3 last. In the new engine no changes whatever have been made in the motor, apart from those incidental to the use of water for cooling; the radiator is of the dash type and the flywheel forms the fan. Briefly, the motor is a three-cylinder two-cycle machine of the three-port type. Its peculiarity, and the feature in which it differs from all other two-cycle motors and which, the makers state, eliminates most of the objections that have been made to two-cycle motors, is the employment of rotary shutters in the ports. A good designer has comparatively little difficulty in making a two-cycle engine that will run well at low speeds, or one that will run well at high speeds; but when it comes to making one that will perform equally well at all speeds the problem is exceedingly difficult —in fact, it is one of the most difficult problems in two-cycle motor building. In a general way, the reason is that the port areas suitable for one speed are not always suitable for other speeds. The Palmer-Moore people have attacked the difficulty by placing shutters in the ports so that the areas can be varied and speeds changed without backfiring, choking or other manifestations of distress that are so well known in two-cycle engines with ordinary port systems.

The motor has a bore and stroke of 4 inches—in technical parlance it is a "square" engine—and is rated at 20 horsepower; the maximum speed is comparatively low, being 950 revolutions per minute. The truck has a wheelbase of 102 inches, 36-inch wheels, 2½-inch solid tires front and 3-inch rear, and either planetary or three-speed selective sliding gear change-speed mechanism. Standard equipment in the air-cooled model includes the planetary gear, and in the water-cooled model the sliding gear with disk clutch. The price of the standard air-cooled chassis is $1,300 and of the water-cooled chassis $1,450. The water-cooled model can be equipped with planetary gear, which resuces the list price by $50.

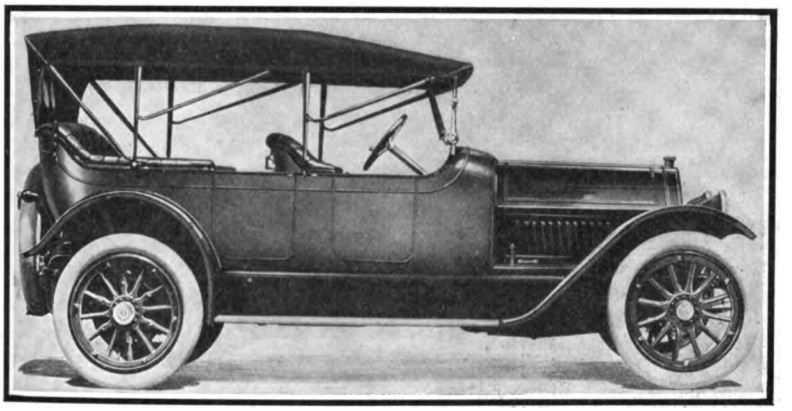
Washington Regulates Vehicle Loads.

The State of Washington will, after January 1, be numbered among those to regulate the ratio between the width of tire and the load which the vehicle may carry; and that the statute may be respected its framers have incorporated provisions for nominal fines for the first and second offenses and $250 or 90 days for the third.

The law provides that for tires two inches wide or less, the maximum load shall not exceed 400 pounds an inch of width of tire. This will make the maximum load permitted on a wagon with two-inch tires 3,200 pounds, or 1,600 pounds for a one-inch tire. For tires wider than two inches and up to five inches, the maximum load is not to exceed 400 pounds an inch of width of tire plus 50 pounds an inch in excess of two inches of width of tire. With a five-inch tire the ratio of weight per inch of tire width is increased to 500 pounds an inch plus 70 pounds an inch for tires in excess of five inches.

The maximum load includes the weight of the vehicle. The law also provides that the load must be evenly distributed on each axle.

What Constitutes Spark Advance.



While it may seem almost as unnecessary as explaining which end of the alphabet comes first, it is a fact that many who drive cars do not know that the spark is advanced by shifting it in the direction opposite to the rotation of the crankshaft and is retarded by shifting it in the direction of rotation; the idea that "advancing" means shifting in the direction of rotation is by no means uncommon.

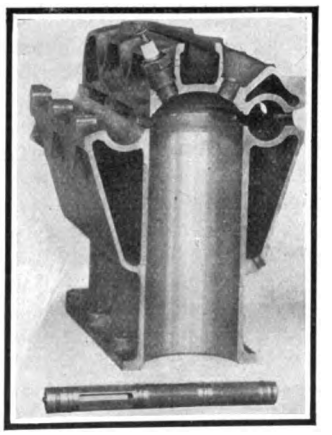
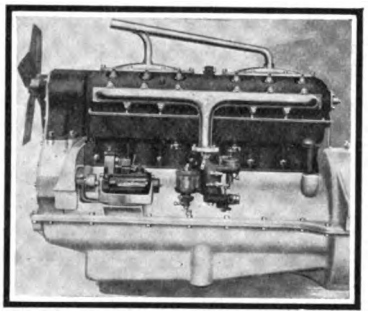
SPEEDWELL ROTARY VALVE "SIX" UNDERGOES CHANGE

Valves Fluted and Fitted with Rings and Improved Manifolds Adopted — Chassis the Same with Much Equipment Added.



With a year of service at the hands of users behind it, though the makers freely admit that it has required more than seven years of constant work to bring it to its present perfected form, the Mead type rotary valve engine which the Speedwell Motor Car Co., of Dayton, O., uncovered at the last New York automobile show, has been materially altered and improved, and in its new form it is markedly simpler than it was in the old. The principle of operation remains exactly as it was, though the valves themselves have been slightly altered, the better to ensure gas tightness, and the external appearance of the motor has been made quite unlike its predecessor by reason of new manifolds, and a new location for most of the accessories.

SPEEDWELL-MEAD ROTARY VALVE "SIX" WHICH SELLS FOR $2,850



Barring the greatly increased accessibility which the new construction brings about, the most important change that has been made is in the valves. As heretofore, each block of three cylinders has its own rotating member for intake ports and another for exhaust ports, the provision of two rotating valves for each cylinder distinguishing the system from the Henriod system which is used in Darracq engines and in which a single rotating member serves alternately for both intake and exhaust. But instead of being smooth, the Speedwell-Mead valves now are lightly fluted, the indentations serving to render lubrication more positive and at the same time to ensure against the possibility of gas leaks. Another important change is embraced in the location of piston rings at each end of each valve member and also between each port, the rings serving to prevent the leakage of gas from one cylinder to the other. As in the past, each valve member is made in two parts—one part for each block of three cylinders—which are flexibly joined through the intermediary of an Oldham coupling.

As regards the rest of the motor, such changes as have been made concern externals more than anything else. The bore and stroke remain the same—namely, 4⅛ x 5¼ inches, respectively—and though the A. L. A. M. formula gives a nominal rating of but 40.8 horsepower, the actual power developed is well in excess of that figure. As a matter of fact, brake tests have demonstrated that from 400 revolutions a minute to 2,000 revolutions, the power curve rises in a practically straight line from 15 to nearly 70 horsepower; the makers rating of 60 horsepower, therefore, is conservative. In reference to the nearly proportionate increase in power with the increase in speed, it is pointed out that this feature is largely due to the positive action of the valves and to the comparatively large port area which they afford. The torque remains practically constant throughout the same range of speeds. Lubrication is carried on by pressure feed, a double pump being used; one compartment of the pump forces oil directly to the three main engine bearings, thence through hollow crankshaft to connecting rod bearings and the other compartment oils the valves directly through eight leads to each. The valves are driven by a combined helical gear and "silent" chain system, as heretofore, their speed being one-fourth crankshaft speed.

ROTATING VALVE AND PORTS

New manifolds for both intake and exhaust constitute the chief element of newness in the external appearance of the motor. Instead of being a continuous unit, the exhaust manifold now is in two units, each of which serves a block of three cylinders; at the same time, the ejector principle has been adopted by way of assisting perfect scavenging of the residual charges. The intake manifold now is very much simpler than it was and careful attention has been given to it to secure flexibility and the entrance of full charges. Instead of being what may be termed a triple "T," it is a single "T," and is fully water-jacketed to assist in the vaporization of low grade fuels. Water pump and magneto positions also have been changed, to increase accessibility and simplicity and a new type of water manifold adopted. As in the past, the clutch is housed in the flywheel, which is enclosed and securely bolted to the gearset, making a unit power plant which is supported at three points.

INTAKE SIDE OF MOTOR

Coincident with the alterations that have been made in the motor, some few changes also have been made in the chassis to which it is fitted, though most of them have to do with added equipment. Briefly, they are as follows: Power tire pump added; indicator on toe board to show condition of electric lighting and starting battery; Warner speedometer added; oil feed indicator placed on dash; electric lighting switches placed on heel board; rear seats widened; front seat fitted with single undivided cushion; quick-detachable curtains adopted; trouble lamp socket placed on dash; larger electric horn with operating button on steering column; gear shift lever lock pro-

Digitized by Google

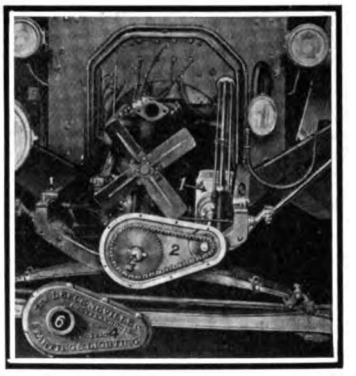
vided; wire wheels made optional at slight additional cost.

The wheelbase length of the standard chassis is 135 inches and it is mounted in front on the conventional semi-elliptic springs and in the rear on three-quarter elliptic members. The transmission of power is through dry disk clutch and selective gearset with the control lever in the center of the footboard, the steering gear being at the left side. Wheels of all five-passenger models are shod with 36 x 4½-inch tires both front and rear, the seven-passenger models being carried on 35 x 5-inch tires. Five- and seven-passenger open models list at $2,850 and $2,950, respectively, the price including the following list of equipment:

Top with boot and quick-detachable side curtains; windshield; Warner speedometer; electric lighting and engine starting system; electric horn; dash ventilators; Firestone demountable rims with one extra and tire carriers; power driven pump; robe and foot rails; and the usual complement of tools, tire repair kit, jack and so forth.

Kellogg's Air Starter for Ford Cars.

Well and widely as the air pumps manufactured by the Kellogg Mfg. Co., of Rochester, N. Y., are known, it is by no means as well known that the company makes, and has made for a considerable time, complete air starting systems. Such, however, is the case, and when it is stated that the Kellogg starters are installed in such cars as the Stevens-Duryea and the older Pierce-Arrow models, it is unnecessary to say anything more as to the merits of the outfits. Kellogg pumps are employed in the air-starting systems of other cars, including the Winton, which, as is well known, is a pioneer in the use of pneumatic substitutes for the fast disappearing hand crank.



For the coming season's business the Kellogg company not only has considerably improved its standard line of pumps and starting systems, but has brought out a complete system especially for Ford cars, consisting of a power pump, air tank and cranking cylinder. With this equipment the motor is turned over much more rapidly than it could be cranked by hand. The whole system is brought down to the simplest possible form consistent with efficiency; the price will be between $60 and $70, complete and ready for installation. The chief improvement in the power pumps consists of making them wholly of metal; the line now includes not only two- and four-cylinder models, but a six-cylinder pump, which just has been added and is designed for the heaviest work in its class. Another addition to the line is a cold-weather priming device to facilitate starting.

LEECE-NEVILLE, TOO, ADDS FORD STARTER AND LIGHTER

Apparatus is Easily Installed and Operates Through Sprockets and Chain—Powerful Enough to Propel Car on "High."

An electric starting and lighting system, designed especially for Ford cars, that will not only do what usually is expected of a starting and lighting system but will also propel the car on high gear in case the motor should stall, has been placed on the market by the Leece-Neville Co., of Cleveland, O. And not only is the outfit claimed to be all that it should be in the matter of operation, but it can be applied to Ford cars without difficulty, and without making mechanical changes.

The accompanying illustration shows the appearance of the Leece-Neville motor-generator unit and its drive installed, the

LEECE-NEVILLE FORD SYSTEM

cover of the chain case having been removed. The chain case is packed with grease and the drive is quiet and efficient both when the engine is being cranked and when it is driving the generator to furnish current for the battery. The large sprocket, 3, is pinned on the end of the engine shaft and the motor-generator is mounted partly under the steering column in the engine space.

Of course, the principles of operation are the same as in other complete systems—that is, a button is pressed to start the engine, and when the engine "takes hold" the driving current is automatically shut off and the engine drives the machine as a generator, replenishing the battery from which current for lighting and starting is drawn. The cranking speed is 150 revolutions a minute. With this outfit all the lamps on the car are electric; six-volt bulbs are used and the light has the steadiness that is a feature of lights supplied with current from a battery. The system is substantially built despite its moderate weight.

Here's the Electrically Operated Window.

Carrying the frameless limousine window idea a little further than any one else has carried it ,a foreign body builder has developed what is styled a self-opening and closing window that is electrically operated, though just how electricity is made to do the work is not divulged. It is stated, merely, that pressure on one button raises the window, release of the button stopping the window at the desired height. Another button is provided to lower the window; the mechanism is hidden.

Claims Defective Car Caused Death.

Somewhat akin to the Cadillac "collapsed wheel" case, wherein a car owner is suing for damages growing out of the breaking down of a wheel, is the suit which has been brought in Osceola, Ia., by Mrs. Alice Goldsmith against the Moyer Automobile Co., an Iowa dealer. She claims her husband met his death June 1, 1913, when his car overturned, and she claims the accident was caused by defective brakes, leakage of axle grease and other faulty mechanism. She asks for $50,000.

Gets One Dollar for Broken Axle.

The Mandel-Frisch Automobile Co., of Sioux City, Ia., was given a verdict of one dollar last week in the Sioux City District Court, in an action brought against the municipality for an axle broken when the wheels of a car owned by the company dropped into a hole in the street. The automobile company charged that the city had improperly finished a piece of sewer construction. The jury deliberated for five hours before it rendered its verdict.

Goodyear "Non-Skid" Now "All Weather."

The Goodyear Tire & Rubber Co. has eliminated "non-skid" from tire terminology, so far as Goodyear tires are concerned. Hereafter the Goodyear Non-Skid will be known as the "All-Weather" tread tire, the change being made on the principle that skidding is not a matter of seasons, and also because the use of non-skid tires, as must be apparent to all, is enormously on the increase.

Seasoning New Spark Plugs.

It is not unusual in a new spark plug to find that the bushing is rather loosely screwed in. This often is done purposely in order to allow the new porcelain core to expand under the heat. After the plug has been in use for a short time and has become somewhat "seasoned" the bushing may be tightened, but it is better not to do so at first unless there is a leak.

CORRESPONDENCE

PREST-O-LITE ENGINEER FINDS COMFORT IN ELECTRIC TEST.

To the Editor of Motor World:

At the conclusion of the Indianapolis Motor Speedway tests last summer, I made the statement that the generation of electricity by an automobile motor involved a power loss of from 5 per cent. to 12 per cent., depending upon the horsepower of the motor. For this statement I have been very liberally roasted in your columns by Mr. Kebler, Mr. Rushmore, Mr. Bailey and others of the electric lighting and starting fraternity, most of whom claimed the loss would be only a fraction of one per cent.

I now want to call your attention to the Packard test recently conducted on the Long Island Speedway, which shows that at 20 miles an hour the loss was 5.2 per cent.

You will also note that in the Packard test the power loss of 3.3 per cent. recorded was at 40 miles per hour. Practically, this may be disregarded, for the reason that 40 miles per hour in daily service is unusual.

Since the amount of power required to operate the generator remains the same whether the engine be large or small, it becomes evident that the burden of operating the generator is far greater, proportionately, in a small engine than in a large engine. The Packard motor has six cylinders and is rated at 38.4 horsepower, A. L. A. M. In the Indianapolis Speedway tests a motor of 32.4 horsepower, A. L. A. M., operating at the same speed, 20 miles per hour, showed a power loss of 6.9 per cent.

Taking into consideration that the Packard test was made on a straightaway, whereas our tests involved the curves of the Indianapolis Motor Speedway, and further considering the fact that in our tests the start in each instance was made on the measured gallon of fuel, whereas in the Packard test the starting was made on a reserve supply of fuel, I think the approximate accuracy of the Indianapolis Speedway tests is confirmed in all respects by the Packard test. Indeed, the Speedway tests would seem to be of more practical value as applied to the conditions of daily driving, which involves starting and stopping, turning corners etc.

It is probably true that the buyer of a Packard is not greatly concerned by the loss of 5 per cent., or even a greater percentage, of his fuel. But isn't the buyer of a medium-priced, moderate-powered car, who is bound to suffer a much larger proportion of loss than 5 per cent., entitled to know it? I think he is.

If the gentlemen who attacked the Indianapolis Motor Speedway tests so promptly and so vigorously in your columns will now proceed to "pooh-pooh" the Packard test in the same fashion, I assume that you will accord the necessary space, and I am certain your readers, as well as the undersigned, will be greatly edified.

R. H. COMBS,
Prest-O-Lite Co., Indianapolis.

WHY LOW-PRICED ELECTRICS ARE SLOW IN APPEARING.

To the Editor of Motor World:

Referring to your editorial "The Popular Priced Electric Car," I am glad to see interest taken in this matter and agree with what you say, but there is something which everyone overlooks who is not in the business, when he writes on the low-priced electric. Your editorial, for instance, while not distinctly describing such a car as you think would be satisfactory, refers to 100 miles on a single charge of the battery, also to an average speed of 22 miles on a test run made two years ago.

Now, there is the whole problem. If the people will buy and be satisfied with an electric car which will run not faster than 15 miles an hour on a level road, meaning that it would give a man actually around town from 10 to 12 miles of service in an hour, which is about twice what a horse would give, and a mileage under such circumstances of not over 40 miles as a maximum and reduced somewhat in bad going, a fairly low-priced car can be built.

The car which will give 100 miles on a single charge at 20 miles an hour, with an average even of not better than 17 or 18 miles, requires a certain amount of electric energy to overcome the road and wind resistance, and therefore a certain size motor and a certain size battery, all of which the electric vehicle engineers can figure to a nicety. That weight battery and that weight motor are almost fixed in cost, regardless of quantity production, because lead, copper, hard rubber and hand assembly are not affected very much by quantity and the copper wire, etc., is made not only for automobiles but in immense quantities for other demands.

With given weights of these principal items and a given speed, certain strengths and weights of axles must be had, certain size tires to carry the load, etc., so the answer every time one figures it is an original cost away beyond what can be termed a "popular" priced car.

Now, in a gasolene car, there is not much difference between certain features of the performance of the cheap car and the high-priced car—that is, one will go about as fast on the road as the road permits of traveling and the cheap car will go just as far as the high-priced car by putting in gasolene as often as the tank is empty.

With an electric it is different, and while doubtless the most of the electric vehicle manufacturers have catered to the very best trade because of the nature of service their cars offered and the demand which people made upon them for better and better goods, there is a certain fundamental distinction, and until there is a demand for an electric car which will go only at slow speeds and with a smaller radius than present cars, reduction in cost which might be obtained from less expensive trimming, upholstery and a lessened luxury and comfort will not avail as much to reduce the price as those who have not had opportunities to investigate thoroughly, at first feel.

It will be foolish to say that lower prices will not sometime prevail, also foolish to assume that we are not going to have further improvements in the cars, such as have already taken place, but if I may be pardoned for using the expression, there has been a great deal of loose talk about a low-priced electric car, and whenever you ask those who made these statements what they want the electric to do, they usually describe exactly the cars now being built, so far as service is concerned, only they would be satisfied with less expensive painting, upholstery, general trimmings and equipment.

They want at least a four-passenger brougham at a 20-mile speed on the level, 75 to 100 miles per charge at 20 miles an hour, batteries accessible by not being under the seat or body, and a low-hung body, both of which make for a long wheelbase; a good hill-climbing ability and plenty of room and comfort in the body, and all those things cannot be given at low prices.

Another thing which is overlooked in the comparison of prices is that electric limousines and broughams are being compared with low priced gasolene runabouts.

When these are compared with the limousines of the better gas cars, the price question is turned about, as indeed it should be, as though the gasolene limousines are larger than the electrics, they are no better in any particular as to quality of body building, paint, upholstery and fittings.

My only reason for writing is that quite a little injury may be done to the established electric vehicle industry by leading the public to feel that all the things they want can be furnished for much less than at present.

I say all this and at the same time want to add that per mile of service an electrtic car can be driven for less money than a gas car and for most requirements of delivery service, can deliver packages per "package mile" cheaper than gas car delivery work.

SIXTH TOLEDO SHOW NEEDS TWO FLOORS FOR EXHIBITS

Pleasure Cars of 37 Makes, Seven Brands of Trucks and Five of Electrics Staged—Complete List of Exhibitors.

With enough exhibits to fill two whole floors, the sixth annual Toledo show, which was opened on Saturday night, 6th inst., and will hold the boards until the 13th, is housed this year in the spacious Toledo Factories Building instead of in the Terminal Auditorium, where it always has been held in the past. The Toledo Auto Show Co., which is composed of prominent members of the trade in that Ohio city, has the exposition under its wing, so to speak.

Pleasure cars and commercial vehicles are segregated, the former being on the first floor of the building and the latter, together with a liberal sprinkling of accessory exhibits, are on the third floor, though fast-moving elevators make the skipping of the second floor scarcely noticeable. All told, there are 36 separate exhibits, which include pleasure cars of 37 different makes, commercials of seven brands and five accessory displays, to say nothing of five different brands of electrics. The complete list of exhibitors follows:

Abbott Motor Sales Co., Abbott-Detroit; H. J. Adams, Reo pleasure and commercial; Atwood Automobile Co., Overland pleasure and commercial, Marmon pleasure and Standard electric; Auto Distributing Co., Regal; Banting Machine Co., Patterson; Baumgardner & Kibby, Oakland; Blevins Auto Sales Co., Studebaker pleasure and White commercial; Bunnell Auto Sales Co., Cole and Chevrolet pleasure, Detroit electric, and Federal trucks; Cornelius Hohly Auto Co., Krit; Gamble Motor Car Co., Peerless, Hudson, Garford and Ohio and Baker electric; Gauntlett Auto Sales Co., Buick; Roberts-Toledo Auto Co., Ford pleasure and commercial; E. W. McBurg, Stearns-Knight and R. C. H.; Landman-Griffith Co., Maxwell and Lozier; Lichie Automobile Co., Cadillac; Maumee Motor Co., Empire and King; Standard Automobile Co., Packard, and Rauch & Lang electrics; H. E. Throne, Mitchell and Paige-Detroit; Union Supply Co., Pierce-Arrow and Chalmers; C. J. Clapp, Winton; White Motor Car Co., White pleasure and commercial; W. H. McIntyre Co., Detroiter, Jeffery and Lyons-Knight; Grasser Motor Co., Hupmobile pleasure and Gramm commercial; Allen Motor Co., Allen; First Garage & Motor Co., Partin-Palmer; Greyhound Cyclecar Co., Greyhound cyclecars; Toledo Rubber Co., supplies; Ray-Kuhn Co., supplies; Bock Bearing Co., bearings; Lewis Foundry Co., castings and motor parts; Lima Cyclecar Co., Lima cyclecars; Erie Supply Co., supplies.

Helping the Amateur Sign Maker.

Although there are times when a very poorly made sign—a slap dash affair—will attract attention and hold it almost because of its very poorness, it is generally the well-lettered, easily-read sign that draws the gaze, and it is because not every one can wield a brush and get good results that the sign shown by the accompanying illustration has been placed on the market; incidentally, the story it tells is a sermon in itself. The sign is made by the Multiform Sales Co., of Chicago, Ill.

In its simplest aspect it is merely a substantial, neatly-finished wooden frame holding a number of thin metal strips separated

MULTIFORM ADJUSTABLE SIGN

by very narrow slots. The letters are printed on separate tabs and are merely hooked into place one after the other; they simply hang from the metal strips. As the letters are all made on tabs having the same margin, it is impossible to gauge the spacing wrongly and the resultant sign must be a presentable one. And as the letters are plain block letters the sign can be read for a long distance. The frames are made in four sizes and are sold complete with the necessary letters and figures, punctuation marks, etc. Two sizes—8 x 15 inches and 13 x 15 inches, the latter size being the one illustrated—sell for $4.50 each, together with 220 letters and figures. The two other sizes are 15 x 28 inches, with which there is included 440 letters and spaces, and 22 x 37 inches, with which there is included 660 letters and spaces.

F. H. Berger former chief engineer of the Oakland Motor Car Co., who only recently returned from Europe, has opened an office of his own in the Sun building in Detroit. He will act as a consulting engineer and also develop several devices which he has in mind.

MAKE PARCEL POST LIMIT 50 POUNDS AND CUT RATES

New Changes in Several Zones to Become Effective January 1—Books to Be Admitted in March—Other Innovations.

Postmaster General Burleson's recommendation that the weight limit of the parcel post be raised from 20 to 50 pounds in the first and second zones has been approved by the Interstate Commerce Commission; this and other changes will go into effect January 1. Rates are to be reduced in the third, fourth, fifth and sixth zones. The maximum weight in all zones above the second becomes eleven instead of twenty pounds. Books will be admitted, but not until March 16, 1914.

For the third zone rates will be reduced from seven cents for the first pound and five cents for each additional pound to six cents for the first pound and two cents for each additional pound; for the fourth zone, from eight cents for the first pound and six cents for each additional pound to seven cents for the first pound and four cents for each additional pound; for the fifth zone, from nine cents for the first pound and seven cents for each additional pound to eight cents for the first pound and six cents for each additional pound; for the sixth zone, from ten cents for the first pound and nine cents for each additional pound to nine cents for the first pound and eight cents for each additional pound.

It is provided by the Postmaster General with the consent of the commission, "that the rate of postage on parcels containing books weighing eight ounces or less shall be one cent for each two ounces or fractional part thereof, and on those weighing in excess of eight ounces the zone parcel post rates shall apply."

This is to be effective March 16, 1914.

The Postoffice Department also has arranged that senders of packages by parcel post will not have to lick the stamps. "Under such authorization," states the department, "when a parcel is presented for mailing, the clerk receiving it, after collecting the required postage, may endorse on the parcel the amount of the postage, which later will be affixed by an employe.

Twelve Bills for One-Cent Postage.

One-cent postage promises to be one of the live issues in the present session of Congress, 12 bills, at least, having been introduced with this object in view. Among other things, it is contended that the increased revenue from the parcel post will render the cut more likely.

A. A. A. ADOPTS STANDARD FOR TRAFFIC REGULATION

Outlines Rules for Pedestrians as Well as for Vehicles—Believes its Suggested Code Would Considerably Clarify Situation.

They do some things better in France. For instance, they regulate pedestrians as well as wheel traffic. In doing so, they even place a burden of responsibility on pedestrians, who quite frequently are arrested even when injured by a vehicle of any sort.

In this country, the pedestrian is unrestricted; he does as he pleases; he knows no regulations and, although it long has been perfectly obvious that the one way quickly and gently to reduce the number of accidents is to regulate the pedestrian, and to place upon him a burden of responsibility, no wise, reverend or any other sort of legislator has dared propose anything of the sort. It is much cheaper to join in a hue and cry and denounce automobilists, truck drivers and street car companies.

In a praiseworthy effort to lend its weight to the reduction of accidents, the American Automobile Association, at its meeting in Richmond, Va., on the 2nd inst., adopted "Rules of the road and regulations of road traffic," the full text of which has just become available and which, among other things, takes note not only of the need of regulating pedestrians but at least of some ways in which they best may be regulated.

The rules and regulations are the product of H. M. Rowe, president of the Automobile Club of Maryland, of Baltimore, who, in introducing the regulations, said:

"No attempt is made to define regulations for control of street cars or any other public service vehicles or for such other uses of the highways as are usually covered in special laws or traffic rules to meet unusual conditions.

"The purpose of these rules and regulations, therefore, has been limited to include only those of a general character, it being understood that they may be supplemented as found necessary to meet local conditions.

"No penalties or fines have been designated or suggested, but it is recommended that they should be included in any draft of bills that may be prepared for legal enactment.

"The general principles that have been observed in framing these rules of the road and regulations of road traffic are these:

1. That all traffic rules and regulations for the control of the movements of vehicles and pedestrians are intended (a) to reduce danger from all sources to the minimum and to prevent accidents by removing the causes therefor; and (b) to facilitate the movement of vehicles and pedestrians expeditiously and safely.

2. That roads and roadways are intended for the use of vehicular traffic and that vehicles should be protected in their reasonable use of the same.

3. That sidewalks and designated crossings are intended for pedestrian traffic and that pedestrians should be protected in their reasonable use of the same.

4. That the elimination of danger to persons and property is determined largely by the extent to which pedestrians and vehicles can be confined to the occupancy of those thoroughfares provided for them—namely, roads and roadways for vehicles and sidewalks and crossings for pedestrians.

5. That vehicles should have the right of way on roads and roadways except at crossings; that pedestrians should have the right of way on sidewalks and at designated crossings.

6. That pedestrians should, if possible, not be permitted to occupy roads and roadways, except at crossings, for any purpose whatever and that when any deviation from this rule is necessary so that they may enter and depart from street cars and other public carriers they should be protected from vehicular traffic by suitable standards, railings or other barriers.

7. That accidents can only be reduced to the minimum by eliminating as far as possible all of the factors contributing to them, not only those arising from the improper use of vehicles on roads and roadways, but also those arising from the improper use of pedestrians of roads, roadways, sidewalks and crossings.

Definitions—Definitions of terms used herein. The following terms wherever used herein except as otherwise specifically stated shall be defined as follows:

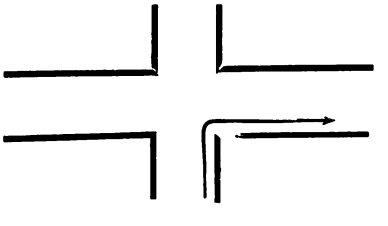
Road: The word "road" includes highways, streets, avenues, parkways, boulevards, viaducts, bridges, alleys, and every public way used or laid out for the use of vehicles.

Roadway: That portion of any road that is included between the curb lines or edge thereof and is designed for the use of vehicles.

Curb: The outside boundaries of that portion of a road designed for the use of vehicles whether marked by curbstones or not so marked.

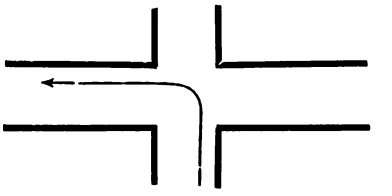
Vehicles: All conveyances of every kind and description which are used on roads, propelled in whatever manner or by whatever power; i. e., that may be driven, ridden or propelled (excepting baby carriages).

Pedestrians: All persons occupying, going or moving on foot on roads, roadways and sidewalks; i. e., all those using roads or thoroughfares when not carried by vehicles propelled by animals or by motor power.



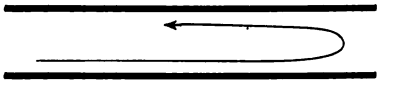
ARTICLE 1—RULES OF THE ROAD FOR VEHICLES.

Sec. 1. Vehicles Keeping to the Right—Vehicles shall keep to the right-hand side of the road.



Sec. 2. Vehicles Meeting—Vehicles meeting shall pass each other to the right of the center of the road.

Sec. 3. Vehicles Overtaking Others—All vehicles overtaking others shall, in passing, keep to the left of the center of the road and shall not pull over to the right of the road until entirely clear of the vehicle passed.



Sec. 4. Turning to the Right into Another Road—All vehicles turning to the right into another road shall turn the corner as near the curb as practicable. Thus:

Sec. 5: Turning to the Left into Another Road—All vehicles turning to the left into another road shall pass to the right of and beyond the center of the intersecting road before turning. Thus:

Sec. 6. Crossing Roads—All vehicles crossing from one side of the street to the other shall do so by turning to the left so as to go in the same direction as the traffic on each side of the street. Thus:

Sec. 7. Stopping on the Road—A vehicle shall stand only with its right-hand side to the curb, except in the open country, where standing on the left will in no way interfere with traffic.

Sec. 8. Slow Vehicles—Slow vehicles shall keep close to the right-hand side of the road or to the right-hand curb, leaving left-hand space for faster moving vehicles to pass—the slower the speed the nearer to the curb.

Sec. 9. Notice of Approach—All motor vehicles before passing other vehicles from the rear shall give notice of approach by horn or other signal before passing.

Sec. 10. Loading and Unloading—Vehicles must not remain backed up on the side of a road or to a curb except to load or unload, and then it must be in such a manner as not to seriously interfere with traffic.

Sec. 11. Obstructing Crossings—No vehicle shall stop on crossings except in case of accident or other emergency or when directed to stop by a police or traffic officer.

Sec. 12. Stopping Near Corners—No vehicle shall stand within 10 feet of any intersecting street corner or crossing.

Sec. 13. Right of Way—Vehicles moving in a northerly or southerly direction shall have the right of way over vehicles moving in an easterly or westerly direction. United States mail, fire apparatus, ambulances, police patrols, and vehicles of physicians when so designated, shall have the right of way in any street and through any procession.

Sec. 14. Signals When Stopping or Starting—Drivers of all vehicles shall indicate by hand or whip their intention of stopping or starting, and no vehicle shall be started forward or backward until the driver has first looked to see that the way is clear.

Sec. 15. Passing on the Left or the Center—No vehicle shall pass to the left of the center of any road except where passage on the right of the center is blocked or where the roadway is occupied by slower moving vehicles, and then only in case there is an open roadway to the left of the center of the road.

Sec. 16. Stopping in Center of Road—No vehicles, unless in emergency or to allow another vehicle or pedestrian to cross its path, shall stop in the road except near the right-hand side or curb thereof.

Sec. 17. Stopping on the Opposite Side of the Road—Vehicles moving forward on the right side of the roadway wishing to stop on the left side shall turn around before stopping so that when motion is resumed said vehicles shall proceed along the right side of the roadway.

Sec. 18. Backing of Vehicles—No vehicle shall be backed without ample warning having been given, and while backing care must be exercised not to injure either persons or other vehicles in the rear.

Sec. 19. Lights—All vehicles occupying any road or roadway shall carry lights at night between one-half hour after sunset and one-half hour before sunrise. Vehicles carrying a single dash lantern shall

Digitized by Google

carry same on the left hand side so that it can be seen from either direction.

Sec. 20. Reasonable Care—All vehicles shall be driven carefully with due regard for the safety and convenience of all other vehicles and pedestrians. Nothing herein or omitted therefrom shall be construed or held to relieve any person or vehicle using, or traveling, or being upon any road for any purpose whatever from the exercise of all reasonable care to avoid or prevent injury through collision with all other persons and vehicles.

ARTICLE II—RULES OF THE ROAD FOR PEDESTRIANS.

Sec. 1. Pedestrians shall keep to the right and shall not stop or stand on sidewalks or road crossings so as to obstruct their free use by others.

Sec. 2. Pedestrians shall not stand or walk on or in any way occupy roads or roadways except while crossing same at indicated crossings.

Sec. 3. Pedestrians shall not stop upon a roadway from a sidewalk or at crossings or elsewhere without first looking to see all traffic approaching that point from either direction, and they shall not cross the roadway diagonally or at any other point except at regular indicated crossings. Neglect to observe the requirement and carelessness and, in case of accident resulting in injury, the responsibility for said accident shall be placed upon the person so injured unless it can be proven otherwise. Nothing in this regulation, however, shall relieve drivers of vehicles from being constantly vigilant, exercising all reasonable care to avoid injury to persons and property.

Sec. 4. Pedestrians shall have the right of way over all vehicles at designated road crossings only, but in crossing they shall not loiter and shall continue to cross the roadway without stopping.

Sec. 5. No person shall jump, hang or ride upon any vehicle while standing without the consent of the owner and under no circumstances while in motion, while the vehicle is on a road or roadway.

Sec. 6. No person shall use roller skates, coasters, tricycles or any other vehicle, toy or other article or wheels or runners (excepting bicycles) or operate the same on any road or roadway.

Sec. 7. No one shall carry children on bicycles under the age of five years.

"Women "Students" Discuss Automobiles.

The Committee for the Prevention of Reckless Driving and Street Accidents of the Society for Political Study—it sounds formidable, anyway—is out to solve the automobile accident problem; the precise connection between automobiles and political study is not explained, but the committee, of which Attorney Edith Reiffert is chairman, met this week in the Hotel Astor, New York City, and, with members of different women's clubs, discussed the situation. Miss Reiffert herself couldn't see the effectiveness of saving babies through pure milk agitation, if instead they are to be "slaughtered" by automobiles.

As is customary in such gatherings, someone presented statistics showing the alleged deadliness of the automobile, several people gave their opinions and recommendations were adopted; one very sensible suggestion was that secular and religious schools open their grounds to the children so they will not be obliged to add to the element of danger by playing in the streets. The chauffeur came in for a harrying, and Mrs. Simon Baruch declared she never allowed her chauffeur to drive faster than 12 miles an hour.

"SMOKE" AND "DENSE SMOKE" NOT THE SAME, SAYS COURT

Appellate Division of New York Remits Fine Imposed on Railroad—How the Ruling May Apply to Motor Cars.

Although the law specifies "dense smoke," and the vigilant traffic "cop" continues to arrest automobile owners whenever he feels in the humor and regardless of the density of the smoke their cars may emit, there is a big difference in smoke—some of which is not smoke—according to a decision handed down by the Appellate Division of the New York Supreme Court, First Department. The gist of the opinion is that smoke which is produced when the "smoker" is doing his best to avoid it by mechanical means and which therefore may be considered more or less necessary and unavoidable, does not come within the meaning of the sanitary code of New York City.

This provides that "no person shall cause, suffer or allow dense smoke to be discharged from any building . . . locomotive engine or motor vehicle . . . . within the jurisdiction of said city" and the action in question was brought by the City of New York against the New York Central & Hudson River Railroad. It was charged that a roundhouse gave out a dense smoke and the court stated that the question upon which this litigation turned was whether the railroad could lawfully be put off the streets of the City of New York.

Referring to the generation of power in railroad steam engines—and by inference in automobile motors—the court said: "It is clear that the ignition of this fuel is always accompanied by more or less smoke, and in a prosecution under this ordinance it was competent for the defendant to show . . . . that the best method for lighting fires was that adopted by the defendant, although it necessarily was accompanied by a certain amount of smoke, and that the method actually adopted by the defendant caused as little smoke as was possible to obtain the desired result. . . .

"There was no evidence to show that there was an excess of smoke over that necessary for the operation of the locomotive engines and no evidence to show that by any other method than that adopted . . . . . could a fire be started in a locomotive engine which would produce less smoke than that produced by the locomotive engines of the defendant."

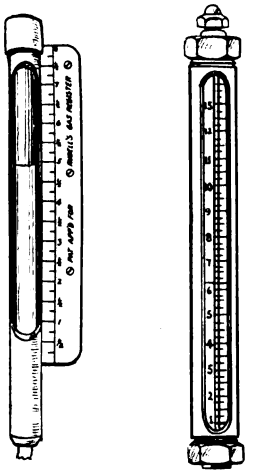
Upon this ruling—that the company did the best it could and that the authorities failed to show that any way existed for avoiding the smoke—the fine which had been imposed in a lower court was ordered remitted. The railroad holds a right to the streets by virtue of a franchise and, having that right—which automobiles also possess—was not held to do an unreasonable thing.

Hunting Accident Costs Jenatzy's Life.

Camille Jenatzy, who won world-wide fame as an automobile racing driver in 1903 when he won the James Gordon Bennett cup race, was accidentally shot at Habay la Neuve, in the Belgian Ardennes, on Sunday, 8th inst. The accident was caused by darkness, in which Jenatzy was mistaken for a deer by a hunting companion and shot in the thigh with an explosive bullet; he died from loss of blood before he could be transportetd to a hospital.

Jenatzy's first prominent appearance as a racing driver was made in 1902 when he drove a car of his own make in the Ardennes Circuit race in France but was wrecked through the collapse of a wheel. It was in the following year that he won the Bennett cup race at the wheel of a German Mercedes. The race was held in Ireland on July 2, and Jenatzy finished the 369 miles in six hours 32 minutes elapsed time, which is at the rate of 39.56 miles an hour. In 1905 Jenatzy made his first American appearance as a contestant in the Vanderbilt Cup race, which was held on Long Island on October 14th. He drove a Mercedes but was forced out at the end of 84 miles with a cracked cylinder. In 1906 he again competed for the Vanderbilt cup over the Long Island course, the race being held on October 6th, and finished fifth in a Mercedes; that was his last appearance in America. He was a slightly-built, nervous foreigner whose red hair and pointed goatee singled him out in any crowd. After quitting automobile racing he entered the trade with an automobile tire of his own.

Traffic Cop Halts Even Uncle Sam.



Although holding up the United States mails is a penal offense, and although the postal authorities in New York City claimed the mail motor trucks should be exempt from traffic regulation, the city has removed them from the privileged class—such as ambulances, fire engines, etc.—and drivers who exceed the speed with the mail carrying vehicles and who otherwise disregard the "corner coppers" are being arrested. The action followed a number of accidents which were attributed to the high and reckless rate of speed made by the truck drivers. The latter, however, claimed they had orders to "make time" and had to do it or lose their jobs. The first driver to be arrested, however, was promptly discharged by the court on the ground that recklessness had not been proved.

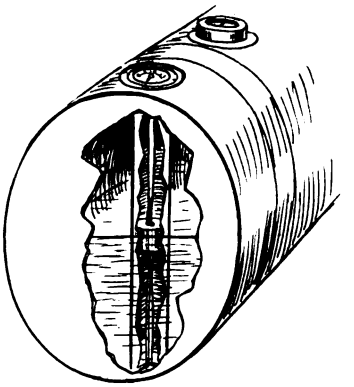
DEVICES THAT SOUND THE GASOLENE TANK

Manifold Functions of Gauges of Various Types That May be Fitted by Any Garage Mechanic—Their Advantages Over the Measuring Stick Method —Wherein Different Types Differ and How They Operate.

The story is told of a man who was absolutely certain that his fuel tank was full when he left the garage; there could be no doubt of it, for he had specifically instructed the garage attendant to replenish his supply against his leaving early the following morning. Ergo: The fuel must be in the tank. Yet, when he had travelled scarcely more than a mile from the garage he found himself "en panne," as the French say, which means, freely translated, out of business by the roadside. And because his motor had stopped with a cough and a pop in the carburetter he knew only too well that his gesolene tank had not been filled

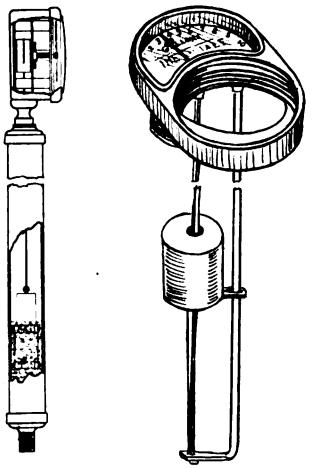


RUDELL AND IMPERIAL

after all; that the garage attendant had overlooked his car in filling the others; that he had to walk back and "take the head off" the man responsible for the oversight.

Of course, he might have lifted his seat cushion, unscrewed the tank cap and taken a slant at his fuel supply before he started —which would have been the logical thing to do. Or he might have emulated some of his brother motorists and poked a stick or a wire or anything else that happened to be handy down into the depths of the tank and judged by its wetness the quantity of the needful in the tank—that is, judged in a kind of a way. But he was in a hurry and he took the word of the garage attendant —and then he walked back. Perhaps he was glad he had only a very little fuel in the tank when he started.

After the owner's wrath had been somewhat appeased and his tank filled up, the garage proprietor would have exhibited a fine sense of the possibilities of his business if he had suggested the advisability of fitting a gasolene gauge to the tank; if he had had a gauge handy so that he could exhibit it to the owner, point out its advantages and make plain that its installation



PFAHL INTERNAL GAUGE

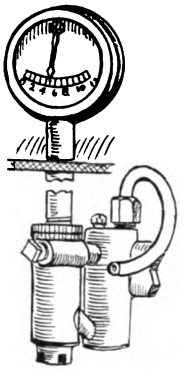
would preclude the possibility of a recurrence of the trouble.

What the Garage Man Might Have Done.

He might have pointed out that a device of the kind not only would serve at a glance as a sure and certain tell-tale of the quantity of fuel in the tank, but that it might be so placed that it would be always in front of the driver; that it would inform him of leaks in the gasolene line or the tank and afford him a ready means of ascertaining exactly the quantity of fuel burned every hour the car was under weigh; it would greatly lessen the likelihood of dirt finding its way into the tank, for it would render unnecessary the frequent unscrewing of the tank cap for inspection of the contents and would do away with the unsightly, awkward, antiquated, dangerous measuring stick. But most important of all is that it places before the operator's eyes an actual record of the quantity of fuel in the tank or the quantity that ought to be there.

The garage proprietor might have had any of eight or a dozen different gasolene tank gauges on his shelves—or, better still, in a showcase—ready for just such an emergency. One proprietor of a garage in a good locality housed 20 cars and 19 of them were fitted with gasolene gauges built into place at the factory of the car maker. The 19th car had none. The garage man knew it and he "laid for" the owner, so to speak, by placing in his stock of supplies a gauge that could be fitted to that particular car in a short time and at little expense. Finally, he "got" him and at the same time advanced a couple of pegs in the estimation of the owner, who was convinced that the garage man kept the best interests of his patrons at heart. The owner was mightily pleased with his gauge. The garage pro-

HANS AND TEL-TALE



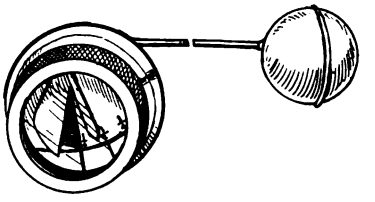
prietor pocketed his just profit—and smiled.

There are a number of different kinds of gasolene tank gauges; some of them are particularly suitable for attachment to some cars and some are more suitable for others; some of them are equally applicable to practically any car; and probably the simplest of them all is the kind that works on the principle of the water gauge glass that forms such a prominent and such a necessary adjunct to steam boilers. It is sure that this type of gauge has less "works" than any other, for, properly speaking, it has no "works" at all.

Two gauges of the kind are illustrated herewith, the Imperial, which is produced by Imperial Fluid Gauge Co., of Canton, O., and the Rudell, which is made by the Rudell Gasoline Indicator Co., of Los An-

Digitized by Google

geles, Cal. In principle and in operation, these two gauges are exactly the same, though their construction differs somewhat, as the pictures make plain. In the Imperial, for instance, the graduations are placed behind the glass tube, whereas in the Rudell they are on a tab at the side. Obviously, gauges of the kind must be so mounted that the bottom of the gauge is level with the bottom of the tank, for inasmuch as they operate on the well-known principle that liquids find their own level, their indication would not be correct unless they are so positioned. In applying either, it is merely necessary to tap the gasolene feed line at any convenient place, insert a "T" coupling and connect the gauge, when the fuel will run up the gauge until its level is the same as that of the fuel in the tank. The graduations do not indicate gallons; they indicate

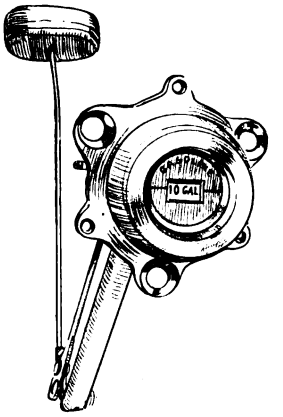


DEPENDO MERCURY GAUGE

inches. It is a simple matter, however, to determine the number of gallons necessary to raise the level in the gauge to any particular inch mark and in this way to check the quantity of fuel in gallons. Such gauges are placed on the dash, of course, and may be any distance away from the tank, though they cannot be used with pressure feed gasolene systems.

Applying the Float Principle.

There are several types of gauges designed to be placed directly in the tank that rely for operation upon a float, and of them the Pfahl gauge, which is manufactured by the Pfahl Gauge & Mfg. Co., of Akron, O., is a good example. Two types of the same gauge are shown in the illustration, one setting flush with the top of the tank and the other having its dial slightly raised. The operating principle of the gauge is very plainly shown by the picture, the float moving up and down in a tube and twisting a flat metal ribbon, to which the needle is attached. As the float is held by a pin entering the slot in the tube so that it cannot rotate on the ribbon, it follows that the ribbon must turn as the float either rises or falls with the level of the fuel in the tank. The gauge, of course, is equally applicable whether gravity or pressure feed is used. In another style made by the same company, the whole tube enclosing the float is mountetd on the dash and connected to

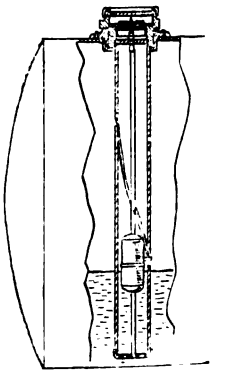


BUSH FLOAT GAUGE

the gasolene tank through piping. In this case, the bottom of the tube must be level with the bottom of the tank, and where pressure feed is used a compensating air pipe from above the float to the top of the gasolene tank must be provided.

Gauge that Replaces Filler Cap.

The Tell-Tale gauge, which is produced by the Bundy-Goebel Mfg. Co., of Detroit, Mich., operates on exactly the same principle as the Pfahl gauge, though it differs from it in several important respects. The first of them is that there is no tube for the float to slide up and down in, its place being taken by a wire to which the float is attached and which prevents it from turning.



TANNER HUDSON SPECIAL

The second of them is that the gauge requires no fitting whatsoever; it can be installed in practically any tank in about two shakes, the modus operandi being to remove the filler cap and screw the gauge in its place with the float and wire projecting down into the fuel. In the upper portions of the device the dial is made to include a threaded opening for the reception of the filler cap. Obviously, the gauge must fit the tank in two respects: It must have the proper thread to fit the filler cap opening, and the float must reach to the bottom of the tank.

Magnetically Operated Needle.

The Triumph gauge, which is produced by the Boston Auto Gage Co., of Boston, Mass., is another which operates on the same general principle as the Pfahl and the Tell-Tale, though in this case, too, there are a number of distinctive features. The principal point of difference between the Triumph and the others is that there is no positive connection between the float and the dial needle. Another important difference is that instead of being a twisted metal ribbon, the member upon which the float slides up and down with the level of the fuel in the tank turns in bearings both top and bottom, and the float is made to

TRIUMPH MAGNETIC TYPE

turn and carry with it the central rod through a spiral slot cut on the inside of the tube containing the float.

How the Needle is Operated.

The most conspicuous feature of the Triumph gauge is the manner of causing the dial needle to register. At the top of the central rod that is turned by the movement of the float there is a tiny magnet. Directly above it, though in a separate compartment which can be unscrewed and carried away in the pocket, there are the dial and the needle. When the dial is screwed in place, the needle immediately assumes a place directly over the magnet and parallel with it. Hence, it indicates on the dial the depth of the fuel in the tank. The Triumph gauge has a number of advantages, prominent among which is the fact that fracture of the glass over the dial can have no effect in lowering the pressure in the tank in pressure feed systems, for there is no opening between the removable dial portion and the rest of the gauge. The gauge is made in a number of styles and can be mounted in any kind of a tank or in practically any position on the car.

Digitized by Google

Though the Hans gauge, which is made by the Hans Motor Equipment Co., of La Crosse, Wis., relies for operation upon the rise and fall of a float resting on the fuel in the tank, the principle is quite different from any of the others, as the accompanying picture makes plain. The gauge may be mounted either directly in the tank with the tube projecting into the fuel, or on the dash. When it is mounted on the dash, the bottom of the tube must be level with the bottom of the fuel tank, of course. The gasolene is led to the float chamber through a small tube which is small enough to ensure a steady flow of fuel regardless of vibration.

Employs Miniature Cable and Drum.

The dial needle is mounted on a spindle which carries a drum over which a fine thread leading to the float is wound. Hence, as the float drops it pulls the needle around, the needle moving in the other direction when the float rises as the tank is filled. In the gauge illustrated the needle is direct connected to the drum, though in another style the needle is moved by a magnet as is the case with the Triumph gauge. The float is so constructed that the larger part is always submerged, the smaller upper part preventing capillary action affecting the accuracy of the readings. The small projections on the submerged portion of the float prevent it sticking to the sides of the tube.

The Bush Mfg. Co., of Hartford, Conn., manufactures a number of different styles of tank gauges, one of which is illustrated herewith. As the picture makes plain, the hand on the dial is moved by a float which is connected to it through the intermediary of a long rod. As the float rises or falls, the dial hand moves with it, registering the height of fuel in the tank. In another style, otherwise exactly like the one illustrated, the dial hand engages and raises a section of the dial when the float drops to the one-quarter-full level, showing a red background as an easily distinguishable warning signal.

Manifestly, it is a comparatively simple matter to calibrate any of the gauges that have been described so that they will indicate the contents of the tank in gallons or quarts or pints, though where gauges are carried in stock to fit tanks of various sizes and shapes it is not possible for the manufacturer to do so; the work then must be done by the purchaser. But where a gauge manufacturer contracts to supply a large number of gauges to a car maker for tanks of a known size, it is quite possible for him to calibrate the gauge to indicate gallons. This is what the Tanner-Hower Co., of Akron, O., does with many of the gauges supplied by it to manufacturers. The gauge that is pictured herewith, for instance, is a special type, designed for attachment (at the factory) to Hudson cars, and shows the contents of the tank in gallons. The gauge is mounted on the dash with the float mechanism in the tank.

Gauge With But Two Moving Parts.

The Dependo tank gauge, which is manufactured by C. F. Roper & Co., of Hopedale, Mass., differs from all of the others in nearly every respect; it is of the kind that attaches to the dash. Without delving deeply into the engineering principles involved in the gauge, it is pointed out by the makers that variations of the height of the gasolene in the tank cause varying pressures on one side of a U-tube partly filled with mercury. A pipe connects one side of this U-tube with the tank, the tube and all the space above the mercury in the U-tube being filled with gasolene and thus excluding all air.

In the other branch of the U-tube there is placed a solid metal float which is connected to the indicating hand by a wire rod. As the pressure on the mercury varies, due to the different heights of the gasolene in the tank, the float moves, moving, in turn, the dial hand which indicates on a suitably graduate scale. An important feature of the gauge is that it is devoid of springs or rods and has only two moving parts.

Wonderful Car Found by a Reporter.

Journalistic enterprise can accomplish stupendous results, on occasion, but it is doubtful if anything has equalled the discovery of a British reporter in the automobile line. Prowling around the recent Paris automobile show, he found a car—no one has seen it since—that he described as having a single cylinder of 60 horsepower. This was nothing, however, for the feature of the machine was that it eliminated, at one fell swoop, all the evils resulting from the emission of the exhaust gases by having a neat and tight-fitting cap over the end of the exhaust pipe.

"Holler" as Solution of Parking Problem.

Alderman Tandler, of Grand Rapids, Mich., is original; he can prove it, and did so when the question of what to do with cars whose owners attend the Powers Theater came up last week. Parking them on Pearl street, a thoroughfare of heavy traffic, was undesirable, and Tandler came to the rescue. He proposes to park them on Ottawa avenue, a block away and around the corner from the theater, and the original part comes in in the means of summoning the cars after the show is ended.

Tandler would have one man in front of the theater with a megaphone and another down at the corner with another megaphone. The first man would holler "Twenty-four," the man at the corner would relay the number to the driver; thus the vehicle would be summoned.

Why Tire Wounds Should be Inspected.

Instructions in the care of tires, cautioning the absolute necessity for the early vulcanization of small cuts and tears, have been drilled in so often that they scarcely require reiteration, though there is one point about the work that as often as not is quite overlooked. Even the tiniest puncture may contain a sharp splinter of metal, or an almost imperceptible particle of sharp gravel that in time will work itself around, even after the hole through which it entered is vulcanized, and make a cavity for itself that eventually will result in a blow-out. Hence, it is quite important that exploration of wounds be made and all such particles of foreign matter extracted before any attempt is made to stop the hole. For the purpose a small, sharp pick, or probe, should be provided, preferably of metal. When a small cut is noticed, its depths should be probed with the pick and every particle of foreign matter removed before the vulcanizer is applied.

Figuring Out Electric Starter Trouble.

A little figuring back from effect to cause sometimes saves trouble. For instance, if the man who had starter trouble, employed fiery language in referring to his battery and shipped the cells to a battery man for overhauling, had reasoned within himself that, as the lights worked beautifully the battery must be about right and that the trouble with the starter must be outside of the battery, he would have been a good deal better off in every way.

Starter Switches that Should be Cleaned.

Most electric starter switches have what is known in electrical parlance as rubbing contacts, but the fact remains nevertheless, that a film of oil may get between the contacts and interfere with the establishment of proper connection. It is wise, therefore, occasionally to examine such switches to make sure that the contact surfaces are bright. If they are dirty or greasy, they may be cleaned with gasolene and touched up with fine emery cloth.

France's Export Trade Still Expanding.

Despite the great stress of competition of the three other large importing automobile exporting nations, France appears to have no trouble in more than holding its own. During the first nine months of the present year, its exports amounted, in round figures, to $34,417,000, as against $31,027,300 during the corresponding period of 1912. During the same period, France's imports increased from $2,0001,000 to $2,996,000.

1,067,800. Spring-Mounted Vehicle Wheel. Samuel M. Cowan, New York, N. Y., and Edward W. Barnum, Danbury, Conn. Filed Oct. 25, 1911. Serial No. 656,742. (Wheel with coil springs between rim and hub.) 5 claims.

1,067,865. Valve Mechanism for Internal-Combustion Engines. Clarence T. Cleve, San Francisco, Cal. Filed April 24, 1912. Serial No. 692,779. (Rotary cylindrical valve.) 5 claims.

1,067,,996. Device for Heating the Carburetters of Combustion-Engines and More Particularly for Flying-Machine Engines. Robert Esnault-Pelterie, Billancourt, France. Filed Oct. 6, 1910. Serial No. 585,666. (Heating carburetter by circulation of hot lubricating oil.) 6 claims.

1,067,934. Accessory for Automobiles. William E. Martin, St. Paul, Minn., assignor of one-half to Mary E. Hartman, St. Paul, Minn. Filed Oct. 26, 1912. Serial No. 727,927. (Two-wheeled truck as substitute for disabled wheel.) 9 claims.

1,067,940. Device for Extracting Traction-Wheels from Holes. Samuel Rohe, Fostman Rohe, and Louis H. F. Rohe, Kenmare, N. D. Filed Aug. 6, 1912. Serial No. 713,629. (Chain pulling device for rear wheels.) 5 claims.

1,067,949. Resilient Tire. Winfield S. Temple, Sidney, Ill. Filed Sept. 9, 1912. Serial No. 719,390. (Tire with circumferential coiled springs.) 1 claim.

1,067,960. Vehicle Wheel. Marion Milton Bailey, Springfield, Ohio. Filed Oct. 7, 1907. Serial No. 396,232. (Resilient wheel with pneumatic cushion under tire.) 17 claims.

1,067,982. Vehicle Wheel. Chester C. Harbridge, Chicago, Ill., assignor to Detroit Demountable Rim Co., Detroit, Mich., a corporation of Michigan. Filed Jan. 23, 1911. Serial No. 604,109. (Connection for ends of split ring of demountable rim.) 3 claims.

1,068,020. Supplementary Spring for Vehicles. George Sumner, New York, N. Y. Filed Oct. 4, 1912. Serial No. 723,831. (Auxiliary spring shock absorber.) 2 claims.

1,068,022. Liner for Pneumatic Tires. Robert K. Taylor, Detroit, Mich., assignor, by direct and mesne assignments, to Gilbert S. Field, Detroit, Mich. Filed Oct. 29, 1912. Serial No. 728,473. (Tire lining with metal insert.) 1 claim.

1,068,040. Sectional Solid Tire. John Clarence Cole, Chicopee Falls, Mass., assignor to Fisk Rubber Co., Chicopee Falls, Mass., a corporation of Delaware. Filed Sept. 27, 1910. Serial No. 583,988. (Solid tire of annular sections.) 1 claim.

1,068,041. Rim Construction. John Clarence Cole, Chicopee Falls, Mass., assignor to Fisk Rubber Co., Chicopee Falls, Mass., a corporation of Delaware. Filed March 25, 1912. Serial No. 686,004. (Mounting for dual pneumatic tires.) 4 claims.

1,068,044. Vehicle Running Gear. Samuel F. Douglass, Prairie du Rocher, Ill. Filed April 19, 1911. (Four rear driving wheels.) 3 claims.

1,068,056. Combined Air and Oil Valve for Internal Combustion Engines. Clarence Whittington Jackson, Dunkirk, Mont., assignor of one-half to Nels P. Hanson, Dunkirk, Mont. Filed Feb. 27, 1913. Serial No. 751,034. (Crankcase air valve.) 4 claims.

1,068,061. Rim. James S. Johnston, Utica, N. Y. Filed Dec. 6, 1911. Serial No. 664,214. (Demountable rim.) 2 claims.

1,068,071. Endless-Chain Autosled. Julius F. K. Otto, Milwaukee, Wis. Filed Oct. 7, 1912. Serial No. 724,290. (Traction chain drive for motor sled.) 5 claims.

1,068,086. Explosive Engine. Samuel D. Shakley, Pittsburgh, Pa., assignor of one-half to Frank C. Hockett, Cleveland, Ohio. Filed July 17, 1912. Serial No. 709,939. (Four-cycle motor with crankcase compression of mixture.) 6 claims.

1,068,094. Heating Apparatus for Automobiles. Reginald A. Bailey, New Castle, Pa., and Max F. W. Pliske, Cleveland, Ohio. Filed Dec. 24, 1910. Serial No. 599,223. (Heater using exhaust gas.) 1 claim.

1,066,671. Valve Actuating Mechanism for Internal Combustion Engines. Karl Steinbecker, Charlottenburg, Germany, assignor to General Electric Company, a Corporation of New York. Filed Dec. 18, 1911. Serial No. 666.396. (Valve actuated by fluid pressure.) 8 claims.

1,066,672. Internal Combustion Engine. Karl Steinbecker, Charlottenburg, Germany, assignor to General Electric Company, a Corporation of New York. Filed May 25, 1912. Serial No. 699,684. (Oppositely moving pistons in one cylinder.) 10 claims.

1,066,698. Sand Distributing Device for Automobiles. William F. Barcafer, Los Angeles, Cal. Filed Jan. 13, 1913. Serial No. 741, 894. (Pedal-operated sand distributer.) 1 claim.

1,066,712. Cushioning Means for Vehicles. Benson P. Cooper, Ithaca, N. Y., assignor of one-sixteenth to Roscoe C. Wilson and one-sixteenth to Willets Wilson, Ithaca, N. Y. Continuation of application Serial No. 528,414, filed Nov. 16, 1909. This application filed Dec. 8, 1910. Serial No. 596,207. (Pneumatic suspension system.) 11 claims.

1,066,714. Engine Cooling System. Paul Daimler, Cannstatt, Germany, assignor to The Firm of Daimler-Motoren-Gesellschaft, Unterturkeim, Germany. Filed Aug. 30, 1912. Serial No. 717,897. (Cooling system with two radiators.) 3 claims.

1,066,724. Spring Wheel. Friedrich Wm. J. Goersch, Cleveland, Ohio. Filed June 10, 1912. Serial No. 702,834. (Spring cushioned hub.) 10 claims.

1,066,729. Magneto. Edward S. Huff, Detroit, Mich., assignor to Henry Ford, Detroit, Mich. Filed Mar. 2, 1908. Serial No. 418,811. (Flywheel type magneto.) 2 claims.

1,066,738. Shock Absorber. John M. Lansden, Jr., New York, N. Y., assignor, by mesne assignments, to The Aristos Company, a Corporation of Delaware. Filed June 23, 1910. Serial No. 586,437. (Double-arm friction shock absorber.) 2 claims.

1,066,755. Admission Valve. Claude Rorabeck, Dayton, Ohio. Filed Dec. 23, 1912. Serial No. 738,-227. (Valve for fuel injection.) 3 claims.

1,066,756. Air Starter and Relief Valve. Claude Rorabeck, Dayton, Ohio. Filed Dec. 23, 1912. Serial No. 728,228. (Valve for admitting compressed air for starting.) 2 claims.

1,066,763. Attachment for Shock Absorbers. Fred Smith, Stamford, Conn., assignor, by mesne assignments, to The Aristos Company, a Corporation of Delaware. Filed July 27, 1910. Serial No. 574,108. (Shock absorber adjustable bracket arm.) 1 claim.

1,066,768. Internal Combustion Engine. Adolf Vogt, Tulse Hill, county of Surrey, England. Original application filed May 18, 1906, Serial No. 317,-591. Divided and this application filed Oct. 1, 1907. Serial No. 395,451. (Fuel injection type of motor.) 4 claims.

1,066,784. Elastic Tire for Automobiles. Charles W. Barrett, San Jose, Cal. Filed Mar. 4, 1912. Serial No. 681,369. (Tire with inner and outer rims and rubber cushions between.) 1 claim.

1,066,791. Tire. Isaac Broome, Trenton, N. J. Filed July 29, 1912. Serial No. 712,029. (Sectional tire of rubber with steel reinforcements.) 1 claim.

1,066,793. Safety Device for Automobile Engines. Archibald F. Bunting and John Mohn, Detroit, Mich. Filed June 12, 1912. Serial No. 703,129. (Safety throttle.) 7 claims.

1,066,797. Resilient and Suspension Wheel for Vehicles. Herbert Clifford, Jersey City, N. J. Filed Aug. 15, 1912. Serial No. 715,278. (Wheel with inner and outer rims permanently spaced, and rubber blocks in outer rim.) 5 claims.

1,066,808. Vehicle Tire. Julius Gersitz, Downer, N. J., assignor of one-half to Sam Folkman, Philadelphia, Pa. Filed Aug. 9, 1912. Serial No. 714,195. (Wheel with inner and outer rims with enclosed air-tight space bteween.) 3claims.

1,066,861. Tire Protector. Thomas Young Stewart, Winnipeg, Manitoba, Canada, assignor of one-half to James Birrel, Winnipeg, Canada. Filed July 16, 1912. Serial No. 709,630. (Outer shoe.) 3 claims.

1,066,868. Spring Fower Engine Starter. Otto E. Wadewitz, Racine, Wis. Filed May 28, 1912. Serial No. 700,287. (Motor starter of the clock-spring type.) 3 claims.

1,066,887. Gas Engine. Harold D. Chaney, Newton, Mass., assignor of one-half to Louis S. Ross, Newton, Mass. Filed Jan. 27, 1908. Serial No. 412,754. (Arrangement and operation of two-cycle engine ports.) 7 claims.

1,066,919. Vehicle. Theodore A. Klenke, New York, and Frank N. Roerich, Brooklyn, N. Y., assignors, by mesne assignments, to Klenke Cushion Axle Company, a Corporation of New York. Filed Apr. 4, 1908. Serial No. 425,149. (Pneumatic cushions and underhung springs.) 14 claims.

1,066,920. Vehicle Suspension. Theodore A. Klenke, New York, N. Y., and Frank N. Roerich, Jersey City, N. J., assignors to Klenke Cushion Axle Company, a Corporation of New York. Filed Sept. 18, 1911. Serial No. 649,945. (Pneumatic cushions and underhung springs.) 8 claims.

1,066,933. Shock Absorber for Vehicles. Julien Francois Mamet, Billancourt, France. Filed Mar. 27, 1913. Serial No. 753,299. (Auxiliary spring shock absorber.) 4 claims.

1,066,926. Means for Supplying Liquid Fuel to Internal Combustion Engines. James McKechnie, Barrow-in-Furness, England, assignor to Vickers, Limited, Barrow-in-Furness, county of Lancashire, England. Filed Apr. 22, 1912. Serial No. 692,231. (Fuel injection system.) 4 claims.

1,066,953. Vehicle Wheel. Henry G. Sarbach, Cleveland, Ohio. Filed Aug. 7, 1911. Serial No. 642,738. (Wheel with springs between inner and outer rims.) 9 claims.

1,066,954. Self Propelled Vehicle for Transport and Tractive Purposes. Herbert Percy Saunderson, Bedford, England. Filed Nov. 11, 1910. Serial No. 592,882. (Spur gear drive direct to road wheels.) 2 claims.

1,066,958. Equalizing Gearing for Automobiles. Elliott J. Stoddard, Detroit, Mich. Filed May 21, 1912. Serial No. 696,371. (Differential lock automatically actuated.) 5 claims.

1,066,985. Engine Starter. William G. Black and Erastus R. St. John, Pittsburgh, Pa., assignors of one-fourth to said Black, one-fourth to said St. John, one-fourth to W. A. Richwine, and one-fourth to A. H. Sarver, Pittsburgh, Pa. Filed Dec. 29, 1911. Serial No. 668,544. (Compressed air starting system.) 13 claims.

1,067,008. Vehicle Seat. Arthur F. Draper, Berkeley, Cal. Filed May 16, 1910. Serial No. 561,753. (Combined seat and storage compartment.) 2 claims.

1,067,048. Door Lock for Automobiles, etc. Franklin C. Miller, Easton, Pa. Filed Mar. 19, 1912. Serial No. 684,869. (Rotary sleeve lock.) 3 claims.

1,067,078. Power Transmission Mechanism. Clarence W. Taylor, Oak Park, Ill., assignor to Frank M. Lewis, Chicago, Ill. Filed July 17, 1912. Serial No. 710,083. (Roller drive for live rear axle.) 4 claims.

1,067,090. Internal Combustion Engine. Aaron M. Wolf, New York, N. Y. Filed June 13, 1910. Serial No. 566,597. (Rotary valve.) 8 claims.

1,067,130. Shock Absorber. Greene E. Newell, Houston, Tex. Filed Nov. 19, 1912. Serial No. 732,313. (Pneumatic shock absorber.) 1 claim.

1,068,408. Spring Wheel. Dirk H. Brinkman, Sheldon, Iowa. Filed May 7, 1912. Serial No. 695,706. (Concentric-rimmed wheel with outer rim spring cushioned.) 3 claims.

1,068,414. Internal Combustion Engine. Charles R. Courtenay, Watertown, N. Y. Filed Oct. 5, 1911. Serial No. 653,046. (Motor with fuel injection.) 5 claims.

1,068,427. Engine-Starting Apparatus. Edward A. Halbleib, Rochester, N. Y., assignor to North East Electric Company, Rochester, N. Y., a Corporation of New York. Filed Oct. 9, 1911. Serial No. 653,671. (Combined electric and compressed air starting system.) 7claims.

1,068,528. Muffler Cut-Out. Harold C. Peckham, Bristol, R. I., assignor to Auto Improvements Company, Bristol, R. I. Filed Aug. 26, 1912. Serial No. 717,152. (Muffler cut-out with hinged valve.) 1 claim.

National

Buy Service, Not Specifications

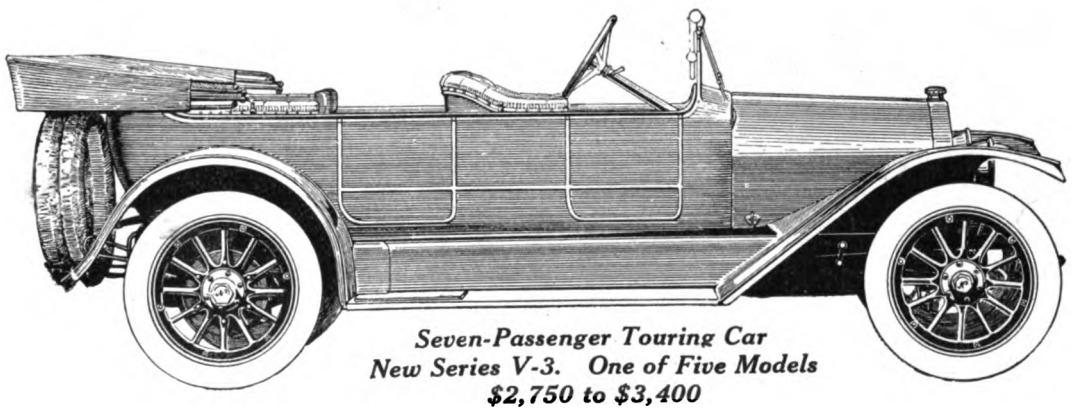
OUR Policy makes it possible to buy a National car as you do a reliable Watch, or a high-grade Piano. You want a watch to give accurate Time, and a piano because of its Quality. In other words, you buy a Watch and a Piano for Results—and not because of the particular individual parts that enter into their construction. You leave that to the makers.

OUR ambition is Quality. We take the responsibility for what enters into the car's makeup, while you need think only of its Performance.

JUDGE the National by what it can actually Do; how adequately and comfortably it Performs; and the Longevity of its efficient Service.

WE offer you a Whole Car where every mechanical part operates harmoniously to produce a Unit of satisfactory Results.

SPECIFICATIONS alone are misleading. An inferior car may have similar specifications, or similar parts to a quality car.



WE put the Right material in the Right place. Our experts devote their lives to this Duty. We take that Responsibility. You enjoy the Results.

WE give you a car you can buy without having to raise the hood to investigate; without worrying about its Insides and without bothering to make a detailed analysis of its various component Parts or Specifications.

ONLY a company of unimpeachable reputation, of sound financial standing, of reliability built upon years of success can make you this most Liberal Offer ever made by any automobile builder.

SERVICE, with us, begins when the car is built. Service is put into your car. This is why the National requires the least attention afterwards.

AND freedom from faults and complete abandon of worry about the mechanical operations taking place beneath your seat, can not be bought for less than the National.

Seven-Passenger Touring Car
New Series V-3. One of Five Models
$2,750 to $3,400

National Motor Vehicle Co.

WIRE WHEELS

for all makes from

FORDS to PACKARDS

Are you the DEALER we want in your city?

Are you awake to the opportunity offered in SUPPLYING the DEMAND for WIRE WHEELS?

Are you in a position financially to handle them?

All right, then; write us for detailed proposition—and *don't forget your references.*

George W. Houk Co.
1703 Elmwood Ave., Buffalo, N. Y.

NOTE **Dealers located in New York City, Philadelphia, Boston, Chicago, and Detroit—don't trouble to write—CLOSED!**

THE LBA

TRADE MARK REGISTERED

STORAGE BATTERY

Roll of Honor

It is with a feeling of pardonable pride that we direct attention to the following galaxy of Automobile Manufacturers who use LBA Storage Batteries exclusively with their Electric Starting and Lighting Equipment.

A

Abbott Motor Co.....Detroit, Mich.
Adams-Lancia Co.....New York City
Allen Motor Car Co.....Fostoria, Ohio
Alpena Motor Car Co.....Alpena, Mich.
American La France Fire Engine Co., Elmira, N. Y.
American Motors Co.....Indianapolis, Ind.
Ames Motor Car Co.....Owensboro, Ky.
Apperson Bros. Automobile Co. Kokomo, Ind.
O. Armleder Co.....Cincinnati, Ohio
Auburn Automobile Co.....Auburn, Ind.
Austin Automobile Co..Grand Rapids, Mich.
The Avery Company.....Peoria, Ill.

B

Bartholomew Co.....Peoria, Ill.
Benton Motor Car Co.....Benton, Ill.
Berg Carriage Co., L.....Dallas City, Ill.
Briggs-Detroiter Co.....Detroit, Mich.
Buckeye Mfg. Co.....Anderson, Ind.

C

Canadian Standard Auto & Tract. Co., Ft. Wayne, Ind.
Cartercar Co.....Pontiac, Mich.
J. I. Case T. M. Works....Racine Jct., Wis.
Chadwick Engineering Works. Pottstown, Pa.
Chandler Motor Car Co.....Cleveland, Ohio
Chevrolet Motor Co.....Flint, Mich.
Colby Motor Car Co.....Mason City, Ia.
F. Coleman Carriage & Harness Co., Ilion, N. Y.
Commerce Motor Truck Co...Detroit, Mich.
Corbitt Automobile Co....Henderson, N. C.
Crane Motor Car Co.....Bayonne, N. J.
Crawford Automobile Co....Hagerstown, Md.
Crescent Motor Co.....Cincinnati, O.
Crow Motor Car Co.....Elkhart, Ind.
Jas. Cunningham Son & Co..Rochester, N. Y.

D

Geo. W. Davis Carriage Co...Richmond, Ind.
De Dion Bouton.....New York City
Dorris Motor Car Co.....St. Louis, Mo.

E

Elkhart Carriage & Harness Co. Elkhart, Ind.
Enger Motor Car Co.....Cincinnati, O.

F

F. A. L. Motor Car Co.....Chicago, Ill.
F. I. A. T. Company...Poughkeepsie, N. Y.
Flanders Motor Co.....Detroit, Mich.
H. H. Franklin Mfg. Co.....Syracuse, N. Y.

G

Gramm-Bernstein Co.....Lima, O.
Gramm Motor Truck Co.....Lima, O.
Gramm Motor Truck Co...Walkerville, Ont.

H

Havers Motor Car Co....Port Huron, Mich.
Haynes Automobile Co.....Kokomo, Ind.
Henderson Motor Car Co..Indianapolis, Ind.
Herreshoff Motor Co.....Detroit, Mich.
Howard Motor Car Co....Connersville, Ind.
Hupp Motor Car Co.....Detroit, Mich.

I

Imperial Automobile Co.....Jackson, Mich.

J

Jackson Motor Car Co.....Jackson, Mich.

K

Kelly-Springfield Motor Truck Co., Springfield, O.
King Motor Car Co.....Detroit, Mich.
Kissel Motor Car Co.....Hartford, Wis.

Give your automobile a firm and sure roadway.

Know that you can turn the corner when you reach it; *know* that you can dodge vehicles and street cars; *know* that you can stop when you want to and where you *have* to. Begin, if you like by equipping the rear wheels of your car with

Goodrich Safety Tread Tires

Best in the Long Run—Best in the Short Stop

The tread that makes the brake effective

The thick, tough rubber fingers of the Goodrich Safety Tread wipe away the mud, ooze and slush. They clean and grip the roadway. They make you *know* that *you* are in control. The extra thickness of heavy Goodrich rubber in the treads means longer wear and low cost mileage all the time.

The following are the prices on the best and most practical anti-skid tires made. *You should never pay more.* Your dealer will gladly sell you the famous Goodrich Safety Tread Tires at these prices:

28 x 3 ....$11.85	33 x 4....$25.25	36 x 4 ....$27.75	37 x 4½....$38.15
30 x 3 .... 12.65	34 x 4.... 26.05	35 x 4½.... 36.05	36 x 5 .... 43.15
30 x 3½.... 17.00	35 x 4.... 26.90	36 x 4½.... 37.10	37 x 5 .... 44.45
32 x 3½.... 18.10			38 x 5½.... 57.30

Branches in All Principal Cities

"American" Axles

Their Presence in a Car is an Indication of Highest Class Construction Throughout

YOU can judge absolutely the character of any motor car—its efficiency and reliability—by a careful analysis of its rear axle.

The car that is built to sell "at a price," must necessarily use an axle that is limited by that price both as to materials and workmanship.

Yet the one thing about a motor car that should not be limited in quality—in real value—is its rear axle.

If your car has "American" Axles its manufacturer has recognized this fact, and has put quality above price in this vital feature of car construction.

"American" Axles are made to fill the need that exists for an axle of unquestioned value, judged either by its design, materials or workmanship.

Their distinctive features are not to be found in any other axle because they are protected by our own comprehensive, basic patents.

The superiority of their design and the excellence of our manufacturing processes reduce friction to the minimum, and give the maximum of mileage.

In "American" Axles only can you have the option of the highest class of Bevel or Worm Gears. Both are fitted throughout by us with the best types of foreign made ball bearings.

The adjusting and full floating features of "American" Axles are fully covered by our own patents and by shop rights from other patentees.

The Plug that Plugs

MASTER

All Spark Plugs of Our Manufacture Are Licensed Under the Canfield Patent and Have Been Since January 8, 1912.

Come and See Them At the New York Show

Booth No. D-81

The "MASTER" spark plug which we are now introducing will do all that any other plug can do and more.

The materials throughout have been selected solely for efficiency in their respective functions regardless of cost.

The extremely heavy porcelain core is of a special nature and will stand tests which easily break down ordinary insulators.

Over 1500 have been on trial ***since last March*** in manufacturer's test cars, motor trucks, etc., ***without one failure reported to date.***

"MASTER" spark plugs will be highly appreciated by discriminating buyers who realize the economy of buying the best rather than the cheapest.

Price, $1.00 ***Quantity Prices on Application***

Hupmobile

Dealers Know No Closed Season

Hupmobile sales in October were the largest of any October in Hupp History.

Hupmobile sales in November were the largest of any November in Hupp History.

Hupmobile sales in December (mind you, December) promise to be the largest of any December in Hupp history—and the largest of any month in the last six.

Hupmobile values have won such firm conviction in the minds and hearts of American families that the volume of our business, month by month, has become as steady as that of any other staple product.

Hupmobile sales, season in and season out, go forward with the momentum of popular affection and the irresistible force of a national institution such as the Hupp Motor Car Company has grown to be.

A Force of Substantial Business Men

The reputation, the popular affection, the solidity, the steady sales of the Hupmobile have been built on an organization of progressive and successful dealers.

There are some fifteen hundred of these—all men of standing and permanence in their respective communities. The views at the left show typical Hupmobile sales rooms and service stations.

These men are as they are—

First: Because the Hupp Motor Car Company has always believed that the character of the Hupmobile must be reflected by the character of the men who represent it.

Second: Because these men have prospered—precisely as the Hupmobile has grown and prospered.

The success of the Hupmobile has been the success of a loyal commercial family—flourishing members in every state in the Union and virtually in every country on the globe.

We believe that these fifteen hundred dealers enjoy a close intimacy, a mutual confidence, a reciprocal benefit and abiding harmony seldom to be found in any sales organization.

It is gratifying to be named—as we recently were—by competent authority as one of the six big successes of the year.

But it is even more gratifying to acknowledge the part that our fifteen hundred dealers have had in the building of this achievement.

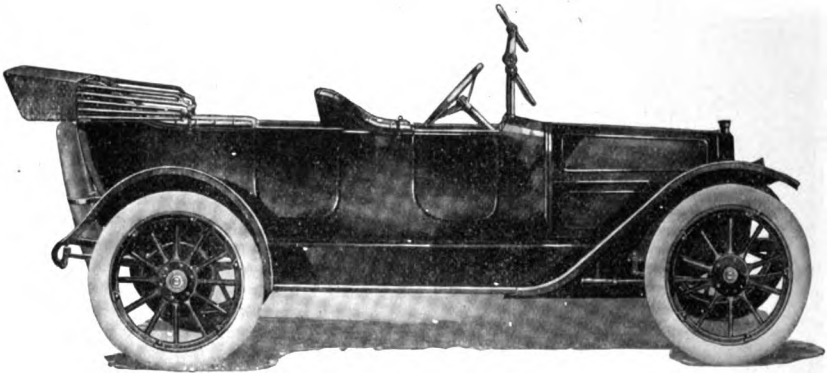
THE NEW AUTO STAR



Northway's Motor Car

After years of experience, exhaustive tests and expensive experiments, the greatest of all designers and inventors, Mr. R. E. Northway, the founder of the Northway Motor Co. and original designer of that now famous motor, which is acknowledged by the best engineers and experts to be the greatest motor in the world, now brings out his latest and greatest of all motors, to be used exclusively by the Crescent Motor Co. of Cincinnati, O.

14 Features that Make OHIO An Ideal Automobile

Northway's Latest and Greatest Crowning Glory

ROYAL MODEL, $1,985

MOTOR—Six-cylinder, 4 x 6.
AXLE—Full floating on annular bearings.
TRANSMISSION—Four speeds ahead and one reverse.
CLUTCH—Multiple disc.
CONTROL—Center and left hand drive.
SPEEDOMETER—Warner, flush.
TIRES—35 x 4½ and 36 x 4.
WHEEL BASE—132 inches.
ELECTRIC STARTER, LIGHTS and HORN.
RIMS—Demountable.

OHIO MODEL, $1,275

MOTOR—Four-cycle, 4¼ x 4¾.
AXLE—Floating on roller bearings.
TRANSMISSION—Three speeds ahead and reverse.
CLUTCH—Multiple disc.
CONTROL—Center.
SPEEDOMETER—Stewart.
TIRES—34 x 4.
WHEEL BASE—116 inches.
ELECTRIC STARTER, LIGHTS and HORN.
RIMS—Demountable.

We are now ready to contract with good, reliable, live wide-awake dealers and distributors on this greatest of all lines.

Springfield Metal Bodies

Springfield Metal Bodies are perfect in design, material and workmanship. They are made in a factory of magnitude—well equipped with the most modern machinery, much of it especially devised for the manufacture of metal bodies.

Ten years' experience in the making of metal bodies justifies the claim that these products are far in advance of competitive effort. That these bodies are used on practically all the high-grade cars in this country is proof that may not be disputed.

Springfield Metal Bodies are made in aluminum or steel, including the highest grade limousine, landaulet and town car closed bodies, and touring car bodies in all forms, torpedo, runabout, baby tonneau, etc.

The trade will be interested in information which will be sent upon request.

SPRINGFIELD METAL BODY CO.
Springfield, Mass.

THE SURVIVAL OF THE FITTEST

Never, since the beginning of the automobile industry has there been such a determined insistence on genuine motor car value as there is at the present time.

Olds Motor Works has built into the Oldsmobile, since the very first model, a quality which has always been recognized as the utmost in automobile practice and engineering.

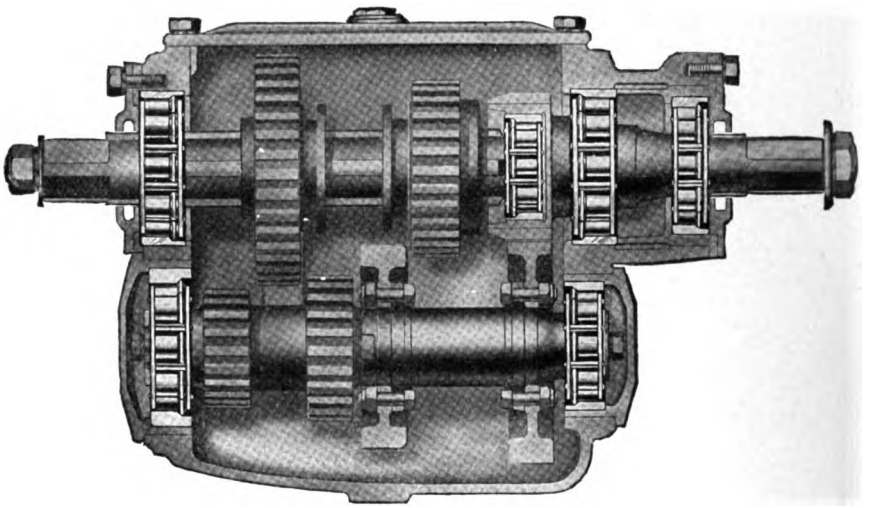
The 1914 Oldsmobile is the development of this foresight and sound policy, and now stands—the greatest of all sixes.

Throughout the entire automobile manufacturing field are makers who are exploiting sixes, but the public is now educated to appreciate quality and reputation in a motor car, just as in any other commodity, and the inevitable has happened—the demand has settled upon a six-cylinder motor car with reputation, experience and stability behind it. The day of the makeshift is over.

The popularity of the Oldsmobile this year is a natural outgrowth of this insistent desire for quality. The Oldsmobile was a pioneer in the six-cylinder field, and during the past decade has witnessed the passing of many newcomers. Now that the time has arrived when motor car purchases are made on merit alone, it has been fittingly and deservedly acclaimed "the greatest six-cylinder car ever produced."

A Few Words to Dealers

You are probably familiar enough with prevailing conditions to recognize the truth of the above statement. We believe it would be to your advantage and profit to sell a car with the reputation, stability and quality of the Oldsmobile—at a price astonishingly near to that of cheaper makes, and considerably lower than that of any other car in its class.



We have some territory open which we can allot to responsible dealers. Are you prepared to take advantage of this opportunity?

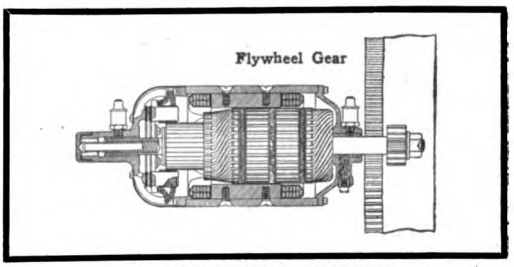
A WORD ABOUT OURSELVES

Occasionally a friend asks us:

"With a starter and a dynamo so unique and efficient as yours, why are you in the field so late? Why are so few car makers ready to have you announce the adoption of Rushmore equipment on their cars? Why did you let a score of competitors get the start of you?"

And we reply with another question.

"Did you ever hear of a really worth-while book being written by a man who said to himself, 'Go to, now, let us write something and visit Europe on the proceeds'?"



Can you mention a single motor car device of enduring merit that was put together in haste to reap a quick harvest? If we had committed ourselves three years ago to a half-baked design, isn't it likely that we would presently be fighting for our life in competition with some real engineer who preferred to wait till his system was right?

We preferred to do the waiting and developing ourselves. We had faith in the future of electric starting and electric lighting; we did not wish to see them wounded by the haste of false friends. Until we could produce a system whose every user would pronounce electric starting and lighting the perfect method, we were willing to work in silence.

The principle of action which we first showed a year ago in the Model A Starter was fundamentally right. Improvements since then have been in the direction of increasing the power developed per pound of metal. The Model B, and now the Model C, all operate automatically, meshing and unmeshing at the right instant without guidance by the operator. So efficient is the Model C that, though weighing but 30 lbs., it does more than most starters of double its weight, and more per ampere of current than any other starter made. At length we are satisfied!

"A stern chase is a long chase," but our voluntary delay gave to the world a system of which we are proud to the last screw. Every one of our customers has come to us against the keenest competing salesmanship, and solely on the demonstrated superiority of the Rushmore System. Most of them formerly used electric systems of other types.

We have no regrets for our conservatism. Not one of our 1913 customers has left us. Several additional concerns whom we will shortly be free to name will join our list for 1914. We are content with a measure of success that already promises sensational developments when the Rushmore System becomes known to the public through its performance on Rushmore-equipped cars.

Large sums of money have been expended by automobile and parts manufacturers in producing "noiseless" cars, with particular attention paid to Motors, Gears, Rear Axles, Universal Joints, Clutches, Brakes, etc.

But many producers—not all—have apparently forgotten that looseness is most prone to develop in bolted-up construction.

This loosenoss can be obviated by using spring lock washers of pre-determinod efficiency. There is no guesswork in the foregoing statement. Challenge us to prove it.

Bearing in mind that a rattling bolt or a squeaking fender is even more annoying to the ear than the grind of a gear, you will be rather eager to get to the real crux of the Nut Lock Washer situation.

And that means that you will read a new and important significance into the three essential points of an efficient Nut Lock Washer, viz., PROPER SECTION, PROPER ANALYSIS, PROPER HEAT TREATMENT.

THE NATIONAL LOCK WASHER COMPANY

Greatest Knight Motor

$2400 MOLINE-KNIGHT $2400

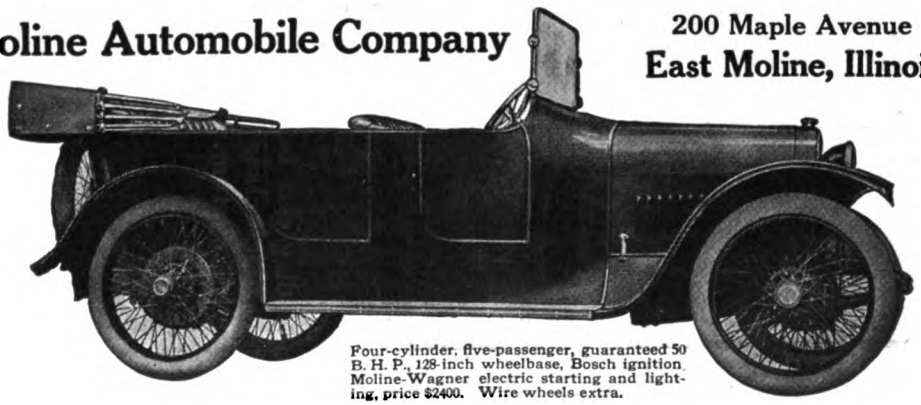
Nothing extra to pay — *Completely Equipped*

The car you have long wanted

More Power—More Flexibility—More Economy—More Silence

Guaranteed fifty brake horsepower The car of the future is here today—a guaranteed fifty brake horsepower "Four" as powerful and as flexible as any "Six"—a big, roomy five-passenger car, ironed for two auxiliary seats, with an electric starter that starts each and every time. The Moline-Knight will be a delightful surprise, with its perfect, graceful, smooth streamline body and foreign air. Moline upholstering quality has been embodied throughout.

The car of the future will not have poppet valves The old poppet valve has outlived its usefulness because high compression, large valves, strong springs and precipitous cams are necessary in the poppet valve engine to get great power and high speed. Here is a weakness the poppet valve will never be able to overcome. In the Moline-Knight there are no valves to clog or grind—no cams, no springs, no timing gears to get out of order.



Everything you have desired Full floating rear axle, 128-inch wheelbase, selective transmission, half eliptic rear springs of unusual length, Truffault-Hartford shock absorbers, Bosch ignition, Schebler carburetor, Moline-Wagner electric starting and lighting, adjustable foot pedals, center control, left side drive, lubrication by force through hollow shaft, 36x4 1-2 artillery or wire wheels, Firestone demountable rims, 18-gallon gasoline tank in rear, finished in blue-black, other colors optional with three weeks notice. One-man Mohair top, cover and side curtains, automatic wind shield, electric horn, power tire pump, Warner 60-mile speedometer, Goodrich Unit Molded Tires, gasoline and oil gauge and speedometer, foot rail, robe rail, tire irons, complete set of tools, jack, tire repair kit, eight-day clock.

At least investigate — write today for our Advance Information Folder—learn the truth about motors.

Dealers if you can show us you are entitled to a Moline-Knight contract, write or wire us at once.

GRAY & DAVIS
STARTING-LIGHTING SYSTEM

The leading cars in every price-class carry this system.

In these days, the starting-lighting system helps to sell the car or — otherwise. Depending on the quality of the system.

THIS was the first 6-volt starting-lighting system. The fact that 6 volts is now considered as standard, shows that the Gray & Davis system was designed correctly at the very beginning.

¶ Consider that the moderate-priced car at $1075 as well as its big, powerful brother at $7000 carry the Gray & Davis system. There is no class distinction when it comes to insuring starting-lighting efficiency.

¶ If you can assure a prospective purchaser that Gray & Davis stand back of the starting-lighting equipment you have a pretty forceful argument which is well worth using.

The Gray & Davis

Digitized by Google

The Gray & Davis system is delivered on time in accordance with specifications.

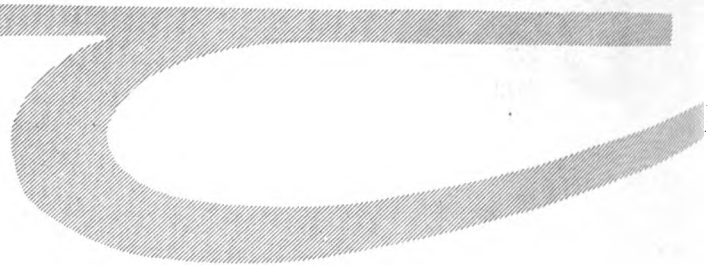
62 Service Stations render assistance and advice to Gray & Davis users.

A national advertising campaign has standardized this equipment.

1914 will be another Gray & Davis year.

¶ In England, France and Germany, they are equipping with this system—not because of price but for the reason that the Gray & Davis starting motor and dynamo is of the quality that appeals to engineers and motoring public, irrespective of where it is built.

¶ The name "Gray & Davis" is a guarantee that has been recognized throughout the industry during the past fifteen years. We consider it our duty to see that equipment bearing this name gives service and satisfaction.



¶ When the prospective purchaser says: "What starter?" and the answer is "Gray & Davis," you do not have to explain the merits of this system nor sell it, as well as the car, because practically everyone interested in motoring knows this system and what it will do.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to *prevent* accidents.

"I can't afford to take *any chances.* We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of *Weed Chains* and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—*Life Insurance* and *Accident Insurance Companies* strongly endorse them and recommend their use. *Taxicab Companies,* for their own protection, *insist* that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the *most profitable* Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

THE NAME WEED ON EVERY HOOK WEED

You build Silence, Neatness, Simplicity and Efficiency into your vehicles when you equip them with the

SHELDON WORM DRIVE

Every additional part in **anything** mechanical **generally** betokens extra **wear** and possibly trouble.

There are more than 3 times as many double reduction parts as worm drive parts. Of course YOU know which is most efficient.

A CHAIN is no stronger than its weakest link. Every nut, cotter, washer, head pin casting, forging, chain link and rivet is a necessary unit of the assembly it composes. The failure of one of those units may mean the wreck of your truck, and perhaps the damage of property and the loss of life.

Only one-third the number of parts required for a Worm Drive that are required for a two-step reduction of the chain driven type. This is convincing proof that, all things being equal, the single reduction Worm Drive has a three-to-one chance of giving better service than a two-step reduction with three times as many parts.

But all things are not equal. The Worm Drive is a single reduction, transmitting the power direct from the motor to the rear wheels. It is the only drive in which it is possible to secure this result.

The Worm Drive conserves power because it is a single reduction. Every moving power transmitting unit works in oil, reducing friction to a minimum.

Sheldon Worm Drive is non-adjustable. The Worm carrier is machined exactly true by specially constructed machines.

If the carrier is not true, the Worm can not be assembled. Once assembled the Worm and Worm Wheel can be removed and replaced without disturbing their alignment. No adjustment to tamper with.

It is not necessary to provide adjustment for wear. The slight wear of the imported Worm and Worm Wheel only adds to its efficiency.

Of course, the Worm and Worm Wheel wear out, but not during the life of one truck. The experience of the largest user of Worm Drives has proven this.

Invest Ten Dollars and Make One Hundred

Ten dollars will buy a **Perfect Carbon Remover.** With it, **all** carbon deposits can be **completely** and **thoroughly** removed from the cylinders. Averages about fifteen minutes per cylinder. Does away with many engine troubles. Makes satisfied customers — and **big profits.** Can pay for itself **in first few days**—after that, **all profit!**

One of best known money-makers for garages. Helps motor truck and large private owners keep up efficiency of cars at low cost.

Usual Price is $15

But our Price is NOW $10 (without oxygen tank). We sell for cash only and do not carry accounts. Therefore, we take **1-3 off** the regular price and give our customers the benefit of this additional $5.00 from every one we sell. Every outfit is positively guaranteed—we stand back of every one of them. It does not waste oxygen; gauge always shows exact pressure. No unnecessary parts—but every part as complete and perfect as any other outfit made.

Express companies are instructed to allow purchaser to open package before accepting it —therefore you take absolutely no chances.

Price only $10.00. Express prepaid.
Sent, cash with order—or C. O. D.

We Manufacture Patterns

We don't "make" patterns—we MANUFACTURE them—

There's a difference and the difference means that we not only work to CUT THE FOUNDRY COSTS of our customers but to reduce pattern costs. In a word we are not trying to "feather our nest" off one job, but building up a steady, reliable trade that "sticks." Proof of the fact lies in the erection of our new factory—one of the most completely equipped and most modern in the country. "At your service" really means what it should here.

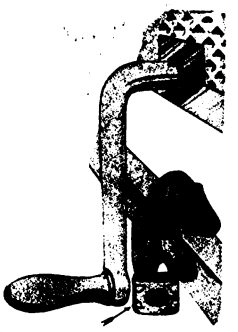
THE B. & W. CRANK LOCK



Investigate the B. & W. before your customer's car is stolen. Every motor car owner needs constant and complete protection against the thief and joy rider.

The only Positive Crank Lock manufactured that absolutely locks the crank in engagement with crank shaft, making it an impossibility to start motor by pushing car, towing or by jacking up the rear wheels.

It is a Positive Locking Device and can be attached by anyone in ten minute's time.

The B. & W. Lock is finished in black enamel and provided with a strong lock and two keys. To be attached to the front axle as shown in cut.

Price $1.50

We furnish you complete, a new wooden steering wheel *rim*, with the heater installed (as indicated with illustration) and wire connection from wheel to magneto which furnishes the heat. To turn on the heat you insert the plug in socket nearest the ribbed part or heater on left-hand side of wheel. To turn off heat, remove plug and place in next adjoining socket.

The heating coil is composed of an indestructible metal tube in which is carried a heavily insulated heating wire. It is impossible to get a shock.

The rim we furnish is all ready to screw on in place of the rim you now have.

Write today for detailed description. Satisfaction guaranteed.
Price, $10. Prepaid in U. S.

75% of all tire trouble is due to under inflation

THERE is no method yet discovered of ascertaining the pressure in the inside of a tire, except by the use of a pressure gauge. A casing containing 40 pounds of air looks and feels exactly like a casing containing 80 pounds. If your tires require 80 pounds and you only give them 40, they're on the quick road to the scrap-heap.

USE A

SCHRADER
Universal Tire Pressure Gauge

and Save Your Tires

Price, $1.00

For Sale by

A. SCHRADER'S SON, Inc.

783-791 Atlantic Ave., Brooklyn, N. Y.

Everyone marvels that such a brilliant light can be produced for from 300 to 420 hours by only six 30-amp. dry batteries.

You can have an efficient electric lighting system at one-third the operating cost of standard equipment by equipping your car with

JM Mobilite Electric Lamps

These lamps are fitted with a special Tungsten bulb. The light is intensified by a powerful lens and reflector. Neat and attractive in appearance.

For head lights, dash lights, tail lights, speedometer light and for illuminating car interior. Also for motor boats, camps, etc.

Can be installed by any handy man.

If your dealer can't supply you write our nearest branch. Write anyhow for Booklet.

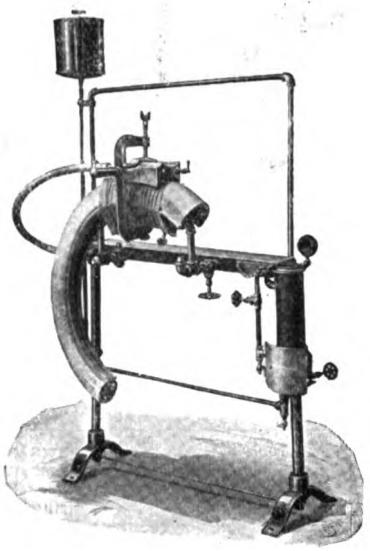
Blow-out repairs that outlast the tire

The only way to make **durable** blow-out repairs **economically** is to reinforce the tire with fabric applied to the inside, fill the hole through the tire with Para gum, then apply heat **both** to the inside and outside. This method avoids cutting away and wasting a lot of expensive tread stock, requires a minimum of fabric and makes a repair that is stronger than the tire. Anyone can use it because the work is all straightforward, requiring no special experience. One set of forms fits all sizes of tires. No extra moulds required.

SHALER Steam Vulcanizer

The Shaler is the only steam vulcanizer that permits using the approved wrapped tread method as it is the only one that applies heat to the inside and outside of a tire simultaneously. It makes perfect blow-out repairs.



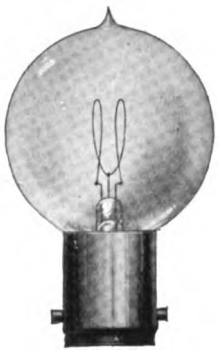
To make it complete as a garage equipment it is provided with a tube plate 4 x 30 inches that will mend six tubes as quickly as one.

The boiler, a conical copper coil, heated by a powerful gas or gasoline burner, raises steam so quickly that you can profitably heat the Shaler even if you only have a tube puncture to mend.

The essential Shaler feature of a thermostat to hold the temperature at the vulcanizing degree automatically makes it impossible to overheat a tire. Simply light the burner, and steam is raised to the correct pressure and held there indefinitely.

Price of the complete outfit, including all attachments for tube and casing work, $45.

C. A. SHALER CO., 449 Fourth St., Waupun, Wis.



Free—a tire handbook for repairmen

Write today on your letterhead for a copy of "Common Sense About Tire Repairs." It contains a lot of money-making ideas about the most profitable part of the repair business.

The Right Lamp for the Right System

We co-operate closely with car builders and the makers of lighting systems in the manufacture of Edison Mazda (drawn wire tungsten) Lamps for automobile service. When **Edison Mazda Lamps** are used, car owners are assured of getting the right kind of lamp to meet the requirements of different lighting systems.
We supply lamps for any make of car and standard lighting system, with either the double contact bayonet candelabra base or single contact bayonet candelabra base, using ground return.

Edison Mazda Lamps are on all the representative cars—adopted as standard by car manufacturers, because of their successful and continued operation.
This detailed manufacture—making the lamp to fit the lighting system—cannot help but insure the most satisfactory and efficient service.
All over the country there are Service Stations established where Edison Mazda Lamps for renewals may be readily obtained.

MOTOR WORLD

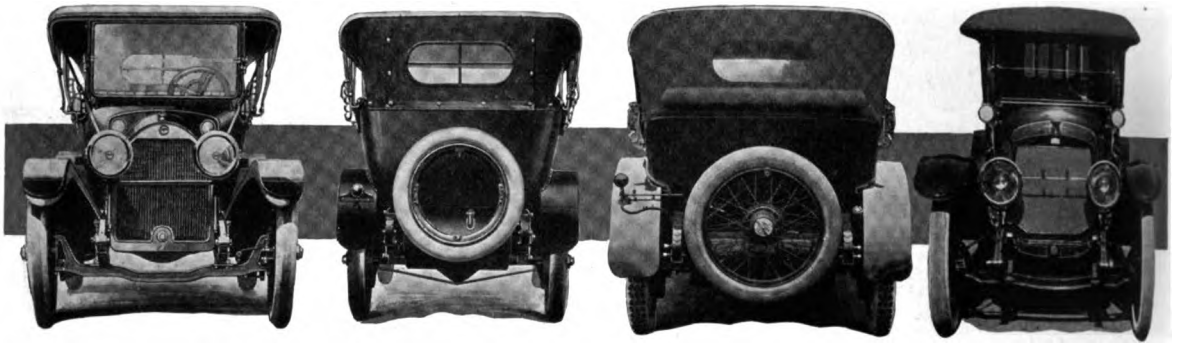
NEW YORK, DECEMBER 18, 1913

LOOKING FORWARD TO TWO SHOWS IN TWO CITIES



During recent years the tendency of things commercial in New York has been to "move uptown." Not because of the tendency, but for other reasons, not part but all of the New York automobile show of 1914 is "going uptown."

It is necessary to make this distinction because half of the 1913 show was located "uptown" and the other half "downtown," which latter distinction requires explaining, for the difference between uptown and downtown, in this instance, is merely the distance between 26th street and 46th street, where Grand Central Palace is located and where the Automobile Chamber of Commerce's show will be inaugurated Saturday, January 3rd, and continue until Saturday, January 10th.

Madison Square Garden, where the automobile show was born 14 years ago, still stands in the same old place on 26th street but it probably will know the automobile show no more; certainly it will not house it on this occasion, and its oft-threatened demolishment can now proceed for all the automobile industry may care.

The last New York show was split 50-50, two ways; that is to say, half of it was staged in the Garden, the other half in the Palace, and it ran two weeks in both places, the first week being devoted to passenger cars and the second to commercial vehicles. This time there will be no second week and no trucks; the show will be made up wholly of passenger cars and the thousand and one articles that are accessory thereto, and they will occupy four floors in Grand Central Palace. The same condition of things will prevail in

Digitized by Google

Chicago, where, however, the Coliseum and the First Regiment Armory, which adjoins it, will again shelter the National show in the West from Saturday, January 24th, to Saturday, January 31st.

For the first time, too, both the New York and Chicago shows will be conducted under the auspices of one organization, the Automobile Chamber of Commerce, and also for the first time Samuel A. Miles, the general manager of the organization, will be the directing genius of both.

In other years, Miles's efforts were restricted to Chicago, where each twelvemonth he uncovered what was more than an automobile show, i. e., an automobile spectacle; for never was the decorative hand called on to perform such grand, gorgeous and glittering embellishment as characterized the Chicago exhibition.

Miles, however, is now a year older, and his hair is slightly thinner, and whether because of the fact, or in spite of it, the decorative scheme of both shows will be less lavish than in yesteryears.

DRAPERY AND FLOWERS TO BE NEW YORK'S EMBELLISHMENT.

Grand Central Palace does not readily lend itself to decorative treatment, and, in truth, it needs little; the grand stairway which leads to the great hall, with its many marble columns of Corinthian design and of noble height, in themselves constitute an imposing sight.

Such embellishment as will be employed will be chiefly in the nature of artistic draping of bare windows and walls, and of relieving the nakedness of the Corinthian columns. On each of the four floors, the windows will be draped with tapestries, the curtaining on each floor being of a different color. The wall panels will be concealed, or half-concealed, by huge floral designs, and at the foot of each window there will be boxes of flowering plants, while real smilax and other greenery will be utilized to relieve the bareness of the marble columns, not, however, by festoonery or garlandry but rather by a deft touch which will suggest that the smilax has taken root and is trailing loosely from the capitals of the columns themselves.

By comparison with New York, the Chicago show still will be a spectacle, even though less spectacular than the Chicago shows of other years. There a definite decorative scheme will be followed.

"CONSERVATORY EFFECT" FOR CHICAGO EXHIBITS.

For the week, both the Coliseum and the Armory will be transformed into make-believe conservatories. There will be no looking glasses and little of that rainbow-colored staff and plaster of paris which, fashioned into all manner of fantastic shapes, has made eyes blink and given to the Chicago show a truly theatrical aspect.

The conservatory design will begin on the ground floor and be carried to the roof. The wall spaces—those tucked under the gallery—of both buildings will be "dressed" to simulate a hothouse, more politely termed a conservatory; that is to say, canvas will the painted to resemble panes of glass, the same design being carried upward to the roof, which likewise will be concealed by the painted glass effect, fanciful scroll work relieving the "stiffness" of the "glass" panes.

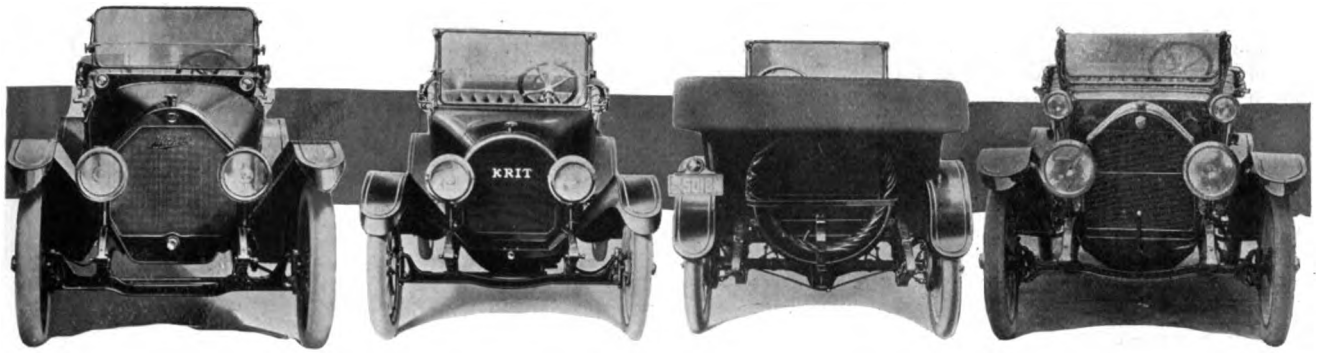
In the Coliseum, the roof of which is domed or rounded, the real conservatory effect should be striking. On the ground floor, flowering vines will "take root" and "grow" upward to the roof, while on the floor slim poplar trees—imported from Austria, by the way—and giant vases overflowing with flowers will mark the aisles. Gold pillars surmounted by a statue of a kneeling automobile girl will mark the dividing line of each exhibit.

Even to those familiar with the Coliseum, however, the building probably will seem somewhat altered for, after many years, the overhanging gallery is to be so greatly extended as to permit the aisle to be placed outside the exhibits and next the railing; this will render unnecessary the ducking of heads which hitherto has been required when spectators filled the gallery and when the aisle was located next the wall, and just about the point where rest the bases of the great curved iron girders.

Despite the eliminations brought about during the year by the workings of the elimination processes, neither the New York nor the Chicago show will betray much of the effects, so far as car exhibits are concerned, at any rate.

THE NUMERICAL POPULATION OF THE TWO SHOWS.

At the forthcoming show in New York, there will be 82 exhibits of cars as against 89 at the 1913 exhibition; in Chicago, there will be 86 as against 93. Of the New York car exhibits, six will be electrics; of those in Chicago, ten will be electric vehicles. Of all the cars, seven "gas" and one electric will be exhibited exclusively in New York, while eight "gas" and seven electric will be staged in Chicago only.



Among the other vehicles to be displayed in New York will be 12 exhibits of motorcycles, none of which will be in Chicago.

In both cities, however, there will be a considerable falling off in accessories. In New York last January, there were 320 exhibits of the sort; on the forthcoming occasion, there will be but 244, of which 111 will be confined to that city. At the last show in Chicago, there were 177 accessory exhibits; at the next show there will be 165, the total number of exhibitors of all sorts being 348 in New York and 251 in Chicago.

Perhaps the most notable absentees at the shows will be the tire exhibitors. By common agreement, practically all of the better known tire manufacturers, whose displays have been conspicuous features of all previous shows, will exhibit no more. The same is true of several other branches of the trade, notably those which have to do with axles, bearings and similar fittings.

However, the number of exhibitors that will be in attendance will be more than sufficient to fill the eye and keep keenly interested all whose interest is real

Digitized by Google

Trade Tendencies Take Decided Turns

Left Steer, Streamline Bodies and Light "Sixes" and Equipment are Uppermost But Less Observable "Swings" are Numerous and Notable.

Everything, so the proverb runs, comes to him who waits. It may come dribbling along, bit by bit, slowly but surely—making haste deliberately, so to speak—and sometimes it comes all of a rush—kerplunk! and it's here! Not always are there indications of its imminence. Sometimes, promised improvements that are to be really big are more or less thinly disguised by those who style them "detail refinements." But little things added together made big ones and in the mass of detail improvement that has been brought to the surface during the year gone by, it is not even a little bit difficult to envisage the big change—the big improvement that really has been made.

FORCES THAT HAVE EVOLVED THE CAR OF 1914.

The car of 1914 is far and away superior to its year-old brother in construction, in appearance, in equipment. Deep down in its bowels the old functions are carried on in much the old way, but from the outside, topside, bottomside or just plain side, it is not very much more like its prototype than a magnificent steel Pullman car is like its antiquated wooden predecessor. Those who travel in railroad trains wanted comfort; they wanted luxurious appointments; equipment commensurate with the luxury reflected by their own homes; and a whole lot of other things too numerous to mention. They got them all. And in the same way, slowly and surely, has nearly everything come to the motorist who has waited for it. In the crop of cars that now is offered to a public already grown fastidious—a crop which will be "harvested" at the forthcoming shows in New York and Chicago—it is doubtful if, considering price, any one could ask for more—with or without a clear conscience.

The promise of the past twelvemonth has been more than fulfilled. Last year undoubtedly was fully and rightfully entitled to the all-covering designation, "The Year of Greater Value." The coming year just as undoubtedly is "The Year of Greatest Value." It has not come all of a rush—kerplunk! it's here! It has come slowly and surely. But the main fact is: **it's here.**

TRENDS OF THE TRADE

- LEFT SIDE CONTROL
- INCREASE OF LIGHT "SIXES"
- SMALL-BORE HIGH-SPEED MOTORS INCREASE
- CABRIOLET BODIES
- STREAMLINE BODIES
- MOULDED FENDERS
- CONCAVED SKUTTLES
- WIDER U-SHAPED DOORS
- SIDE LAMP ELIMINATION
- REAR AND COWL FUEL TANKS
- REAR TIRE CARRIERS
- LOWERED CHASSIS
- BLOCK "SIX" MOTORS
- DETACHABLE CYLINDER HEADS
- FLAT TOP PISTONS
- INCREASED PISTON SPEED
- OIL GROOVE ELIMINATION
- HOT AIR CARBURETTER INTAKES
- ELECTRIC GEAR SHIFTERS
- CANTILEVER SPRINGS
- INCREASE OF INTERNAL BRAKES
- ENCLOSED SPEEDOMETER DRIVES
- ONE-MAN TOPS

It is the year of greatest value from nearly every angle it is viewed; cars that always have been fully equipped carry still more equipment; cars that never had equipment now have it; and practically without exception the electric lighting and engine starting system that last year came into such vogue, has been adopted by large and small.

QUICK ON-COMING OF THE LIGHT-WEIGHT "SIX"

But perhaps the feature that gives the fact greatest emphasis is the unparalleled advance of the medium-priced light-weight six-cylinder car. Makers who last year brought forth their first "sixes" this year have added "light sixes" and among the brand new six-cylinder creations that stand out as being the first efforts of builders who heretofore have confined their efforts to the production of "fours," there are the National, Buick, Jeffery, Marion, Pathfinder, Abbott-Detroit and Imperial. Among the makers whose older six-cylinder models already have made a name for themselves and who have turned their attention to the production of lighter six-cylinder models, Kissel and Chalmers, Oakland and Franklin, Marmon, Lozier and Hudson stand out prominently.

Not any of these new models rightfully can be termed high-priced. Take the Hudson at $1,750; nothing high-priced about that. Or the Oakland at $1,785. Of the others, all but the Lozier is well below the $3,000 mark. As a matter of fact, most of them are considerably under $2,500. The Franklin, for instance, is $2,300; the National, $2,375; the Pathfinder, $2,200; the Buick, $1,985; the Imperial, $2,000; the Pathfinder, $2,200; the Ohio, $1,985; and so they go.

Among the brand new cars that will

Digitized by Google

make their first formal appearance there are the Chandler and the Vaughan, both moderate-priced "sixes," the former listing at but $1,785 and the latter at $2,750, and in the four-cylinder class there is the Vulcan at $850, the Partin-Palmer at $975, the Briscoe, the McCord, the Howard and the Carnation, all of them under $1,000. The last two are cyclecars.

But though "sixes" undoubtedly have increased, "fours" have not dropped out to any appreciable extent. It is true that several makes have adopted the slogan "sixes exclusively" and have dropped their four-cylinder models, but in their place there are a number of new "fours" and in at least one case—the Lozier—a maker who one time dropped "fours" again has taken them up.

Nor will all the new cars to be exhibited under the bright lights be driven by poppet valve motors. There will be the Moline-Knight, which is a new type of Knight with all its four cylinders in a single block; and there will be the Speedwell-Mead rotary valve motor, which, by the way, has superseded all other Speedwell models; and the Mondex-Magic car, which is fitted with the Fischer sliding valve motor; and a brand new Premier, which has an overhead valve motor of still another new type. All of them will be uncovered for the first time.

LANDSLIDE MARKS ADOPTION OF LEFT SIDE STEERING WHEEL.

To the ordinary man in the street, who, by the way, is the man with the "roll," the appearance of any car always has been and probably always will be, a potent factor. Bodies that are, as the French say, outre or bizarre, serve a useful purpose in that they attract attention and stimulate curiosity, even for a moment. But it is the utilitarian body that really holds attention. In this respect, the cars that are destined to roll a good many others off the roads during the next year are the greatest attention holders that ever have been produced. They are utilitarian cars first and last and all the time.

Undoubtedly the greatest single trend of the times—though it can hardly be classed with the well-developed tendencies that are bordered 'round herewith because of its effectual standardization—that has served to develop the utilitarianism of the newer season's models, is the veritable landslide to left-side steering with center control. The genuine value of the system, where the universal rule of the road is "keep to the right," at last has received almost general recognition. Whereas last year it was comparatively easy to count the makes of cars steered from the left side, next year it will be a great deal easier to count those that still are steered from the right; right-side steering is passing out—or rather it has already passed out—and it soon will be but a memory.

The shifting of the control elements has had some slight effect in altering external appearance, for there no longer is any reason for controversy regarding whether gear shift and emergency brake levers should be inside or outside the body. But the factor that has done more to alter appearance than has anything else—it has changed the silhouette of the car almost as radically as the minaret gown has changed the silhouette of the modern woman—is the widespread adoption of the Prince Henry type of streamline body.

EFFECT OF STREAMLINE BODIES IN CHANGING THE SILHOUETTE

When the closed-front car first gave evidence of its influence three years ago, the striving and straining of designers to meet the demand was plainly apparent in the generally unfinished appearance of dashes and engine hoods and forward body lines. The wail that went up over the unsightly lines—the poor blending—was long and loud and sincere. During the following year the deep skuttle became a really pronounced feature and it gave the designers greater latitude for drawing unbroken lines from stem to stern. Some of them did so, though for the most part it was more or less painfully evident that the "knack" remained to be acquired. But things are different now. The development of the streamline body has been slow but sure. And whether or not the new bodies really meet their theoretical requirements—which is that their form shall cause the pressure at the back practically to balance the head resistance—it is certain that they are infinitely more pleasing in their finished state than they were in the embryo.

It can be said for these new streamline bodies, and it can be said for no other type, that they emulate the entering wedge principle. Though their fronts are not any narrower, their backs are in the majority of cases slightly wider and the wedge principle has been carried out by tapering engine hoods in a manner that is unmistakeable. Sloping hoods are now new of course, but there is a vast difference between the old sloping engine covers and the tapered ones that will be in such evidence at the shows.

When one or two American makers last year pioneered the tapered engine hood, they virtually uttered a promise that has been taken up almost without reserve. Coincident with the adoption of tapered hoods and streamline bodies, it has been a perfectly natural step for designers to turn their skuttles inside out, so to speak, by way of ensuring an unbroken sweep from the radiator to the dash. The deep skuttles that last year hid under convex surfaces this year are hidden a great deal more effectively under concaved surfaces. In this way a pleasing, unbroken line has been obtained that is in marked contrast to previous bulbous effects.

With the rapidly increasing use of the concaved skuttle in place of the convexed one, there has come a noticeable tendency to take the fuel tank out of its place of comparative obscurity beneath the front seats where it long has rested with little attempt made to put to good purpose the valuable space it occupies, and to place it instead at the back of the tonneau adjacent to the rear axle or else in the skuttle behind the board that holds the various meters and control devices. In more than a score of cases, fuel tanks that never have rested anywhere else but under the front seat now are in one or the other of these two positions, the preference being about evenly balanced.

ELIMINATION OF SIDE LAMPS INCREASES UNBROKEN EFFECT.

In such a great number of cases that the movement must be chronicled as one of the genuine trends of the trade—at the same time, it is one of the brand new developments of the year—designers have materially heightened the unbroken effects of their exteriors by the elimination of the usual side lamps; not even the cleverly flush-set lights that last year in so many instances ousted other types find a place on quite a number of the newer cars, their functions being performed either by the headlamps themselves, which are equipped with some sort of a dimming arrangement so that they can be used for city driving, or by small bulbs placed in the headlamps along with the larger ones. The movement is a pronounced one and is not confined to any one class of cars, the makers of high-priced vehicles as well as the makers of medium- and popular-priced ones having given it impetus.

The closer attention that had been given the designing and fitting of fenders was one of the pronounced features of last year's cars, and here, too, the promise of something still better has been amply fulfilled. Not only do the fenders on the new cars fit a great deal better than did the fenders on their predecessors, but they have been made to fit in a new way—at least, the way is new to American cars. Instead of being flat, as they always have been in the past, except for a few isolated cases, they now are crowned, or, rather, moulded;

REVISED WARRANTY COMBINES CAR AND TRUCK PROVISIONS

Phraseology of Former 90-Day Truck Guarantee Basis of All-Embracing One—Annuling Clause Made Clearer.

Official promulgation of the new all-embracing guarantee adopted by the Automobile Chamber of Commerce shows it to be substantially the warranty that previously applied to commercial vehicles. To all intents and purposes, the language is the same, provision being made, however, for the insertion of the name of each respective manufacturer and the signatures of the president and treasurer of each corporation.

The new warranty, as previously stated in Motor World, covers all vehicles and takes the place of the separate guarantees previously applied to cars and trucks. In at least one respect, so far as passenger cars are concerned, the revised warranty is far-reaching in that it has eliminated the clause which practically made the old guaranty no guaranty at all—the which unequivocally annulled the guaranty when a car was repaired outside the factory of its origin, a stipulation, however, which was more honored in the breach than in the observance but which, whenever desired, offered grounds for first-class dispute.

In the new guaranty, this clause is so amended as to annul the agreement only when the repairs affected, in the judgment of the manufacturer, "affect the stability, or reliability," of the car. The 90-day limit is still retained and, even more specifically than heretofore, is set forth the fact that the official guaranty, and no other, applies to whatever vehicle may be purchased. As it now stands, the newly adopted guaranty is as follows:

"This is to certify that we, the ....., of ....., warrant each new motor vehicle manufactured by us, whether passenger car or commercial vehicle, to be free from defects in material and workmanship under normal use and service, our obligation under this warranty being limited to making good at our factory any part or parts thereof which shall within ninety (90) days after delivery of such vehicle to the original purchaser be returned to us with transportation charges prepaid, and which our examination shall disclose to our satisfactiton to have been thus defective; this warranty being expressly in lieu of all other warranties expressed or implied and of all other obligations or liabilities on our part, and we neither assume nor authorize any other person to assume for us any other liability in connection with the sale of our vehicles.

"This warranty shall not apply to any vehicle which shall have been repaired or altered outside of our factory in any way so as, in our judgment, to affect its stability or reliability, nor which has been subject to misuse, negligence or accident, nor to any commercial vehicle made by us which shall have been operated at a speed exceeding the factory rated speed or loaded beyond the factory rated load capacity.

"We make no warranty whatever in respect to tires, rims, ignition apparatus, horns or other signaling devices, starting devices, generators, batteries, speedometers or other trade accessories, inasmuch as they are usually warranted separately by their respective manufacturers.

"In witness whereof, the said company has caused this warranty to be signed by its duly authorized officers."

Ranney and Day Quit Automobiles.

Quite unexpectedly, A. Elliott Ranney and A. M. Day, president and vice-president, respectively, of the A. Elliott Ranney Co., of New York, and two of the best known men in the Metropolitan trade, not only relinquished those offices on Monday last but retired from the automobile industry, with which Ranney, particularly, had been connected for many years. S. J. Toback, sales manager of the company, succeeded to the presidency of the Ranney company, which distributes Hudson cars in the Metropolitan district.

First rumors stated that the Hudson Motor Car Co. had taken over the Ranney business and would conduct it as a branch, but this is authoritatively denied. Toback declares that Day and Ranney will retain their holdings and with himself and Dr. Steese will, as heretofore, constitute the company. Ranney purposes devoting himself to the exploitation of certain patents and inventions in which he is interested, while Day is to become a Wall street broker. The latter is the head of the New York Dealers' Association, and only two weeks ago was elected president of the State Automobile Trade Association.

Mosler Issues Seven More Licenses.

Seven more licenses to produce spark plugs under the Canfield patent have been granted by A. R. Mosler & Co., the owner of the patent, to as many manufacturers. The new licensees bring the total number to 19 and are as follows: Belvidere Screw & Machine Co., Belvidere, Ill.; Lockwood-Ash Motor Co., Jackson, Mich.; Oakes & Dow, Boston, Mass.; Reflex Ignition Co., Cleveland, O.; V-Ray Co., Marshalltown, Ia.; E. Q. Williams, Syracuse, N. Y.; Sharp Spark Plug Co., Cleveland, O.

MOTOR TRUCK CLUB BECOMES A NATIONAL ORGANIZATION

New York Body Undergoes Radical Change — Scope and Usefulness Enlarged and Truck Owners Appealed To.

Hereafter the Motor Truck Club of New York will be the Motor Truck Club of America, and instead of appealing chiefly to automobile trade interests it will appeal more largely to motor truck owners and operators.

The nationalization of the organization has been in progress for some time and took definite form last night, when a New York charter was issued to the Motor Truck Club of America and when the new organization elected officers as follows: President, George H. Duck, Locomobile; vice-presidents, Edward W. Curtis, Jr., General Vehicle Co.; Arthur J. Slade, Atlantic Truck Co., and George Stevens; secretary, Ellis L. Howland, Journal of Commerce; treasurer, A. M. McCool, La France Fire Engine Co.

The following were elected directors: For one year, E. L. Hoopengarner, Swinehart Tire & Rubber Co.; Geo. H. Pride, Heavy Haulage Co.; P. K. Sleeper, Seeman Bros.; W. O. Shadbolt, Shadbolt Mfg. Co. For two years, Frank W. Smith, United Electric Light & Power Co.; H. P. Caverly, National Lead Co.; E. Lascaris, De Dion; J. W. Perry, Lippard-Stewart. For three years, David C. Fenner, International Motor Truck Co.; C. R. Langenbacher, Lord & Taylor; Charles E. Stone, Peerless; Roderick Stephens, Olin J. Stephens, Inc.

While the titled officers all are actively identified with the automobile industry, the majority of the directors are truck owners.

During the year the club membership has grown from 96 to 257, of whom about one-fourth are truck owners. In the national campaign which will be conducted from headquarters, which will remain in New York, most of the recruiting will be done among truck owners, which of itself implies that the club's working policy will undergo changes in order that it shall be more far-reaching and of more benefit to truck buyers and truck users than to truck manufacturers and dealers.

Included the plans are the development of such departments as Efficiency, Development of Better Drivers, Legislative Work, Legal Protection and Advice to Members, Assistant Traffic Regulations, Aiding in Insurance Questions, the Publication of an Official Organ and furnishing the members of other truck publications, the conduct of an Information Bureau, library and clear-

Digitized by Google

ing house of ideas for motor trucks, conducting educational classes for drivers, holding meetings for the interchange of thought between motor makers, sellers and users, and furnishing competent drivers.

It also is the intention of the organization to hold an annual competition covering several months and aiming to increase the efficiency of all who have to do with motor trucks. The contest will be similar to one conducted annually by the Commercial Motor Users' Association, of England, and will be broad enough to include drivers, superintendents and owners.

In the drivers' class, such items as mileage, tire and fuel economy, freedom from accident, dates of regular work, appearance, etc., will be the factors which will decide the award of prizes.

In the superintendents' class, which will include the men in charge of garages or equipment, awards will be based on periodical inspections of condition of vehicles and plants, plant efficiency, truck days in operation, etc.

The awards to owners will be decided on routing, loading, unloading and garaging,

Magic Motor Passed on to Fischer.

With the announced intention of licensing the building of the Magic crescent-valve motor if the company does not go into the manufacturing business itself, the Fischer Motor Corporation has been formed in New York City and this week took possession of a suite of offices in the Hudson Terminal building, at 30 Church street; the company is a successor to the Motor & Gear Improvement Co., of New York City, which attempted to build a Magic-equipped car styled the Mondex-Magic but which struck financial rocks this week.

According to Arthur C. Brady, the present Fischer manager, the Motor & Gear Improvement Co. was the holder of the Fischer American patent under which Magic motors are built, but the reason for the change of owners was not made plain. In fact, Brady was remarkably reticent and even disclaimed knowledge as to the principals in the corporation he represents.

Four More Swell M. A. M. to 265.

The strength of the parts and accessory trade, which has been cause for remark during a period of many failures of car and truck manufacturers, is reflected by the size of the Motor and Accessories Manufacturers, Inc., who this week reached the record figure of 265 members. The election of four new members brought it up to this number. They are as follows: Dunlop Wire Wheel Corporation, New York, N. Y.; Grant-Lees Gear Co., Cleveland, O.; Sulzberger & Sons Co., Chicago, Ill.; American Gear & Mfg. Co., Jackson, Mich.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

J. B. Bray has been appointed service engineer for the Atterbury Motor Car Co., of Buffalo. Previously he was connected with the Continental Motor Mfg. Co., of Detroit.

J. E. Baird has been appointed advertising manager of the General Motors Truck Co., in Detroit. Previously he served an Illinois plow company in a similar capacity.

M. E. Brackett has been promoted to the management of the General Motors Truck Co.'s New England branch in Boston. Previously he performed special work for the company with all of the United States as his territory. He succeeds J. L. Morris.

H. C. Gentry has been appointed a special factory representative of the Cataract Rubber Co., of Wooster, O. He will make his headquarters with Meyers & Grayson, 1808 Broadway, New York, who have been appointed Cataract distributers in the city.

Norris N. Mason, salesmanager of the Renault Selling Branch, Inc., in New York, and for many years connected with the importing trade, has resigned that office to become president of the Henderson Eastern Motors Co., of New York. He will assume has new duties on Saturday next.

A. F. Marshall has been appointed chief inspector for the Moline Automobile Co., of East Moline. He comes from Coventry, England, where for 10 years he was identified with the Daimler Motor Co., in which capacity he obtained the ripe experience with Knight engines which commended him to the notice of the Moline people.

Howard Wilcox, former president and general manager of the Standard Motor Truck Co., of Detroit, has been appointed a factory representative of the Federal Motor Truck Co., of that city. Wilcox disposed of his interests in the Standard company about two months since, at which time it was stated he would reengage in truck manufacture on his own account.

Former Mergerers Go Into Wilcox Trucks.

F. E. Kenaston, M. J. Scanlon and P. M. Starnes, of Minneapolis, who two months ago organized the Standard Motor Co. and incorporated it under the laws of Delaware with an authorized capital of $6,000,000, for the purpose of merging the Minneapolis Motor Co., of Minneapolis, and the Colby Motor Co., of Mason City, Ia., which merger fell through, have become identified with the H. E. Wilcox Motor Car Co., of Indianapolis. Their entry into its affairs has caused the capital of the Wilcox company to be increased from $1,000,000 to $1,500,000. The new money will be used to enlarge the Wilcox plant and greatly increase its production of trucks. H. E. Wilcox will become vice-president of the reorganized company, of which O. P. Briggs is president. Kenaston, Scanlon and Starnes are among the directors.

Used Car Man is Mysteriously Shot.

Morris Froehlich, president of the Times Square Automobile Co., of New York and Chicago, who was mysteriously shot one night last week in the latter city, has recovered from hos wound and offered a reward of $500 for the arrest of the shooter. Froelich was attacked in front of his home, as he stepped from his automobile, but a truss which he wore deflected the bullet and probably saved his life. He did not recognize the assassin and knows of no reason why anyone should seek to kill him. There are those who think that a buyer of used cars, in which Froelich's company deals, may have sought to "get even," but this theory is scouted.

Fisher Can't Use "Gramm" in Canada.

The Fisher Motor Co., of Orilla, Ont., which proposed reproducing or selling Gramm-Bernstein trucks in the Dominion, will be unable to do so; or at any rate, not with the name Gramm attached to them. This situation grows out of a decision rendered last week in favor of the Gramm Motor Truck Co., of Walkerville, which, when the Fisher intentions became known, brought suit to restrain the use of the word "Gramm" as being an infringement of the Walkerville company's trade mark.

Reiss Purchases American-Marion Parts.

Charles E. Reiss & Co., who handle the Hupmobile in New York City, have taken over the entire stock of the bankrupt American-Marion Sales Co., which includes a full line of parts and accessories for both the American and Marion cars, with which Reiss, until a few months since, was closely identified. The stock will be carried in Reiss & Co.'s service station at 250 West 54th street.

O'Connor Returns to Pullman Presidency.

Thomas C. O'Connor, who about 10 months ago relinquished the presidency of the Pullman Motor Car Co., of York, Pa., and retired from active participation in the company's affairs, while still retaining a minority interest, has returned to his old duties. He has been reelected president and is again devoting all of his attention to the Pullman establishment.

The Week's Incorporations

Wichita, Kan.—Jackson Motor Co., under Kansas laws; to deal in motor cars.

Columbus, O.—Direct Drive Axle Co., under Ohio laws; authorized capital, $10,000. Corporators—W. E. Campbell, C. O. Haines and C. T. Phillips.

Cleveland, O.—Dunham Motor Co., under Ohio laws; authorized capital, $10,000. Corporators—L. A. Dunham, W. C. Rush and G. K. Wadsworth.

Cleveland, O.—Lincoln Motor Van Co., under Ohio laws: authorized capital, $1,000. Corporators—Leon A. Kujawski, Garfield Suhn and P. E. Pankuch.

Detroit, Mich.—Parrett-Barbour Motor Sales Co., under Michigan laws; authorized capital, $10,000. Corporators—W. L. Parrett, H. J. Latour and others.

Detroit, Mich.—Barton Auto Top Co., under Michigan laws; authorized capital, $10,000; to manufacture automobile tops. Corporators—Alberton and others.

Youngstown, O.—Dietrich Motor Car Co., under Ohio laws; authorized capital, $15,000. Corporators—Dale Dietrich, Albert Dietrich and Frank Dietrich.

Montreal, Que.—Gadbois, Ltd., under Canadian laws; authorized capital, $45,000; to deal in motor cars. Corporators—J. P. Gadbois, Joseph Boule and others.

Louisville, Ky.—Louisville Motor Co., under Kentucky laws; authorized capital, $5,000. Corporators—R. T. Durrett, W. P. Gray, Louisville; C. M. Logan, Cleveland.

Orangeburg, S. C.—Edisto Automobile & Machinery Co., under South Carolina laws; authorized capital, $5,000; to engage in a general automobile and machinery business.

Worcester, Mass.—Worcester Tire Fabric Co., under Massachusetts laws; authorized capital, $50,000. Corporators—A. S. Sykes, Rockville, Conn.; F. G. Norman, Worcester.

Racine, Wis.—Reliance Automatic Lighting Co., under Wisconsin laws; authorized capital, $10,000. Corporators—Benjamin F. Fliegel, Elbert E. Haud and F. H. Fliegel.

Los Angeles, Cal.—Buffalo Vehicle Co. of Pacific Coast, under California laws; authorized capital, $500,000. Corporators—John R. Avery, Arthur D. Avery and Norman A. Bailie.

Hartford, Conn.—Buick Taxicab Co., under Connecticut laws; authorized capital, $25,000. Corporators—Albert C. Bieber, Frederick H. Bieber and David B. Roberts, all of Hartford.

Toronto, Ont.—Toronto Auto Repair & Garage Co., under Canadian laws; authorized capital, $40,000. to manufacture and repair motor cars. Corporators—W. B. Proctor, J. A. E. McDonnell and others.

Dallas, Tex.—Adolphus Auto Rent Co., under Texas laws; authorized capital, $15,000; to conduct a general garage, taxicab and delivery business. Corporators—T. Bower, C. L. Bower and T. A. Pitman.

Levis, Que.—National Drop Forge Co., Ltd., under Canadian laws; authorized capital, $49,000; to engage in drop-forging work, manufacture saws, etc. Corporators—John B. Dorais, E. Belleau and others.

Toledo, O.—Silent American Motor Co., under Ohio laws; authorized capital, $10,000; to experiment with a newly patented noiseless motor. Corporators—J. R. Ford, W. C. Kirkbridge, H. C. Crane and others.

Westmount, Que.—Westmount Motors, Ltd., under Canadian laws; authorized capital, $50,000; to manufacture motor cars, bicycles, motors, etc. Corporators—William K. McKeown, Leopold Choquette, and others.

Chicago, Ill.—Chicago Motor Bus Co., under Illinois laws; authorized capital, $10,000; to operate a motor livery and transportation line. Corporators—Daniel J. Schuyler, Samuel A. Ettelson and Charles Weinfeld.

New York, N. Y.—Keaton Tire & Rubber Co., under New York laws; authorized capital, $1,000. Corporators—Harold A. Forbes, 611 West 137th street; William J. Kreuder, Bloomfield, N. J.; Thomas F. MacMahon, 1402 Broadway.

Brooklyn, N. Y.—Empire Postal Motor Co., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—Eugene Beugnet, 24 West 50th street; Gustave Posner, 62 East 90th street; Sidney S. Devine, 55 oJhn street.

Brooklyn, N. Y.—Oriental Rubber & Supply Co., under New York laws; authorized capital, $10,000; to deal in tires and rubber goods. Corporators—Homer G. Martin, 228 60th street; C. Roy Gedney, 594 6th street; Richard F. Lucey, 340 Clifton place.

New York, N. Y.—M. J. L. Rear Adjustable Bumper, under New York laws; to manufacture bumpers for automobiles. Corporators—Maise J. Leclerc, 554 West 114th street; Samuel Solinsky, 948 Leggett avenue; Henry Stern, 522 West 161st street.

St. Louis, Mo.—Pneumatic Devices Co., under Missouri laws; authorized capital, $50,000; to market an electro-pneumatic door closing and opening device especially adapted for automobiles, garages, etc. Corporators—Nelson S. Gottshall and others.

Buffalo, N. Y.—Hurd-Landsheft Motor Co., under New York laws; authorized capital, $7,500; to conduct a general motor car business. Corporators—Melville J. Hurd and Cora M. Hugo, both of Elma, N. Y.; Raymond Landsheft, 250 Humboldt Parkway.

New York, N. Y.—William Wiese & Co., under New York laws; authorized capital, $25,000; to manufacture upholstery for automobiles, etc. Corporators—Wm. Wiese and Chester Wiese, both of Bronxville; Albert Maertens, 83 Danforth avenue, Jersey City, N. J.

New York, N. Y.—Auto Accessories Association, under New York laws; authorized capital, $10,000; to deal in automobile accessories, tires, etc. Corporators—Samuel Falk and Henry C. Falk, both of 299 Broadway; Edward E. Braendle, 100 William street.

New York, N. Y.—Meyers & Grayson, under New York laws; authorized capital, $25,000; to manufacture and deal in tires, tubes, etc. Corporators—Morris Meyers, 945 East 163rd street; Shirley J. Grayson 251 Ft. Washington avenue; Mary Ginsburg, 691 Wales avenue.

Change in Capitalization.

Indianapolis, Ind.—Motor Car Mfg. Co., to $100,000.

Alliance, O.—Alliance Rubber Co., from $100,000 to $150,000.

Cleveland, O.—Parish & Bingham Co., from $224,000 to $1,000,000.

Detroit, Mich.—Packard Motor Car Co., from $10,000,000 to $16,000,000.

East Palestine, O.—East Palestine Rubber Co., from $50,000 to $150,000.

Detroit, Mich.—Detroit Motor Truck Body Co., from $10,000 to $40,000.

Minneapolis, Minn.—H. E. Wilcox Motor Car Co., from $1,000,000 to $3,500,000.

MANLEY SECTIONAL GARAGE "FALLS" ON MAKER'S HEAD

Arrested on Charge of Misusing Mails —Complaint by Man Who Sent Money But Never Got Garage —"Behind Orders" Plea.

Charged with fraud and misuse of the mails, Charles H. Manley, head of the American Sectional Garage Co., of Detroit, was arrested in that city on Thursday last by a United States post office inspector. The particular complaint on which Manley was taken into custody was filed by R. E. Tuthill, in Bridgeport, Conn., who, more than four months ago, sent Manley $153 for one of his sectitonal garages, which, despite repeated demands, failed to arrive.

Manley advertised sectional garages at prices ranging from $140 to $400, but, so far as known, he never delivered even one of them. When his victims complained, he explained that delay was due to his inability to get material, or that his "factory" was so far behind in orders that he was not able to keep pace with the demand. Before going to Detroit, Manley operated in Palatka, Fla., as the Southern Portable House Co., but many inquiries sent to that address were returned unopened.

On the Tuthill complaint, Manley was held in $1,000 bond for examination on December 23rd.

Maxwell to Sell Columbia Factory.

Putting an end to hopes which had slumbered in Hartford, Conn., the Columbia factory of the Maxwell Motor Co. is finally about to be offered for sale. When the long-famous Columbia car was discontinued, it was given out that the factory in Hartford would be continued for the manufacture of parts, but instead it was shut down and has remained idle for many bonths. The property to be disposed of comprises 10 acres of ground, valued, according to a recent appraisal, at $110,000, and buildings, $250,000.

Ohioans in a Noiseless Motor Enterprise.

The Silent American Motor Co., of Toledo, which was incorporated last week under the laws of Ohio with a nominal capital of $10,000, has in view the manufacture of a recently patented noiseless motor which so impressed a number of Toledo automobile tradesmen that they have linked their names with the enterprise.

They are represented on the official board of the company as follows: Charles S. Turner, of the Morton Truck Co., president; J. R. Ford, J. R. Ford Realty Co., secretary; J. W. Hawk, Kinsey Mfg. Co., treasurer; S. F. Sawyer, general manager. S. L. Kelly, of the Electric Auto-Lite Co., and B. O. Gamble, of the Gamble Motor Car Co., are the directors. If the experiments which are in progress pan out as expected, the capital of the company will be increased to $300,000 and the engine be produced on a large scale.

Aristos Petitioned Into Bankruptcy.

The Aristos Co., which entered the trade several years ago in New York City as a distributer of Disco starters, which later made a shock absorber and a gas saver and which recently attempted to put out the Mondex-Magic car, was made the object of a petition in bankruptcy on Saturday last in the Federal court in New York City; the petitioners and their claims are: Charles Pine, $243; Edmund W. Lyons, $200, and James T. Parkes, $103, all on notes. It is charged that since September 2, while insolvent, the company made preferential payments aggregating $6,585. The company is a Delaware corporation with a capitalization of $400,000. Clyde D. Knapp is president and Henry C. de Rham, treasurer. Space which the company had contracted for at the New York automobile show has been taken over by the newly formed Fischer Motor Corporation, and it is stated that the Aristos Co. will be wound up.

Dealer and Customer Dispute a Point.

Was or was not Alexander W. Ailringer pleased with a used Overland car when it was demonstrated to him in October? This is the uestion which is the cause of a suit against him in the New York City Court by the C. T. Silver Motor Co., Metropolitan Overland distributer, and in which Silver says he will prove his point in about fifteen minutes.

Arlinger claims he promised to buy the car for $650 if it suited him when demonstrated, but he claims it did not suit; the Silver company alleges that it can prove that Arlinger was well satisfied at the time of the demonstration but declined to take the car when it was tendered him.

Creditors to Decide Columbus's Future.

For the purpose of deciding the future of the Columbus Buggy Co., of Columbus, O., which manufactured the Firestone-Columbus cars, a general meeting of the creditors has been called to occur today. The company failed on January 18th last, and since June has been in the hands of a group of creditors who bid in the plant. It is stated that the auditors' report shows a profit on the operation and today's meeting is to decide whether it is advisable to form a new corporation and continue the business.

ADAMS CAN'T COLLECT OLD CLAIM AGAINST U. S. MOTOR

Federal Court, Which Guided Receivership, Says Only "Fund" Available Was Dayton Property—Sold to Maxwell.

Gridley Adams, one-time advertising manager for the Dayton Motor Car Co., and later for the United States Motor Co., cannot collect an indebtedness he claims against the former concern, which was absorbed by the Maxwell Motor Co., when it grew out of the ashes of the United States Motor. Adams attempted to collect his claim this week in the United States District Court for the Southern District of New York, where the United States Motor receivership has filled two envelopes with documents weighing several pounds, but the court denied his request.

The court stated that in the case of a fund which is being distributed to claimants, there is no question but that the distribution rests in the discretion of the court, but in this case the only fund was the property of the Dayton company: this property, the court said, was sold by the court, and the only reason for seizing the property would be to enforce the terms of the sale. The terms of the sale, however, said nothing about paying anything to Adams, wherefore the judge said he didn't see where Adams was going to get anything.

Bearing Companys' Officers All Resign.

Preliminary to a reorganization of the Suspension Roller Bearing Co., of Sandusky, O., President E. A. Neighbor and Secretary-Treasurer W. W. Boyer and all other officers have resigned their offices, their resignations to take effect January 1st. Thereafter the affairs of the company will be controlled by a voting trust, of which August W. Smith and V. M. Montgomerr, of Spartansburg, S. C., will be the representatives.

To Mix Oils and Electric Goods.

Arrangements have been consummated whereby the Electric Appliance Co., of New Orleans, will handle the complete line of Invader oils and greases. The company's territory includes the States of Louisiana and Mississippi and parts of Alabama, Florida, Arkansas and Georgia.

Cox Opens Branch on Pacific Coast.

The Cox Brass Mfg. Co., of Albany, N. Y., has established a Pacific Coast branch in San Francisco at 1216 Van Ness avenue. It is in charge of Charles M. Weaver.

Digitized by Google

In the RETAIL WORLD

Victor M. Stamm has resigned as manager of the tire department of the Goodyear Rubber Co., of Milwaukee, and will become manager of a branch which the Hub-Mark Rubber Co., of Boston, will establish in that city; Harold D. Detienne, also a former Goodyear man, likewise has resigned to establish himself as the Wisconsin Rubber Co. Both the Wisconsin and Hub-Mark concerns will distribute tires. The Goodyear Rubber Co., while not a tire maker and not connected with the Goodyear Tire & Rubber Co., is Wisconsin distributer of G & J tires. The Goodyear company is planning a new building to take the place of the one destroyed by fire October 26 at 384-6 East Water street with a loss of $600,000.

The Central Garage & Painting Co. has been formed in Pontiac, Mich., by F. W. Hamlin, a garage operator, and C. R. Greenwood and E. R. Farlow, formerly employed by the Oakland Motor Car Co., of that city; 15,000 square feet of space has been leased in the Osmun building, where the company will conduct a garage and repair business.

J. W. Shelor and W. W. Morris, Jr., have formed the Shelor-Morris Co. in Dallas, Tex., and "opened up" at 2219 Commerce street. They will distribute Velie cars and trucks through a large territory. Morris, for the past five years, has been with S. F. Bowser & Co. in Dallas; Shelor also is well known to the trade in that city.

Preparatory to replacing its entire horse-drawn equipment with motor trucks, the Joseph Schlitz Brewing Co., of Milwaukee, is securing plans for a two-story, fireproof garage, 200 x 150 feet, to cost $50,000; it will stand at 4th and Galena streets and, it is said, will be the largest private garage in the Middle West.

The Maxwell Motor Sales Co. is about to open up in Oskaloosa, Ia. Fred L. Good, who is district manager in that territory, will direct the business. A lease has been secured of the Harvin building, 40 x 120 feet, at 213-15 South 1st street. This will be the Maxwell headquarters in that territory.

B. L. Losee, formerly of Charlotte, Mich., has purchased the Tracy Garage, 117 Harrison street, Elkhart, Ind., and will style it the Lincoln Highway Garage. He has leased space to Kleinert & Elliott, who recently established a taxicab business in Elkhart.

Edward Coryell and William F. Anderson have purchased the Canon Auto Co. in Canon City, Col., from F. E. Thomas; it is located in the Rainbow Route Garage. Coryell has been in charge of the company's machine-shop for two years.

Mark Garner, Elmer W. Garner and William A. Garner, formerly of Flint, Mich., have formed the Garner Motor Car Co., in Bay City, in the same State; they will operate a garage and will distribute Chevrolet cars in six counties.

Alfred H. Coates, a manufacturers' representative in San Francisco, with an office at 444 Market street, has opened a branch office in Los Angeles, at 1329 West 5th street; J. P. Hermans is in charge.

Bunker Hill Garage is the style of a new business which will be established in Los Angeles by Samuel Richteiner; he will locate in a building which is now being erected at 126 North Grand avenue.

Boudinot & Cuthbert have opened a garage and salesrooms in New Brunswick, N. J., at 3 Schuyler street; they have the agencies for Studebaker, Hupmobile, Marion and American cars.

Heise Bros. are about to enter the garage trade in New York City; they have purchased a new garage building which was recently erected at 505 West 171st street at a cost of $15,000.

J. F. Hunt and Thomas Vasbinder, formerly of Chicago, are about to open a garage and repair-shop in Oskaloosa, Ia. They have leased the Slatten building, at 217-19 South 1st street.

Howard Miller and F. A. Brown have formed the Richland Motor Co. in Shelby, Ohio. They have opened salesrooms on South Walnut street and have secured the Buick agency.

C. C. Eichelberger, a veteran tire man on the Pacific Coast, has been made Coast distributer of Portage tires; he has made his headquarters on Golden Gate avenue at Hyde street.

The Tri-City Motor Co. has entered the trade in Moline, Ill., at 3402-12 4th avenue; C. M. Ahlene is manager. The company will make a specialty of garage and machine work.

John Mashak, of Cashton, Wis., has awarded the contracts for a fireproof garage, 50x100 feet; it will contain a heating plant and a completely equipped repair-shop.

Glen R. Austin, of Grand Rapids, Mich., has taken over the repair and storage departments of the Barkwell-Buick Sales Co. They are located on Pleasant street.

W. H. Phillips, of Ogden Station, Mich., has remodeled a blacksmith shop for use as a garage; part of the building, however, will be occupied by a blacksmith.

Nathaniel M. Cory and Homer Stanley, of Oskaloosa, Ia., have formed a partnership and will operate a garage; they will locate at 213-15 South 1st street.

The Bair Farrell Garage, in Webster City, Ia., has been taken over by H. Stenson, formerly of Minneapolis; he has taken charge and will operate it.

Damp Bros., of Lake Mills, Wis., have purchased a building in Fort Atkinson, in the same State, and will establish a garage and repair business there.

Frank J. Rockwell has completed a garage in Dorchester, Mass., at 739 Washington street; it cost $25,000. He styles it the Dunbar Avenue Garage.

L. G. Smith, L. C. Week and H. A. Donnelly have formed the Tri-City Commercial Garage Co. in Davenport, Ia. They will handle Universal trucks.

W. S. Edwards, of Wapello, Ia., has purchased the interest of W. S. Otto in the Eland & Otto Garage; Edwards replaces Otto in the firm name.

Eugene Ball and Don Leary, of Carthage, N. Y., have formed a partnership to operate a garage; they have styled their business the Elmhurst garage.

Hazen & Franks, of Philo, Ill., are about to enter the garage trade; they have leased what formerly was a livery stable and will handle Ford cars.

Government Square Garage is the style of a new business in Cincinnati, O. It is located on 5th street and will handle cars and accessories.

A garage is to be opened in Moorehead, Minn., to be operated in connection with

Digitized by Google

the Hotel Comstock; it is located on the hotel property.

Recent Losses by Fire.

Hohokus, N. J.—Joseph F. Tout; garage destroyed. Loss, $2,000.

Watertown, Mass.—John E. Fleming; garage destroyed. Loss, $20,000.

Ironton, O.—Bonze Bros., South 3rd street; garage damaged. Loss not stated.

Dayton, O.—Charles Bandelspaugh, 630 Smith street; garage damaged. Loss, $1,200.

Anamosa, Ia.—Fred Sigsworth; garage, two cars, tires and tools destroyed. Loss, $3,000.

West New Brighton, N. Y.—Interboro Garage; garage and 40 cars destroyed. Loss, $25,000.

Minor Business Troubles.

A petition in bankruptcy has been filed against L. P. Cutler, of Rock Island, Ill. He operated a garage on 3d avenue.

The Firestone Tire & Rubber Co. has filed a petition in bankruptcy against the Wright Rubber Co., of Salt Lake City, Utah, claiming that the latter is insolvent and owes the Firestone company $526.04; it is charged that November 10 accounts aggregating $1,500 were assigned to the United States Tire Co., constituting a preferential payment.

The Springfield Tire & Rubber Co., of Springfield, O., has filed a petition in bankruptcy, with liabilities at $15,223 and assets of $8,441; nearly the entire indebtedness is unsecured. The Citizens' National Bank of Springfield claims $5,707 on notes; the other claims are small. The assets inclue: Stock on hand, $1,000; machinery, $4,120; accounts, $1,480; bills and notes, $1,238. J. W. Garnier is president and D. K. Gotwald the treasurer.

Foundryman and Motor Maker at Adds.

Claiming an indebtedness of $339.21, the Detroit Foundry Co., of Detroit, filed suit this week in the Supreme Court for New York county against the Kirkman Motor Mfg. Co., of Bath, N. Y. It is charged that goods to the value of $104 were supplied between August 4 and September 3, 1913, and that a three-months note for $265.34, given August 16, went to protest with a fee of $1.47. A credit of $32 was deducted from the total of these figures.

M. A. M. Fixes Date for Annual Banquet.

The annual banquet—the sixth—of the Motor and Accessory Manufacturers, which is the one big social event of the show season, has been fixed for Wednesday evening, January 6th. It will be served at the Waldorf-Astoria, New York. The annual election and business meeting of the organization will occur the same afternoon at the same place.

Dec. 17-20, Davenport, Ia.—Tri-City Automobile Trade Association's fifth annual show in the State Armory.

Jan. 2-10, New York City—Importers' annual automobile Salon in Hotel Astor.

Jan. 3-10, New York City—Automobile Chamber of Commerce's national automobile show in Grand Central Palace.

Jan. 4-5-6-8, New York City—Annual winter meeting of the Society of Automobile Engineers.

Jan. 7, New York City—Eleventh annual meeting of the Motor Accessory Manufacturers in the Waldorf-Astoria.

Jan. 7, New York City—Sixth annual banuet of the Motor & Accessory Manufacturers in the Waldorf-Astoria.

Jan. 10-16, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's sixth annual automobile show in the Auditorium.

Jan. 10-17, Cleveland, Ohio—Cleveland Automobile Show Co.'s annual show in Euclid Square Exposition Hall.

Jan. 10-17, Philadelphia, Pa.—Philadelphia, Pa.—Philadelphia Trade Association's show in the Metropolitan building.

Jan. 20-24, Baltimore, Md.—Baltimore Automobile Dealers' Association's show in the Fifth Regiment Armory.

Jan. 12-17, Bridgeport, Conn.—Second annual show in the State Armory.

Jan 24-31, Chicago, Ill.—Automobile Chamber of Commerce's national automobile show in the Coliseum and First Regiment Armory.

Jan. 24-31, Rochester, N. Y.—Rochester Automobile Dealers' Association's annual show in Exposition Park.

Jan. 24-31, Montreal, P. Q.—Montreal Automobile Trade Association's pleasure vehicle show.

Jan. 26-31, Scranton, Pa.—Automobile show in the State Armory.

Jan. 17-24, Detroit, Mich.—Automobile Dealers' Association's show in the Ford Building.

Jan. 31-Feb. 7, Minneapolis, Minn.—Minneapolis Automobile Trade Association's seventh annual show in National Guard armory.

Feb. 2-7, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's pleasure vehicle show.

Feb. 3-7, Kalamazoo, Mich.—Kalamazoo Automobile Dealers' Association's fifth annual show in the State Armory.

Feb. 3-7, Montreal, P. Q.—Montreal Automobile Trade Association's commercial vehicle show.

Feb. 4-7, St. Joseph, Mo.—St. Joseph Automobile Show Association's show.

Feb. 9-14, Seattle, Wash.—Annual show in State Armory.

Feb. 9-14, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's commercial vehicle show.

Feb. 14-21, Pittsburgh, Pa.—Pittsburgh Automobile Show Association's fourth annual show.

Feb. 16-21, Kansas City, Mo.—Annual show.

Feb. 18-21, Bloomington, Ill.—McLean County Automobile Club's show.

Feb. 21-28, Newark, N. J.—New Jersey Automobile Trade Co.'s show.

Feb. 22-March 1, Hartford, Conn.—Automobile Dealers' Association's show in Park Casino.

Feb. 21-28, Cincinnati, O.—Automobile Dealers' Asscciation's pleasure vehicle show in Music Hall.

Feb. 23-28, Omaha, Neb.—Omaha Automobile Show Association's annual show.

March 2, 3, 4, Cincinnati, O.—Automobile Dealers' Association's commercial vehicle show in Music Hall.

March 2-6, Fort Dodge, Iowa—Automobile Dealers' Association's show in the Armory.

Mar. 9-14, Des Moines, Ia.—Automobile Dealers' Association's annual show.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's 12th annual pleasure car show in Mechanics Building.

March 17-21, Boston, Mass.—Boston Commercial Motor Vehicle Association's 12th annual commercial vehicle show in Mechanics Building.

Louis Hupp Not With Briggs-Detroiter.

Louis G. Hupp has not joined the Briggs-Detroiter Co., of Detroit, nor has he abandoned the manufacture of the Tribune car. Hupp is a close personal friend of President Briggs, of the Detroiter company, and the widely printed reports linking the two grew out of some special work which Hupp had performed in Briggs's behalf. Hupp still has irons of his own in the fire and they shortly will be held up to public gaze.

NEW YORK, DECEMBER 18, 1913

THE SHOWS AND THE CARS OF 1914.

Whatever may be said for or against the National shows, it is undoubted that they serve as the mile-posts of the industry; they mark its advance as nothing else can or, at any rate, has marked it.

During each of the more recent years, it has seemed, and has been asserted times without number, that the motor car had reached close to finality, that point which marks the end of the road. At such times, it has been usual to declare that such advances as had been made during the previous twelvemonth were chiefly in the nature of minor improvements—of refinement of details. And viewed separately the cars appeared to bear out such assertions. When brought together, however, and staged under one show roof, and there viewed collectively, the "minor" improvements and refinements usually have been found to be so numerous, or so far-reaching in their effects as to make those terms too belittling truly to represent the state of the art.

With another mile-post in close sight, the truth of these statements will be made even more distinctly and impressively visible. For, great as were the advances of the two previous years, the cars of 1914, which will be collectively displayed at the forthcoming shows, will bear witness that improvement is still the order of the age. That the improvements, viewed collectively, are of major and not minor importance will be plain to all who have eyes to see, and who are sufficiently interested to follow the painstaking forecast which is outspread on the pages of this issue of Motor World.

Quite apart from the item of equipment, which now figures so conspicuously, the cars, both outwardly and inwardly, are vastly better productions and vastly better values than even their immediate predecessors. Though ill-fortune may have visited an unusually large number of the trade units during the year, the cars on exhibition will bear witness that the not unnatural process whereby the fittest survives was not accompanied by stagnation of ideas or of energy.

INFLAMMATION AND PERSECUTION.

These are great days for the man, or woman, or organization that seeks the notoriety that comes of figuring in the public prints. All that is necessary is to "take a whack at the automobile"—to stand up and holler loudly about the "recklessness of drivers," the "ruthless disregard of human life," or the "slaughter of the innocents" by "arrogant owners of motor cars." The newspapers will hear the cry and do the rest. For the mental agony of newspaper publishers, or editors, is on the border line of the exquisite.

During recent weeks, particularly in certain portions of the East, the agony and shrieks of the daily press have made it almost appear that men who drive motor cars are not human beings—that they take keen delight in flouting the laws and in killing or maiming others who use the public highways.

The lawyer and the doctor, and many other kinds of man, who seek advertising, or need it, not to remark the dear ladies who want votes, or who don't want them, and who appear to have lots of time to indulge their whims—to some of these the "automobile agitation" has been a boon indeed; it has given them a chance to "get their names in the papers." To those high-sounding organizations, composed chiefly of one man, it has been a godsend; indeed, there is cause for suspicion that in order to assist their pockets some of these so-called organizations have "sicked" the lawyers and the doctors and the ladies onto the automobile. For when the public mind is thus inflamed, contributions flow most freely into the tills of such "societies" and "associations."

They are all having their innings these days and, as a result, the man who owns or operates an automobile—most of whom are law-abiding citizens—are receiving the attention of the police in a manner that is akin to persecution; they are being punished for the most trivial offenses while all others who use the public thoroughfares are permitted to do as they please. They probably will be permitted to continue to do so while such editorial notions as those expressed by the New York Evening Mail, for instance, find lodgment in human skulls, for the Evening Mail, flouting a suggestion that children be kept off the streets, actually declares that there are "plenty of drivers who would be more careless than ever if children were taught to be more careful."

GETTING CASH FOR REPAIRS

Abolishing Credit in Shop Work a Better Business Method — One Garageman Who Tried It and Who Found It Not Difficult.

"All Repairs Cash."

That sign is being seen more frequently in garages the country over. It is a sign that wins. It is a sign of good business methods. Cash is rigidly asked for a commodity that requires cash in turn. The quently longer.

Prior to July 1st a certain Detroit garage used to do business in the ordinary way. Customers would come in and leave their cars for repairs and drive out again when the work was finished. Often they would take 60 and 90 days on their bills, frequently longer. With a large number of customers it did not take long to have a fair-sized sum of money tied up.

Peculiar Attitude Toward Garage.

There were other disadvantages. Often a customer would feel that as long as his bill was unpaid he was entitled to many free services. By some peculiar mental twist there seemed to be a feeling on the part of many that the garage was really under obligations to them in having them owe money.

This is all very nice, but it is very costly and it does not pay the help. And why borrow money, if you can, when the money owed by customers would take good care of you if only in your hands when due? Some thoughts like these ran through the mind of the garage man referred to and resulted in a decision to work for cash only.

He selected a big sign to convey the message to his customers. It was placed right near the door where it could not fail to be seen. Besides the words, "All Repairs Cash After July First," it bore the additional warning, "Repairs Must be Paid for Before Cars Are Taken from Garage. There are no exceptions to this rule."

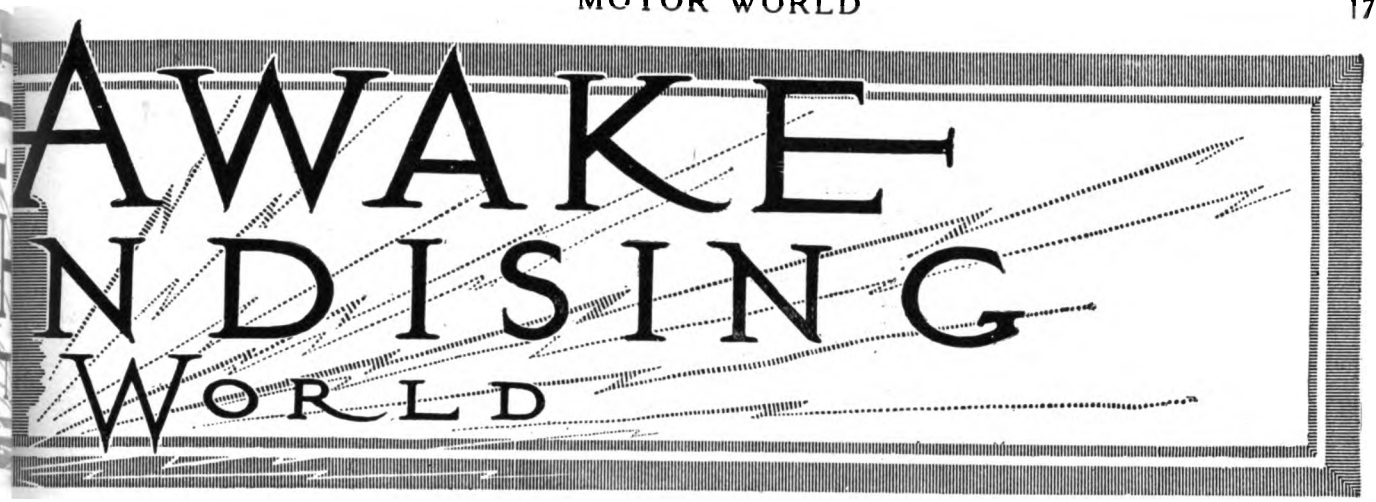
It worked like a charm. Customers came into the office and asked for bills. They were always ready. The transaction was closed then and there. It saved much work in the bookkeeping end; it saved postage, collector's salaries and has resulted in a business-like appreciation on the part of customers worth while. Those that haven't the money stay away till they get it. Furthermore it is not half the trouble it used to be to meet the weekly payroll.

CONCERNING GUARANTEES COVERING REPAIR WORK

"Anent request for views on repairmen's guarantees," writes W. F. Schaphorst, "I believe the garageman who was held to the guarantee he made really has no cause for complaint. He is at fault because he should have been more explicit in the limitations of his guarantee. There certainly should have been a tire or a distance specification; otherwise I can't see but that the owner would have had the right to hold the garageman indefinitely. Had he said, 'I will guarantee your car for 500 or 1,000 miles after I finish it, to run flawlessly,' the guarantee would have been within reason.

"It is foolish to simply guarantee repair work on so complex a machine as an automobile that has already demonstrated its ability to quickly run itself out of order. It is all right for builders to make good all breakages and small repairs for a period of one year, but even the builders specify 'provided the broken part or parts needing repairing was defective at time of sale.' It is therefore up to the owner to sometimes attempt to prove the impossible. How, then, can an owner reasonably expect a garageman to guarantee an expensive car for $45.75—money that the garageman has already honestly earned?

"In the case cited in Motor World it was plainly up to the garageman to make good his promise. Any promise or guarantee (I can't see that there is much difference) should be kept. This man should have been more cautious in defining the extent of his responsibilities. I think the owner, who really had the garageman 'on the hip,' was a pretty decent sort of fellow to pay half the cost of doing the work over again. Of course, had the owner understood the intricacies of automobile repairing as well as a garageman does, had he wanted to be absolutely square, and had he sincerely believed that the garageman was in no way responsible for the new trouble, he would have borne the expense of the second repair entirely."



ACTION THAT SPOKE LOUD AND BROUGHT IMMEDIATE ORDER

Action will sometimes make sales when no amount of argument will start the ball a-rolling. After a long, hard struggle, the salesman for a paint manufacturer induced a big paint dealer to give him a sample order and permission to arrange a window display. To that salesman there was no time like the present. He got busy. Goods were drawn from the local warehouse, signs, "cutouts" and booklets were ordered.

When they arrived the salesman was on the spot. The windows were dirty. Instead of going to the boss and asking him to have them washed, the salesman secured a pail, water and the rest of the necessities and did the job himself. He hustled and he did a good job. He was in earnest and he was not ashamed to do a little menial work if it meant a better display of the goods he represented.

His act resulted in two things: First, it emphasized to that big dealer the value of clean windows. Second, the nerve of that salesman doing the job himself, tickled him. The following day the salesman pulled out of town with a $2,500 order, which is some order in the paint business.

SALE THAT WAS EASY AND WHY

Instead of Telling of a Difficult Sale, Electric Man Describes an Easy One—But Despite Its Easiness There Was a Reason.

"I see Motor World is running a series of stories regarding difficult sales, but I am going to tell you how I made my easiest one," remarked an electric car salesman.

"It was made to the man who just drove by in that Hupmobile and waved his hand at me. He is a big, energetic fellow who is the head of our local factories. One day he dropped into our salesroom. 'I'm just looking around,' he remarked. 'My wife has an electric, but she's got an idea she wants one of this type.' I took him around the store, showed him what we had, asked him to sit down, and we had a nice little chat, during which we became really acquainted. I did not urge the purchase of a car, but just made myself pleasant.

Didn't Even Ask Him to Buy Car.

"Finally, he looked up at me and asked: 'Say, what color of upholstery do you think my wife would like?' I had never seen his wife, but I suggested to him that there was nothing any finer or more serviceable than that shown on the very car he had been looking at. 'How much will you allow me for my old car?' he then inquired. After getting the facts about it, I named him the allowance we would make. 'Well, just tag that car for me; I will send my old car in here to-morrow morning,' he responded.

"That's all there was to it. His old car came the next day; I sold it within 48 hours for just what I allowed him for it and got my money for it before he had taken delivery of his new car. Two days later along came his check for $2,000.

"Why was it so easy?" was asked the salesman. "The customer was ready—that was all," was his view of it.

The man who heard the story could not help but think that the answer applied with equal force to the salesman.

DEALER WHO PROTESTS AGAINST ABUSE OF SERVICE AGREEMENT

"We dealers, and the trade as a whole, have gone from one extreme to the other on the question of the service that should be given with a car," recently remarked a prominent Indianapolis dealer. "A few years ago everybody who purchased an automobile expected to get the worst of it and be robbed every time he drove a car into a garage for adjustment or repairs. To-day every salesman and every manufacturer is trying to convince the purchaser that he can run his car indefinitely without spending any money and that all adjustments and repairs are covered by the service agreement.

"Just as soon as the dealer acquires enough backbone to inform his patrons that it costs money to maintain an automobile, the same as it does to maintain a horse-drawn vehicle or any other means of transportation and that he will give him value received for every dollar he spends on it, the whole industry will begin to get on a more solid foundation."

WOMAN GARAGE MANAGER WHO TURNED LOSS INTO A PROFIT

That there is money in the automobile and garage business when carefully managed is indicated by the experience of an Ohio woman who took hold of the business and managed it after her husband had run it for some time at a loss.

In less than a year the business showed a regular monthly profit. Discounts were taken advantage of—parts and replacements were carefully watched. Workmen were kept busy and the work carefully planned. And both shop and salesroom were kept clean and neat where they had been sloppy.

People got to know that when they did business at this garage they would get businesslike treatment. If a job was promised at a certain hour it was delivered, and supplies were never allowed to run down. She looked after the details with a keen eye, and if she found a loafer among the shop men he was promptly fired. A wash-and-polish had to be well done before it was allowed out—and when anyone did business there they got the impression that someone was looking after the business and the customers.

DISPLAYING ACCESSORIES AND PREVENTING THEFT

Omer Thomas, who sells Buick cars in Kokomo, Ind., also carries a substantial line of accessories—and he displays them in one of his front windows instead of keeping them in the stockroom at the back of the garage, as do so many otherwise progressive dealers.

Incidentally, it is worth remembering that this window has a glass back with doors that lock, so that when supplies are sold from the window an adequate check is kept on them and there is no chance for that annoying petty larceny of small supplies.

WHERE SHIFTING A SHOW CASE QUADRUPLED THE SALES

When you have a showcase in your store for the display of accessories, take pains to place it where will be sure to be noticed. If possible, situate it so that every customer will have to pass by it. A Detroit dealer in tires and accessories had a show case in which there was a nicely arranged display of tire tubes, patches, tape, blow-out patches, cement, etc. But it was somewhat out of the way. He changed the location to a place where everyone who came in the store would be sure to see it. The effect was instantaneous. The sales of the articles displayed quadrupled the first month.

ANSWERING THE VITAL QUESTION "HOW MUCH?"

Concerning the Cars that will be Exhibited at the New York and Chicago Shows

In these tables, designed for quick reference, the prices are arranged according to Chassis. The term "Price Range" signifies that different bodies, or equipment, or both, are applied to the same Chassis.

THE EVEN DOZEN OF CARS WHOSE PRICE IS BELOW THE $1000 MARK

Name	H. P.	Price Range
Twombly two	11.25	$395
Twombly four	12.1	495
Metz	22.5	475
Voiturette four	18.25	$495—520
Maxwell four	20.25	750
Vulcan four	18.25	750—850
Detroiter four	19.6	850—900
Empire four	22.1	900
Buick four	22.5	950
Overland four	27.25	950
Paige four	22.5	950
Partin-Palmer	38.0	975

CARS WHOSE PRICE RANGE IS BETWEEN $1000 AND $2000—MOSTLY "FOURS"

Name	H. P.	Price Range
Buick four	22.5	$1050
Studebaker four	19.6	$1050— 1200
Hupmobile four	16.9	1050— 1350
Overland four	27.25	1075— 1550

TRADE TENDENCIES TAKE DECIDED TURNS

(Continued from page 8.)

they have become, in fact, a veritable part of the car, and are not, as no inconsiderable number of them have suggested in the past, a something crudely made and apparently fastened on at the last minute. That the improvement is a marked one must be apparent to even the most casual observer.

LOWER BODIES AND REAR TIRE CARRIERS INCREASE STABILITY.

Bodies themselves now are considerably lower than they have been in the past. There is, in fact, a well-defined tendency toward compactness and an increase in stability, both of these features having as contributing factors the increasing adoption of underslung springs at the rear, and in some cases at the front as well. Naturally, the shifting of gasolene tanks to the rear has served to fill the void between the body and the rear axle, and in this way to increase the effect of solidity. The cleared running boards that last year caused so much talk now are clearer than ever, for the tendency to carry spare tires at the rear of the tonneau has increased to the point where it now demands serious consideration. In some cases, makers still prefer to carry spares on the running board, though the majority have adopted the rear position as being preferable both insofar as appearance goes and as a measure to carry out the streamline effect.

The carriers themselves, of course, have undergone no little refinement, the most prominent feature of which is a concerted effort to support the inflated tires and their comparatively heavy rims in such a way that their weight comes on the rim rather than on the tire; quite as important in its way has been the development of carriers which dispense with straps and are fitted with locking devices which, while discouraging the unwelcome attention of the light-fingered gentry, still offer hitherto unknown advantages in the way of quick demountable features.

SEATING IMPROVEMENT IN AUXILIARY SEAT DISPOSAL.

It goes without saying, of course, that in the general refinement that has been made, the comfort of those who ride in the cars has not been overlooked. The limit in the thickness of upholstery appears to have been reached and greater attention now is being paid to the height of the seats and to the angle of inclination of both seat and back. For the most part, seats that heretofore have been practically parallel with the floorboards now are tilted slightly backward to give the luxurious lolling effect of the club lounge.

A notable improvemt has been made, too, in the disposition of the so-called auxiliary seats that make five-passenger cars into seven-passenger ones. In many instances such seats remain in the auxiliary class, which is to say, they apparently are intended only for emergency use and are properly uncomfortable when used as fixtures. In other cases, however, it is apparent that a genuine effort has been made to make them really comfortable for everyday, continuous use; they are more substantial; more comfortable; are fitted with arm rests; and what is perhaps most important, they do not interfere with the occupants of the rear seats when they are in use, and when they are not in use fold up quite out of the way and almost, if not quite, out of sight. Coincidently, entrance to the tonneau has been facilitated by the general adoption of wider doors of what has come to be styled the full U-shape.

OPEN AND CLOSED CAR FEATURES IN CABRIOLET BODY STYLES.

The unmistakable manner in which the comfort of passengers has been catered to is made plain by the development of what virtually amounts to a new type of convertible body, which may be either an open roadster or a coupe on occasion and at the whim of the owner. Some makers style them coupelettes, though it is likely that the more general designation "cabriolet"—pronounced cab-ri-o-lay—is the one that best describes them and that will endure the longest. They are, as the designation does not make very plain, a combination of roadster and coupe, and bid fair to take the place the coupe gave promise of assuming two years ago.

Further down in the bowels of the car in the abstract, the motor continues to be one of its most important parts and the improvements that have been made in it are both numerous and suggestive. During the past year, the small bore, long stroke motor has more than held its own—in fact, it has made a distinct advance, for there now are a great many more motors with bores that range from 3¼ to 3¾ inches and strokes of from 5 to 5¾ inches than there ever have been in the past; the large-bore, comparatively slow-speed motor appears to be giving away slowly but surely to the lighter, faster running small bore engine that foreign manufacturers long ago adopted as the more efficient and the more flexible of the two. The increase in piston speed is worthy of more than passing notice, for it indicates not only a tendency toward higher efficiency in general but serves to make plain that no little improvement has been made in both materials and balancing methods. To operate the motors of a few years ago at the speeds that now are common would have spelled quick and certain disaster.

SIX-CYLINDER BLOCK CASTINGS SHOW WELL-MARKED INCREASE.

The block casting of cylinders grows apace. It was to be expected, of course, that block-cast "fours" would increase and that the expectation was warranted has been made plain. But the real surprise is contained in the strong advance of the block-cast six-cylinder motor. Last year there was scarcely more than half a dozen makers who essayed the difficult task of incorporating all six cylinders in a single casting. The accomplishment marked a distinct advance in motor manufacturing methods. During the past year, however, the block casting of six-cylinder units has made a truly wonderful advance; with very few exceptions the new "sixes" that will be revealed by the forthcoming shows will exhibit the simplicity, the compactness and the rigidity that is obtainable in no other way. Incidentally, though most of the new block-cast "sixes" have L-head cylinders, several are of the T-head type, which suggests still further difficulties that have been overcome. L-head and T-head cylinders, by the way, in both "fours" and "sixes," remain in about the same proportion, though, if anything, the L-head type has made a slight advance in popularity. Quite as important in its way, as presaging further development along similar lines, is the appearance of the first block-cast Knight engine—the Moline.

REMOVABLE CYLINDER HEADS INCREASING IN POPULARITY.

Among developments more or less unlooked for, the apparently increasing popularity of the detachable cylinder head furnishes food for thought. Detachable heads always have remained a factor, though a minor one, and when last year the makers of Garford motors came out with a detachable head "six" the action presaged a slight return to favor of construction which permits such ready access to the combustion chambers. Now, however, the return

Digitized by Google

to favor would seem to have set in in earnest, for several other makers of "sixes" have formally adopted the detachable head.

Another tendency that is interesting as revealing a return to favor of construction discarded in favor of something else because of theoretical advantages that experience would seem to indicate have not been as fully borne out in fact as on paper, is the substitution of plain, flat-topped pistons for cupped or domed ones. It long has been advanced by engineers that the theoretically perfect combustion chamber should be as nearly spherical as can be obtained. And while this is true to a certain extent, it is stated by those who have indicated a preference for flat-topped pistons that the advantage of the flat, smooth, machined surface in discouraging the collection of carbon deposits and in facilitating their removal outweighs every other advantage.

HOT AIR CARBURETTER INTAKES NOW ARE COMMON PRACTICE.

Delving still deeper into the internal economy of the new motors brings to light a tendency which a year ago probably would have been viewed with alarm by more than one person less conversant with engineering matters than a real "M. E." It is nothing more or less than that the time-honored oil grooves that always have been deemed absolutely essential to the proper operation of main bearings be eliminated. Several makers have taken the initiative in this respect on the well-known theory that for the least possible resistance a bearing should literally float upon a film of oil.

Closely allied to matters pertaining to lubrication are carburation and ignition. In neither field, however, has any very radical departure from previous practice been made during the past year. Due, perhaps, to the lowering gravity of fuels, and to the knowledge that successful use of the heavier distillates requires pulverization quite as much as strenuous attempts at vaporization, intake manifolds in some instances have decreased slightly in diameter, the speed of the mixture being proportionately increased. Practically without exception, manufacturers now are fitting hot air intakes to the carburetter and in a few isolated cases others have fitted electric heaters designed to facilitate starting during cold weather, the heater being inserted in the intake pipe. In the majority of cases, where hot air intakes are fitted, they consist of plain, flexible pipes leading to some sort of box-like contrivance on or adjacent to the exhaust piping.

With regard to kerosene carburation, very little has been done during the year gone by. Of the several devices that have been heralded as making the solution of the problem imminent none has succeeded of wide adoption as yet. As already is fairly well known, the makers of Henderson cars stand ready to equip them with the Harroun kerosene carburetter, though no other manufacturer has indicated as great a measure of faith in the possibilities of oil.

SEVERAL AIR STARTER USERS "CHANGE OVER" TO ELECTRIC.

One other development connected with motors, serving as an apt indication of the trends of the times, pertains to starting devices. During the past year the electric engine starter has made further advances upon the ranks of air starters. Although a number of makers still adhere to the pneumatic device as embracing a number of advantages peculiar to itself, several prominent makers, including the Pierce-Arrow and Chalmers companies, have substituted electric starters for the pneumatic devices they always have used. McFarlan and Stevens-Duryea and Winton, and a few others, however, apparently are quite content to let well enough alone, which is to say, their pneumatic starters will remain, though all of them have adopted electric lighting quite as a matter of course.

OVERSTEP FOUR-SPEED GEARSETS ADOPTED BY MANY MAKERS.

Further along on the conventional chassis, the four-speed gearset in which the third speed is direct drive, has made sufficient advance to entitle it to consideration, several makers having adopted it for the forthcoming year. The single electric gear-shifting device which made its first public appearance at the last Boston show still bears the distinction of being the only one that has been worked out to a point of perfection warranting its general adoption. And that the adoption bids fair to be much more general ere another year has rolled around is revealed by the fact that already half a dozen car makers have incorporated it in their products and will exhibit it for the first time at the forthcoming shows. Pullman, Norwalk and Haynes all will have it. In addition, the McFarlan car, which is the first to be equipped with the Gray pneumatic engine starting and gear shifting apparatus, will swell the ranks of the cars in which the labor of gear shifting has been eliminated.

Spring suspension is another feature of the year's cars that has been given very careful attention at the hands of designers. The Lanchester type of cantilever spring gives promise of becoming a genuine factor in the not far distant future. Several makers have cast in their lot with it for the first time. In the older types of spring suspension, the most noticeable alteration is embraced in the employment of thinner leaves and the provision of some means for ensuring positive lubrication between them. Incidentally, the use of shock absorbers does not appear to be as extended as was the case last year. The practice of attaching the under spring member beneath the axles steadily is becoming more popular, the method serving as a material aid in lowering the chassis.

The tendency toward the elimination of construction which may possibly permit the development of rattles at some future time in the life of the car is well reflected in the increasing adoption of twin expanding brakes. Obviously, the construction serves another end that is quite as important in that it affords excellent protection for this very vital part of a car.

LATEST MODELS REVEAL MANY EQUIPMENT IMPROVEMENTS.

An important part of the equipment of practically every car that hitherto has been passed over with an extreme degree of lightness by the average designer at last appears to have become the subject of serious thought, in the provision of adequately protected and noiseless speedometer drives. From a noticeable number of cars, the more or less noisy and unprotected star wheel has been eliminated and in its place there has been substituted a fully enclosed drive incorporated in the wheel hub. In several other cases, front wheel drive for the speedometer has been done away with and a place for the driving mechanism found on the propeller shaft.

The most noticeable improvemnt that has been made in equipment accessories that the forthcoming shows will reveal is the veritable landslide to the "one-man" top. The old-style two- and three-man top, to continue the analogy, rapidly is giving away to the more up-to-date covering which can be raised or lowered by one person.

These are the things that stand up bold and black—that cast their shadows ahead of them—and indicate to those who have an eye to see, what may be expected in the light of coming seasons. They indicate a vast and wonderful improvement, but what is far more important, they hold the promise of what the future is to bring forth. Other improvements than those briefly listed herewith have been made, it is true, but their delineation is best left to a more careful survey of just what the shows will reveal—a more searching examination of the little touches of finesse that serve either as distinguishing marks well known or as individualities destined to become better known.

LUXURIOUSNESS DISCLOSED WHEN CLOSED CARS ARE THROWN OPEN

Digitized by Google

Looking Searchingly Into the 1914 C

Big Things, and Little, That Will Be Revealed by the New Y and Chicago Shows—More of Real Novelty than for Seve Years, Some of It in Unexpected Places and of Vital Nat

REFURBISHMENT OF BODIES

From a small beginning that can be traced without any trouble to sources beyond the seas, the streamline type of body, which a year ago was practically unknown in American markets, has within the year gone by become of tremendous importance. The external appearance of the scores of cars that are to be uncovered at the forthcoming National shows in New York and Chicago, has changed out of all semblance to the cars of yesteryear—straight-line creations for the most part which gave evidence of a mighty striving for a more or less chimerical blended effect that eluded all but a very few of the more wary designers. The new cars are different and they show it in every line. In point of fact, there is a far greater difference between the car of 1914 and the car of 1913 than there was between last year's products and those of two years ago.

"Cleanness" of Streamline Bodies.

The new cars have an unparalleled appearance of "cleanness"; they give the impression of the finely kept, beautifully tapering fingers of the refined and well-groomed belle by comparison with their predecessors, which, to continue the same sort of simile, suggested rather stubby, ill-kept digits to which hangnails gave an unsightly appearance—and caused more or less pain. They have snipped all the hangnails from the new cars; they have cleaned them up; smoothed them down; and rubbed them over with something more than a mere veneer of beauty. The beauty is more than skin deep; it's bone deep, for the very bones of the cars have been made over and they don't show through the way they did, not so very long ago.

The adoption of a totally new type of body quite naturally requires some sort of a start, and that start was made when the V-shaped radiator that suggested the entering wedge principle that the coming year will make so common. From the pointed cooler it was but a tiny step to the tapered hood; and from the tapered hood grew the concave skuttle; and so on back through the whole of the body the refining process has been carried on until at present the streamline body is an accomplished fact; and, be it added, in parenthesis, some of the newer creations quite easily may make the foreign body designer, who generally is credited with the idea, turn a beautiful shade of pale green with envy.

Most makers have adopted the streamline principle whole-heartedly, and some of them have gone a little further; but it cannot be said with any degree of truth that any have transgressed the line that distinguishes pure freaks from strictly utilitarian types. Without doubt, the same motive has urged each—to increase the comfort of those who ride in the cars and to increase the sightliness of the cars themselves.

The Clearing Away of Side Lamps.

Among the more pronounced types of streamline bodies, the new six-cylinder National—it is the first six-cylinder brother the "four" Nationals have had—probably is as good an example as can be found; the absolute "cleanness" of the lines literally compels attention. The things that have marred other bodies are simply not there. From the stem to the stern the lines are unbroken. They suggest the long, lean greyhound. There are no outside projections. Even the side lamps are gone; and the windshield has been reduced in size until it presents not an inch of surface that is not necessary.

The new Pullman light "six" is another that is a really excellent example of streamline designing. In this case the tapered hood is even more pronounced than is the case in the National; one marked difference between the two is that the Pullman body is quite a little higher than is the National. But the car that suggests the entering wedge more than does any other is the Vaughan, and this one, too, is a brand new "six." Instead of being of the usual width, the Vaughan radiator is considerably narrower than standard and the engine hood both slopes and tapers backward to blend with the lines of the concave skuttle.

The elimination of side lamps has had a pronounced effect in heightening the smooth external appearance of the new cars. Winton, Chalmers, Hudson, Reo, National, Pullman, and a whole l no longer have even the littl glass set flush with the dash th served for side lamps. Instea lamps are made to do double d Chalmers, for instance, and in others, small auxiliary bulbs are to the big ones in the head lam bulbs being used for city drivi larger ones for touring where a light is needed. In others, nc son and Reo, for example, a si connects the two headlamp bu tiple for full light and in seri driving. When the bulbs are in consume but a fraction of the sumed when they are in multi light is proportionately decreas little Hupmobile coupe the smaller lamps atop the large o is familiar, and though Pierce gineers have not eliminated they have found a new place fo lamps. Instead of being on br are built right into the fender least important advantage of th tion is that it permits better of curves in the roadway than d further back and at the same tim are better protected.

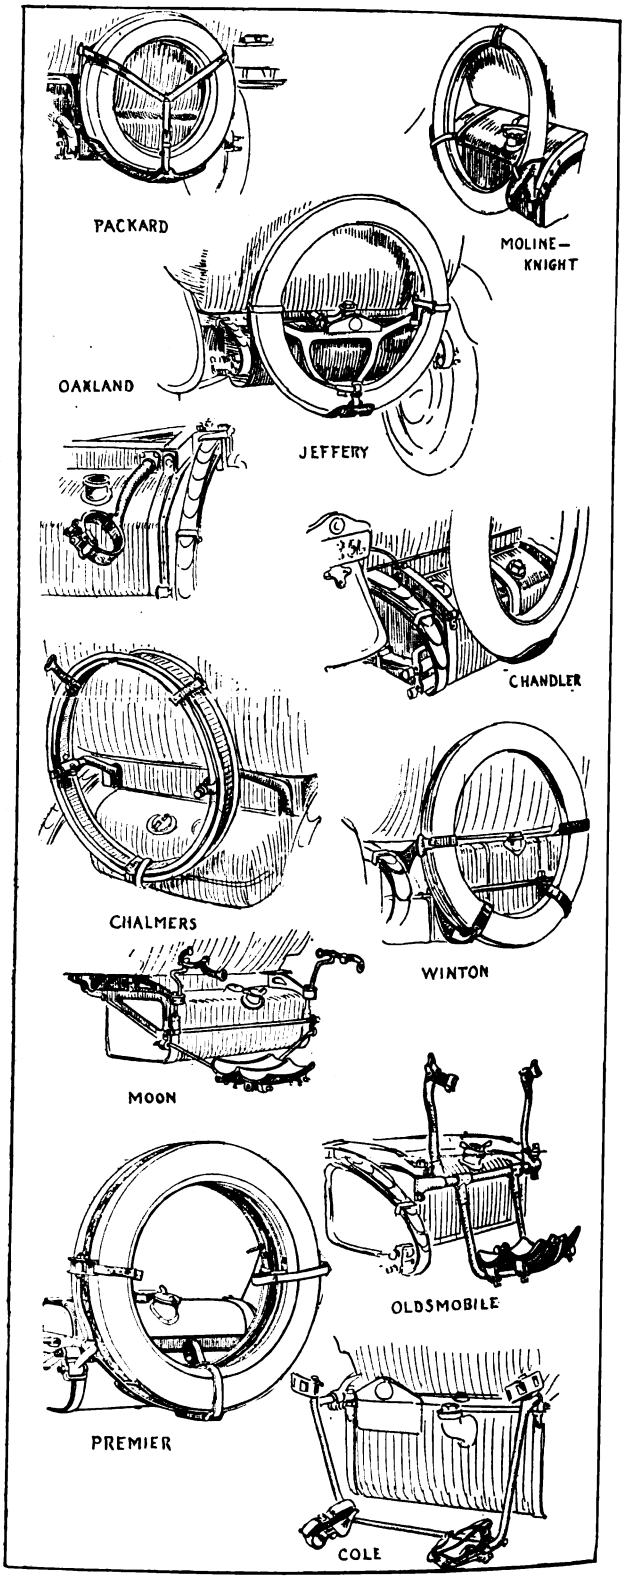
Return of the Moulded Mu

The casting out of side lamps radical difference in appearar greater difference has been m widespread adoption of the moulded fender. In the concrete, fender is not new, for it was ago on the Garford, for one, long dead Pope-Toledo, for an what a difference there is betwe hearted doming of the old-time well-formed guards of the new is difficult to say who started which has been taken up so ra mers and Lozier and Hudson a Duryea and a number of others up moulded fenders as a logic ment over the older patterns.

In some cases the fenders ar more than one piece, and in of which the Oakland and th

Digitized by Google

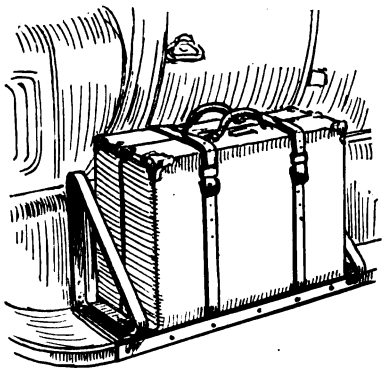
and the Studebaker are good examples, even the under bead is moulded in place. Obviously the construction serves to strengthen the fenders quite as much as it does to enhance appearance and to add protection. Incidentally, rear fenders now are reaching further around the tires than they have; the straight rearward extension is passing out rapidly. Take the Jackson and the McFarlan and the Cole and the Pathfinder, for instance, to say nothing of the Keeton and the Mitchell.



Wider Doors of Full U-Shape.

Still another thing that has a great big effect in altering the appearance of the cars that will be at the shows is the almost complete alteration in the shape of doors that has come about during the year. Doors as a rule are considerably wider than they have been in the past, and for the most part they are of the full U-shape; the point is made plain by the accompanying pictures of Keeton, White, Mitchell, National, McFarlan, Jackson and Cole cars. The flowery lines that served little purpose, in other words, have been eliminated. Latches and hinges long since have disappeared, of course. The Packard company has adopted a new type of latch that is a little different from anything else of its kind. It is styled a safety latch and is illustrated herewith. When the handle is turned the lock comes against a little catch which necessitates that the handle be turned again. Thus, even if the door is not securely latched it cannot swing open.

Ingenuity Revealed in Tire Carriers.



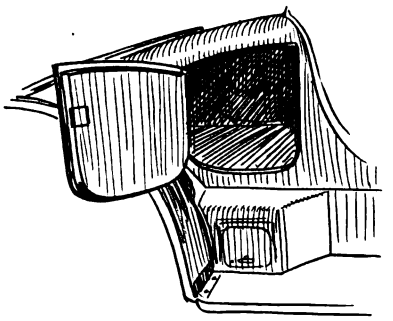
Spare tires, which last year gave evidence of moving backward off the running boards, now have moved backward in earnest and assumed positions of comparative obscurity behind the tonneau. The new position has required the development of new carriers, of course, and designers have taken advantage of the opportunity to exercise their ingenuity in devising holders that will not only hold the tires but will do so with absolute security and, for the most part, in such a way that the weight comes on the rim instead of on the tire.

Generally, the attachments are fastened directly to the chassis, the Packard, Moline, Chandler, Jeffery, Oakland and Premier being good examples. In the Oldsmobile the carrier is formed of tubing attached to rear extensions of the side frame members and in the Moon the same supports serve for both fuel tank and tires. The Chalmers carrier is different from any of the others in that the spare rims are held in place by clamps operated by means of the regular demountable rim wrench. Quite a few of

DIVERSITY IN REAR TIRE CARRIERS AND FUEL TANKS

Digitized by Google

CHANDLER LUGGAGE CARRIER



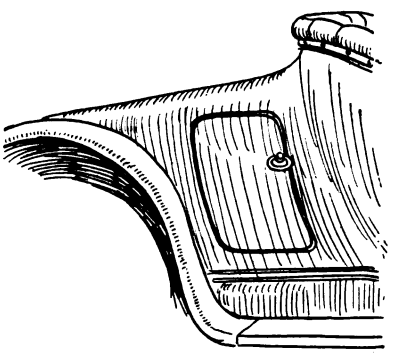
the new tire supports, as the Chandler, for instance, serve as very effectual protectors for the fuel tank.

In the new crop of cars, the disposition of tools and spare parts presents no such problem as it has presented in the past, for even though the running board no longer is looked upon as a perfectly legitimate resting place for sundry boxes and carry-alls, other spaces have become available. Due to the general shift of gasolene tanks from under the front seat to somewhat more conspicuous places at the back, or in the cowl, the space under the driver now houses the things that once were put into running board boxes. The Marmon makers, however, continue to exploit their running board suitcase carrier, though, strictly speaking, it is more on or in the front fender than on the running board, and hence it is quite out of the way. Oakland makers have attacked the tool disposition problem in a quite logical way by locating a commodious cupboard under the deep skuttle, where it is at once inconspicuous and out of the way. In a number of other cars, including National and Stearns, Stevens-Duryea and White, deep, well-hidden lockers are incorporated beneath the chassis and, opening onto the running boards, where things can be spread out if necessary with plenty of room to work.

Cowlboards Continue to Increase.

Inside bodies, the adoption of cowlboards for the mounting of control elements, the various lighting and starting switches, oil gauges and what not, grows apace. The movement, in fact, now has become a very general one, since its worth has come to be realized. The tendency to group control elements also is more pronounced than it has been, the Pierce-Arrow arrangement, for instance, being typical. In the Hudson and the National, too, elements have been grouped so that a single light serves to illuminate all. In the Oldsmobile arrangement, the devices are placed rather further back than they are in the others, by way of affording them better protection from the elements, and the Stearns dash is in marked contrast to the others because of its simplicity.

Control elements that are not placed on the cowlboard gradually are finding a place on the steering column itself, though no other makers have gone to the length of the Packard company in placing all controls on the column. Carburetter adjustments at the

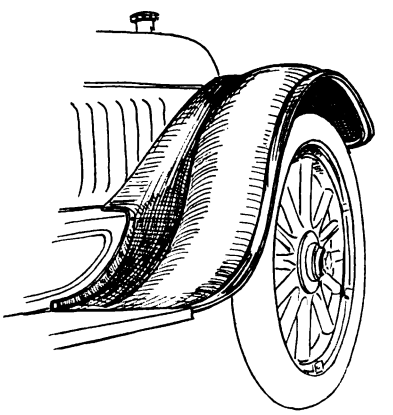


PACKARD STORAGE SPACE

operator's finger ends are much more common than has been the case in the past, a number of makers having adopted them.

Majority Have Left Side Control.

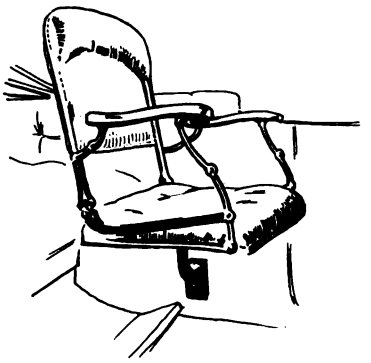
The veritable landslide to left-side steering with center control already has been



OAKLAND LUGGAGE CARRIER

remarked—the movement, in fact, undoubtedly is one of the most pronounced of all the features that go to distinguish the new cars from the old. Last year the trend toward such construction foretold the coming landslide, though it is doubtful if any expected that the movement would be so nearly universal. Of those that always have been driven from the right side, Jeffery, Stearns, Oakland, Regal, Apperson, Hudson, Franklin, Pathfinder, Buick, Chalmers, Winton, Abbott-Detroit, Marmon and a number of others now are controlled from the left side. Some few makers—such, for instance, as Pierce-Arrow, Mercer, Oldsmobile and Stutz and a few others—still adhere to right-side control, though by far the majority have switched. Locomobile and Peerless, however, offer the option of either right or left control, as do one or two others. Cadillac, too, still is driven from the right side and, by way of facilitating entrance to the front compartment from the left side, the makers have adopted an ingenious type of steering wheel that can be folded out of the way; at the same time, the front cushion "opens up," so to speak, leaving the entrance quite clear.

Few Alterations in Upholstery.

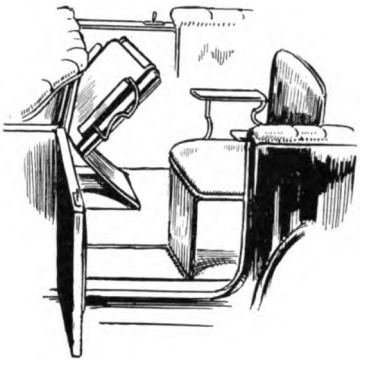


Regarding upholstery, makers would seem to have reached the limit in depth, or thickness, and practically without exception the 10-inch cushion that was virtually introduced two years ago now is standard. Some makers, it is true, have raised the ante, so to speak, but few have seen fit to worry along with anything thinner and less resilient. With but one noteworthy exception—the Stearns company—the style of cushions remains much the same, though in the main better materials now are being used than have been used in years gone by. The Stearns upholstery is distinctly different from anything else of its kind and has been chosen for utilitarian reasons as well as for purely esthetic ones. Instead of following the standard practice and locating the buttons rather close together, Stearns designers have used about one-quarter the number of buttons and have spaced them proportionately further apart. The result is that there are considerably fewer interstices for the collection of dust and dirt and, it would seem, wear is reduced because there are fewer spots which rise above the indentations made by the buttons. At the same time, the rear seat is divided in the center by a roll arm rest and similar roll arm rests are provided at either side of both front and rear compartments.

Due perhaps to a carrying out of the entering wedge principle, though more likely to an honest endeavor to increase the com-

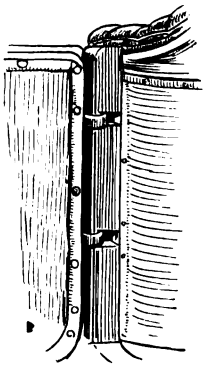
HUDSON MOULDED FENDER

Digitized by Google



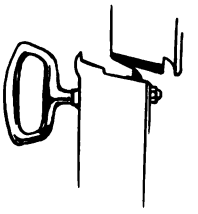
STEARNS TONNEAU CHAIR

fort of passengers, the rear seats of the new cars are generally wider than those in their predecessors. Despite the improvement in other directions, however, comparatively little attention has been paid the necessity for providing adequate and comfortable auxiliary seats in seven-passenger cars. The seats are, for the most part, uncomfortable, to express the matter in plain language. Yet a few makers have attempted to improve the condition of those who sit in them—and those who sit behind them. Stearns seats, for instance, are full-sized and are fitted with proper arm rests. When they are folded they offer little obstruction. The same may be said of the Kissel seats. In the case of the new Hudson, the designers have adopted a method which makes use of a couple of small tracks on the tonneau floor upon which the auxiliary seats rest and upon which they slide close up to the back of the front seat, quite out of the way, when they are not in use. Chalmers seats, too, fold out of the way, close to the back of the front seats, and partly into a well in the tonneau floor. A noteworthy improvement that has been made by Jeffery and Imperial and a number of others is embraced in the addition of leather facing to the back of the front seats by way of preserving the finish.



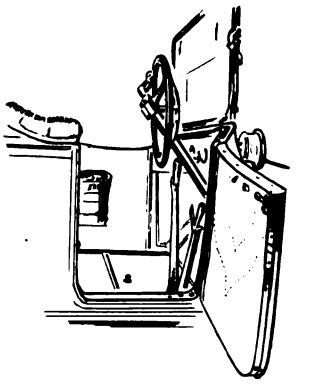
STEARNS AUXILIARY SEAT

One of the more important developments of the year—and it is a development that has direct bearing on the comfort of those who ride—is the quick springing up of that



CHALMERS FOLDING SEAT

type of small convertible body which may be one minute a completely enclosed coupe in which the occupants can be as snug as the proverbial bug, and the next minute a

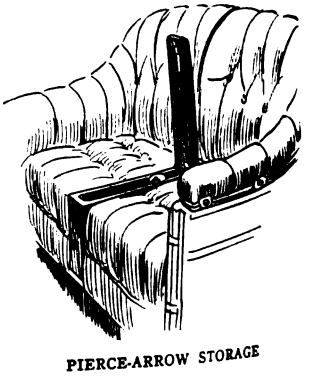


JEFFERY INVISIBLE HINGE

pretty roadster as wide open as all outdoors. Some makers style them convertible coupe, some call 'em coupelette, but most of all they are styled cabriolet, and

PACKARD LATCH

that seems to be the term that is most favored. They may be had on the smallest four-cylinder chassis or the largest six-cylinder one, the makers who produce them including such well -known names as Oakland, Paige-Detroit, Stevens-Duryea, Hudson, Keeton and Studebaker and the prices



CADILLAC TILTING WHEEL

range from $1,950 for the Studebaker and Hudson (both "sixes") to $5,000 for the Stevens-Duryea (also a "six," of course).

Among the more aristocratic closed bodies—the big limousines, the Berline limousines, the Sedans, the landaulets and the smaller "sure enough" coupes—the changes that have been made are not as pronounced as are those that have been made in the open bodies, though the refining influence of the streamline tendency is plainly apparent in most of them. Probably the most pronounced difference between the new and the old lies in the general smoothing of angles and the rounding of corners that has been offered. The arched roof that belonged to the Pierce-Arrow people by right of prior discovery, so to speak, has been quite widely adopted by other makers, and the rounded roof, sloping to the front, is much more general now than ever before.

Pierce-Arrow and Packard and Peerless and Stevens-Duryea always have been noted for the beauty of their enclosed bodies, but the Peerless company at least, and very probably all the others, will uncover genuine surprises in the way of luxurious appointments. One interesting little feature of the Stevens-Duryea models that serves as an indication of the thoughtful manner in which their design has been worked out

PIERCE-ARROW STORAGE

Digitized by Google

is embraced in the addition of tiny rain-conveying moldings on the roof to divert the rain that ordinarily would drop, unwelcome, down the necks of those who enter the car in a storm.

The Peerless company is to have on view what is styled a "Salon-Sedan" that is promised will be the very last word in luxurious appointments. There are no seats of the standard type in the car; thickly upholstered mahogany chairs take their place. The fittings are to be dark mahogany and ivory cleverly blended together; all the fittings, it is said, have been especially imported for this particular body.

MOTOR DEVELOPMENTS

Motor construction has not undergone any very great change during the year gone by, though the refinements and improvements that have been made cannot be denied and make plain the universal tendency toward higher efficiency—which means, in the fewest possible number of words, higher speed. The increase in the number of motors having bores of three and a fraction inches and strokes of five inches or more is one of the very pronounced tendencies of the time, and a tendency which serves to emphasize the fact that the small bore high speed engine bids fair to be the engine of the future. Although there has not been any remarkable falling away of those who adhere to the larger bore somewhat shorter stroke motor, the newer type of faster running machine undoubtedly has made such a noteworthy advance that it is worthy of a good deal more than passing notice. It would seem to be only a matter of time, before these larger motors finally give way to the more modern ones.

Smaller Bores and Higher Speeds.

Of the new models that make their first appearance on any stage, by far the greater number of them are fitted with small-bore, high-speed motors, the newer preference in the matter of cylinder dimensions ranging from 3⅛ inches bore and 5 inches stroke to 3⅞ inches bore and 5½ inches stroke. Incidentally, practically all of them are "sixes." Thus, for instance, in the 3⅛ x 5-inch class, the Chandler, which is a "six," and the Vulcan, which is a "four"—both of them are brand new—stand as excellent exponents. In the next larger size —3½ x 5 inches—there are the Hudson and the Oakland, which are "sixes," and the Cartercar, which is a "four," all three being new products added within the year to the already long list of motors in this class. The 3¾ x 5-inch class has won a convert in the new Buick "six"; in the 3⅞ x 5-inch class there is the King.

As a rule, bores slightly larger than 3¼ inches are the most popular, the 3¾-inch piston being in the majority. Thus, for instance, there is the White, which has a stroke of 5⅛ inches. Among the newcomers in the six-cylinder field, Jeffery, Auburn, Velie, Abbott-Detroit, Pullman, Marion and Moon all have 5¼-inch strokes, the bore being the same in each case and measuring 3¾ inches. The next larger class, which includes those cars having cylinders measuring 3¾ x 5½ inches—a still greater ratio in bore and stroke—Imperial, National, and Apperson, all are new "sixes," and the McCord is a new "four." All these, of course, are in addition to the makes that already exploit cylinder dimensions in the various classes listed.

Block Cast Motors Multiplying.

The 5½-inch stroke appears to strike the limit of popular fancy, though there are one or two examples where this has been exceeded in the production of new motors. White, for instance, has increased the stroke of its larger four-cylinder motor from 5¾ inches to 6⅜ inches and in the new Lozier "six" the stroke is set down as 6½ inches. Above that limit, however, there are very few motors, the Mitchell and the Austin, with their 7-inch strokes, to say nothing of the Peerless, which has a correspondingly large bore, and the Fiat, being practically the only exponents.

Coincident with the development of the new light "sixes," there has become apparent a very pronounced tendency to cast all six-cylinders in a single block, practice which a year ago was confined to comparatively few makers. Now, however, that is changed, and the block-casting of six-cylinders is the rule rather than the exception. Nor is the method confined to motors which have their valves all on the same side. Makers of T-head and overhead valve motors as well, now are essaying the task, both the Apperson and the McFarlan being among the newer "sixes" with T-head cylinders. In the overhead valve class, the new Premier motor is one of the very few sixes that has block-cast cylinders. Among the more conventional types of motors, National, Ohio, Keeton and Oakland—all are among the new ones that have cylinders in one block instead of two blocks or three.

Exit the Cup-Headed Piston.

Block-casting of cylinders can be expected to lighten construction to a certain extent, of course, and in other directions, too, designers have sought, with a great deal of success to reduce weight. The lightening of reciprocating parts has been going on for some time, though not yet has it reached its limit. During the past year there has come a tendency to get along with a smaller number of piston rings than have been used in the past, the Peerless engine, for instance, being one of a number in which three rings now take the place of four; friction on the cylinder walls is reduced as a matter of course.

At the same time, theory with regard to the peculiar advantages of the cupped or domed piston would seem to have received quite a jolt, for several makers who heretofore have had pistons remarkable chiefly for the absence of flat tops, have changed over and now draw especial attention to the fact that their pistons hereafter are to have plain, flat tops. Studebaker is one and Mitchell is another, both makers having come to the conclusion that such advantages as appear possible with combustion chambers as nearly spherical as possible, pale before the discouraging effect that flat, polished surfaces have on the accumulation of deposits which normally go under the name of carbon. It is pointed out, too, that the flat tops greatly facilitate the removal of such accumulations. At the other end of the street, so to speak, there is the Moline-Knight engine, which probably has a rounder combustion chamber than has any other motor. Not only are the tops of the cylinder deeply recessed, as is fairly common in Knight motors, but the effect has been heightened by deeply cupped pistons.

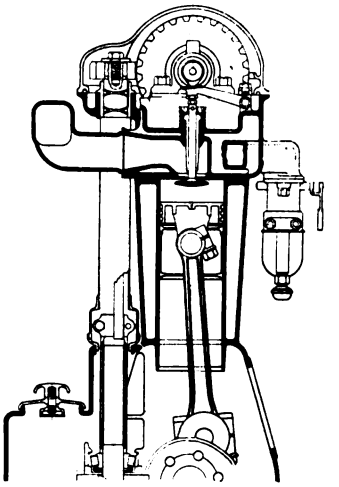
More Removable Cylinder Heads.

Any mention of Knight motors naturally brings to mind detachable cylinder heads, and examination of the newer motors that are to be uncovered at the forthcoming shows brings to light that the practice of making cylinder heads separate and afterward bolting them in place certainly gives evidence of increasing in popularity. The Moline-Knight has detachable heads, quite as a matter of course, as have a number of the smaller and better known light four-cylinder motors that have been on the market for some time. What gives emphasis to the movement, however, is the appearance of four brand new motors which feature construction of the kind. Thus, for instance,

Digitized by Google

both the Partin-Palmer, which is a "four" that will make its debut, and the Weidely-Premier, which is a "six" of a new type, both have detachable cylinder heads. What is stranger still, however, is that both motors are of the overhead valve type. The third new "six" which has a detachable head is the Oakland, though in this case the cylinders are of the conventional L-head type, and the fourth is the Lozier "four."

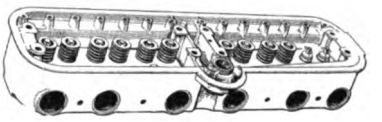
Weidely Reveals Radical Construction.



Another peculiarity of motor equipment, rather than of motor construction, that the year has brought forth, is the apparently growing practice of makers to offer the choice of two motors in a standard chassis. This has been done by way of catering to the individual requirements of the purchaser, or to his whims. The makers of Lambert cars offer the option of Continental or Rutenber motors, the dimensions differing by a very slight amount. In the Mitchell cars the purchaser may have his choice only insofar as stroke is concerned, the stroke being either six or seven inches, and in the McFarlan, either 4- or 4½-inch bore may be chosen, the stroke being six inches in either case.

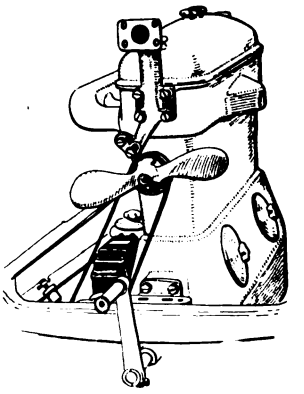
Among motors that are not of the conventional poppet-valve type, the Weidely motor that is to be exhibited for the first time by the Premier company is the newest thing that will turn a wheel at the shows. The motor in the abstract is of the poppet-valve type, but it cannot by any stretch of the imagination be styled conventional; except that it has six pistons and six cylinders and 12 valves, there is practically no point of similarity between it and any other motor. But even the valves and the pistons are different from anything else of their kind—and the same can be said of the cylinders. In only one respect is it exactly like other automobile motors—it operates on the four-cycle principle. Needless to add, there is no trace of former Premier practice forward of the flywheel, and back of the flywheel the unit construction of the motor, clutch and gearset also is new.

Crankcase and Cylinders Cast Together.



As already has been made plain, the six-cylinders are cast in a block with the cylinder head detachable. But in casting the cylinders together, the designer went still further and included the whole crankcase as well, so that only a flat plate is needed to close the bottom of the oil sump. Even the water pipes have been eliminated and the radiator attaches directly to the motor without any intervening rubber connections.

Properly speaking, there are no valve cages, the valves seating directly in the cylinder heads; they are offset, however, so that in the event of breakage they cannot drop into the cylinders. No rocker arms or



PREMIER SENSATIONAL MOTOR

tappets are used, the single camshaft being directly over the valves, which are operated through finger mechanism. Naturally, the finger mechanism eliminates side thrust on

WEIDELY CYLINDER HEAD

the valve stems. The lubrication system oils the valve stems so thoroughly that special means are provided to prevent oil working down into the cylinders.

WEIDELY MOTOR FAN

The cylinder head is held in place by 16 half-inch cap screws, and these screws serve also to hold the camshaft bearings. The whole of the valve mechanism is covered by an aluminum housing held in place by four hand wheels. Between the cylinder head and the cylinders there is a copper asbestos gasket.

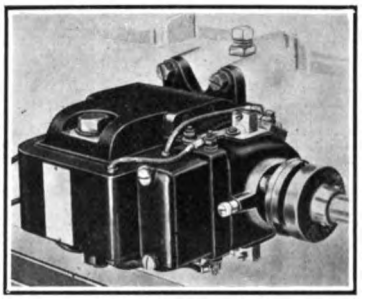
The lubrication system of the motor is one of the its most interesting features. The lower part of the crankcase holds about three gallons of oil. The plate which forms the bottom of the sump is an aluminum casting and is ribbed to facilitate cooling of the oil. Two deepening troughs in this plate lead from the ends toward the center, and lead the oil to a little pocket on the right side of the case, near its center, under the oil pump, which is bolted to the crankcase.

Providing for Valve Lubrication.

A spiral gear in the middle of the crankshaft drives a similar gear on the vertical shaft at the left side of the motor, and this, in turn, drives the camshaft through another pair of spiral gears. The oil pump is driven from the bottom of this shaft. It is of the gear type, and a large strainer precludes the entrance of dirt from the sump.

At the top of the pump there is a rotating sleeve which distributes the oil. One-seventh of the oil is pumped to a vertical passage, and one-seventh to each splash trough; all the remainder goes through a passage cored in the bottom plate. Each trough has a hollow leg that is bolted to a finished pad on the cored plate, and the oil is thus brought to the splash troughs without pipe connections. A drilled plug is put in each trough where the oil emerges, so the system is always under pressure, and the front trough is not robbed when the car mounts a hill.

Through the camshaft for its entire length there is a hole three-eighths of an inch in diameter which carries oil to the cams and the end bearings. The cored passage from the pump leads to the middle bearings, one of which has a groove extending around its inner periphery. A hole drilled in the camshaft registers with this groove. A small hole is drilled through the back of each cam, so a stream of oil squirts out over each cam finger every revolution. The end bearings are capped, so that the oil tends to flow out of the shaft at each end and back through the bearings.



Overhead Gearing Runs in Oil Bath.

Surplus oil runs toward the center of the cylinder head and falls back to the crank case through a large cored hole. This has two openings from the cylinder head casting. A well is formed in the center of the head casting by the ribs for the two middle bearings of the camshaft, and in this well the driving gear comes. Oil from the bearings keeps this oil well filled and the gear

Digitized by Google

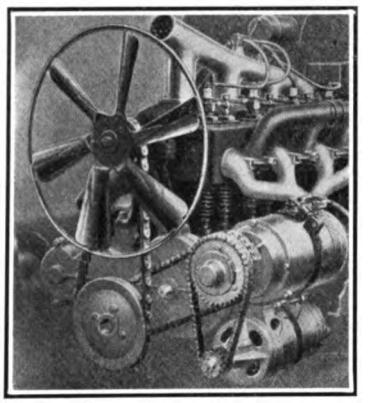
runs in a constant bath. This also lubricates the upper bearing of the vertical shaft.

The oil falling back to the crank chamber strikes the gear in the middle of the crankshaft and fills as well two pockets over the two middle main bearings, next to the gear. The front and rear bearings are oiled by

MITCHELL LIGHTING DYNAMO

long troughs, 1½ inches deep, that run from the middle of the case on either side toward the ends.

"Crosshead" Pistons in Weidely Motor.



As the accompanying illustration makes plain, the pistons that are used are quite different from anything else of their kind. They are styled by their inventor, "crosshead pistons," and are constructed on the theory that the part serving as a guide and the part taking the pressure of the explosion should be separate. The piston head and ring grooves are formed as usual, but the skirt is not continuous with the grooved part, a slot of one-eighth inch or so intervening. The bosses are linked to the head by two crescent-shaped webs, and the skirt hangs on the bosses. The result is a piston which is ground cylindrical on the skirt, with a clearance of only .0015 of an inch. With this design, it is pointed out, no heat is transmitted from the head of the piston to the skirt, and the latter may be more closely fitted than is customary.

Next to the Weidely engine in point of newness and construction that is quite out of the ordinary, though basic principles of operation remain the same, is the Moline-Knight. As is the case with all Knight engines, the four cycles are carried on with the aid of reciprocating sleeves which encircle the pistons, though the similarity to other Knight engines ends here. Instead of having its four cylinders separately cast, or at least cast in pairs or triplets, the Moline-Knight has them all in a rigid block, the construction marking an era in American Knight engine building.

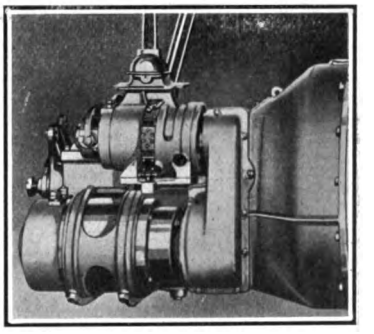
With the cylinders in a block, it has been comparatively simple for the designers to form both intake and exhaust manifolds in the same casting—which indicates another difference between the Moline and other Knight motors. Furthermore, the circulation of the cooling water is carried on by thermo siphonic action, which is another and a very important individuality of this particular motor. Still another distinctive feature lies in the adoption of force-feed lubrication entirely, splash having been eliminated. Through interconnection with the throttle lever, the quantity of oil fed to the bearings is properly proportioned to the requirements of the motor as determined by the power developed quite as much as by the speed of the crankshaft. One of the clever "wrinkles" of design lies in the use of a combined breather pipe, fan standard and oil filler, practice which gives evidence of becoming more general in other motors as well.

Magic Motor With Crescent Valves.

Somewhat like the Knight type of motor in that it uses sliding valves in place of the

OVERLAND ELECTRIC INSTALLATION

usual poppet members, the Mondex-Magic, which makes its first appearance, is another motor that differs radically from anything else of its kind. Briefly, the principle of operation requires the use of sliding crescent-shaped valves located for intake and exhaust on either side of each cylinder. The motor itself is not new, of course, but it has had no presentation " at court," so to speak.



Also in the class with non-poppet valve machines, there is the Speedwell-Mead rotary-valve motor, which, since its first introduction at the last shows, has undergone a number of important alterations destined to improve its running and its appearance, though in the main it is unchanged. Thus, the valves have been fluted and new manifolds, very much neater and more efficient, have been adopted and several other minor changes made. Incidentally, the motor has superseded the Speedwell poppet valve type, which is discontinued.

As was to be expected, the methods of mounting and driving electric engine starting and electric lighting gear have undergone no little alteration tending toward standardization during the past year. The advance which such equipment has made must be apparent to even the most casual observer and it already has been remarked that several car makers who always have featured pneumatic devices have changed over to electrical euipment.

The past twelvemonth has afforded automobile engineers abundant opportunity for exercising their ingenuity in drawing up more substantial mountings than have been used in the past, and no little improvement is apparent. The trend toward the gearset location of starting units, if not pronounced, at least is quite perceptible, both Lozier and Mitchell having chosen such locations in preference to engine brackets. In the Mitchell, the lighting generator drive also has been revised, and the installation as it now stands makes for a not altogether common degree of accessibility combined with simplicity seldom excelled. The generator, as is shown by the accompanying picture, is bolted to the side of the engine crankcase, the drive being direct by short shaft to the timing gear train. The Chalmers starter is geared to the clutch shaft through a "silent" chain.

Mounting Starting Motors and Generators.

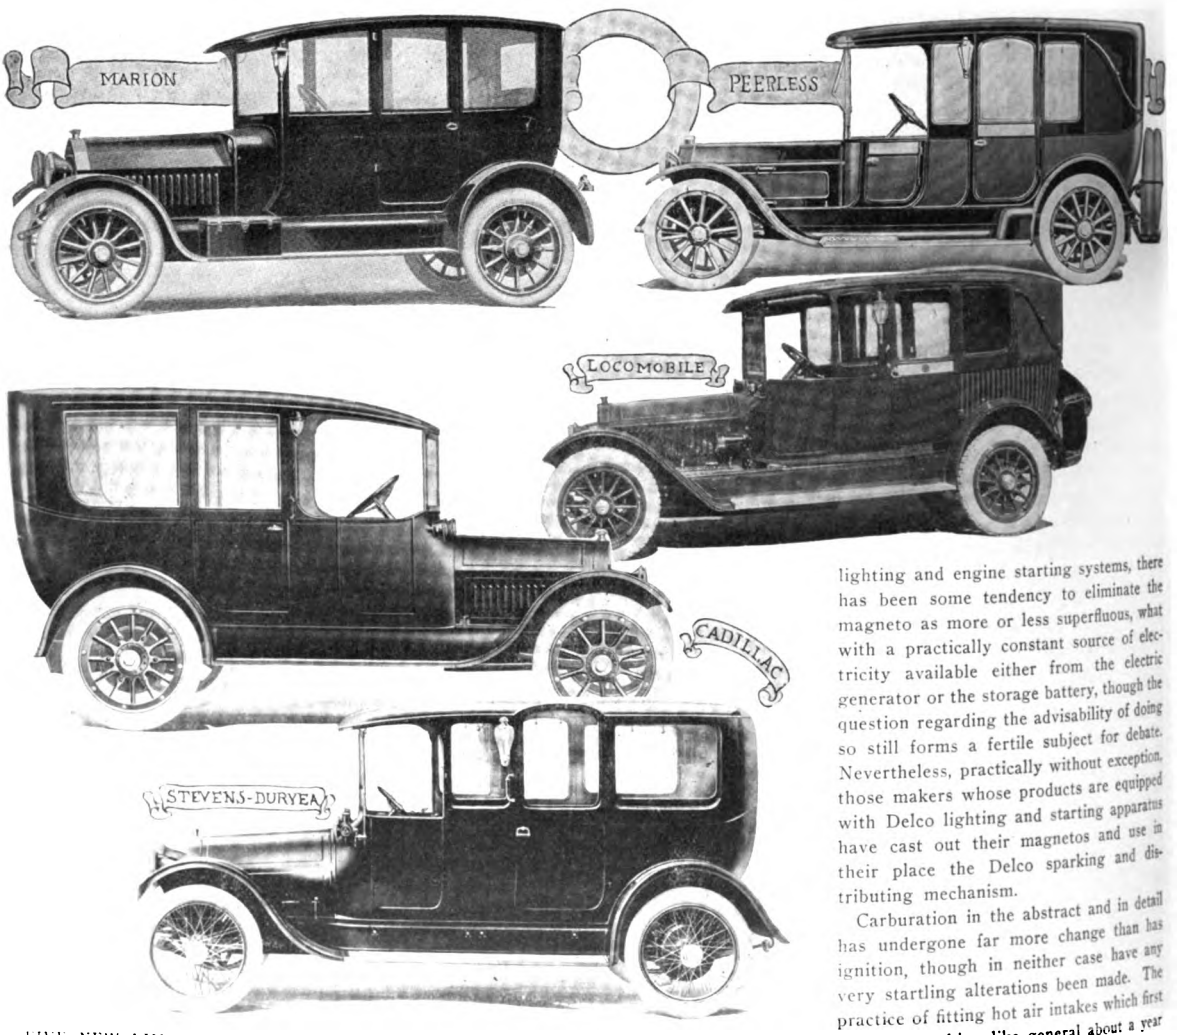
Another mounting which, though not new, offers easily recognizable advantages upon the score of accessibility, is the White. In this case the combined generator and starting motor is mounted on a special bracket at the side of the engine, to which it is attached through the intermediary of a short "silent" chain to the magneto shaft. The

LOZIER GEARSET STARTER

Overland company has adopted a somewhat unusual method of driving the lighting generator and connecting the starter, the method being best made plain with the aid of the accompanying picture.

The method of connecting the starting motor to the gasolene engine through the intermediary of gearing cut in the periphery of the flywheel continues to hold its own

Digitized by Google



and in at least one case—that of the Abbott-Detroit—it has gained a convert. Another noticeable tendency which indicates a desire on the part of manufacturers to increase simplicity, is the substitution of ordinary indicators—something in the nature of a narrow or a plain pointer—for the meters that at first proved so plentiful. Studebaker, among others, has made the change. Cole equipment is unusual in that a quick-opening circuit breaker takes the place of the usual fuse. There is a marked tendency, too, to simplify wiring and to protect it to a greater extent than has been common, the method used in Marion cars serving as an excellent case in point. The wiring is fully protected by metallic tubing over its whole length and all the wires lead to a centralized junction box on the dash; at the same time, the wiring is attached not to the body but to the chassis, which permits of the removal of the body without the necessity for breaking the wires, which can be disconnected at the junction box.

IGNITION AND LUBRICATION

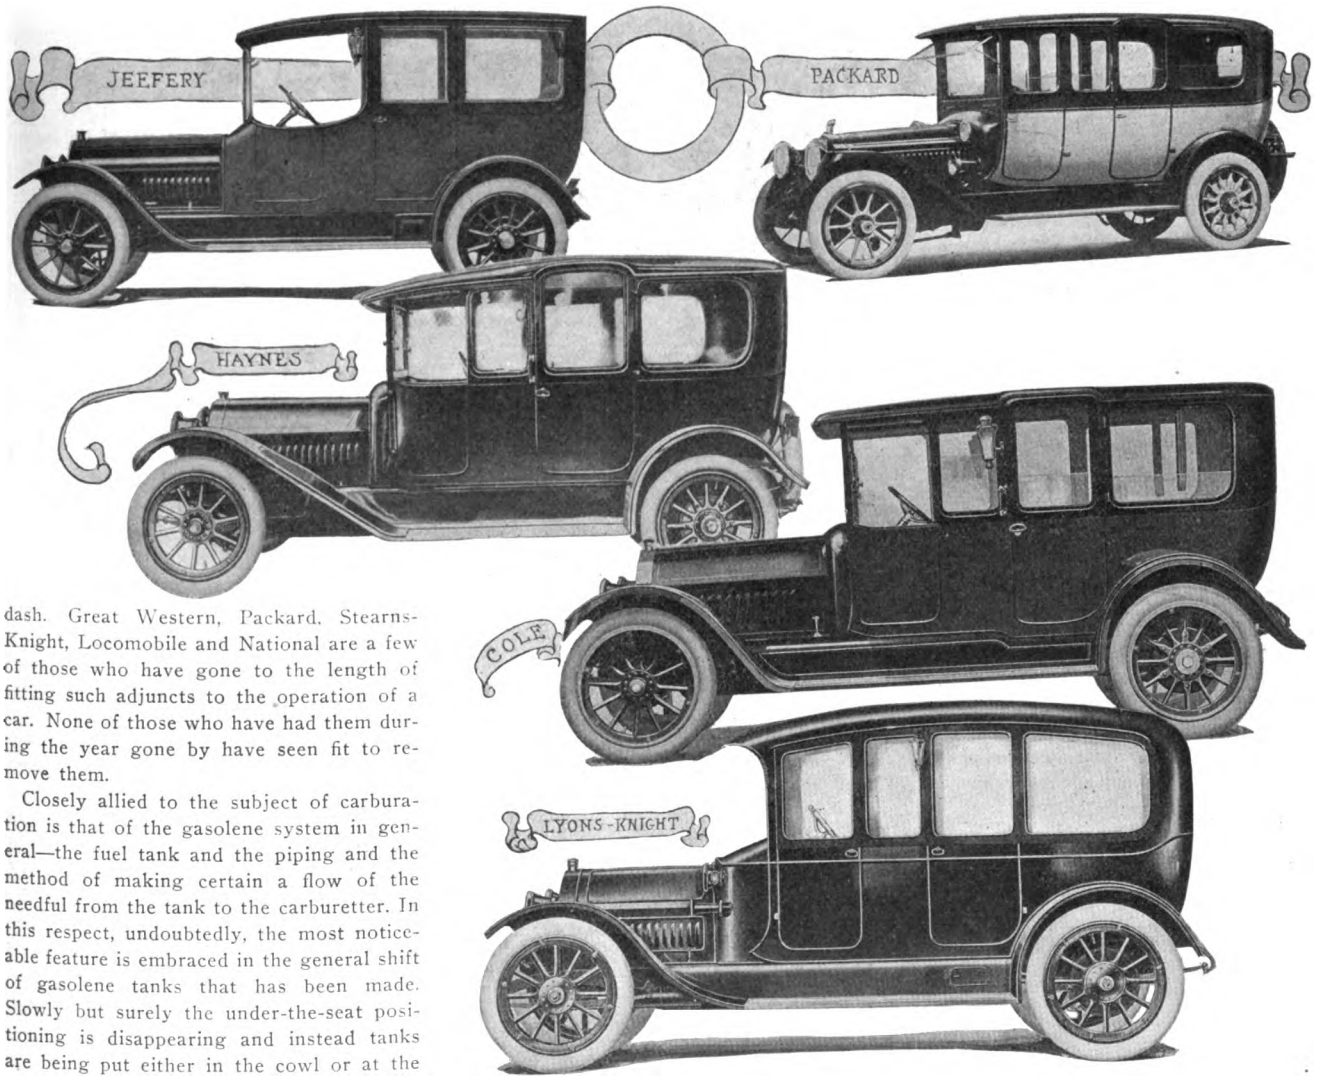
In connection with the modern gasolene automobile engine, there are few factors which have become standardized to the extent that the word applies to ignition and ignition devices, including the high-tention magneto, the wiring and the plugs. Thanks to the ingenuity and the indefatigable work of those who have to do with such things, the magneto has been brought to a high state of efficiency and it could not be expected that any great change would be made in it or in the method of adapting it to the requirements of the individual motor.

With the general adoption of electric lighting and engine starting systems, there has been some tendency to eliminate the magneto as more or less superfluous, what with a practically constant source of electricity available either from the electric generator or the storage battery, though the question regarding the advisability of doing so still forms a fertile subject for debate. Nevertheless, practically without exception, those makers whose products are equipped with Delco lighting and starting apparatus have cast out their magnetos and use in their place the Delco sparking and distributing mechanism.

Carburation in the abstract and in detail has undergone far more change than has ignition, though in neither case have any very startling alterations been made. The practice of fitting hot air intakes which first became anything like general about a year ago, now has become very much more general and there are very few makers who do not fit them as standard equipment; among those who have adopted them during the

FIVE NEW LIMOUSINES THAT EXHIBIT THE TENDENCY TOWARD CURVED ROOFS

Digitized by Google



year are Kline and Winton. The fitting of water-jacketed manifolds also is becoming more common, Speedwell and Chalmers being among those who have made use of them for the first time this year. Cadillac engineers have adopted an ingenious intake heater of the electric type which serves to facilitate starting when the mercury flirts with the zero mark.

Increasing attention is being paid, too, to the desirability of providing means whereby the proportions of either gasolene or air, or both, can be varied from the driver's seat without the necessity for stopping either engine or car. Generally this requires nothing more than the addition of a tiny lever on the steering column or on the dash. Great Western, Packard, Stearns-Knight, Locomobile and National are a few of those who have gone to the length of fitting such adjuncts to the operation of a car. None of those who have had them during the year gone by have seen fit to remove them.

Closely allied to the subject of carburation is that of the gasolene system in general—the fuel tank and the piping and the method of making certain a flow of the needful from the tank to the carburetter. In this respect, undoubtedly, the most noticeable feature is embraced in the general shift of gasolene tanks that has been made. Slowly but surely the under-the-seat positioning is disappearing and instead tanks are being put either in the cowl or at the rear now, instead of under the front seat. Some of those who have chosen cowl locations are Studebaker, Ohio, McIntyre, Hudson, Krit and Allen. In the Hudson, the designers have taken an ingenious and obvious method of insuring against the surge of fuel causing leaks; they have provided the tank with what is technically known as a swash plate.

Obviously, where tanks are placed at the rear, pressure feed to the carburetter is necessary and whereas it was at one time comparatively common practice to obtain the necessary pressure by tapping the exhaust pipe and using a Lunkenheimer device, this method quickly is passing out of vogue. Instead, the majority of makers employ tiny plunger pumps.

Just as surely as pressure feed to the carburetter seems to be coming in, so is the employment of pressure feed lubrication methods increasing. The splash method which at one time was judged to be all-sufficing, despite the difficulty of controlling the emission of smoke with it, quickly is passing out and in its place there is coming either straight force-feed systems in which splash has been eliminated, or combined systems in which splash is relied upon only to lubricate the cylinder walls, the main bearings being fed direct. The practice of interconnecting throttle levers with the oil control mechanism is becoming more general and the place of the four—or six—large splash compartments beneath the connecting rod big end bearings is being taken by tiny troughs into which little scoops dip. The Lozier "six" system is a good example of the latter method, which, of course, first became prominent with the introduction of Knight motors. In the new Lozier "four" there is a unique method of causing the oil to circulate by contact with the flywheel. The Chandler is another that uses the individual trough system and the Marmon pressure system, of course, is

FIVE MORE NEW CLOSED CARS SHOWING TREND TOWARD ROUNDED CORNERS

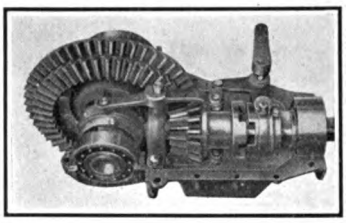
Digitized by Google

too well known to require lengthy explanation.

As a measure to obviate the possibility of smoke issuing from the exhaust pipe, regardless of the quantity of oil in the reservoir or the speed of the motor, quite a few makers have adopted the practice of fitting what is styled a "wiper" ring on the piston with a number of holes drilled beneath it through which the excess oil scraped down is permitted to flow back to the crankcase. Jeffery and Regal and Keeton and a number of others all have done this.

Another tendency, which as yet has not become very pronounced, is toward the elimination of the oil grooves that always have been deemed necessary. So far, the Moline-Knight company and one or two others are the only ones who have attempted anything along this line. Where such grooves are eliminated, the assumption is that the bearing will be literally "floated" upon a film of oil, which necessitates, of course, that the lubricant be applied under considerable pressure.

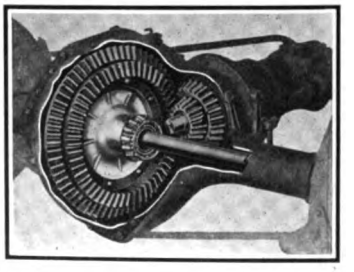
The cooling system of the modern car is another part which is not susceptible of a great deal of change, and hence not a great deal has been made. One or two makers whose water has been circulated by thermo-siphonic action — Keeton is one of them, for instance—have fitted pumps, but for the most part few excuses have been found to make changes. So far, no one has seen fit to desert water cooling for the field that is virtually dominated by the Franklin company, though one maker of air-cooled cars has adopted water cooling; that maker is the Cameron company, which company, by the way, has practically reconstructed its whole line of cars.



TRANSMISSION ELEMENTS

Among the various transmission elements that go to make the newer crop of cars complete, very little that is new is revealed in clutches and in clutch construction. All of the various types of clutches that have become familiar through years of use remain, the more prominent types being the cone, which is too widely used to permit of any listing of names, the disk, for which the same may be said; the contracting band, which is featured by Apperson and Haynes, and the internal expanding, which has as its sole exponent the Peerless company. Construction that is out of the ordinary is embodied in the Keeton clutch, however, for though the mechanism nominally is of the multiple disk type, each of the disks is coned so that the whole becomes virtually a cone-disk clutch.

Jeffery Leather Differential Marks Era.



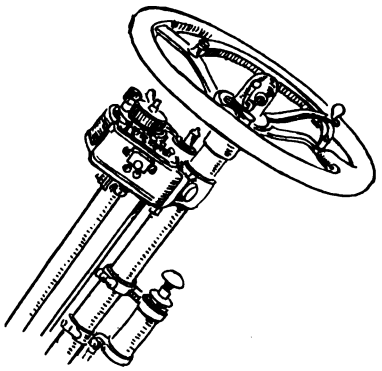
Between the clutch and the gearset it continues to be the practice to incorporate either one or two universal joints and for the most part these are of the conventional type. In the new Jeffery cars, however, the designers have taken a leaf out of foreign books and adopted the Daimler type of leather universal for the transmission of the engine power. Leather universals have been used before for magneto and pump drives and for other minor purposes, but so far as is known this is the first time that any American maker has indicated a sufficient measure of faith in the device to warrant his adopting it for such strenuous duties. The joint, which is illustrated herewith, is of the type used for many years in the Daimler 'buses that run about the streets of London, and has been adopted by the Jeffery company only after extensive tests which have demonstrated its ability not only to "stand up" but to perform its duties quietly and surely.

Although gearsets have not changed materially in construction—here and there designers have increased the diameter of shafts or substituted ball or roller bearings for plain ones and styled the improvement "detail refinement"—there is a well-

AUSTIN TWO-SPEED AXLE

defined tendency toward an increase in the popularity of the four forward speed mechanism in which the third speed corresponds to direct drive. In other words, the overstep "fourth" is gaining in favor in a man-

CADILLAC DOUBLE DRIVE



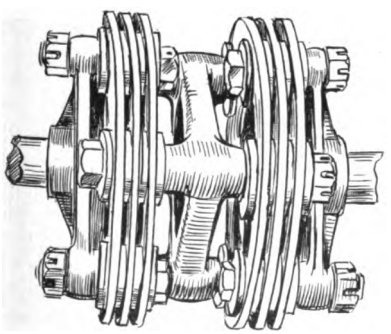
ner that is unmistakable, judging merely by the increasing number of makers who are using it. Abbott-Detroit and Keeton and Jeffery all have gearsets of the kind for the first time in their new models, the list including also the larger Hudson "six," the Lozier "four" (but not the "six"), the Pathfinder, the Winton and the Kissel. As a general rule, gearsets remain practically where they were, insofar as their position in the chassis is concerned, though in isolated cases makers have shifted them; the Stearns-Knight gearset, for instance, now is in a unit with the motor instead of being in a unit with the rear axle.

The conventional type of gearset is the selective type, of course, and there have been no changes worthy of mention made in control methods. Among the gearsets that are out of the ordinary, the Cameron mechanism is likely to attract attention because of its unusual features. Although it affords four forward speeds and the control is selective, every one of the four speeds is in effect a direct drive. The mystery is easily solved by a glimpse of the mechanism, which shows the gearset to be transverse of the propeller shaft instead of parallel to it, as is usual. Incidentally, the whole mechanism is carried on the rear axle, though the size of the casing is no indication of its contents. Lambert and Carter and Metz continue to be the leading friction transmission exponents, of course, and except for slight improvement here and there are as they always have been in the past.

Electric and Pneumatic Gear Shifters.

The newest thing in the way of gearsets and gearset control that the forthcoming shows will have to reveal quite obviously is the Vulcan electric gearshift that has been adopted by Haynes, and Pullman, and Norwalk, to say nothing of a couple of others whose products will not be exhibited either in New York or Chicago. Other than the Vulcan device, there is to be the Gray pneumatic gear shifter and engine starting system, which, though some time on the market, has not yet had a formal "coming out" party, so to speak, and therefore is not quite as familiar as the Vulcan, which made its first appearance at the last show in Boston on an S.G.V. chassis. The essential difference between the Gray and the Vulcan, of course, is that the one is electric and the other pneumatic, though in

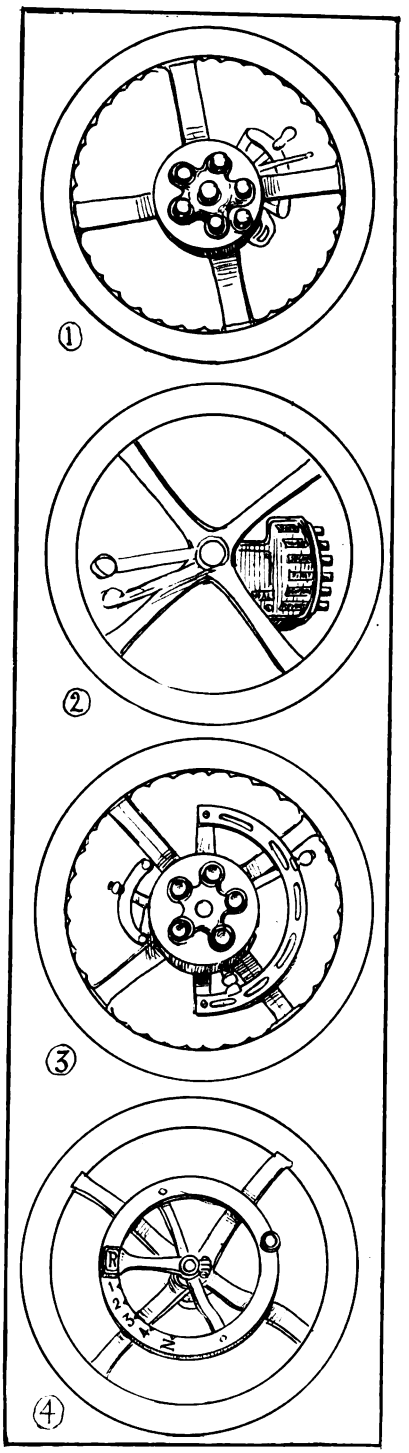
Digitized by Google



PACKARD COLUMN CONTROLS

the end their functions are the same. Both have steering column devices by which the operator can indicate the gear he intends to use in driving, when depression of the clutch pedal automatically shifts the gears without further fuss or feathers, through the medium of the apparatus that is securely hidden in the gearset, where it is out of sight and out of harm's way.

Back of the clutch and gearset and ahead of the rear axle there is not much, of course, that is susceptible of change, the propeller shaft that is almost universally solid through and through occupying the space in silent majesty with the Pierce-Arrow tubular shaft as the single exponent of its kind.



Where Radius Rods Have Vanished.

The tendency toward the elimination of radius members by causing the springs to take their place is even more pronounced than was the case last year, both Stearns-Knight and Winton being among the more prominent makers who within the year have made away with parts of the transmission elements heretofore considered well-nigh indispensable. In both cases the springs are solidly connected at the front and the drive is transmitted directly through them. The Winton makes use of a torsion arm which extends from the differential casing to a cross frame member, where it is flexibly connected. In the Chalmers the makers have adopted a somewhat unusual method of attaching the torque member to the chassis, the arrangement being best made plain with the aid of the accompanying picture, which shows the installation as it now is made. In the Hudson "little six," both torsion and radius members are missing, their functions being carried on by the springs.

MOLINE BREATHER-BRACKET

Worm Drive Makes No Great Gain.

Contrary to what may be expressed as the general expectation, the worm drive has not made the advance that it was supposed it would make. As heretofore, the Lyons-Knight and the Willys-Knight, the latter being virtually the Edwards-Knight, continue to be about the only cars that have worm drive as standard equipment. In the Stearns-Knight, however, the makers have signified their intention of equipping with worm drive instead of the standard bevel drive when the purchaser so specifies, the alteration adding $100 to the list price of the car. Among the makers of poppet-valve cars, the Packard company is the only one that has made any serious attempt to eliminate the usual bevel gear drive. The combination worm-bevel gear that but lately has been adopted for all Packard products will make its first formal appearance at the shows.

The two-speed rear axle which last year had its only exponent in the Austin car, and then only as added equipment, this year has gained another convert in the Cadillac, which, as nearly everyone knows, has brought out an electrically controlled two-speed rear axle that will be standard equipment on all its future models. Incidentally,

CHALMERS TORSION HANGER

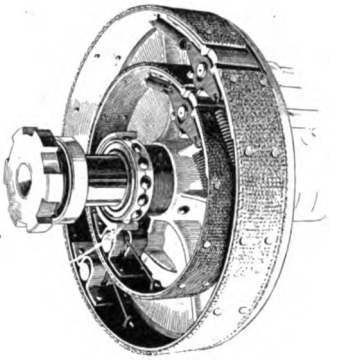
Digitized by Google

the Austin company now has decided to make its two-speed rear axle standard equipment, and it will be fitted to all Austin cars hereafter. This axle, too, makes its first appearance in New York, though it was exhibited last year at the Chicago show.

Not a great deal of change has been made in rear axle casings, the Peerless as heretofore retaining its arched design and the Stearns its solid forging, these two being representative of their respective classes. In the case of the Franklin, which always has been noted for its light weight anyway, a considerable reduction in weight has been made by the substitution of an aluminum housing for the one in use in the past. The Cole, which uses Timken axles, has made a reduction in the same way, by the use of a nickel steel housing in place of previous construction.

REFINEMENT OF CHASSIS DETAILS

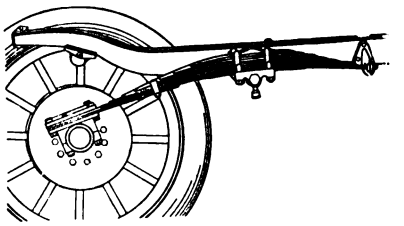
Among the various components that go to make up the chassis of the cars that are to be exhibited at the forthcoming shows—the running gear, that is, without the power plant and the transmission elements—springs and spring suspensions will show the refining hand of the engineer more than will any other parts. It is true that no really new spring suspensions have been evolved during the past year, but in the old ones many improvements have been made.



The most noticeable alteration is in the method of attaching the springs to the axles. Whereas only a few makers last year essayed the lowering of the chassis that comes from attaching the under member of the springs beneath the axles instead of over them, the list this year is much longer, and it contains names well known throughout the automobile industry. The Oldsmobile now has its rear springs hung beneath the axle, and so has the Krit and the Paige-Detroit and the McFarlan and the Hudson and a score or more of others; the tendency toward such construction is unusually pronounced.

Thinner Spring Leaves and More of Them.

The various types of spring suspensions that always have been a feature of American cars—the Lozier and the Peerless platform, the Jackson and the Franklin and the Paige-Detroit full-elliptic, the King cantilever, the semi-elliptics and the three-quarter elliptics that belong to no particular brand of car but to all—are much the same as they always have been and the improvements that have been made are rather deeper down than the eye can see.



For instance, there is a tendency to use thinner leaves and a greater number of them, Peerless, as an example, having taken up construction of the kind. Also, there is a trend toward the adoption of methods that will permit positive lubrication between the leaves for long periods; the Marmon and several others have springs of this kind. And last but not least, the problem of spring shackle lubrication appears in a fair way to being solved.

Marion engineers have attacked this problem in a manner that has banished forever the grease cup that formerly perched at the ends of spring shackles, nearly always was forgotten until "canary birds" were hatched, and never was much of an ornament. Marion spring bolts are three-quarters of an inch in diameter and are hollow. Through the tube thus formed a wick carries the lubricant to the bolt bushing by means of a hole cut in the side of the bolt. And because of the capacity of the lubricant chamber, it is unnecessary to replenish the oil more than once a season. Incidentally, as the bolt has a large bearing surface, wear is minimized.

JEFFERY INTERNAL BRAKES

Up until the present time the King has remained practically the only exponent of the cantilever type of rear springs, though now the system has gained one more convert in the new National "six" which will be exhibited for the first time. Under the new National construction the rear springs are swivelled to the frame and are rigidly connected to the axle at the back; the front springs are of the conventional semi-elliptic type.

KING CANTILEVER SPRING

Although the Stevens-Duryea rear springs appear much like the ordinary three-quarter elliptic members to the average layman, that such is not the case is pointed out by those who are in the know. It is explained that in the designing, most careful plans were laid to cause the oscillations of one member practically to damp out the oscillations of the other, and that the result is a highly resilient suspension which gives readily to ordinary road obstructions but which is without the usual quick rebound and continued "bouncing" that make other springs objectionable and create a demand for shock absorbers. These latter devices, by the way, appear to have lost ground in popular estimation during the year, for the number of makers who now find it possible to get along without them appears to be increasing. Nevertheless, several makers have specified that for the coming year their products will carry Gabriel rebound snubbers for the first time.

Provision for Shorter Turning Radii.

What with the generally longer wheelbases that are coming to be the vogue, most makers have found it desirable to make provision for turning their cars on a somewhat shorter radius than has been possible in the past. The Marmon company probably was the pioneer in this respect, and for the coming season retains the somewhat unusual front wheel spindle that it uncovered at the last show. The spindle itself is so constructed that the steering center comes directly over the center of the tire, thus decreasing the amount of force required to turn the wheels. At the same time, the steering lock is such as to permit the car to be turned in an ordinary street without backing. The Chalmers company, too, has developed a new type of steering spindle which will be shown for the first time at the forthcoming shows.

The worm and full wheel steering gear still continues popular, and in the Great Western arrangement the designers have adopted a clever means of ensuring proper lubrication of the working parts. Instead of fitting the gearcase with a great grease cup, which is fairly common practice, they have substituted a fairly large receptacle

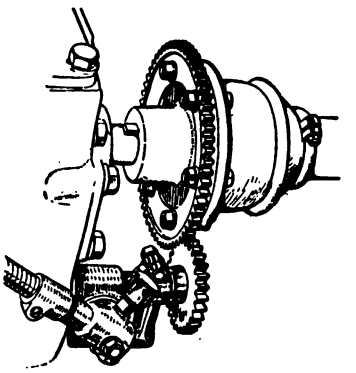
Digitized by Google

which has a plain snap lid. Hence, to fill it, it is only necessary to open the lid, which is closed with a spring, and drop in the grease. The simplicity with which the whole operation can be completed acts to encourage proper care of the gear.

In the Keeton car, the makers have found it necessary, and no less expedient, to adopt construction that is out of the ordinary in the upbuilding of the steering column. Because the radiator is placed at the rear end of the engine it ordinarily would be necessary to remove it in order to disassemble the steering gear mechanism. To overcome the difficulty, the steering column has been made in two parts which are readily separable, though once they are put together they must "stay put."

Cut-outs rapidly are coming to be considered not only unnecessary but an actual nuisance, and as a consequence quite a few cars that have had them in the past will have them no more. As a rule, the natural demand for quiet operation has resulted in somewhat closer muffling of engines than has been the case in years gone by, and in this connection the muffler construction adopted by the Peerless company for its new cars is interesting. Instead of being virtually a one-piece affair with no take-apart to it, the device is so made that it is comparatively easy to extract the "insides" so that they may be cleaned; incidentally, the baffle plates are perforated.

Brakes have undergone a general enlargement during the year, and there is a marked tendency to employ construction which will render the develeopment of rattles less likely, the Franklin company, for an apt example, having adopted a new type of spring brake band retainers which effectually do away with the trouble. Twin internal expanding brakes appear to be on the increase, a number of makers, including Keeton, Allen, Jeffery and Cameron, all of them with new products, have adopted such construction in preference to internal and external members. The Marmon, of course, and the Great Western and a few others, always have had twin internal brakes. In the Pierce-Arrow arrangement—the brakes are internal and external, however—the designers have adopted a clever means to ensure stoppage of the car regardless of weather conditions and the wetness of the brakes. It is simply that in one set of brakes the materials are the same, while in the other set different materials are employed. Thus, if one set will not hold, the other is practically certain to stop the car.



WIDENED SCOPE OF EQUIPMENT

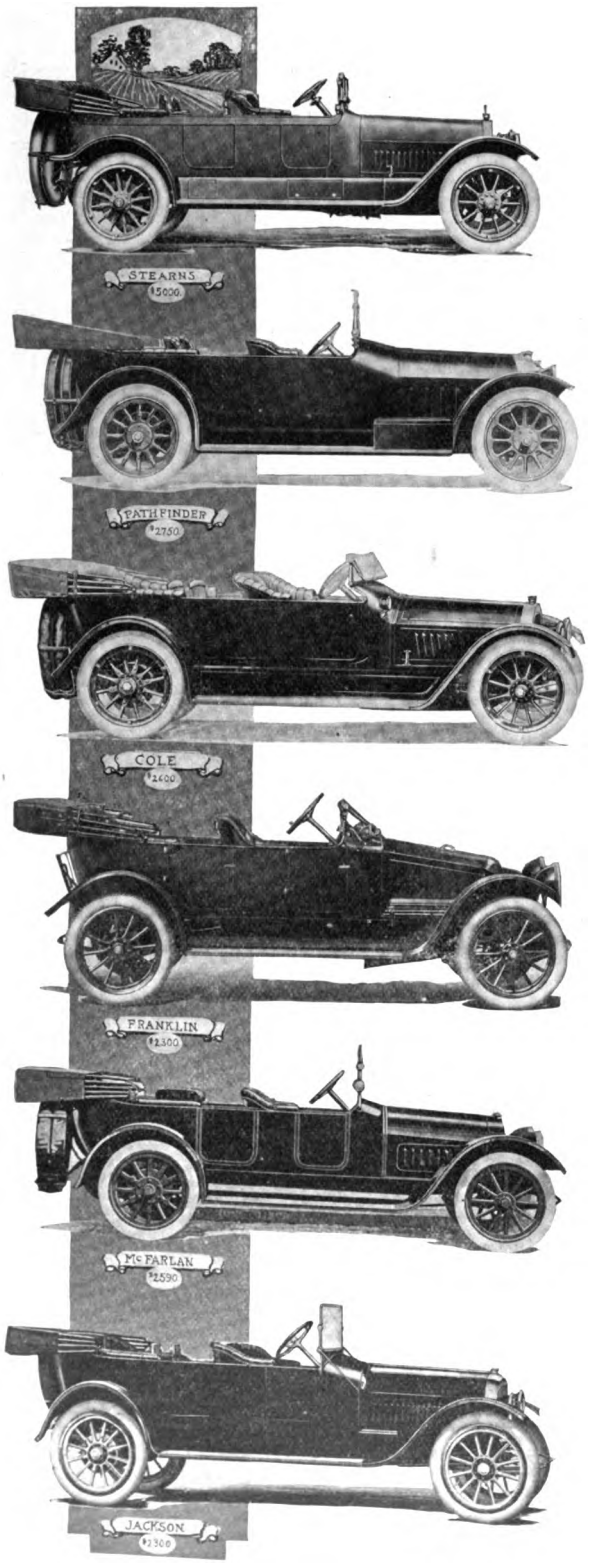
The "one-man" top, which last year remained in the obscurity of the future, this year is one of the most conspicuous features of equipment in general—equipment which, by the way, now is even more complete than was the case a twelvemonth ago, when manufacturers first really saw the light and commenced listing their cars with the many things that once were listed as "extras" and charged for as such. In addition to tops and windshields and speedometers and electric lighting and engine starting systems, to say nothing of the usual complement of tools and spare parts and such things, not a few makers now are adding other devices that not even a stretch of the imagination would have placed on the cars of a year ago.

Carriers That Carry and Protect Tires.

Take the new Marion tire carrier, for instance. The holder is in the form of a wheel felloe, over which a tire, already mounted on a rim and inflated, is slipped. One lug, similar to those that fasten the rim to the vehicle wheel, holds the rim and tire securely in place. Straps and covers are done away with and there is no danger of the tire dropping off or being stolen, for its removal is impossible without the proper wrench. Incidentally, the bracket is held well away from the body so that the tire cannot chafe and ruin itself or the body, and the tire and rim are readily removable without the necessity for lifting the top when it is laid back. The Chalmers tire carrier is another that is somewhat similar in appearance and operation. In both of these designs and in many others, it is worthy of note that the weight of the equipment is supported not on the tire but on the rim itself.

With the introduction of electric lighting systems, manufacturers have found a ready means of increasing equipment by adding incandescent bulbs in places where heretofore there have been none. Dash lights are common, but in the Abbott-Detroit the idea has been carried a little further than is usual by providing a switch in the tonneau so that those who sit in the rear seats can "light up" in front at will. The lamp, needless to add, illuminates the speedometer as well as the other items on the cowlboard. Lights placed in the roofs of tops also are increasing, the Oakland car being so equipped. Neither raising nor lowering the top can affect the wiring or the lamp, both being fully protected. Another clever little "wrinkle" in the Oakland is the provision of a large tool case in the cowlboard and a glass robe rail for the tonneau.

COLE SPEEDOMETER DRIVE



The Pierce-Arrow car probably always has been the best "locked" one there is, what with locks to the tool cases, the ignition, both sides of the engine hood and what not. And for the first time this year the makers of Speedwell and Chalmers cars both have added to their already long equipment lists, locks designed to prevent tampering with the gear shift lever in the absence of the person with the key.

Jiffy and Collins side curtains—figuratively speaking, miles ahead of the older style curtains which required much time and patience and no little expert knowledge to fit—this year are common, few cars leaving the factory without them. Packard curtains are a little different from any others, in that they are so arranged that they open with the doors, the door and the curtain, in fact, forming a large door.

Enclosing Speedometer Drive Mechanisms.

Speedometers now have come to be such a standard item of equipment that strange indeed is the car that is sent away from the factory without one. Latterly, there has become apparent a strong tendency toward the elimination of the usual, unprotected and more or less noisy front wheel drive. Several makers, among them the Cole, have dropped the front wheel drive entirely, and in its place have substituted drive from the propeller shaft or from the gearset, where the driving car can be either entirely enclosed or at least protected from dust and dirt and the effect of encounters with road obstructions. Others, like the Lozier, the Cadillac, the Hudson and the Chalmers, convinced of the advantages of a perfected front wheel drive, have adopted vastly improved drives in which the mechanism is fully enclosed within the hub of the wheel.

SIX "SIXES" THAT COMPEL ATTENTION

Abbott-Detroit—Abbott Motor Co., Detroit, Mich.

Models—Three models on one six-cylinder chassis and three models on each of two four-cylinder chassis. All motors have L-head cylinders, the "six" measuring 3¾ x 5¼, the larger "four" 4½ x 5½ and the smaller "four" 4⅛ x 5¼. Transmission elements include dry disk clutches and three-speed gearsets in the "fours" and a four-speed gearset in the "six." Drive is by shaft to bevel gears in full-floating rear axles.

Prices—"Six": Roadster and touring, $2,190; limousine, $3,500. Larger "four": Roadster and touring, $1,985; limousine, $3,150. Smaller "four": Roadster and touring, $1,685; coupe, $2,250.

Changes from Previous Construction—The "six" is new throughout and is exhibited for the first time. In the "fours": Tires mounted at rear; headlamps provided with dimmer; new type cowl added; sloping hoods adopted.

Selling Features—Continental standard motors; electric Auto-Liter starter; dual ignition systems; Timken bearings; service; equipment; wide range of choice in body styles; luxurious upholstery; underslung springs; four-speed gearset in "six" with direct drive on third speed.

Equipment—Top with boot and Jiffy curtains; electric lighting; electric starter; electric horn; electric trouble lamp; windshield; number holders; Stewart-Warner speedometer with clock; demountable rims and double tire holder on rear.

Allen—Allen Motor Co., Fostoria, O.

Models—Two models on the same four-cylinder chassis with L-head cylinders measuring 4⅛ x 5 inches. Transmission elements include disk clutch, three-speed gearset, and bevel drive to full-floating rear axle. Wheelbase is 118 inches on 34 x 4 tires.

Prices—Roadster and five-passenger touring car, $1,395.

Changes from Previous Construction—Cylinder dimensions increased from 3¾ x 5 (in pairs) to 4⅛ x 5 (block); flywheel instead of chain starter attachment; generator direct connected instead of chain driven; full-floating instead of semi-floating axle; streamline body; wheelbase lengthened six inches to 118 inches; gasolene tank in skuttle instead of under seat.

Selling Features—Three-point motor suspension; unit power plant; block motor; disk clutch; gasolene tank in skuttle; deep, tilted cushions; convenient control arrangement; one-piece, built-in windshield; quickly adjusted curtains; heavy nickel trimmings; bullet side lamps; electric equipment.

Equipment—Auto-Lite electric lighting and starting system; speedometer; horn; windshield; top with boot and side curtains; Baker demountable rims; tools; jack; pump; tire repair kit; trouble lamp.

Apperson—Apperson Bros. Automobile Co., Kokomo, Ind.

Models—Eight models on one four- and one six-cylinder chassis, the "four" having cylinders measuring 4½ x 5 and the "six" having cylinders measuring 3¾ x 5½ inches. Transmission elements include compression band clutch, three-speed gearset and shaft drive to bevel gears in demountable floating type rear axles. Wheelbases are 116 and 120 inches for the "four" on 34 x 4 tires for light model and 36 x 4 for the standard type; 128 inches for the "six" on 36 x 4 tires.

Prices—"Light four": Touring and roadster, $1,600; coupe, $2,350. Larger "four": Five-passenger touring, $1,785; Sedan-limousine, $2,500. "Six": Roadster and five-passenger touring, $2,200.

Changes from Previous Construction.—Gasolene capacity increased; doors widened 2 inches; steering wheel corrugated; upholstery made thicker; cowl board added; Bijur electric lighting and engine starting system added; Mea high-tension magneto added; double tire irons instead of single; new type compression grease cups adopted; five- instead of four-bow top; wheelbases lengthened.

Selling Features—Block T-head six-cylinder motor; demountable floating rear axles; large motor valves; contracting hand clutch; sliding vane water pump; silent transmission; Apperson springing system; left steer with center control; electric lighting and engine starting system; high-tension Mea magneto.

Digitized by Google

Equipment—Top with dust cover; Collins quick adjustable curtains; ventilating rain-vision windshield; full cowl board equipment; speedometer; clock; demountable rims with one extra rim attached with double tire irons in rear; robe rail; foot rail; license holder; electric starter, generator; electric horn; tools; jack; tire pump; repair kit. On the Light "Four forty-five" the equipment is the same excepting that Collins curtains, rain vision windshield, cowl board, double tire irons and license holder not furnished on this model. Removable side curtains, clear vision windshield, dash equipment and single tire irons are furnished instead on the Light "Four forty-five."

Austin—Austin Automobile Co., Grand Rapids, Mich.

Models—Three models on three six-cylinder chassis, the motors measuring 4½ x 7 inches, 4½ x 6 inches and 4 x 5½ inches, respectively. Transmission elements include disk clutches, three-speed gearsets and shaft drive to bevel gears in full-floating rear axles, including the Austin two-speed gear. The wheelbase of the standard chassis is 141 inches and the tires measure 37 x 5 inches.

Prices—Smallest chassis with touring model, $4,000; next larger, $5,000; largest chassis, $6,000.

Changes from Previous Construction—The motor in the smallest chassis is new throughout and replaces one with cylinders measuring 4 x 5 inches. Electric lighting and engine starting equipment added; two-speed rear axle made standard equipment on all. Other chassis remain practically unchanged.

Selling Features—Austin two-speed rear axle; hydraulic spring controllers; extreme flexibility; only car featuring two-speed axle and six-cylinder motor.

Equipment—Top with boot and curtains; windshield; electric lighting and engine starting system; speedometer; tools; pump; jack; tire repair kit.

Auburn—Auburn Automobile Co., Auburn, Ind.

Models—Two models on one four- and one six-cylinder chassis, the "four" having cylinders measuring 4½ x 5 inches and the "six" 3¾ x 5¼ inches. Transmission elements include cone clutches, three-speed gearsets and shaft drive to bevel gears in floating rear axles. Wheelbases are 120 inches on 36 x 4-inch tires for the "four"; and 130 inches on 37 x 4½-inch tires for the "six."

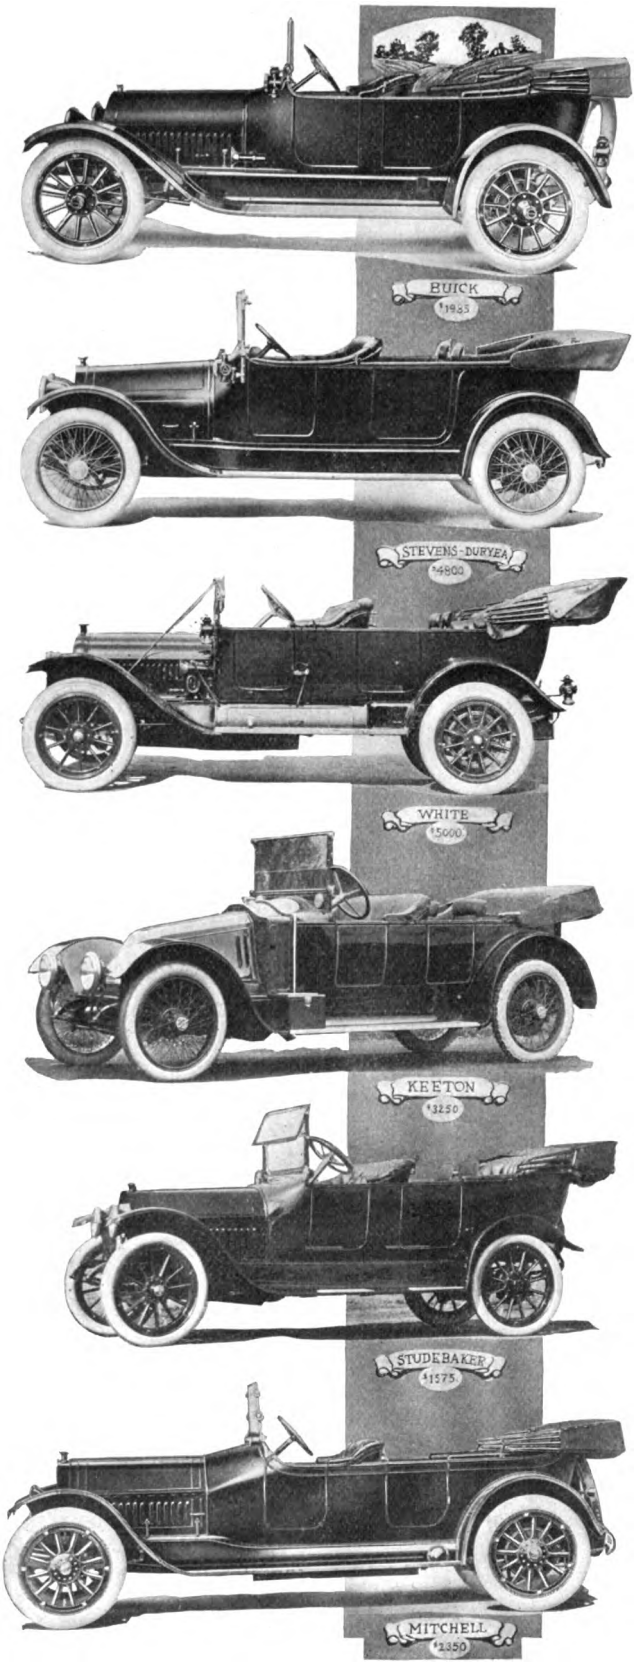
Prices—"Four": Roadster, $1,490; touring, $1,590. "Six": Roadster, $2,000; touring, $2,100.

Changes from Previous Construction—The "six" is new throughout and is exhibited for the first time. Few changes in the "four."

Selling Features—Low price; small bore, high-speed motors; economy of operation; standardization of parts.

Equipment—Top, top hood; electric lighting and starting; electric horn; windshield; speedometer; demountable rims; foot rail; tire irons and extra demountable rim.

Buick—Buick Motor Co., Flint, Mich.



Models—Six models on three chassis, two "fours" and a "six," all having overhead valve motors. Cylinders measure 3¾ x 3¾ for the smaller "four" and 3¾ x 5 for both the larger "four" and the "six." Transmission elements include cone clutches and three-speed gearsets, bevel drive and three-quarter floating axles in the "fours" and full-floating in the "six." Wheelbases are 105, 112 and 130 inches, and tires measure 32 x 3½, 34 x 4 and 36 x 4½ inches.

Prices—Smaller "four" roadster, $950; five-passenger touring, $1,050. Larger "four" roadster, $1,235; five-passenger touring $1,335; coupe, $1,800. "Six" five-passenger touring, $1,985.

Changes from Previous Construction—New style ball and socket rocker arms on motor, lined with felt; center control with left drive; Delco electric lighting and engine starting added; new six-cylinder model added to line.

Selling Features—Overhead valve motor; Delco electrical equipment; variety of body styles; large tires; long wheelbase; liberal bearing surfaces; left side steering with center control; extra large brakes.

Equipment—Combination oil and electric lamps; Delco electric

MORE "SIXES" OF THE APPEALING SORT

Digitized by Google

lighting and engine starting system; electric horn; top; windshield; speedometer; top boot and curtains; demountable rims; foot and robe rails; tools; jack; tire repair kit; pump.

Cadillac—Cadillac Motor Car Co., Detroit, Mich.

Models—Seven models on one four-cylinder chassis with L-head cylinders measuring 4½ x 5¾. Transmission elements include cone clutch, three-speed gearset with double bevel drive to electrically controlled two-speed rear axle. Wheelbase measures 120 inches with 36 x 4½ tires.

Prices—Roadster, four- and five-passenger touring car, $1,975; seven-passenger touring car, $2,075; coupe-landaulet, $2,500; inside drive limousine, $2,800; seven-passenger limousine, $3,250.

Changes from Previous Construction—Improved Delco lighting, starting and ignition system with automatic spark control; switch lock added; cranking speed increased; swinging type air valve substituted for poppet type valve in carburetter; auxiliary air inlet eliminated; electric intake air heating device adopted; Cadillac electrically controlled two-speed rear axle adopted; rear side springs lengthened six inches; gasolene tank located at rear and fuel fed by pressure; tilting steering wheel adopted; speedometer drive placed in hub of wheel; equipment added.

Selling Features—Copper jacketed engine cylinders; extreme accuracy in fitting parts; "silent" chain camshaft drive; five-bearing crankshaft; automatic spark control; carburetter air heater; cone clutch with spring ring; two-speed rear axle; worm gear sector steering gear; right hand control; tilting steering wheel; tilting front seat cushion; three-quarter platform rear suspension; pressure gasolene feed; hand-buffed leather upholstery; linoleum-covered running boards, metal bound; clean lines.

Equipment—Top with boot and side curtains; windshield; full lamp equipment; Delco electric lighting, engine starting and ignition system; gasolene gauge; electric horn; power tire pump; foot and robe rails; Warner speedometer; tire irons; tools and tire repair kit.

Case—J. I. Case T. M. Co., Racine, Wis.

Models—Three models on three four-cylinder chassis having cylinders measuring 3¾ x 4¾, 4¼ x 5½ and 4½ x 5¼ inches, respectively. Transmission elements include disk clutches, three-speed gearsets and shaft drive to bevel gears in floating rear axles. Wheelbases are 110 inches on 32 x 4-inch tires for the smallest chassis; 120 inches on 35 x 4½-inch tires for the next larger chassis, and 124 inches on 37 x 4½-inch tires for the largest chassis.

Prices—Touring models, $1,250, $1,850 and $2,300, respectively.

Changes from Previous Construction—The two smaller models are new throughout and are exhibited for the first time. In the largest model, dual instead of single Bosch ignition; Pantasote instead of mohair top; fenders pressed steel instead of built up type.

Selling Features—Unusually complete equipment; T-head motors; disk clutches, selective gearsets; left drive with center control; Westinghouse electric lighting and engine starting system.

Equipment—Westinghouse electric starter and lighting equipment; Warner speedometer; eight-day clock; two-tone electric vibrator horn; extra tire on rim, with tire cover, carried on side; two extra inner tubes; Weed tire chains; all lamps electric; Pantasote top; combination oil and electric dash and tail lamps; automatic impulse tire pump; work light; rain vision ventilating windshield.

Chandler—Chandler Motor Car Co., Cleveland, O.

Models—Five models on one six-cylinder chassis with L-head cylinders measuring 3⅛ x 5 inches. Transmission elements include multiple disk clutch, three-speed gearset and bevel drive to floating rear axle. Wheelbase is 120 inches on 34 x 4 tires.

Price—Touring model, $1,785.

Changes from Previous Construction—Coventry "silent" chain drive to camshaft.

Selling Features—Light weight, weighing less than 3,000 pounds fully equipped; low gasolene consumption, 16 miles to the gallon; unit power plant; mud-proof motor; left side drive and center control; Westinghouse electric system; Mayo, Mercedes-type honeycomb radiator; complete equipment; long stroke, accessible motor; roomy bodies.

Equipment—Top with boot and curtains; windshield; speedometer; clock; Sparton electric horn; nickeled trimmings; pump; demountable rims; tire repair kit; jack.

Chalmers—Chalmers Motor Co., Detroit, Mich.

Models—Eight models on two chassis, one four-cylinder and one six-cylinder. "Six" cylinders measure 4 x 5½; "four" cylinders measure 4¼ x 5¼. Transmission elements include disk clutch and four-speed gearset in both, with bevel drive and full-floating rear axles. Wheelbases measure 132 inches in the "six," with 36 x 4½ tires, and 118 inches in the "four," with 36 x 4 tires.

Prices—"Six": Roadster, four- and five-passenger touring car, $2,175; six-passenger touring car, $2,275; coupe, $2,850; limousine, $3,600. "Four": Four- or five-passenger touring car, $1,775.

Changes from Previous Construction—Motor of T-head type with enclosed valves; cylinder dimensions altered from 4¼ x 5¼ to 4 x 5½; water-jacketed manifold adopted; pneumatic starter replaced by Entz electric system; cork inserts provided in clutch; new torque rod hanger adopted; steering gear shifted to left side with control in the center; more leaves added in springs; wheelbase lengthened two inches to 132 inches; fenders domed; running boards cleaned of equipment; gasolene tank shifted to rear. "Light six" added to line.

Selling Features—Non-stallable, long-stroke motor; unit power plant; quietness; flexibility; rear gasolene tank; fuel economy; molded fenders; four forward speed gearset; combination force feed and splash oiling system; cork insert clutch; electric equipment; tires carried at rear in new carrier; balance; long wheelbase; wide doors; invisible speedometer drive; quick-acting top; interchangeable bodies; underslung rear springs.

Equipment—Silk mohair top with boot and side curtains; Entz electric lighting and engine starting system; Warner speedometer; windshield; demountable rims with one extra; special tire carrier; electric horn; license brackets; inspection lamp; Corbin gear lock; robe and foot rails; tire repair kit; tools; pump; jack.

Cole—Cole Motor Car Co., Indianapolis, Ind.

Models—Three models on both four and six-cylinder chassis, both motors having L-head cylinders measuring 4¼ x 5¼. Transmission elements include cone clutches, three-speed selective gearsets and shaft drive to bevel gears in full-floating rear axles. Wheelbases are 120 inches with 34 x 4½-inch tires on the "four" and 136 inches with 36 x 4½-inch tires on the "six."

Prices—"Four": Roadster, four- and five-passenger touring car, $1,925; coupe, $2,350. "Six": Six- and seven-passenger touring, $2,600; coupe, $3,000; limousine, $4,000.

Changes from Previous Construction—Bodies enlarged; motors and tires enlarged; wheelbase lengthened; long-grain hand-buffed leather upholstery adopted; Pantasote adopted for top material; electric lighting and engine starting system added.

Selling Features—Standardization of parts; Timken axles; tungsten steel valves; Timken bearings throughout; three-point suspension of unit power plant; Delco electric lighting and engine starting system; Mayo radiator; Gemmer steering gear; Detroit Steel Products springs; Spicer universal joints; Hydraulic pressed steel frames; Stromberg carburetter; Firestone tires and demountable rims; Warner speedometer and clock; Janney-Steinmetz seamless tank; Collins curtains; Taylor motor-driven pump.

Equipment—Top with boot and Collins curtains; windshield; Warner speedometer and clock; Delco combined electric lighting engine starting and ignition system; Taylor power tire pump; tools; tire repair kit; demountable rims; horn; jack.

Colby—Colby Motor Co., Mason City, Ia.

Models—Touring and roadster models on four- and six-cylinder chassis.

Price—Highest price, $2,750.

Digitized by Google

Changes from Previous Construction—New type starter; new style hood; streamline bodies.

Selling Features—Continental long-stroke motors; Timken axles; Brown-Lipe transmissions; Rayfield carburetter; Eisemann magneto; Gray & Davis electric lighting systems.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting system; tools; tire repair kit; pump; jack.

Crow—Crow Motor Car Co., Elkhart, Ind.

Models—Ten models on two four- and one six-cylinder chassis. "Four" cylinders measure 4 x 5 inches and 4¼ x 5½ inches, respectively. Transmission elements include disk clutches, three-speed gearsets and shaft drive to bevel gears in semi-, three-quarter and full-floating rear axles in the three models, respectively. Wheelbases are 114 inches on 33 x 4-inch tires for the smaller "four," 120 inches on 34 x 4-inch tires for the larger "four" and 130 inches on 36 x 4-inch tires for the "six."

Prices—Not quoted.

Changes from Previous Construction—Mechanical alterations consist essentially of detail refinements.

Selling Features—Power; flexibility; choice of four- and six-cylinder models; large brakes; easy riding qualities; extra heavy wheels; electric lighting and engine starting system; drive shaft completely enclosed; reinforced radiator supported on trunnions; worm and nut type steering gear; three-quarter elliptic rear springs.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting system; Stewart speedometer; tire carrier; tools; tire repair kit; pump; jack. "Six" has in addition electric engine starter.

Cameron—Cameron Mfg. Co., New Haven, Conn.

Models—Five models on one four-cylinder chassis, with cylinders measuring 3⅝ x 5. Transmission elements include inverted cone clutch and Cameron direct drive four-speed gearset on rear axle. Wheelbase is 115 inches and tires measure 32 x 3½.

Price—$1,200.

Changes from Previous Construction—Water cooling substituted for air cooling; special design pointed radiator adopted; brake equalizers hung to driving shaft tube; electric lighting and starting adopted; left drive with center control.

Selling Features—Four-speed direct drive transmission system in rear axle; full-floating rear axles; long-stroke block motor; full elliptic rear springs; clean cut motor design; magneto driven from transverse shaft; all parts of motor accessible by lifting only one side of hood; light weight.

Equipment—Mohair top with boot and side curtains; windshield; speedometer; tools; tire repair kit; pump; electric lighting and engine starting system; jack; pump.

Cartercar—Cartercar Co., Pontiac, Mich.

Models—Six models on two four-cylinder chassis, the smaller of which is new throughout and has a 3½ x 5-inch motor. Transmission elements include the Cartercar friction system with "silent" chain drive to rear axle. Wheelbases are 106 inches on 32 x 3½-inch tires for the smaller chassis and 116 inches on 36 x 4-inch tires for the larger.

Prices—Smaller chassis: Roadster and touring, $1,250: Larger chassis: Roadster, $1,600; touring, $1,700; coupe, $1,900; Sedan, $2,000.

Changes from Previous Construction—The smaller chassis is new throughout and is exhibited for the first time.

Selling Features—Carter friction transmission system; deep upholstery; roomy bodies; complete equipment.

Equipment—Top with boot and curtains; windshield; electric lighting and engine starting system; tools; tire repair kit; pump; jack, and horn.

Cornelian—Blood Bros., Kalamazoo, Mich.

Models—One model on one four-cylinder chassis. Transmission elements include disk clutch and two-speed gearset with drive through four special leather joints.

Price—Roadster, $425.

Changes from Previous Construction—Cyclecar which is new throughout and is exhibited for the first time.

Selling Features—Light weight; standard tread; sliding gears; disk clutch; wire wheels.

Equipment—Complete.

Empire—Empire Automobile Co., Indianapolis, Ind.

Models—One model on one four-cylinder chassis having L-head cylinders measuring 3¾ x 4½ inches. Transmission elements include disk clutch, three-speed gearset and shaft drive to bevel gears in semi-floating rear axle. The wheelbase is 110 inches on 32 x 3½-inch tires.

Price—Touring model, $900.

Changes from Previous Construction—Except for an increase in the wheelbase length, the car remains substantially the same.

Selling Features—Low price; unit power plant; disk clutch; three-speed selective gearset; complete equipment; long springs; three-point motor suspension; three-quarter scroll elliptic rear springs.

Equipment—Top with boot and curtains; windshield; speedometer; gas head lamps; horn; pump; jack; tools; tire repair kit.

Fiat—F. I. A.T., Poughkeepsie, N. Y.

Models—Eight models on two four- and one six-cylinder chassis. The smaller "four" and the "six" measure 4½ x 6 inches, the larger "four" measuring 5⅛ x 6⅞ inches. Transmission elements include disk clutches, four-speed gearsets and shaft drive to semi-floating rear axles. Wheelbases are 123 inches on 36 x 4½ and for the smaller "four"; 128 inches on 36 x 4½ and 37 x 5-inch tires for the larger "four"; and 135 inches on same size tires for the "six."

Prices—Smaller "four": Roadster and phaeton, $4,000; limousine, $5,000; landaulet, $5,100; Berline, $5,300. Larger "four": Roadster, touring and phaeton, $4,500; limousine, $5,500; landaulet, $5,600; Berline, $5,800. "Six": Touring and phaeton, $5,000; limousine, $6,000; landaulet, $6,100; Berline, $6,300.

Changes from Previous Construction—No alterations except for addition of engine starting system where specified.

Selling Features—Long-stroke, block-cast motors; simplicity; accessibility; beautiful coach work; both four- and six-cylinder motors.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting system; clock; Klaxon and bulb horns; demountable rims with extra and tire carriers; trunk rack; robe and foot rails; tools; tire repair kit; pump; jack.

Franklin—Franklin Automobile Co., Syracuse, N. Y.

Models—Six models on one six-cylinder chassis with overhead valve cylinders measuring 3⅝ x 4 inches. Transmission elements include multiple disk clutch, three-speed gearset and bevel drive to semi-floating rear axle. Wheelbase is 120 inches and tires measure 34 x 4½.

Prices—Touring and roadster, $2,300; coupe, $2,950; sedan, $3,200; limousine, $3,300; Berline, $3,400.

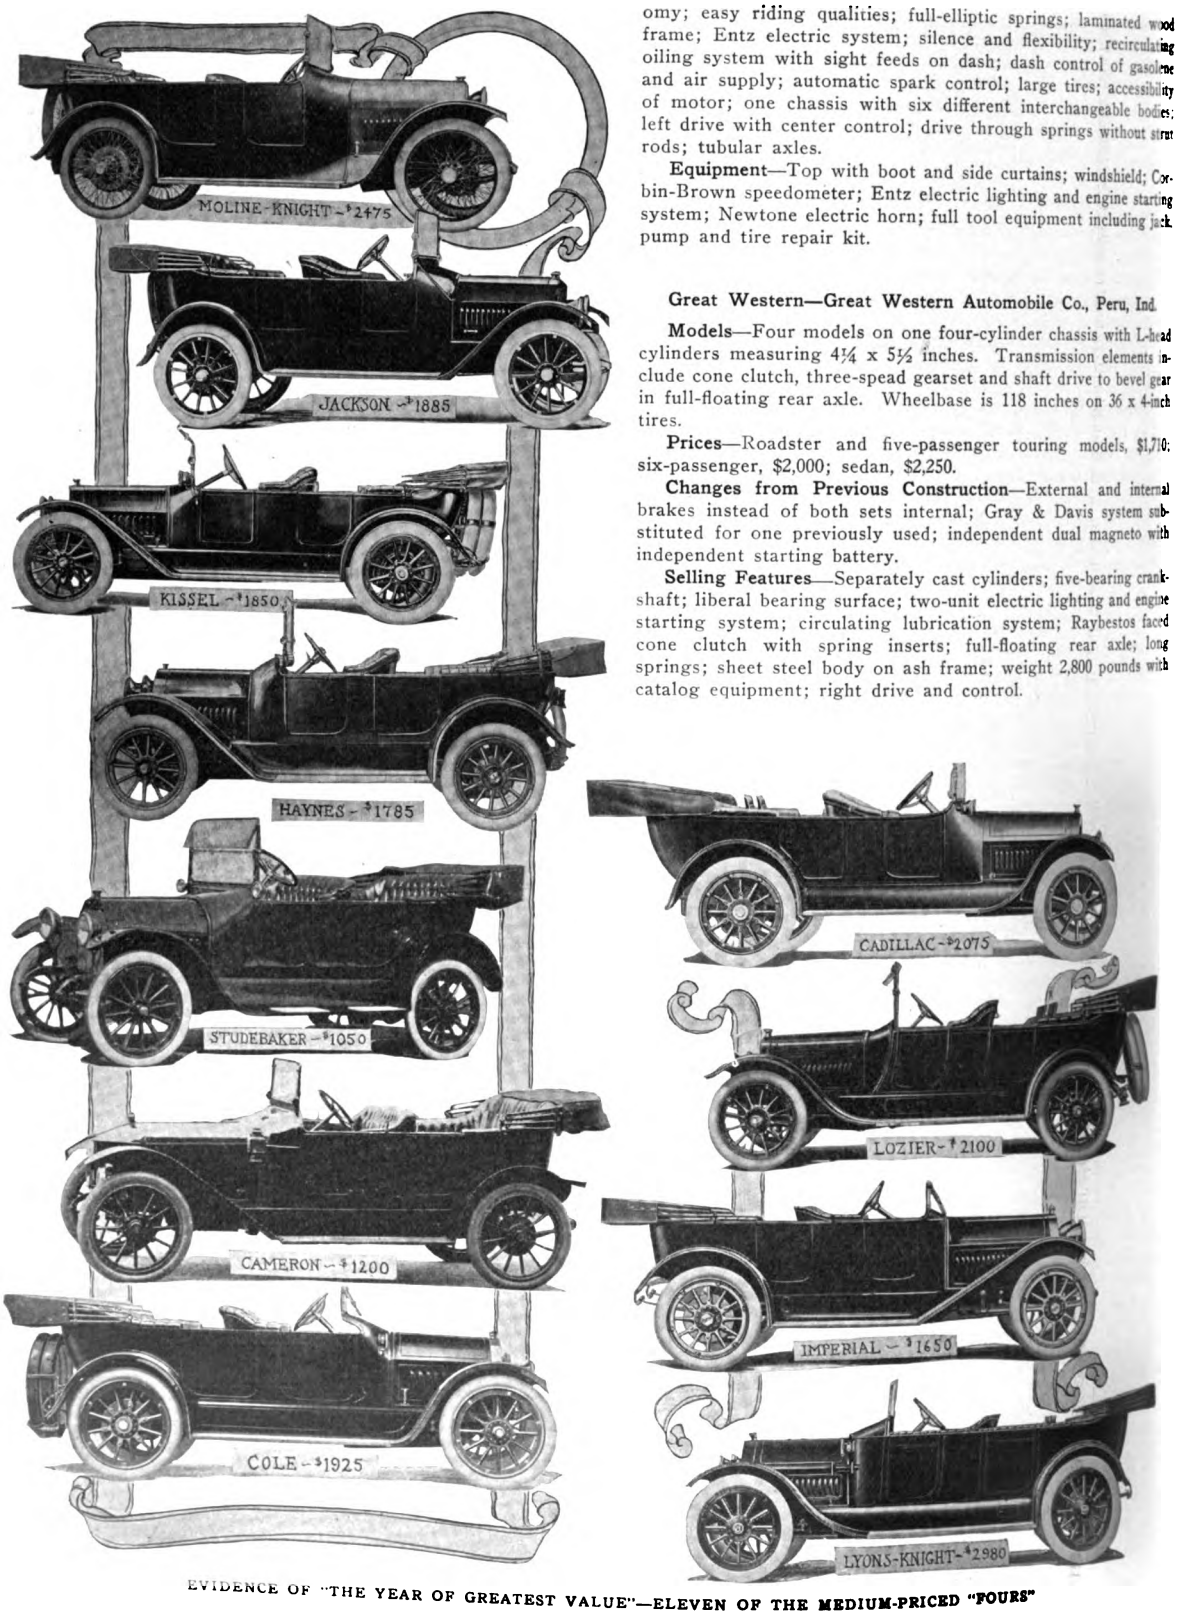
Changes from Previous Construction—Concentration on one model, the "Six-Thirty"; new rear axle; motor more accessible; all units independent of each other and readily accessible; left drive with center control; 200 pounds reduction in weight; spiral timing gears; Eisemann magneto; wheelbase lengthened to 120 inches; engine nickel-plated and black enamel; long walking beam support eliminated; packing removed from engine and placed on wings of engine hood, promoting accessibility; oil tank gauge and filler combined; spring brake band supports adopted; starting switch smaller and operates horizontally; new hood hinges; front mudguards extended; new top irons which hold each bow separately; steering column black enamel instead of nickel; new design luggage carrier.

Selling Features—Direct air cooling; light weight; fuel econ-

Digitized by Google

omy; easy riding qualities; full-elliptic springs; laminated wood frame; Entz electric system; silence and flexibility; recirculating oiling system with sight feeds on dash; dash control of gasoline and air supply; automatic spark control; large tires; accessibility of motor; one chassis with six different interchangeable bodies; left drive with center control; drive through springs without strut rods; tubular axles.

Equipment—Top with boot and side curtains; windshield; Corbin-Brown speedometer; Entz electric lighting and engine starting system; Newtone electric horn; full tool equipment including jack, pump and tire repair kit.



Great Western—Great Western Automobile Co., Peru, Ind.

Models—Four models on one four-cylinder chassis with L-head cylinders measuring 4¼ x 5½ inches. Transmission elements include cone clutch, three-spead gearset and shaft drive to bevel gear in full-floating rear axle. Wheelbase is 118 inches on 36 x 4-inch tires.

Prices—Roadster and five-passenger touring models, $1,710; six-passenger, $2,000; sedan, $2,250.

Changes from Previous Construction—External and internal brakes instead of both sets internal; Gray & Davis system substituted for one previously used; independent dual magneto with independent starting battery.

Selling Features—Separately cast cylinders; five-bearing crankshaft; liberal bearing surface; two-unit electric lighting and engine starting system; circulating lubrication system; Raybestos faced cone clutch with spring inserts; full-floating rear axle; long springs; sheet steel body on ash frame; weight 2,800 pounds with catalog equipment; right drive and control.

EVIDENCE OF "THE YEAR OF GREATEST VALUE"—ELEVEN OF THE MEDIUM-PRICED "FOURS"

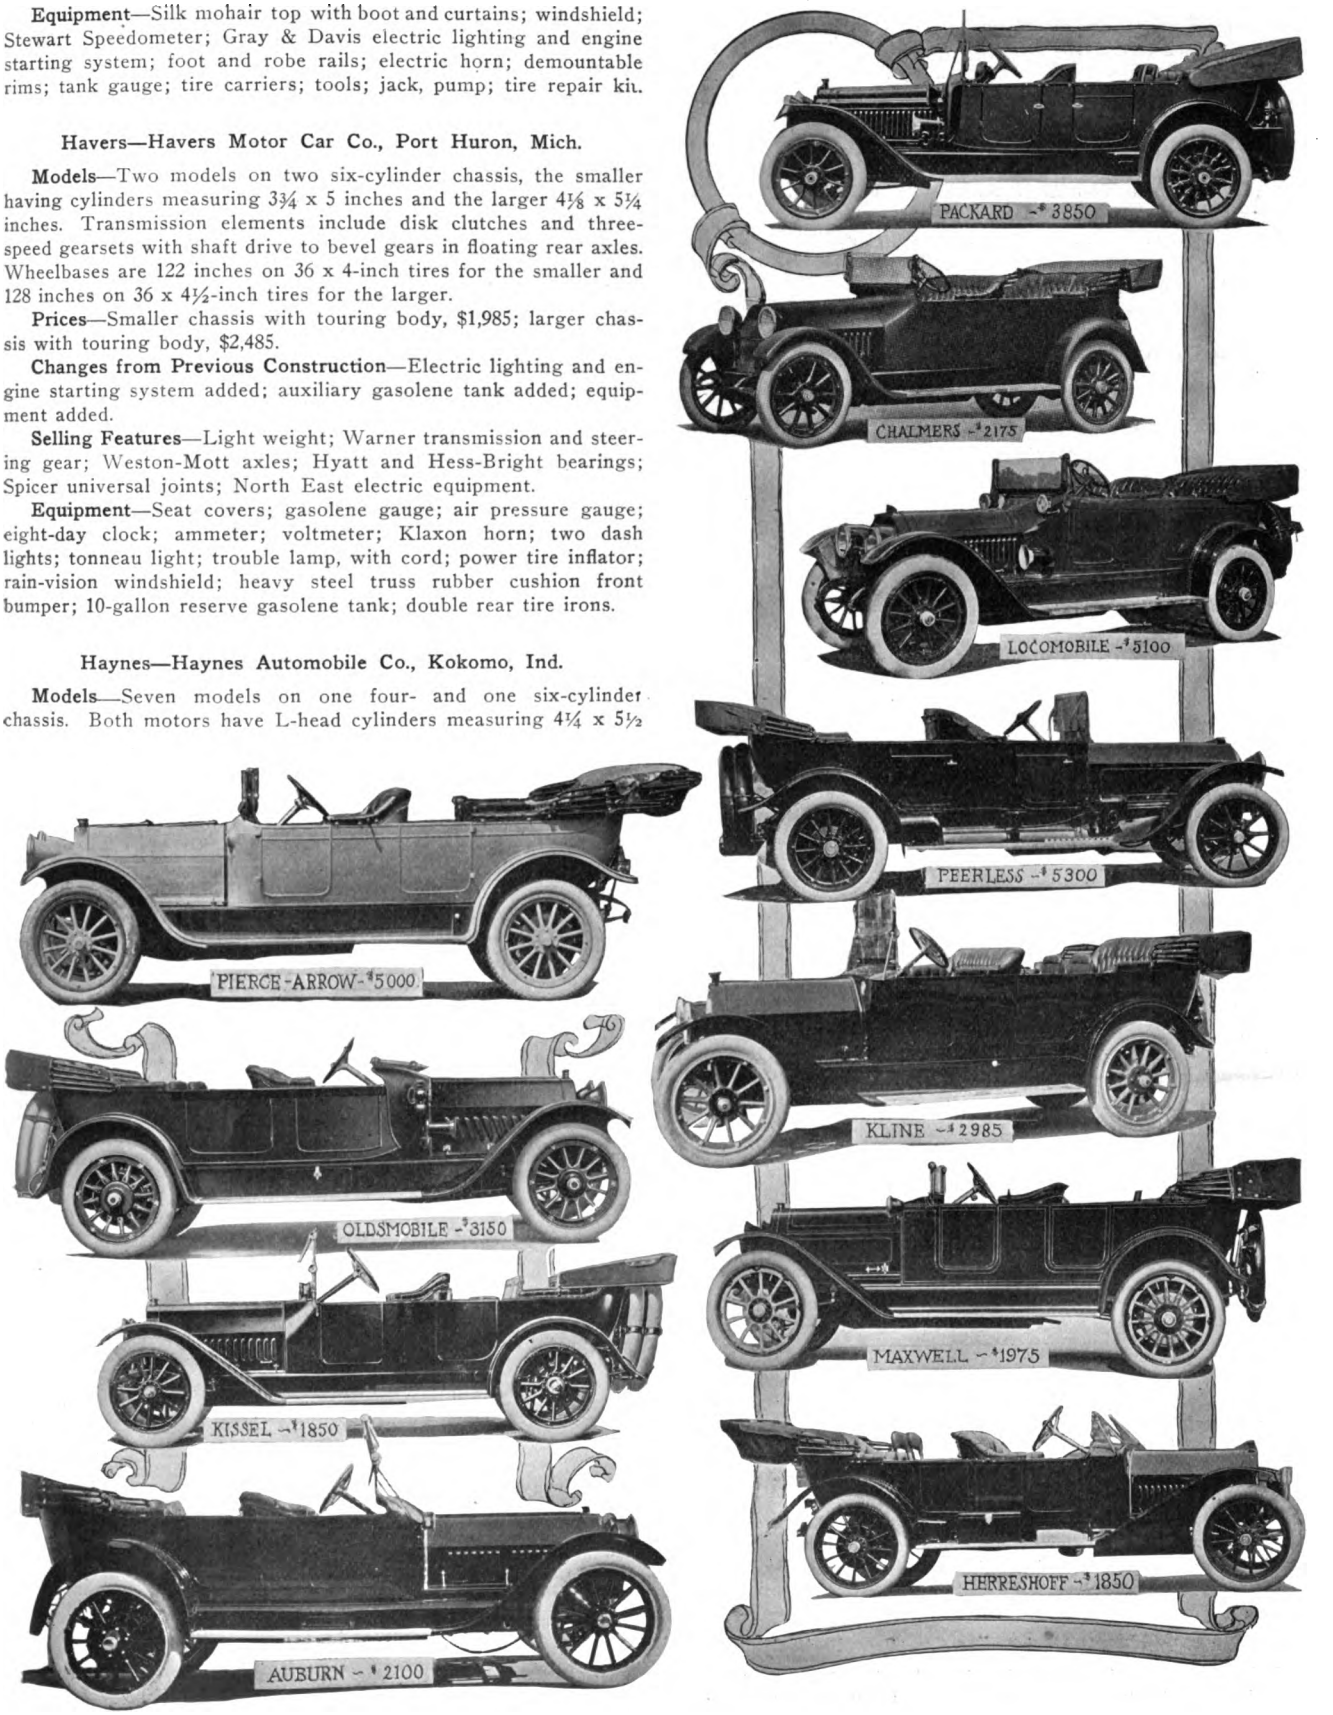
Equipment—Silk mohair top with boot and curtains; windshield; Stewart Speedometer; Gray & Davis electric lighting and engine starting system; foot and robe rails; electric horn; demountable rims; tank gauge; tire carriers; tools; jack, pump; tire repair kit.

Havers—Havers Motor Car Co., Port Huron, Mich.

Models—Two models on two six-cylinder chassis, the smaller having cylinders measuring 3¾ x 5 inches and the larger 4⅛ x 5¼ inches. Transmission elements include disk clutches and three-speed gearsets with shaft drive to bevel gears in floating rear axles. Wheelbases are 122 inches on 36 x 4-inch tires for the smaller and 128 inches on 36 x 4½-inch tires for the larger.

Prices—Smaller chassis with touring body, $1,985; larger chassis with touring body, $2,485.



Changes from Previous Construction—Electric lighting and engine starting system added; auxiliary gasolene tank added; equipment added.

Selling Features—Light weight; Warner transmission and steering gear; Weston-Mott axles; Hyatt and Hess-Bright bearings; Spicer universal joints; North East electric equipment.

Equipment—Seat covers; gasolene gauge; air pressure gauge; eight-day clock; ammeter; voltmeter; Klaxon horn; two dash lights; tonneau light; trouble lamp, with cord; power tire inflator; rain-vision windshield; heavy steel truss rubber cushion front bumper; 10-gallon reserve gasolene tank; double rear tire irons.

Haynes—Haynes Automobile Co., Kokomo, Ind.

Models—Seven models on one four- and one six-cylinder chassis. Both motors have L-head cylinders measuring 4¼ x 5½

STREAMLINE "SIXES" THAT APPEAL TO DIFFERENT-SIZED POCKETBOOKS

Digitized by Google

inches. Transmission elements include contracting band clutches and three-speed electrically operated gearsets, drive through shaft to bevel gears in full-floating rear axles. Wheelbases are 118 on 34 x 4-inch tires for the "four" and 130 on 36 x 4½-inch tires for the "six."

Prices—"Four": Roadster, four- and five-passenger touring, $1,985; coupe, $2,800. "Six": Six- and seven-passenger touring, $2,785. "Six" with 130-inch wheelbase and either roadster, four- or five-passenger touring body, $2,700.

Changes from Previous Construction—In the "six": Gasolene tank shifted to rear; kick pads added to back of front seats; "four" practically unaltered.

Selling Features—Vulcan electric gear shift; electric lighting and engine starting system; flexible four-point motor suspension; contracting band clutch; full-floating axles; twelve-spoked wheels; long springs.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting and engine starting system; horn; robe and foot rails; demountable rims; tire carriers; tools; tire repair kit; pump; jack.

Henderson—Henderson Motor Car Co., Indianapolis, Ind.

Models—Two models on two four-cylinder chassis, one model on one six-cylinder chassis. "Fours" measure 4⅛ x 5½ inches and 4⅛ x 5¼ inches, respectively, the "six" measuring 3¾ x 5½ inches. Transmission elements include cone clutches, three-speed gearsets and shaft drive to bevel gears in floating rear axles. Wheelbases are 116 inches in both "fours" on 34 x 4-inch tires, and 126 inches on 35 x 4½-inch tires in the "six."

Prices—Smaller "four," touring model, $1,585; larger "four," roadster and touring, $1,785; coupe, $2,285; "six": Roadster and touring, $2,285; coupe, $2,785.

Changes from Previous Construction—Smaller "four" is new throughout and is exhibited for the first time. In other models controls have been placed on dash and bodies enlarged.

Selling Features—Kerosene carburetter; center control lever; dash gasolene tank; dash arrangement of controls; long-stroke motors; ebony finish woodwork; clear running boards; electric lighting and starting.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting and engine starting equipment; electric horn; clock; wire wheels; pump; jack; tools; tire repair kit; robe and foot rails.

Herreshoff—Herreshoff Motor Co., Detroit, Mich.

Models—Four models on one each four- and six-cylinder chassis. Both motors measure 3⅜ x 4½ inches. Transmission elements include disk clutches, four-speed gearsets and shaft drive to bevel gears in semi-floating rear axles. Wheelbases are 100 and 110 on 32 x 3½-inch tires for the "four" and 124 inches on 34 x 4-inch tires for the "six."

Prices—"Six": Roadster, five- and six-passenger touring, $1,850; seven-passenger touring, $1,900. "Four": Roadster, $1,250; touring models, $1,350; coupe, $1,650.

Changes from Previous Construction—Alterations concern bodies, which are wider and have deeper upholstery. Mechanical alterations are few.

Selling Features—Light weight (under 2,800 pounds for the "six"); four forward speed gearset with direct on fourth; small bore; long stroke; high speed motor; fuel economy; electric horn button in center of steering wheel; high-speed electric starter of light weight; enclosed mechanism; simplicity and accessibility.

Equipment—Top with boot and curtains; speedometer; windshield; Westinghouse electric lighting and engine starting system; electric horn; demountable rims; tire carriers; extra demountable rim; tools; tire repair kit; pump; jack; foot and robe rails.

Hudson—Hudson Motor Car Co., Detroit, Mich.

Models—Two models on "big six" chassis; three models on "little six" chassis. Both motors have L-head cylinders, the smaller measuring 3½ x 5 inches and the larger 4⅛ x 5¼ inches. Transmission elements include disk clutches, three-speed gearset in the smaller model and four-speed with direct drive on third speed in larger, shaft drive to bevel gears in full-floating rear axles. Wheelbases are 123 inches in the smaller model on 34 x 4-inch tires, 135 inches in the larger model on 36 x 4½-inch tires.

Prices—Smaller chassis: Roadster and six-passenger phaeton, $1,750; cabriolet, $1,950. Larger chassis: Seven-passenger touring, $2,250; Sedan, $3,100.

Changes from Previous Construction—Smaller chassis is new throughout and is exhibited for the first time. In larger chassis: Seven-passenger body; wheelbase lenghtened; left drive and center control; larger tires; extra tires carried in front of forward door; four forward speeds with direct drive on third; streamline body; side lamps eliminated; Delco electric lighting and engine starting system; gasolene tank in cowl; wider doors; extra seats fold out of sight; equipment added.

Selling Features—Six-cylinder engines; streamline bodies; side lamps eliminated; four-speed gearset in larger model with direct drive on third; medium prices; light weight; easy riding qualities; fuel economy; left drive with center control; Delco electric lighting, ignition and starting combined; new speedometer drive; cabriolet body; complete equipment.

Equipment—"One-man" top with boot and quick adjustable side curtains; built-in windshield; speedometer; gasolene gauge; electric horn; demountable rims with extra and tire carriers; trunk rack; tools; tire repair kit; pump; jack; Delco electric lighting and engine starting system.

Hupmobile—Hupp Motor Car Co., Detroit, Mich.

Models—Four models on one four-cylinder chassis having L-head cylinders measuring 3¼ x 5½. Transmission elements include disk clutch, three-speed gearset and shaft drive to bevel gears in full-floating rear axle. Wheelbases are 106 and 126 inches and tires measure 32 x 3½ on roadsters and 33 x 4 on larger models

Prices—Roadster and four-passenger touring with electric starter, $1,200; without starter, $1,050; six-passenger with starter, $1,300; coupe with starter, $1,350.

Changes from Previous Construction—Minor motor changes to accommodate starter; stiffening ribs in motor pan; Westinghouse electric lighting and engine starting system; control hood enlarged; top about two inches higher; rain-vision windshield; gasolene capacity increased three gallons; Kelsey split demountable rims; equipment added.

Selling Features—Long-stroke, small-bore motor; three-bearing crankshaft and block-cast cylinders; hollowed crankshaft; gear and crankcase in single casting; one universal joint; full-floating rear axle; cowl gasolene tank; rain shield on magneto; special tire carriers; over-size tires.

Equipment—Top with boot and Jiffy curtains; windshield; demountable rims; tire carriers; Max-eff electric horn; speedometer; tools; tire repair kit; jack; pump; electric lighting and engine starting system when specified.

Imperial—Imperial Automobile Co., Jackson, Mich.

Models—Five models on two four- and two six-cylinder chassis; smaller "four" measures 4½ x 5; larger "four," 4¼ x 5½; smaller "six," 3¾ x 5½; larger "six," 4⅛ x 5¼. Transmission elements include disk clutches, three-speed gearsets and shaft drive to bevel gears in floating rear axles. Wheelbases are 114 on 33 x 4-inch tires for the smaller "four"; 118 inches on 34 x 4-inch tires for the larger "four"; 126 inches on 36 x 4½-inch tires for the smaller "six"; 137 inches on 36 x 4½-inch tires for the larger "six."

Prices—Smaller "four" roadster and touring, $1,500; larger "four" touring, $1,650; smaller "six" touring, $2,000; larger "six" touring, $2,500.

Changes from Previous Construction—Few alterations except for addition of electric lighting and engine starting systems.

Selling Features—Easy riding springs; Continental six-cylinder motors; silent and efficient electric starter; luxurious upholstery; beautiful body lines; left drive with center control; large brakes

Equipment—Top with curtains and dust cover; windshield; speedometer; combined single and double tire holders; electric

Digitized by Google

horn; robe rail; foot rail; tire repair outfit; demountable rims, with extra rim; tool outfit; jack; pump; speedometer light; lock switch; kick pads.

Jackson—Jackson Automobile Co., Jackson, Mich.

Models—Four models on three chassis, two of which are "fours" and one is a "six." The "fours" have cylinders measuring 4½ x 5¼ inches and 4⅛ x 4¾, respectively; the "six" measures 4¼ x 5¼. Transmission elements include cone clutches, three-speed gearsets and shaft drive to bevel gears in full-floating rear axles. Wheelbases are 115 inches on 34 x 4-inch tires for the smaller "four," 124 inches on 36 x 4 tires for the larger "four," and 132 or 138 inches on 36 x 4½ tires for the "six."

Prices — Smaller "four": Touring, $1,385; roadster, $1,525; larger "four": touring, $1,885. "Six": seven-passenger touring, $2,300; five-passenger, $2,150.

Changes from Previous Construction—Fenders moulded; tool boxes removed from running boards; smaller "four" regularly equipped with electric lighting and engine starting system; side lamps eliminated.

Selling Features—Full elliptic springs front and rear; exceptionally easy riding; moderate price; full-floating rear axles; electric lighting and starting.

Equipment—Mohair top, with boot and curtain; ventilating windshield; speedometer; oil gauge and gasolene gauge on dash; speedometer light; Firestone universal quick detachable demountable rims; extra rim with carrier at rear; foot rail; coat rail; pump; tools and jack; electric cranking, electric lights and electric horn.

Jeffery—Thos. B. Jeffery Co., Kenosha, Wis.

Models—Five models on one each four- and six-cylinder chassis. Both motors have L-head cylinders measuring 3¾ x 5¼. Transmission elements include cone clutches, four-speed gearsets and shaft drive to bevel gears in full-floating axles. Wheelbases are 116 inches for the "four" on 34 x 4-inch tires, and 128 inches on 36 x 4½-inch tires for the "six."

Prices—"Four": Roadster and five-passenger touring car, $1,550; coupelette, $1,950; sedan, $2,350; limousine, $3,000. "Six": Roadster and five-passenger touring car, $2,250; six-passenger touring, $2,300; Sedan, $3,250; limousine, $3,700.

Changes from Previous Construction—High-speed block motor in the "four"; enclosed valves; four-speed gearset; left drive with center control; self-contained oiling system with pressure pump; full-floating rear axle; demountable rims.

Selling Features—U. S. L. electric lighting and engine starting system; Daimler-type flexible leather coupling between clutch and gearset; rear axle and gearset running in imported ball bearings; Spicer universal joints in drive shaft; nickel steel axle and drive shafts; efficiency of motor and ease of operation.

Equipment—Top with boot and curtains; windshield; speedometer; U. S. L. electric lighting and engine starting system; robe and foot rails; demountable rims; pump; jack; tools; tire repair kit.

Keeton—Keeton Motor Co., Detroit, Mich.

Models—Six models on one six-cylinder chassis having cylinders measuring 3¾ x 5½ inches. Transmission elements include cone-disk clutch, four-speed gearset with direct on third, shaft drive to bevel gears in full-floating axle. Wheelbase is 136 inches on 34 x 4½-inch tires on wire wheels.

Prices—Roadster and touring, $3,250; coupe, $3,500; Berline limousine, $3,975; cabriolet, $3,350; phaeton, $3,500.

Changes from Previous Construction—Bore increased; pump circulation adopted; automatic advance Eisemann magneto adopted; road clearance increased; three new bodies added.

Selling Features—Distinctive "Frenchy" appearance; electric light unit starting and lighting system; wire wheels; four-speed gearset with direct on third; top cover incorporated on back of top.

Equipment—Top with boot and Jiffy curtains; windshield; speedometer; electric lighting and engine starting system; electric horn; extension lamp; wire wheels with one extra; wheel carrier; gasolene gauge; tools; tire repair kit; pump; jack; foot and robe rails.

King—King Motor Car Co., Detroit, Mich.

Models—Two models on one four-cylinder chassis having L-head cylinders measuring 3⅞ x 5 inches. Transmission elements include disk clutch, three-speed gearset and shaft drive to bevel gears in full-floating rear axle. Wheelbase is 112 inches on 33 x 4-inch tires.

Prices—Roadster or five-passenger touring, $1,095.

Changes from Previous Construction—Bore of motor increased from 3¾ to 3⅞ inches; stroke remains 5 inches; cylinders cast in a block instead of in pairs; compression raised; motor built in own plant.

Selling Features—Cantilever rear springs; long-stroke motor; unit power plant; left steer with center control; electric lighting; three-point suspension; full-floating rear axle; 18-inch steering wheel; disk clutch; roomy body.

Equipment—Top with boot and curtains; Stewart-Warner speedometer; windshield; electric horn; tire carriers; jack; pump; tools; tire repair kit; demountable rims with one extra.

Kissel—Kissel Motor Car Co., Milwaukee and Hartford, Wis.

Models—Five models on each of two six-cylinder and one four-cylinder chassis. "Four" cylinders measure 4½ x 5¼, as do those of the larger "six." Smaller "six" cylinders measure 3¾ x 5½ inches. Wheelbases are 131 inches on 36 x 4-inch tires for the "four"; 132 inches on 36 x 4½-inch tires for the smaller "six"; and 142 inches on 37 x 5-inch tires for the larger "six." Transmission elements include cone clutches, four-speed gearsets with direct drive on third, and shaft drive to bevel gears in floating type rear axles.

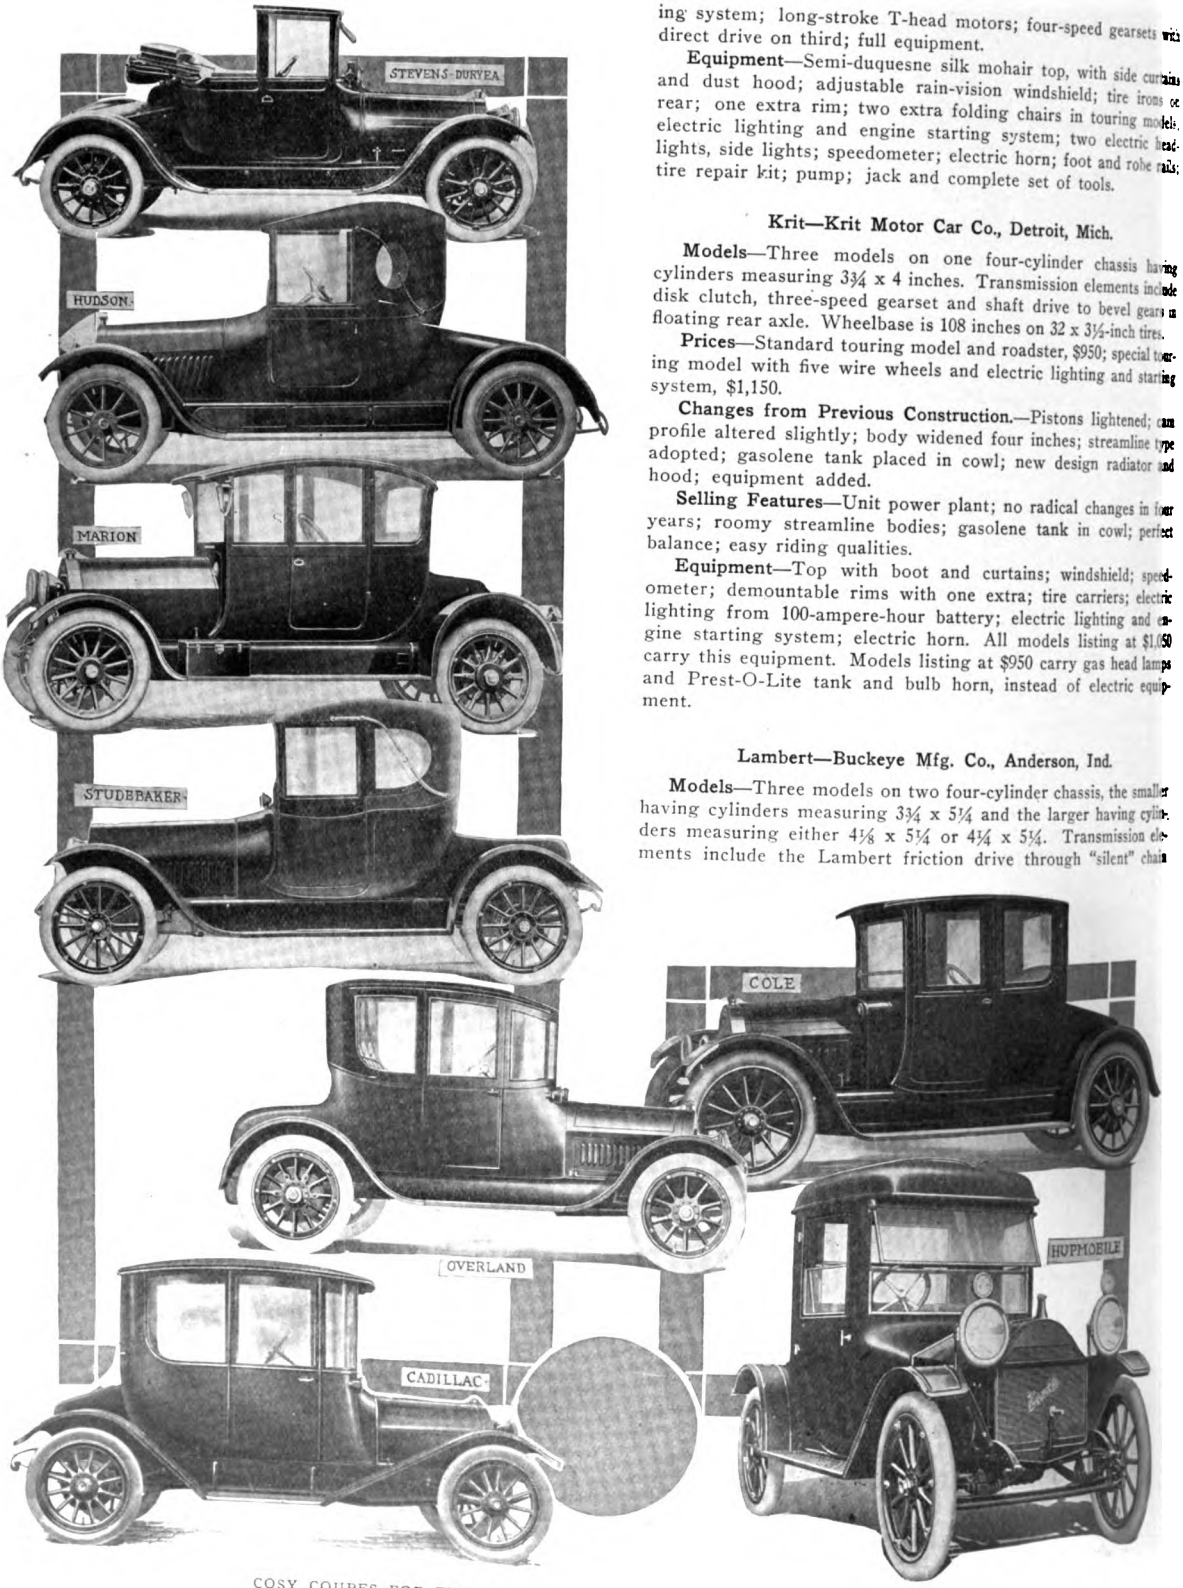
Prices—"Four": Open bodies, $1,850; coupe, $2,850. Larger "six": Open bodies, $3,150; Berline-limousine, $4,900; limousine, $4,650. Smaller "six": Open bodies, $2,350; limousine, $3,850; Berline-limousine, $4,100.

Changes from Previous Construction—Left drive with center control adopted; wheelbases lengthened; tonneaux made roomier; one each four- and six-cylinder models are new throughout, details and prices to be announced later.

Selling Features—Four- and six-cylinder motors; accessibility of power plant; individuality of appearance; commodious seats; liberal wheelbase; low frame; flexible springs fitted with shock absorbers; electric lighting and starting equipment; simplicity of chassis.

Equipment—Mohair top and cover; windshield integral with body; Connecticut shock absorbers, front and rear; demountable rims, one extra; Warner speedometer; double tire irons on rear; robe and foot rails; horn; jack; pump; kit of tools; tire repair outfit.

Kline—Kline Motor Car Corp., Richmond, Va.



Models—Fourteen models on two four- and two six-cylinder chassis. Smaller four-cylinder motor has L-head cylinders measuring 4 x 4⅝; other motors all have T-head cylinders, "four" measuring 4 5/16 x 5¾, smaller "six," 4⅛ x 5½, and larger "six," 4 5/16 x 5¾. Transmission elements include cone clutches four-speed gearsets and shaft drive to bevel gears in floating rear axles. Wheelbases are 115 inches on 34 x 4 tires for the smaller "four"; 120 inches on 36 x 4 tires for the larger "four"; 128 inches on 37 x 4½-inch tires for the smaller "six"; and 133 inches on 37 x 5-inch tires for the larger "six."

Prices—Smaller "four": Four- and five-passenger touring, $1,685; larger "four": roadster and touring, $1,985; coupe, $2,585; smaller "six": Roadster and touring, $2,585; coupe, $3,200; larger "six": roadster and touring, $2,985; coupe, $3,500.

Changes from Previous Construction—Left drive with center control; Turkish upholstery; dual ignition; electric horn; water jacketed intake; hot air connection to carburetter.

Selling Features—Independent electric lighting and engine start-

Digitized by Google

COSY COUPES FOR TWO OR THREE, ALSO SOME OF THE NEW CABRIOLETS

ing system; long-stroke T-head motors; four-speed gearsets with direct drive on third; full equipment.

Equipment—Semi-duquesne silk mohair top, with side curtains and dust hood; adjustable rain-vision windshield; tire irons on rear; one extra rim; two extra folding chairs in touring models; electric lighting and engine starting system; two electric headlights, side lights; speedometer; electric horn; foot and robe rails; tire repair kit; pump; jack and complete set of tools.

Krit—Krit Motor Car Co., Detroit, Mich.

Models—Three models on one four-cylinder chassis having cylinders measuring 3¾ x 4 inches. Transmission elements include disk clutch, three-speed gearset and shaft drive to bevel gears in floating rear axle. Wheelbase is 108 inches on 32 x 3½-inch tires.

Prices—Standard touring model and roadster, $950; special touring model with five wire wheels and electric lighting and starting system, $1,150.

Changes from Previous Construction.—Pistons lightened; cam profile altered slightly; body widened four inches; streamline type adopted; gasolene tank placed in cowl; new design radiator and hood; equipment added.

Selling Features—Unit power plant; no radical changes in four years; roomy streamline bodies; gasolene tank in cowl; perfect balance; easy riding qualities.

Equipment—Top with boot and curtains; windshield; speedometer; demountable rims with one extra; tire carriers; electric lighting from 100-ampere-hour battery; electric lighting and engine starting system; electric horn. All models listing at $1,150 carry this equipment. Models listing at $950 carry gas head lamps and Prest-O-Lite tank and bulb horn, instead of electric equipment.

Lambert—Buckeye Mfg. Co., Anderson, Ind.

Models—Three models on two four-cylinder chassis, the smaller having cylinders measuring 3¾ x 5¼ and the larger having cylinders measuring either 4⅛ x 5¼ or 4¼ x 5¼. Transmission elements include the Lambert friction drive through "silent" chain

Digitized by Google

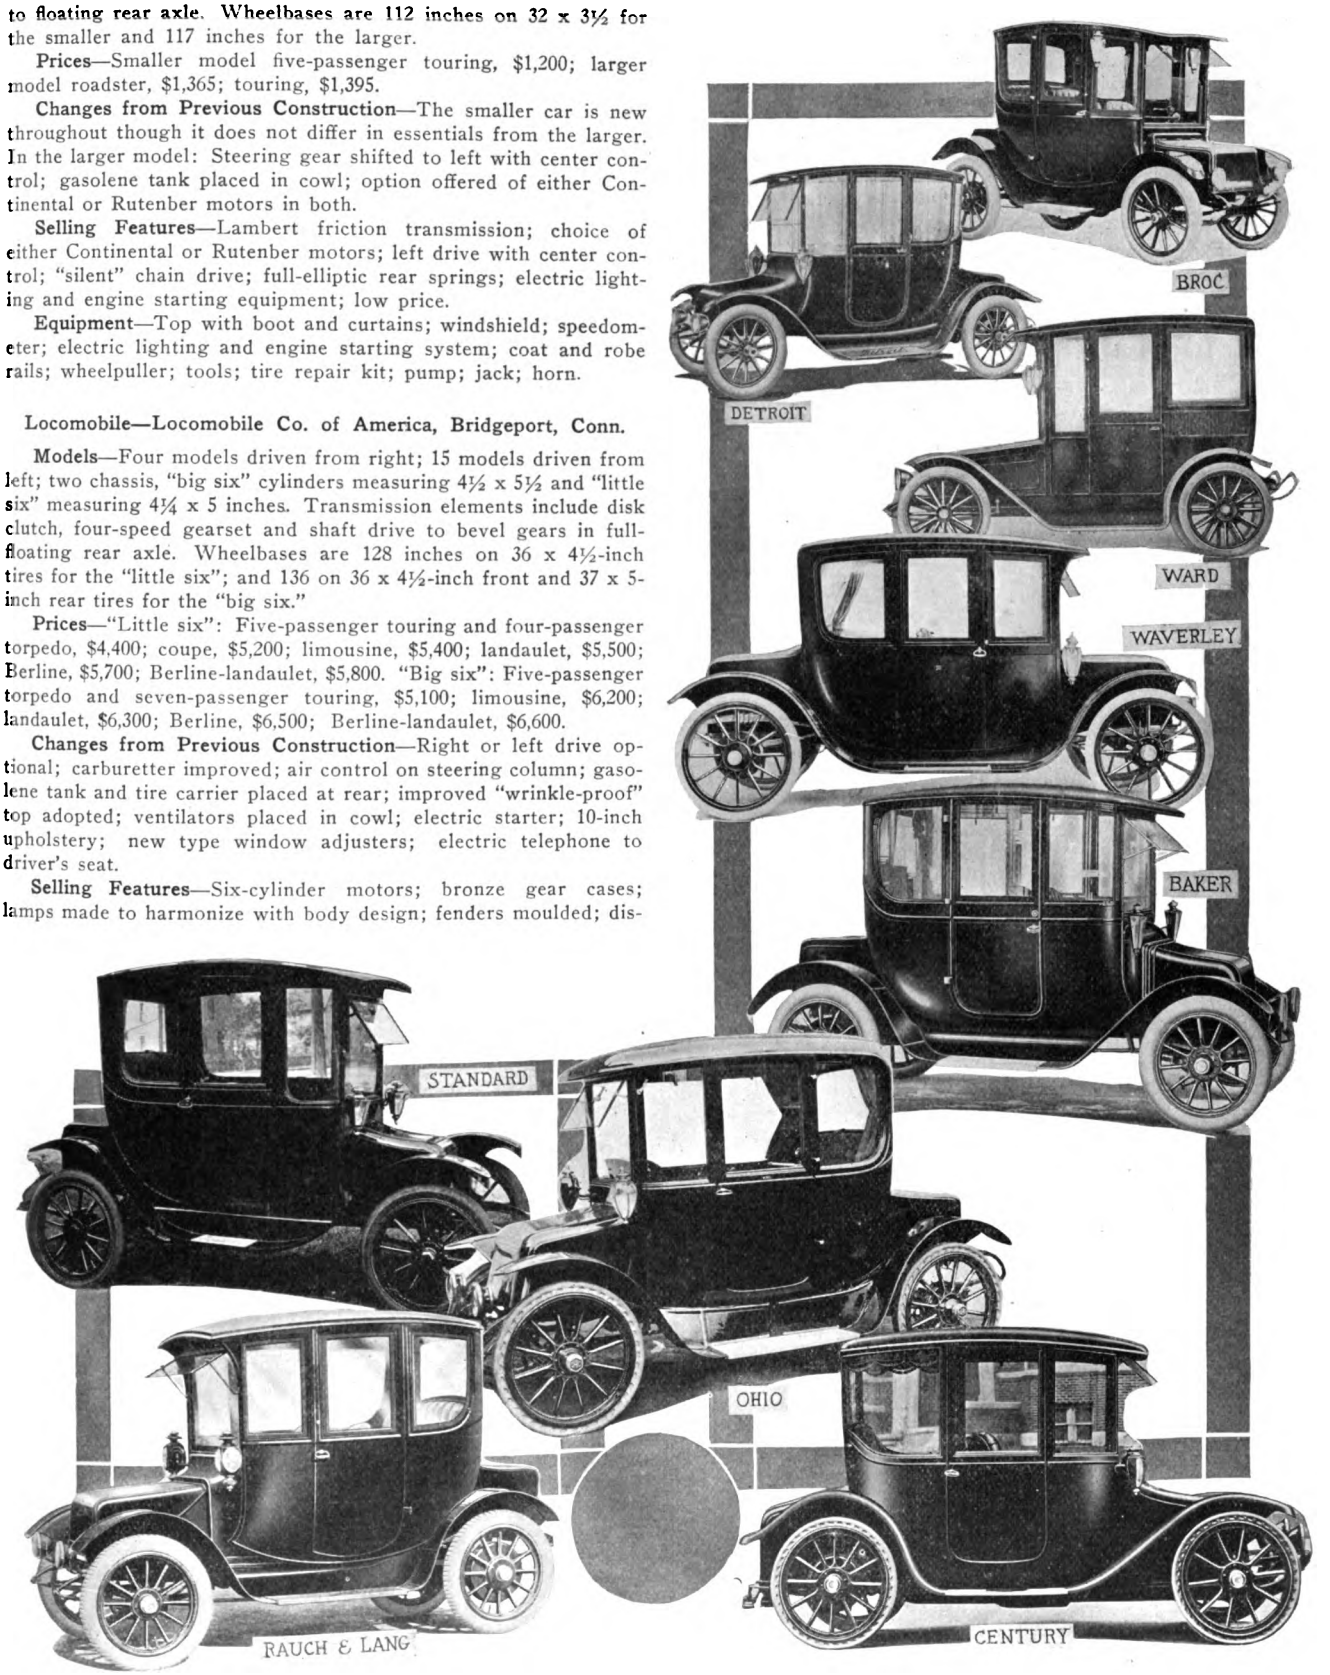
to floating rear axle. Wheelbases are 112 inches on 32 x 3½ for the smaller and 117 inches for the larger.

Prices—Smaller model five-passenger touring, $1,200; larger model roadster, $1,365; touring, $1,395.

Changes from Previous Construction—The smaller car is new throughout though it does not differ in essentials from the larger. In the larger model: Steering gear shifted to left with center control; gasolene tank placed in cowl; option offered of either Continental or Rutenber motors in both.

Selling Features—Lambert friction transmission; choice of either Continental or Rutenber motors; left drive with center control; "silent" chain drive; full-elliptic rear springs; electric lighting and engine starting equipment; low price.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting and engine starting system; coat and robe rails; wheelpuller; tools; tire repair kit; pump; jack; horn.



Locomobile—Locomobile Co. of America, Bridgeport, Conn.

Models—Four models driven from right; 15 models driven from left; two chassis, "big six" cylinders measuring 4½ x 5½ and "little six" measuring 4¼ x 5 inches. Transmission elements include disk clutch, four-speed gearset and shaft drive to bevel gears in full-floating rear axle. Wheelbases are 128 inches on 36 x 4½-inch tires for the "little six"; and 136 on 36 x 4½-inch front and 37 x 5-inch rear tires for the "big six."

Prices—"Little six": Five-passenger touring and four-passenger torpedo, $4,400; coupe, $5,200; limousine, $5,400; landaulet, $5,500; Berline, $5,700; Berline-landaulet, $5,800. "Big six": Five-passenger torpedo and seven-passenger touring, $5,100; limousine, $6,200; landaulet, $6,300; Berline, $6,500; Berline-landaulet, $6,600.

Changes from Previous Construction—Right or left drive optional; carburetter improved; air control on steering column; gasolene tank and tire carrier placed at rear; improved "wrinkle-proof" top adopted; ventilators placed in cowl; electric starter; 10-inch upholstery; new type window adjusters; electric telephone to driver's seat.

Selling Features—Six-cylinder motors; bronze gear cases; lamps made to harmonize with body design; fenders moulded; dis-

QUIET-RUNNING, WEATHER-DEFYING ELECTRICS IN SEVEN NEW BODY STYLES

tinctive type top and bows; silver-tone nickel finish; improved tire bracket; option of left or right drive; 10-inch upholstery; balance of weight; durability and reliability.

Equipment—Top with boot and curtains; electric lighting and engine starting system; speedometer; windshield; electric horn; air compressor; specially designed lamps; quick detachable tires mounted on demountable rims with two extras; tire carriers; swinging-type robe rail; folding foot rest; extension lamp; floor covering; tools; tire repair kit; priming device.

Lexington and Howard—Lexington-Howard Co., Connersville, Ind.

Models—Three models on one four- and one six-cylinder chassis, the "four" having cylinders measuring 4 x 5 inches.

Prices—"Four": Roadster and five-passenger touring, $1,295.

Equipment—Complete, including electric lighting and engine starting system.

Lozier—Lozier Motor Co., Detroit, Mich.

Models—One model on four-cylinder chassis and three on six-cylinder chassis. Both motors have L-head cylinders, the "four" measuring 4¼ x 6½ inches and the "six" 3⅞ x 5½ inches. Transmission elements include disk clutches, three-speed gearset in the "six" and four-speed with direct drive on third in the "four," shaft drive to bevel gears in full-floating rear axles. Wheelbases are 120 inches on 36 x 4½-inch tires in the "four"; 127½ inches on 36 x 4½ tires in the "six."

Prices—"Four" chassis: Five- and seven-passenger touring, $2,100. "Six" chassis: Roadster and touring models, $3,250; limousine, $4,450.

Changes from Previous Construction—The "four" is new throughout and is exhibited for the first time. In the "six": Weight reduced 300 pounds; new top; new silent floating rear axle; direct drive through rear springs; tire pump added; rebound absorbers on front axle; new "one-hand" windshield; moulded fenders; head light dimmers; extra long foot rail; cloth timing gears in motor.

Selling Features—In the "six": Light weight (3,845 pounds with all tanks filled and equipment in place); fuel economy; drive through rear springs; new rear axle of full-floating type; quick acceleration; accessibility; Bosch ignition; Gray & Davis lighting and starting. In the "four": Block motor; removable cylinder head; large valves; chain timing drive; hot air tube to carburetter; flywheel pressure lubrication; disk clutch; four-speed gearset with direct on third; electric lighting and starting; platform rear springs; left drive with center control; clear running boards.

Equipment—Top with boot and curtains; windshield; speedometer; clock; electric lighting and starting system; power tire pump; demountable rims with one extra and tire carriers; chain tread rear tires; rebound snubbers; trunk rack; robe and foot rails; tools; tire repair kit; horn; jack.

Lyons-Knight—Lyons-Atlas Co., Indianapolis, Ind.

Models—Four models on one four-cylinder Knight-engined chassis; cylinders measure 4½ x 5½ inches and are in pairs. Transmission elements include three-plate clutch, three-speed gearset and shaft drive to underhung worm gear in full-floating rear axle. Wheelbase is 130 inches on 37 x 5-inch tires.

Prices—Five-passenger touring, $2,900; seven-passenger, $2,980; Sedan, $3,900; Berline-limousine, $4,300.

Changes from Previous Construction—Practically a new car; first time exhibited.

Selling Features—Knight engine; worm-driven rear axle; long sleeve travel in motor; force-feed oiling; tubular connecting rods; electric engine starter; cowl gasolene tank; left drive with center control; rear axle gearset; long springs; sheet aluminum bodies; Turkish upholstery; complete equipment.

Equipment—Top with boot and curtains; Warner speedometer; clock; combined tire holder and trunk rack at rear; demountable rims with two extras; electric lighting and engine starting system; electric horn; robe and foot rails; jack; pump; tools; tire repair kit.

McCord—McCord Automobile Co., Chicago, Ill.

Models—One model on one four-cylinder chassis having cylinders measuring 3¾ x 5½ inches. Transmission elements include disk clutch, selective gearset and shaft drive to bevel gears in floating rear axle. Wheelbase is 110 inches.

Price—Not yet determined.

Changes from Previous Construction—The car is new throughout and is exhibited for the first time.

Selling Features—Light weight; disk clutch; Rutenber power plant; Weston-Mott rear axle; Imperial wheels; electric starter; three-point motor suspension.

Equipment—Complete.

McFarlan—McFarlan Motor Co., Connersville, Ind.

Models—Seven models on one four-cylinder chassis with option of T-head motor measuring 4 x 6 inches or 4½ x 6 inches. Transmission elements include disk clutch, three-speed gearset and shaft drive to bevel gears in full-floating rear axle. Wheelbase is 128 inches and tires measure 36 x 4½ inches.

Prices—Open cars with smaller motor, $2,590; with larger motor, $2,900. Berline-limousine with smaller motor, $4,000; with larger motor, $4,310. Coupe with smaller motor, $3,300; with larger motor, $3,610.

Changes from Previous Construction—Left drive with center control; wheelbase lengthened four inches; three-quarter elliptic underslung rear springs adopted; streamline bodies added; ball bearings in steering knuckles; slower speed electric generator; double filament head lamps; new air pump; Gray pneumatic gear shift optional equipment.

Selling Features—Gray npeumatic gear shift as optional equipment; comparatively short wheelbase; option of two motors; underslung three-quarter elliptic rear springs; correct weight distribution; simplicity and accessibility; strength of parts; flexibility; block-cast cylinders; rear axle gearset; Mea magneto; disk clutch running in oil; cylindrical gasolene tank; left drive with center control; pneumatic engine starter; electric lighting system.

Equipment—Top with boot and Collins curtains; windshield; speedometer; pneumatic engine starter; electric lighting system; shock absorbers; cigar lighter; demountable rims; tire carriers; tools; tire repair kit; power pump; jack; horn.

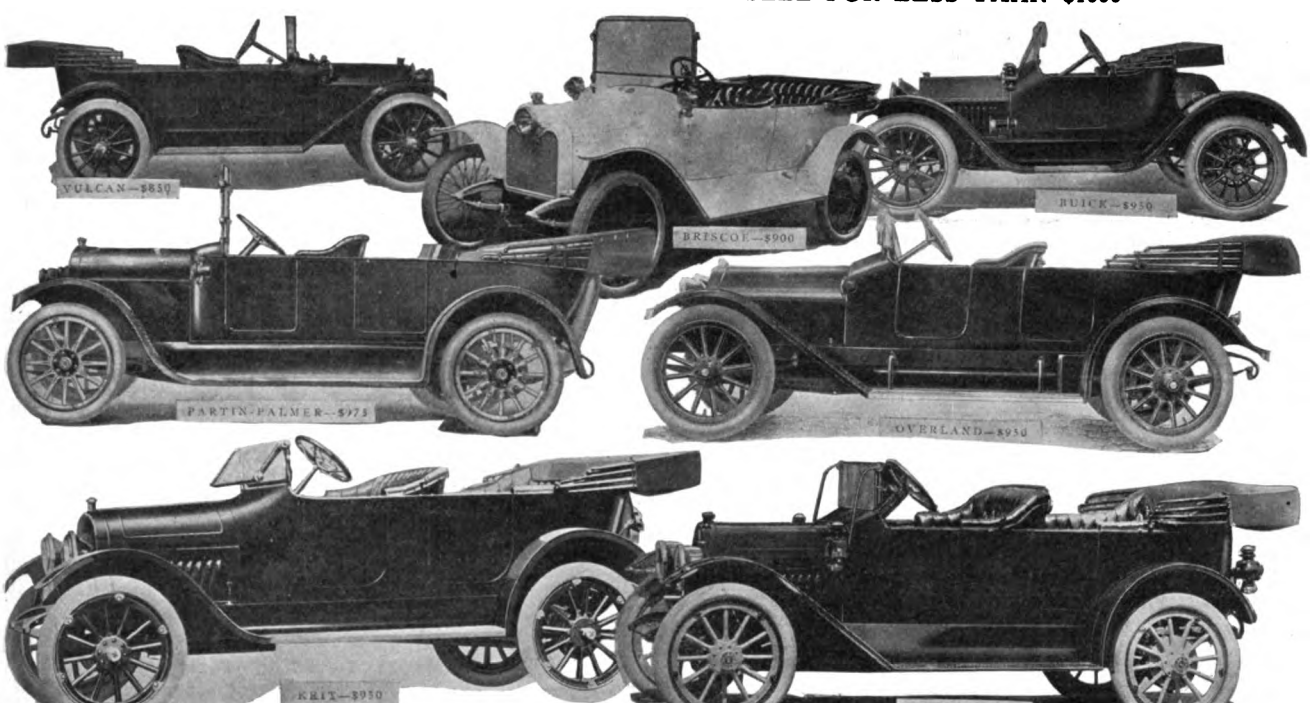
McIntyre—W. H. McIntyre Co., Auburn, Ind.

Models—One model on one six-cylinder chassis having cylinders measuring 3½ x 4½ inches. Transmission elements include disk clutch, four-speed gearset and shaft drive to bevel gears in floating type rear axle. Wheelbase is 128 inches in 34 x 4½-inch tires.

Price—Touring model, $1,485. With Westinghouse electric starter and lighter and automatic priming equipment, $1,635.

Changes from Previous Construction—The car is new throughout and is exhibited for the first time.

Selling Features—Six cylinders; four speeds; unit power plant; three-point suspension; all steel chassis construction; weight with tanks full, 2,850 pounds (and 40 horsepower); central single lever control; starter; center of gravity on line with hubs; straight lines; clearance at lowest point, 11 inches; inside door latches; up-to-date invisible coil with lock switch; enclosed valves; concealed hinges.



Equipment—Mohair top with dust hood; nickel folding windshield; electric signal; demountable rims; spare tire carrier; extra rim; license bracket; limit straps; nickel footrail; robe rail; nickel and black enamel gas headlights, side and tail lights; automatic jump spark lighter; gas tank; speedometer with trip attachment; dash clock; starter; tire pump; jack; tire repair kit; tools; dust cover for entire car.

Marion—Marion Motor Car Co., Indianapolis, Ind.

Models—Five models on six-cylinder chassis and four on four-cylinder chassis. Both motors have L-head cylinders, the "four" measuring 4 x 5 and the "six" 3¾ x 5¼ inches. Transmission elements include dry-plate clutch and three-speed gearset in the

Digitized by Google

SEVEN OF THE ATTRACTIVE CARS THAT SELL FOR LESS THAN $1000

"six" and cone clutch with three-speed gearset in the "four." Both have full-floating rear axles with flange drive. Wheelbases are 117 inches in the "four" on 34 x 4 tires, and 124 inches on 35 x 4½-inch tires for the "six."

Prices—"Six" roadster, special roadster and five-passenger car, $2,150; coupe, $2,650; sedan, $2,950. "Four" roadster, special roadster and five-passenger, $1,650; coupe, $2,150.

Changes from Previous Construction—The "six" is new throughout, as are all the enclosed bodies. In the "four," the wheelbase has been lengthened; full-floating rear axle; imported spring steel; large clutch.

Selling Features—Westinghouse electric lighting and engine starting system; powerful motors; economy of operation; full-floating rear axles with flange drive; Sheffield steel springs; Turkish upholstery; self-lubricating spring bolts; wiring system; special strapless tire holder; roominess of bodies; left drive and center control.

Equipment—Top with boot and curtains; windshield; Stewart speedometer; Westinghouse electric lighting and engine starting system; electric horn; demountable rims with one extra; tire carriers; tools; pump; jack; tire repair kit; foot and robe rails.

Maxwell—Maxwell Motor Co., Detroit, Mich.

Models—Three models on two four- and one six-cylinder chassis. All motors are L-head, block cast, the smaller "four" having cylinders measuring 3⅝ x 4, the larger "four" 4 x 4¾, and the "six" 4⅛ x 4¾. Transmission elements include cone clutches, three-speed gearsets and shaft drive to bevel gears in full-floating axle in the "six," semi-floating in the larger four and three-quarter floating in the smaller "four." Wheelbases are 103 inches on 30 x 3½-inch tires for the smaller "four"; 111 inches on 33 x 4-inch tires for the larger "four"; and 130 inches on 36 x 4½-inch tires for the "six."

Prices—"Six": Seven-passenger touring, $1,975. Larger "four" touring, $1,225; smaller "four" touring, $750.

Changes from Previous Construction—"Six": Optional right or left drive. Large "four": Electric starter added. Smaller "four": Slight change in carburetter and installation of tire irons and front and rear dust shields.

Selling Features—"Six": Size, equipment and price; optional right or left steering. Larger "four": Roomy body; easy riding qualities; electric starting; complete equipment. Smaller "four": Block motor of liberal dimensions; three-speed selective gearset; three-quarter floating rear axle; cone clutch; large tires; big body; 103-inch wheelbase; equipment.

Equipment—Smaller "four": Top with boot and Jiffy curtains; windshield; speedometer; horn; tire holders; Prest-O-Lite tank and tools. Larger "four" has in addition: Electric lighting and starting system; electric horn. "Six" has in addition: Demountable rims with extra tire carriers; trouble lamp and cigar lighter. All have the usual tools; pump; jack; tire repair kit, etc.

Metz—Metz Co., Waltham, Mass.

Models—Two models on one four-cylinder chassis having cylinders measuring 3¾ x 4 inches. Transmission elements include the Metz friction system with double side chain drive to rear wheels. Wheelbase is 90 inches and tires measure 30 x 3 inches.

Price—Roadster model, $475.

Changes from Previous Construction—Practically no mechanical alteration.

Selling Features—Extreme simplicity of chassis and friction transmission system; block motor with detachable cylinder head; full equipment.

Equipment—Extension top with cover; windshield; gas lamps and generator; tools; horn; pump; tire repair kit.

Mercer—Mercer Automobile Co., Trenton, N. J.

Models—Four models on two four-cylinder chassis; both have T-head motors, the smaller having cylinders measuring 4⅜ x 5 inches and the larger 4½ x 5 inches. Transmission elements include disk clutches and four-speed gearsets with drive to bevel gears in floating type rear axles. Wheelbases are 108, 118 and 124 inches, according to body style.

Prices—Raceabout on smaller chassis minus electrical equipment, $2,600. On larger chassis with complete equipment: Roadster and four-passenger touring, $2,900; five-passenger touring, $3,000.

Digitized by Google

Changes from Previous Construction—Five-passenger touring model and roadster are new, though they do not depart from previous construction and only minor alterations have been made in the others.

Selling Features—Slow-speed T-head motor; four-speed gearset; transmission brakes; large valves; light reciprocating parts; concentric piston rings; disk clutch; right-hand control.

Equipment—Top with boot and curtains; windshield; speedometer; electric horn; Rushmore electric lighting and engine starting system; Hartford shock absorbers; demountable rims with tire carriers; pump; jack; tools; tire repair kit.

Mitchell—Mitchell-Lewis Motor Co., Racine, Wis.

Models—Three models on "big six" and three on "little six" and two on four-cylinder chassis; all motors are T-head and all have 4¼-inch bore; "big six" and "four" have 7-inch stroke; "little six" has 6-inch stroke, with 7-inch stroke optional. Transmission elements include cone clutches, three-speed gearsets and shaft drive to bevel gears in floating rear axle. Wheelbases are 144 inches on 37 x 5 tires for the "big six"; 132 inches on 36 x 4½ tires for the "little six"; and 120 inches on 36 x 4½ tires for the "four."

Prices—"Big six": Seven-passenger touring, $2,350; "little six": five-passenger touring or roadster, $1,895; "four," roadster or five-passenger touring, $1,595.

Changes from Previous Construction—Shallower valve chambers; motor supported by six feet; piston tops flat instead of cupped; piston pin diameter increased; distribution gear case redesigned and fan driven by endless canvas belt; carburetter mounted closer to manifold; ignition switch placed on cowl board; electric starter moved to gear box; clutch now a steel stamping instead of aluminum; gear shafts square instead of splined; gear box smaller; rear axle simplified and inspection hole provided; brake rods pass over instead of under the axle; springs lengthened; Cowlboards added to bodies; tire carried at rear.

Selling Features—Exceptionally long stroke motors; option of stroke lengths in light "six"; left drive with center control; electric lighting and engine starting; gravity gasolene feed; long wheelbase; roomy, streamline bodies; Timken wheel bearings; full-floating rear axles; large tires; luxurious upholstery; nickel trimmings; complete equipment.

Equipment—Silk mohair top with boot and quick-adjustable curtains; windshield; speedometer; Remy electric lighting and engine starting system; electric trouble lamp; robe and foot rails; demountable rims; tire carriers; tools; jack; pump; horn; tire repair kit.

Moline-Knight—Moline Automobile Co., Moline, Ill.

Models—One model on one four-cylinder Knight engined chassis with cylinders measuring 4 x 6. Transmission elements include cone clutch, three-speed gearset and bevel gear drive to floating rear axle. Wheelbase is 126 inches and tires measure 36 x 4½.

Prices—Touring model, $2,400.

Changes from Previous Construction—Knight engined model is new throughout.

Selling Features—Knight engine; lowest-priced Knight engined car; only Knight engine in America with block cast cylinders and thermo-siphon cooling; single chassis with one body accommodating either five or seven passengers; integral intake and exhaust manifolds; removable cylinder head; cone-shaped cylinder heads with cupped pistons; hollow connecting rods; forced feed oiling system; bearings devoid of oil slots; breather pipe serves also as oil filler and fan standard; electric lighting and starting; roomy body; high sides.

Equipment—Mohair top with boot and side curtains; rain-vision windshield; electric horn; power tire pump; oil and gasolene gauges; Wagner electric lighting and engine starting system; Warner speedometer and eight-day clock; Firestone demountable rims; robe and foot rails; tools; tire repair kit; jack.

Moon—Moon Motor Car Co., St. Louis, Mo.

Models—Eight models on one four- and one six-cylinder chassis, the "four" having cylinder measuring 4½ x 5 inches and the "six" 3¾ x 5¼ inches. Transmission elements include disk clutches, three-speed gearset in the "four" and four-speed in the "six," shaft drive to bevel gears in floating rear axles. Wheelbases are 129 inchs on 35 x 4½-inch tires for the "six" and 118 inches on 34 x 4-inch tires for the "four."

Prices—"Four": Speedster, roadster, torpedo and touring, $1,750; coupe, $2,350. "Six": Speedster and roadster, $2,150; six- and seven-passenger touring, $2,225; coupe, $2,750.

Changes from Previous Construction—Delco electric lighting, ignition and starting systems adopted for all models; pressure feed with gasolene tank and tire irons at the rear.

Selling Features—Streamline bodies; Delco equipment; light weight; large doors; special windshield; clear running boards; rear gasolene tank and tire irons; low body; four-speed gearset.

Equipment—Top with boot and curtains; windshield; speedometer; Delco electric lighting and engine starting system; power tire pump; electric horn; demountable rims; tools; tire repair kit; jack.

National—National Motor Vehicle Co., Indianapolis, Ind.

Models—Eight models on four-cylinder chassis and two on six-cylinder chassis. "Four" motor measures 4⅞ x 6 inches and the "six" 3¾ x 5½ inches. Transmission elements include cone clutches three-speed gearsets and shaft drive to bevel gears in full-floating rear axles. Wheelbases are 120 to 128 inches for the "four," according to body style, on 34 x 4½ tires for Speedway roadster; 36 x 4½ for touring and 36 x 5 on closed cars. On the "six," 132 inches on 36 x 4½-inch tires.

Prices—"Four": Semi-racing roadster, $2,750; speedway roadster, $3,150; four- and five-passenger touring, $3,300; seven-passenger, $3,400; coupe, $3,500; Sedan, $4,600; limousine, $4,800. "Six": Four- and five-passenger open bodies, $2,375.

Changes from Previous Construction—Practically no alterations in the "four" chassis. "Six" is new throughout and is exhibited for the first time.

Selling Features—New six-cylinder model; block-cast cylinders; long-stroke, high-speed motor; left drive with center control, all models; Deaco electric lighting and engine starting system; cone clutch of large diameter; three-speed gearsets; full-floating rear axles; power; speed; National cantilever springs in "six"; light weight; larger bearings.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting and engine starting system; power tire pump; electric horn; demountable rims; tire carriers; tools; tire repair kit; jack.

Norwalk—Norwalk Motor Car Co., Inc., Martinsburg, W. Va.

Models—Five models on two six-cylinder underslung chassis with T-head motors measuring 4 x 5½ and 3⅞ x 5 inches, respectively. Transmission elements include disk clutches, four-speed gearsets with electric control, bevel drive and full-floating rear axles. Wheelbases are 131 inches with 37 x 4 tires and 136 inches with 39 x 5 tires.

Prices—Smaller chassis with either two or four-passenger body, $2,685; larger chassis with either two-, four- or six-passenger body, $3,500.

Changes from Previous Construction—Adoption of four-speed gearset with Vulcan electric gear shift; adoption of emergency brake electric lock.

Selling Features—Underslung frame; maximum tire and gasolene mileage; silence and flexibility; electric gear shift; electric emergency brake lock; ease of control; geared up fourth speed; three-point motor suspension; electric lighting system.

Equipment—Top with boot and side curtains; windshield; speedometer and clock combination; electric horn; electric lighting system; electric gear shifter; demountable rims with one extra and tire carriers; shock absorbers; inspection lamp; tools; tire repair kit; pump and jack.

Oakland—Oakland Motor Car Co., Pontiac, Mich.

Models—Ten models on two four- and two six-cylinder chassis. "Fours" measure 3½ x 5 inches and 4¼ x 5¼ inches, respectively; "sixes" measure 3½ x 5 inches and 4⅛ x 4¾ inches, respectively. Transmission elements include cone clutches, three-speed gearsets and shaft drive to bevel gears in semi-floating rear axle in the smaller "four" and full-floating rear axle in the others. Wheelbases are 112 inches on 33 x 4-inch tires in smaller "four"; 116 inches on 35 x 4½-inch tires for larger "four"; 123½ inches on 35 x 4½-inch tires for the smaller "six"; and 130 inches on 34 x 4½-inch tires for the larger "six."

Prices—Smaller "four": Five-passenger touring, $1,200; cabriolet, $1,585; roadster, $1,150. Larger "four": Five-passenger touring, $1,785; coupe, $2,500; Sedan, $2,600. Smaller "six": Five-passenger touring, $1,785. Larger "six": Four-, five- and seven-passenger touring, $2,450.

Changes from Previous Construction—Larger tires; Delco electric lighting and engine starting systems; left drive with center control for smaller "six" and "four"; larger "four" motor increased in dimensions from 4⅛ x 4¾.

Selling Features—Simplicity; accessibility; beauty; power; six-cylinder motors; large size of "light six" model; elimination of greatest possible amount of friction; rear gasolene tanks; underslung rear springs, large brakes; Delco electric lighting, engine starting and ignition systems.

Equipment—Top with boot and curtains; windshield; speedometer; Delco electric lighting and engine starting system; demountable rims with one extra and tire carriers; electric horn; tools; tire repair kit; pump; jack; robe and foot rails.

Ohio—Crescent Motor Co., Cincinnati, O.

Models—Three models on one four- and one six-cylinder chassis. Both motors have T-head cylinders, the "four" measuring 4¼ x 4¾ and the "six" 4 x 6. Transmission elements include disk clutches, three-speed gearset in the "four" and four-speed in the "six," shaft drive to bevel gears in floating rear axles. Wheelbases are 116 inches on 34 x 4-inch tires in the "four" and 132 inches on 35 x 4½-inch tires for the "six."

Prices—"Four": Roadster or five-passenger touring, $1,275. "Six": Five-passenger touring, $1,985.

Changes from Previous Construction—Both cars are new throughout and are exhibited for the first time.

Selling Features—Northway T-head motors; full-floating rear axles; left steer with center control; screw and nut steering gear; equalized brakes; cowl gasolene tank; disk clutches; electric lighting and engine starting system; flexible springs; luxurious upholstery; full equipment.

Equipment—Top with boot and curtains; windshield; speedometer; Jesco electric lighting and engine starting system; demountable rims; tire carriers; tools; tire repair kit; pump; jack; foot and robe rails.

Oldsmobile—Olds Motor Works, Lansing, Mich.

Models—Three models on one six-cylinder chassis with L-head cylinders measuring 4¼ x 5¼ inches. Transmission elements inclue cone clutch, three-speed gearset, shaft drive to bevel gears in floating rear axle. Wheelbases are 132 and 139 inches on 36 x 5-inch tires.

Prices—Four- and five-passenger phaeton, $2,975; seven-passenger touring, $3,150.

Changes from Previous Construction—Motor dimensions changed from 4⅛ x 4¾ to 4¼ x 5¼; valves enlarged; centrifugal instead of gear pump; tires and gasolene tank at rear; brake size increased.

Selling Features—Single chassis of two wheelbase lengths; six-cylinder motor; triple cast cylinders; aluminum toe and heel boards; plate glass windshield; long-grain, hand-buffed leather; laminated wood steering wheel; natural horsehair carpet; honeycomb type radiator; solid top bows; Jiffy curtains; Baker rims; beautiful finish.

Equipment—Top with boot and curtains; speedometer and clock; windshield; Baker demountable rims with one extra; tire carriers; power tire pump; Delco electric lighting, ignition and starting system; trouble lamp; patent bow separators; tools; jack; Klaxon horn; tire repair kit; Gabriel rebound snubber on rear springs.

Overland—Willys-Overland Co., Toledo, O.

Models—Three models on one four-cylinder chassis having L-head cylinders measuring 4⅛ x 4½ inches. Transmission elements include cone clutch, three-speed gearset and shaft drive to bevel gears in three-quarter floating rear axle. Wheelbase is 114 inches on 33 x 4-inch tires.

Prices—Roadster or touring car without electric lights and starter, $950; with electric lighting and starting system, $1,075; coupe, $1,550.

Changes from Previous Construction—Motor dimensions increased from 4 x 4½; wheelbase lengthened four inches; lubrication system refined; sight feed located on dash; rotary pump added; equipment added.

Selling Features—Long wheelbase; powerful motor; rear axle gearset; three-quarter floating rear axle; large brakes; low price; flexible springs.

Equipment—Top with boot and curtains; windshield; speedometer; electric lights; storage battery; electric horn; tire carriers; tools; tire repair kit; pump; jack. Electric lighting and engine starting system where specified and at additional cost.

Packard—Packard Motor Car Co., Detroit, Mich.

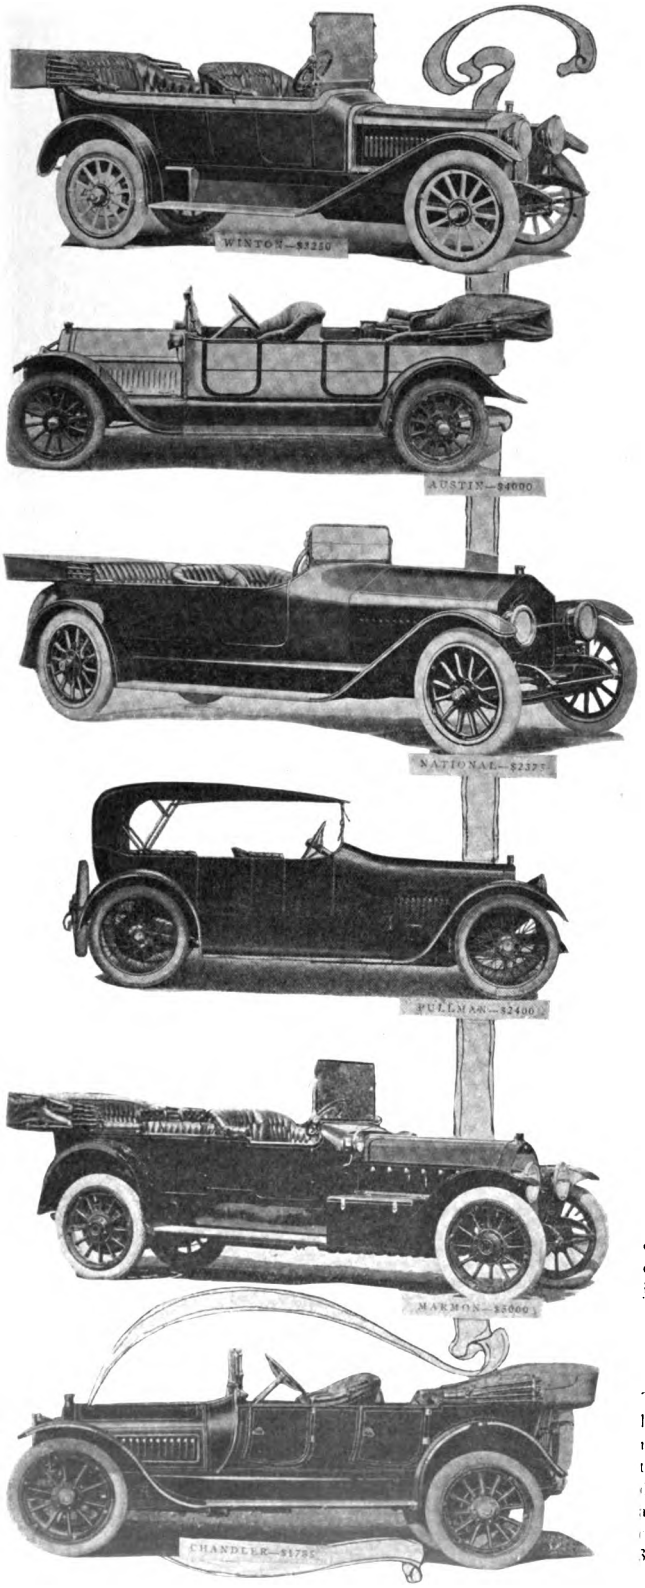
Models—Twenty models on each of two six-cylinder chassis. Both motors have L-head cylinders, the smaller measuring 4 x 5½ inches and the larger 4½ x 5½ inches. Transmission elements include Packard dry-plate clutch, three-speed gearset and shaft drive to worm-bevel gear differentials in floating-type rear axles. Wheelbases are 121½ to 139 for larger "six," according to body, on 36 x 4½-inch front tires and 37 x 5 rear tires; 140 inches in smaller "six" on same size tires.

Prices—Larger "six": Touring, $4,850; phaeton runabout, $4,700; phaeton, $4,750; runabout, $4,650; limousine and landaulet $5,900; imperial limousine, $6,100; salon limousine, $6,050; cabette $5,800; brougham, $5,900; salon brougham, $5,850; coupe, $5,400 imperial coupe, $5,600. Smaller "six": Six- or seven-passenger touring, $3,850; special touring, $3,350; phaeton and runabout, $3,750; limousine with cab sides, $5,000; limousine, $4,950; landaulet, $4,950; landaulet with cab sides, $5,000; imperial limousine, $5,150; salon limousine, $5,100; brougham, $5,000; salon brougham, $4,950 coupe, $4,450; seven-passenger convertible body, $4,525.

Changes from Previous Construction—Cylinders cast in threes; lubrication manifolds enclosed; enclosed ignition wiring; worm bevel driving gears in rear axle; one-man top adopted; auxiliary lubricating system forcing oil direct to cylinder walls.

Selling Features—Worm bevel driving gears; one-man top; enclosed oil and ignition leads; centralized control mechanism; left steering; line of 20 bodies.

Equipment—One-man top with boot and side curtains which open with doors; Packard windshield; electric lighting and engine starting system; acetylene primer with tank; demountable rims with two extra; tools; jack; pump; tire repair kit; horn.



Paige-Detroit—Paige-Detroit Motor Car Co., Detroit, Mich.

Models—Seven models on two four-cylinder chassis. Both motors have L-head cylinders, the smaller measuring 3¾ x 4 inches and the larger 4 x 5 inches. Transmission elements include disk clutches and three-speed gearsets with shaft drive to bevel gears in floating type rear axles. Wheelbases are 110 inches on 32 x 3½-inch tires for the smaller and 116 inches on 34 x 4-inch tires for the larger.

Prices—Smaller chassis: Three-passenger roadster or five-passenger touring, $950. Larger chassis: Two- and three-passenger roadster and five-passenger touring, $1,275; four-passenger coupe, $1,850; five-passenger Sedan, $1,950.

Changes from Previous Construction—Streamline bodies and

Digitized by Google

"SIXES" IN WHICH THERE IS NO SAMENESS

speedster model added for larger chassis; few other alterations.

Selling Features—Block motors; chain timing gear; disk clutch; selective gearset; left drive with center control; cowl gasoline tank; electric lighting and engine starting system; Bosch high-tension ignition; full-elliptic rear springs.

Equipment—Top with boot and curtains; windshield; Stewart speedometer; Gray & Davis electric lighting and engine starting system; demountable rims; tire carriers; license brackets; tool-jack; pump; tire repair kit; robe and foot rails.

Palmer-Singer—Palmer & Singer Mfg. Co., L. I. City, N. Y.

Models—Three models on each of two six-cylinder chassis, both having T-head motors, the smaller cylinders measuring 4 x 5 and the larger 4 x 5½ inches. Transmission elements include disk clutches, three-speed gearsets and shaft drive to bevel gears in floating rear axles. Wheelbases are 128 inches for the smaller, on 36 x 4½-inch tires, and 134 inches for the larger on 36 x 4½-inch tires.

Prices—Larger chassis: Roadster or five-passenger touring model, $2,495; six-passenger, $2,595. On smaller chassis: Roadster or five-passenger touring model, $2,000.

Changes from Previous Construction—Smaller model practically unchanged. In larger model: V-type radiator; streamline body; left drive with center control; wheelbase lengthened; equipment added.

Selling Features—Six-cylinder motors; exceptionally strong frame; bull's-eye side lamps flush with dash; demountable rims; shock absorbers on rear springs; gauges, etc., mounted flush with sub-dash; tire carrier at rear; clear running boards; gasolene tank at rear; multiple jet carburetter; disk clutch; selective-type gearset; extra large brakes; deep upholstery; extra long springs; quiet operation; choice of air or electric engine starter.

Equipment—Included in price with larger model: Stewart-Warner speedometer; eight-day keyless clock; shock absorbers on rear springs; rear tire carriers; clear-vision windshield; "one-man" top and boot; patented type storm curtains; one-ton jack; tire pump; tools, etc; electric horn; emergency electric light; electric starting and electric lighting. Smaller model: Demountable rims; lamps; rear tire irons; horn; tools; pump and jack.

Partin-Palmer—Partin Mfg. Co., Chicago, Ill.

Models—One model on one four-cylinder chassis having overhead valve cylinders; the motor is rated at 38 horsepower. Transmission elements include cone clutch, three-speed gearset and shaft drive to bevel gears in three-quarter floating rear axle. Wheelbase is 115 inches.

Price—Touring model, $975.

Changes from Previous Construction—The car is new throughout and is exhibited for the first time.

Selling Features—Block-cast overhead valve motor; three-point suspension; detachable cylinder head; left drive with center control.

Equipment—Top with boot and curtains; windshield; speedometer; Prest-O-Lite tank; gas head lamps; oil side and tail lamps; demountable rims with tire carriers; tools; tire repair kit; pump; jack; horn.

Pathfinder—Motor Car Mfg. Co., Indianapolis, Ind.

Models—Five models on one four- and two six-cylinder chassis. The "four" cylinders measure 4⅛ x 5¼ inches, as do those in the larger "six," the smaller "six" measuring 3¾ x 5¼ inches. Transmission elements include cone clutch and three-speed gearset in the "four," dry disk clutch and four-speed gearsets in both "sixes"; drive by shaft to bevel gears in floating rear axles. Wheelbases are 120 inches on 35 x 4½-inch tires for the "four"; 124 inches on 34 x 4½-inch tires for the smaller "six"; and 134 inches on 35 x 5-inch tires for the larger "six."

Prices—"Four": Roadster, $2,160; touring, $2,185; coach, $2,500. Smaller "six": Touring, $2,200. Larger "six": Touring, $2,750.

Changes from Previous Construction—Both six-cylinder models

Digitized by Google

are new throughout and are exhibited for the first time. Detail refinements only in the "four."

Selling Features—Both four- and six-cylinder motors; low price; simplicity; elimination of weight; few bearings; comfort; distinctive body lines; V-shaped radiator; electric lighting and engine starting equipment.

Equipment—Top with boot and curtains; windshield; speedometer; Gray & Davis electric lighting and engine starting system; horn; jack; tools; tire repair kit; pump; robe and foot rails.

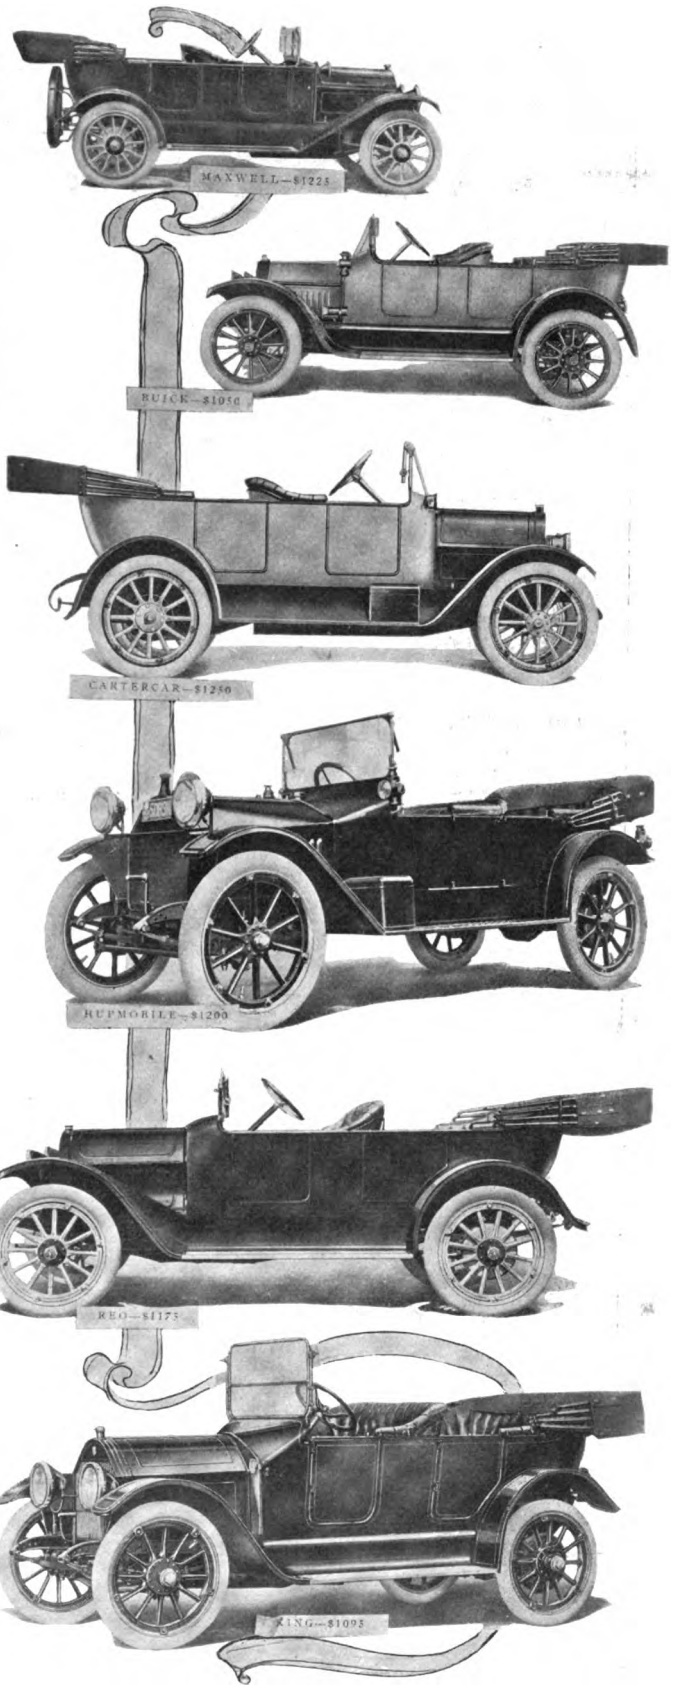
Peerless—Peerless Motor Car Co., Cleveland, O.

Models—Seven models on each of three six-cylinder chassis, motors having cylinders measuring 4 x 5½, 4½ x 6 and 5 x 7, respectively. Transmission elements the same in each and include internal expanding clutch, four-speed gearset and bevel gear drive. Wheelbases measure 125, 137 and 140 inches for the three models, tire sizes being 36 x 4½ front and rear, 36 x 4½ front and 37 x 5 rear, and 38 x 5½ front and rear, respectively.

Prices—"Six-38": Touring, torpedo and roadster, $4.300; coupe, $5,000; limousine, $5,300; landaulet, $5,400; Berline-limousine, $5,500. "Six-48": Touring and torpedo, $5,000; limousine, $6,000; landaulet, $6.100; Berline-limousine, $6.200. "Six-60": Touring and torpedo, $6,000; limousine, $7,000; lanlaulet, $7,100; Berline-limousine, $7,200.

Changes from Previous Construction—Center of gravity lowered; springs redesigned; pistons redesigned to carry but three rings; equipment increased; front compartment of bodies upholstered; muffler redesigned; upholstery made thicker in rear seats; universal joint put in transmission line instead of flexible coupling; new rain-vision windshield; Firestone demountable rims adopted; nickel instead of brass finish; window area of closed cars increased; new type auxiliary seats adopted; electric 'phone added to equipment; gasolene tank placed at rear of body; tire carriers at rear instead of on running board.

Selling Features—Six cylinders; complete electric system; powerful starter; Bosch dual ignition; pressure feed fuel system; throttle governor; dash priming device; patented radiator design; expanding band clutch; selective gearset with four speeds; full-floating arched and trussed rear axle; platform rear springs; new type auxiliary tonneau seats.

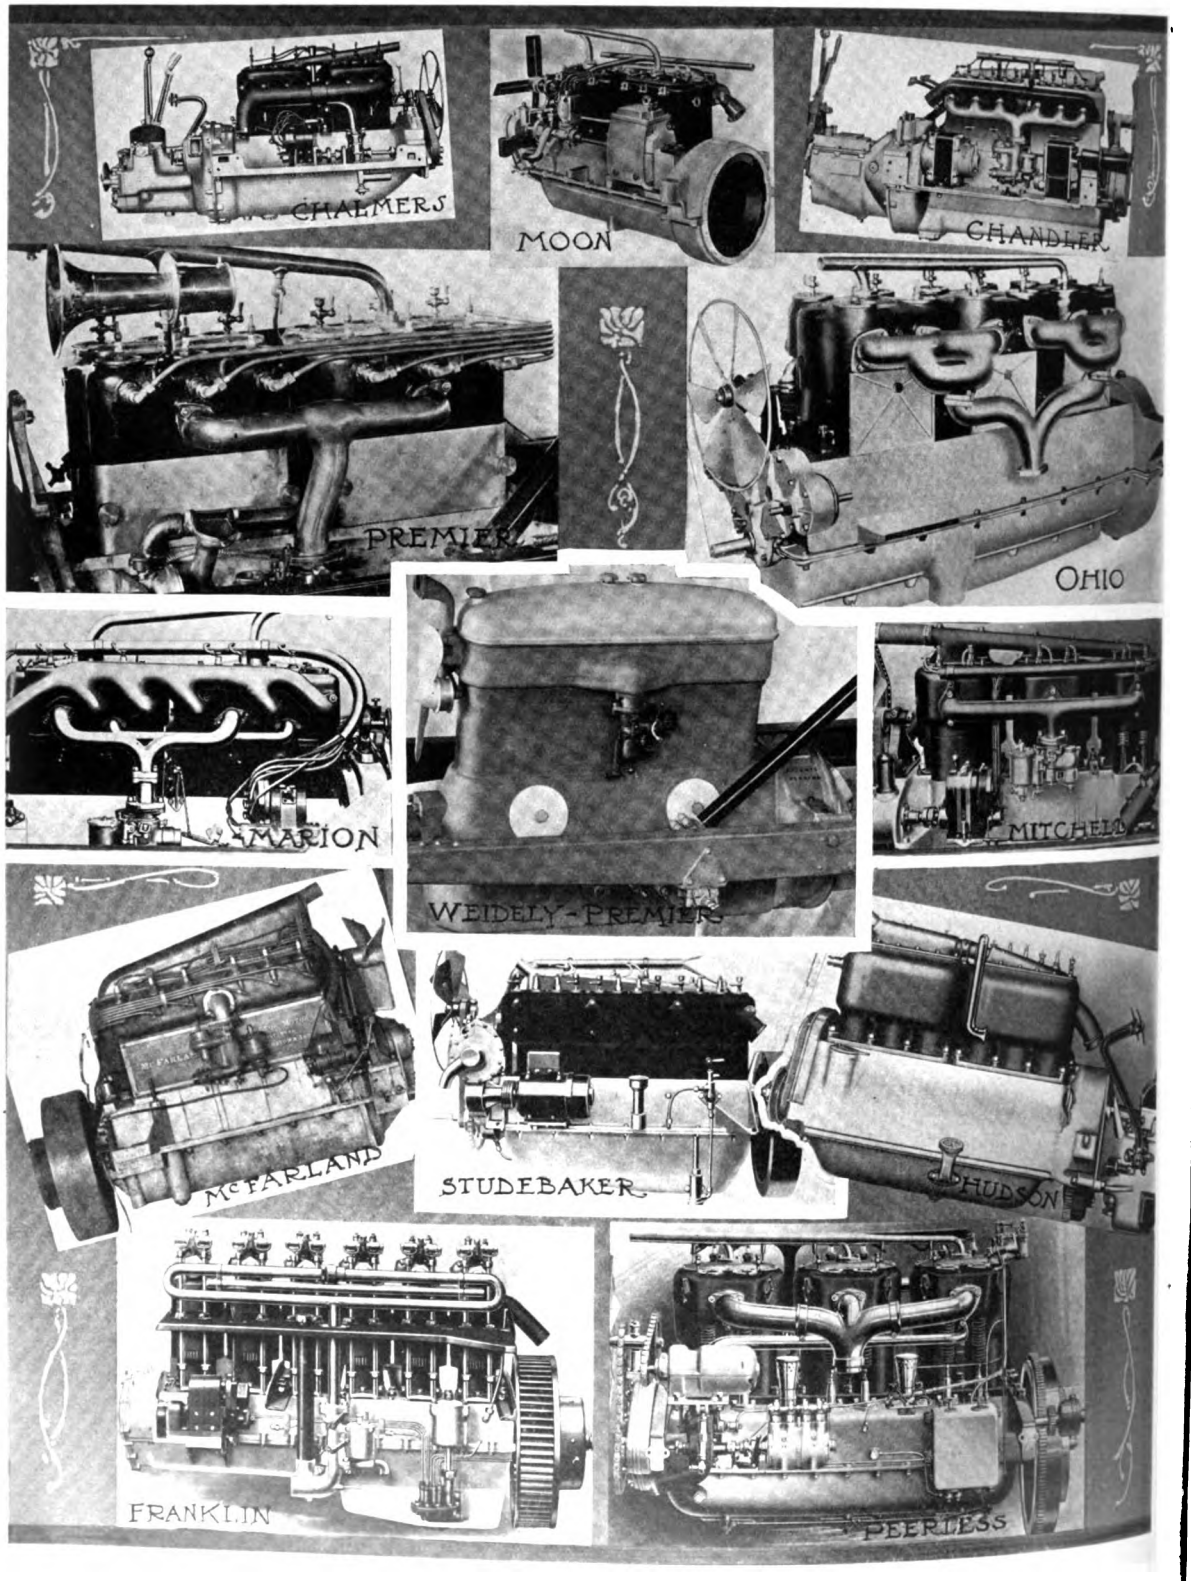


Equipment—Top with boot and side curtains; Gray & Davis electric lighting and engine starting equipment; combination Klaxon and bulb horn; Warner speedometer with clock; rain-vision windshield; Firestone demountable rims; Truffault-Hartford shock absorbers in front and Gabriel rebound snubbers in rear; four-cylinder power tire pump; robe and foot rails; inspection lamp; tools; tire repair kit; jack; tire irons. Enclosed cars have in addition: Chauphone; driver's mirror; toilet cases and flower vases.

Pierce-Arrow—Pierce-Arrow Motor Car Co., Buffalo, N. Y.

Models—Twelve models on each of three six-cylinder chassis. Cylinders measure 4 x 5½ inches, 4½ x 5½ inches and 5 x 7 inches respectively. Transmission elements include cone clutches, four-speed gearsets and shaft drive to bevel gears in semi-floating rear axles. Wheelbases are 127½ to 132 inches for the smallest chassis, on 36 x 4½-inch tires; 134½ to 142 inches for the next larger chassis on 37 x 5-inch tires; and 140 to 147½ inches lor largest chassis on 37 x 5-inch front and 38 x 5½-inch rear tires.

Prices—Smallest chassis: Runabout, four- and five-passenger touring, $4,300; brougham and landaulet, $5,200; vestibule brougham and landaulet, $5,400. Next larger chassis: Runabout, four- and five-passenger touring $4,850; seven-passenger touring, $5,000; brougham and landaulet, $5,800; suburban and landau, $6,100; vestibule suburban and landau, $6,300; vestibule brougham and landaulet, $6,000. Largest chassis: Runabout, four- and five-passenger touring, $5,850; seven-passenger touring, $6,000; suburban and landau, $7,100; brougham and landaulet, $6,800; vestibule suburban and landau, $7,300; vestibule brougham and landaulet, $7,000.



Changes from Previous Construction—Improved cone clutch; electric instead of air starter; gasolene tank gauge added; head-

WELL-KNOWN ENGINES SHOWING DIVERSITY IN SIX-CYLINDER TYPES

Digitized by Google

lamps placed on fenders; equipment includes Pierce-Arrow demountable rims.

Selling Features—Durability of chassis; high class of workmanship; cast aluminum body; complete equipment.

Euipment—Electric generator and starter; number illuminator; dash instrument and extension lamps; bulb and Klaxon horns; full set of tools; Warner speedometer and clock; coat and blanket rail; extra tire carrier with well in running board; folding foot rest in touring and enclosed; gasolene primer and gauge; power tire pump; collision bumper; two extra folding seats in seven-passenger cars; Yale locks, with universal key on hood; dash cabinets, tool compartments, oil and grease box and tire carrier.

Premier—Premier Motor Mfg. Co., Indianapolis, Ind.

Models—Seven models, three six-cylinder chassis. Two of the motors have T-head cylinders and measure 4½ x 5¼ inches and 4 x 5 inches, respectively. The third "six" has overhead valves and measures 3⅝ x 5½ inches. Transmission elements include disk clutches, three-speed gearsets and shaft drive to bevel gears in floating type rear axles. Wheelbases are 140 inches for the largest "six," on 36 x 4½-inch and 37 x 5-inch tires; 132 inches on 36 x 4½-inch tires for both the other chassis.

Prices—"Largest six": Touring, $3,750; De Luxe, $6,000; limousine, $5,500; roadster, $4,000; series X touring, $4,000. Smallest chassis: Touring and roadster, $2,735; limousine, $4,250; De Luxe, $5,000.

Changes from Previous Construction—The overhead valve motor is new throughout and is exhibited for the first time, its chassis being practically the same as that for the 4 x 5 T-head motor. Few alterations in older models.

Selling Features—Six-cylinder motors; new overhead valve motor; Turkish upholstery; honeycomb radiators; left-side steer with center control; pneumatic engine starter; electric lights; disk clutches.

Equipment—Series N cars have gas and oil lamps; Prest-O-Lite tank; demountable rims; shock absorbers; tire irons; jack; tools; robe and foot rails; pneumatic starter. Series X cars have in addition: Pantasote top with boot and curtains; windshield; speedometer; electric horn; electric lighting system. De Luxe cars have in addition: Interior furnishings complete; Burbank top with side curtains.

Pullman—Pullman Motor Car Co., York, Pa.

Models—Four models on two four- and two six-cylinder chassis. the "fours" having cylinders measuring 4 1/16 x 5 inches and 4⅜ x 5½ inches, and the "sixes" 4⅜ x 5½ and 3¾ x 5¼ inches, respectively. Transmission elements include cone clutches in the "fours" and the larger "six" with four-speed gearsets in all models but the smallest "four," which has three speeds; the smallest "six" has a disk clutch. Wheelbases are 118 inches on 34 x 4-inch tires for the smaller "four"; 122 inches on 36 x 4-inch tires for the larger "four"; 130 inches on 36 x 4½-inch tires for the smaller "six," and 138 inches on 37 x 5-inch tires for the larger "six."

Prices—Smaller "four," $1,775; larger "four," $1,975. Smaller "six," $2,400; larger "six," $2,850.

Changes from Previous Construction—The smaller "six" is new throughout and is exhibited for the first time. Few changes in the other models.

Selling Features—Vulcan electric gear shift on smaller "six" and the following: Four-speed gearset; Timken axles; gasolene tank in cowl; extra long rear springs; straight line drive; German silver radiator; left drive with center control; Turkish upholstery; complete equipment; streamline body.

Equipment—Top with boot and curtains; electric lighting and engine starting system; windshield; speedometer; electric horn; power tire pump; Vulcan electric gear shift on light "six" chassis; tools; tire repair kit; demountable rims; robe and foot rails.

Regal—Regal Motor Car Co., Detroit, Mich.

Models—Four models on two four-cylinder chassis, the smaller of which has cylinders measuring 3¾ x 4½ and the larger 4 x 5. Transmission elements include cone clutches, three-speed selective gearsets, and drive through shaft to bevel gears in floating type axles. Wheelbases are: Underslung roadster, coupe and touring car, 108 inches on 32 x 3½-inch tires for open cars and 33 x 4 for coupe; overslung touring car wheelbase is 116 inches on 34 x 4 tires.

Prices—Underslung roadster and touring model, $1,125; coupe, $1,600; overslung touring car, $1,350.

Changes from Previous Construction—Steering gear shifted to left side and control levers to center; electric lighting and engine starting equipment added; springs of overslung model hung below axle; cellular instead of tubular radiator; new clutch collar bearing.

Selling Features—Stability of underslung models; electric lighting and engine starting system; complete equipment; roomy bodies; left drive and center control; cowl dash with instrument board; special adjustable curtains; demountable rims; tire irons built in place.

Equipment—Top with boot and curtains; windshield; demountable rims with one extra, and tire carriers; Rushmore electric lighting and engine starting system; electric horn; robe and foot rails; tools; tire repair kit; jack; pump.

Reo—Reo Motor Car Co., Lansing, Mich.

Models—Two models on one four-cylinder chassis having cylinders measuring 4 x 4½ inches. Transmission elements include disk clutch, three-speed gearset and shaft drive to bevel gears in floating rear axle. Wheelbase is 112 inches on 34 x 4-inch tires.

Prices—Roadster and touring model, $1,175.

Changes from Previous Construction—New body styles; drive shaft universal joint improved; transmission roller bearings altered; equipment added.

Selling Features—Standardization; oversize tires; magneto ignition; doubly heated carburetter; liberal use of roller bearings; $220 lopped off price; streamline body; electric lighting and engine starting equipment added; new tire holder.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting and engine starting system; electric horn; demountable rims with one extra and tire carriers; pump; jack; tools; tire repair kit.

Stearns-Knight—F. B. Stearns Co., Cleveland, O.

Models—Nine models on both four- and six-cylinder chassis equipped with Knight motor. The four-cylinder motor measures 4¼ x 5½, and the "six" 4¼ x 5¾. Transmission elements are the same in both and include dry multiple disk clutch, three-speed gearset in the "four" and four-speed in the "six," full-floating rear axles and final drive by bevel gears, though worm drive is optional at $100 extra. Wheelbases: "Four," 121 and 127 inches; "six," 134 and 140 inches. Tires measure 36 x 4½ in front for all four-cylinder models and 37 x 5 rear in seven-passenger touring and limousine models; "six" tires measure 37 x 5 both front and rear.

Prices—Four-cylinder: Four- and five-passenger touring, $3,750; seven-passenger, $3,900; coupe, $4,450; limousine, $5,100. "Six": Roadster and five-passenger touring, $4,850; six- and seven-passenger, $5,000; limousine, $6,100; landaulet, $6,200; Sedan, $6,100.

Changes from Previous Construction—Left drive with center control; steering column control of carburetter, ignition system, lights and Klaxon; streamline bodies with tapered hoods and cowl; wire wheels optional; tool boxes located under body over running boards; Pantasote substituted for silk mohair in top; gearset in four-cylinder model moved from rear axle to engine; new auxiliary seats in touring models.

Selling Features—Knight sleeve-valve motor; sturdy chassis construction; rear axle construction, solid forging split in center to carry differential mechanism; left drive with center control; attractive, well-finished bodies; steering column control; variety of bodies; complete equipment and convenience of appointments; distinctive body treatment; disappearing auxiliary seats; both brakes expanding type on rear wheels.

Equipment—Gray & Davis electric lighting and starting system; one-man top with boot and side curtains; speedometer;

Digitized by Google

Klaxon horn; Q. D. demountable rims with two extra; robe and foot rails; tools; jack; pump; tire repair kit; body fittings.

Speedwell—Speedwell Motor Car Co., Dayton, O.

Models—Two models on one six-cylinder chassis equipped with Speedwell-Mead rotary valve motor having cylinders measuring 4⅛ x 5¼ inches. Transmission elements include disk clutch, selective gearset and shaft drive to floating rear axle. Wheelbase is 135 inches on 36 x 4½ and 37 x 5-inch tires.

Prices—Five-passenger, $2,850; seven-passenger, $2,950.

Changes from Previous Construction—Valves have been fluted; new manifolds adopted; motor greatly simplified. Few chassis changes.

Selling Features—Timken front and rear axles; Brown & Lipe transmission; Continental motor; Bosch dual ignition; Wagner starting and lighting system; Parish & Bingham frame; Sheldon springs; Fedders radiator; Spicer propeller shaft and Universal joints; Firestone demountable rims; Stromberg carburetter; Jacox steering gear; Turnbull wheels; Powell muffler; Warner speedometer.

Equipment—Electric starting and lighting system; glass front; dash ventilators; powerful electric horn; concealed tool box; lockers under cowl; license tag holders; Pantasote top; quick-detachable curtains, and top cover with Bair patent bow separator and holder, concealed top irons; carburetter choke switch on toe board; gear shift lever lock; folding foot rail; automatically adjusting robe rail; Warner speedometer; electric trouble lamp; Firestone demountable rims; extra rim; tire carriers; tire repair kit and engine driven tire pump; tool kit including jack; and oil can and holder on dash under hood.

Stevens-Duryea—Stevens-Duryea Co., Chicopee Falls, Mass.

Models—Ten models on one six-cylinder chassis having cylinders measuring 4 5/16 x 5½ inches. Transmission elements include dry disk clutch, three-speed gearset, and drive to bevel gears in full-floating rear axle. Wheelbases are 131 and 138 inches on either 37 x 4½ or 37 x 5-inch tires.

Prices—On 131-inch wheelbase chassis: Roadster or five-passenger touring car, $4,550; coupelet, $5,000 landau-phaeton, $5,200; demi-Berline, $5,750; limousine, $5,800. On 138-inch wheelbase chassis: Seven-passenger touring, $4,800; landau-phaeton, $5,400; limousine, $6,000; Berline, $6,200.

Changes from Previous Construction—Compressed air starting system; tonneau light in touring models; new style tail lamp; Westinghouse dynamo and lighting system.

Selling Features—Unit power plant; three-point support; dry disk clutch; underslung compensating rear springs; streamline bodies; adjustable rear seat; highly finished bodies; luxurious upholstery.

Equipment—Top with boot and side curtains; adjustable windshield; speedometer-clock; electric lighting system; electric horn; pneumatic engine starter; power tire pump; gasolene gauge and primer; demountable rims with extras; tire carriers; coat and foot rails; tools; tire repair kit; jack; bulb horn.

Studebaker—Studebaker Corp. of America, Detroit, Mich.

Models—Three models on six-cylinder chassis and two on four-cylinder chassis. Both motors have L-head cylinders measuring 3½ x 5 inches. Transmission elements include cone clutch, three-speed gearset and shaft drive to bevel gears in full-floating rear axles. Wheelbases are 108 inches for the "four" on 32 x 3½-inch tires, and 121 inches for the "six" on 34 x 4-inch tires.

Prices—"Six": Touring, $1,575; landau-roadster, $1,950; Sedan, $2,250. "Four": Touring, $1,050; landau-roadster, $1,200.

Changes from Previous Construction—Left drive with center control; gasolene tank in cowl; auxiliary seats fold in back of front seat; full-floating rear axles with Timken bearings; landau-roadster models added.

Selling Features—Low price considering quality and equipment; block motors; long stroke; quiet operation; left drive with center control; complete electrical equipment; elimination of magneto; cowl gasolene tank; rear axle gearset; full-floating rear axles; large tires; landau-roadster bodies; moulded fenders; wide doors; clean running boards; flexible springs; simplicity of power plant; accessibility.

Equipment—Top with boot and curtains; demountable rims with one extra; Stewart-Warner speedometer; Studebaker-Wagner electric lighting and engine starting system; Gray & Davis lamps; windshield; tire carriers; tools; pump; jack; tire repair kit; electric horn.

Stutz—Stutz Motor Car Co., Indianapolis, Ind.

Models—Two models on one each four- and six-cylinder chassis, the "four" having cylinders measuring 4¾ x 5½ inches and the "six" 4 x 5 inches. Transmission elements include cone clutch and Stutz rear system. Wheelbases are 120 and 130 inches for roadster and touring on both chassis, tires measuring 34 x 4½ inches.

Prices—"Four": Roadster, $2,000; six-passenger touring, $2,000. "Six": Roadster, $2,250; six-passenger touring, $2,400.

Changes from Previous Construction—Pan eliminated; electric starter added; cone instead of disk clutch: brake drums enlarged two inches.

Selling Features—Stutz rear system; strength of parts; four- and six-cylinder motors; Stutz electric starter.

Equipment—Electric starter and lights; tools; demountable rims; tire repair kit; pump: jack; horn.

Twombly—Twombly Car Corp., New York City.

Models—Three models on two chassis, one having two cylinders measuring 3¾ x 4 inches and the other having four cylinders measuring 2¾ x 3½ inches. Transmission elements include Twombly three-step friction mechanism with two-speed shaft giving six forward speeds and two reverse. Wheelbase is 96 inches on 28 x 2½-inch tires on wire wheels.

Prices—Two-cylinder model in two-passenger tandem, two-passenger side by side or single-passenger, $395. Same bodies on four-cylinder chassis will list for under $500. Exact price not yet determined.

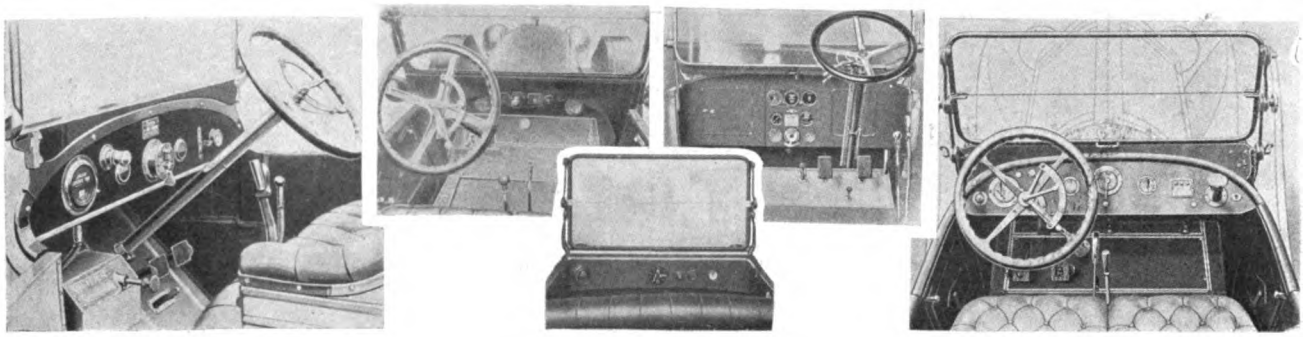
Changes from Previous Construction—Cyclecar which is new throughout and is exhibited for the first time.

Selling Features—Light weight; narrow tread; piston valve motor in both models; 50 miles to the gallon of fuel; 50 miles per hour; mechanical starter; wire wheels; underslung construction.

Equipment—Two side lamps; tail lamp; horn and tools.

Winton—Winton Motor Car Co., Cleveland, O.

Models—Eight models on one six-cylinder chassis with L-head cylinders measuring 4½ x 5½ inches. Transmission elements include disk clutch, four-speed gearset with direct drive on third, and shaft drive to bevel gears in full-floating rear axle. Wheelbase is 130 inches on 36 x 4½-inch tires.



Prices—Runabout, four- and five-passenger touring, $3,250; six- and seven-passenger touring, $3,500; limousine, $4,350; double limousine, $4,600; landaulet, $4,600.

Changes from Previous Construction—Lowered suspension of motor and body; lengthened piston stroke; left drive, with 18-inch steering wheel and center control; clutch release increased; lengthened front springs; rear springs serve as radius rods; factor of safety in frame increased; tire inflation and increased starting pressure supplied by Kellogg pump; primer from cowl to intake, and hot tir tube to carburetter; cowl board carries speedometer, clock coil, etc; no side lamps; small auxiliary lamps in headlights serve instead; German silver radiator; metal parts finished in nickel.

Selling Features—Six-cylinder motor; air starter; electric lights; low suspension; left drive with center control; low upkeep cost; disk clutch; four-speed gearset with direct drive on third speed; proper balance; large tires; flexibility; smoothness of operation.

Equipment—Top with boot and curtains; windshield; speedometer; clock; electric lighting system; pneumatic starter; Kellogg air pump; Klaxon horn; demountable rims and tire carriers; tools; tire repair kit; jack; robe and foot rails.

PUTTING THE CONTROLS UNDER THE DRIVER'S EYE—CONTRASTS IN COWLBOARDS AND DASHES

White—The White Co., Cleveland, O.

Models—Thirteen models on two four- and one six-cylinder chassis. The smaller "four" measures 3¾ x 5⅛ inches, the larger "four" 4¼ x 6⅜ inches, and the six 4¼ x 5¼ inches. Transmission elements include cone clutches, four-speed gearsets which give direct drive on third speed in the "fours" and in fourth for the "six," shaft drive to bevel gears in floating type rear axles. Wheelbases are 110 inches on 34 x 4-inch tires for the smaller "four"; 120 inches on 36 x 4½-inch tires for the larger "four," and 132 inches on 37 x 5-inch tires for the "six."

Prices—Smaller "four": Roadster and touring, $2,500; coupe, $3,250. Larger "four": Roadster and five-passenger touring, $3,300; seven-passenger touring, $3,500; coupe, $4,100; limousine, $5,000. "Six": Roadster, $4,800; five- and seven-passenger touring, $5,000; coupe, $5,400; Berline-limousine, $6,300.

Changes from Previous Construction—New bodies; larger "four" motor bore increased from 5¾ inches; three instead of two bearings in larger "four" motor.

Selling Features—Economy of long-stroke motor; cone clutches, four-speed gearsets; left drive with center control; electric lighting and engine starting system; compression release fitted.

Equipment—Electric lighting and engine starting system; Klaxon and bulb horn; power tire pump; robe and foot rails; demountable rime with one extra; tire carriers; license holders; tire repair outfit; jack.

Willys-Knight—Garford Co., Elyria, O.

Models—One model on one four-cylinder Knight-engined chassis having cylinders measuring 4 x 5½ inches. Transmission elements include four-speed gearset. Wheelbase is 120 inches.

Changes from Previous Construction—The car is virtually a new one and is exhibited for the first time.

Selling Features—Lanchester type rear springs; wire wheels; worm drive; Knight engine.

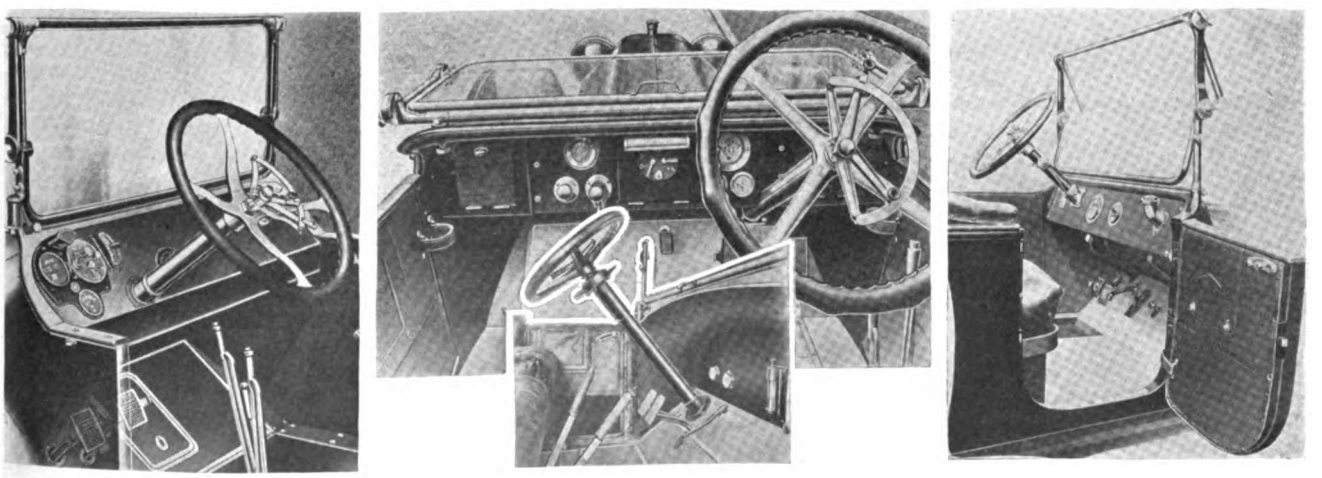
Equipment—Complete.

Marmon—Nordyke & Marmon Co., Indianapolis, Ind.

Models—Six models on six-cylinder chassis and eight on four-cylinder chassis; one model on "light six" chassis. Larger "six" and the "four" have T-head cylinders measuring 4½ x 6 and 4½ x 5, respectively; "light six" has L-head cylinders measuring 4¼ x 5½. Transmission elements include cone clutches in "four" and "light six" and dry plate in large "six," selective gearsets in all with shaft drive to bevel gears in Marmon floating rear axles. Wheelbases are 145 for the larger "six" on 36 x 4½ and 37 x 5 tires; 132 inches for the smaller "six" on 35 x 5 tires; and 120 inches for the "four" on 35 x 4½ tires.

Prices—Larger "six": Roadster or touring, $5,000; limousine, $6,250; Berline-limousine, $6,450. "Four": Roadster, $2,900; speedster, $2,850; touring, $3,000.

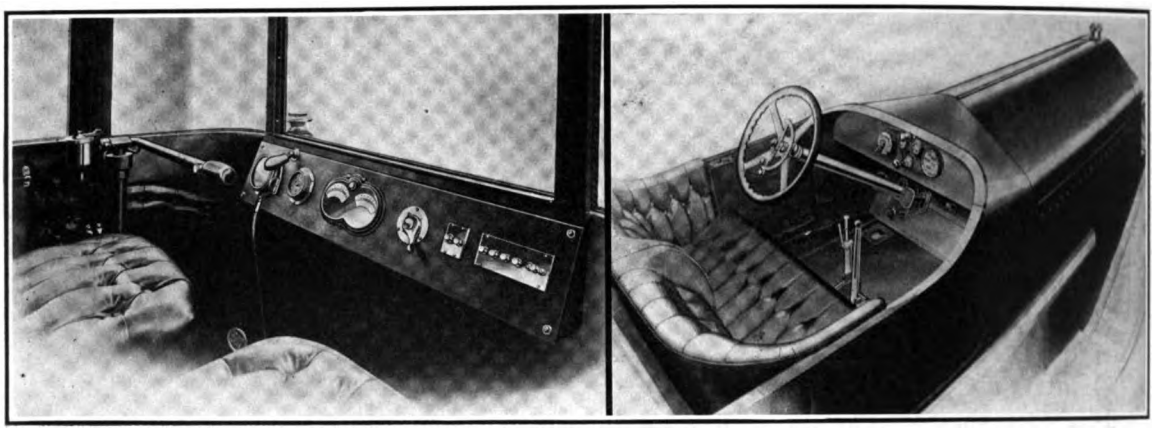
Changes from Previous Construction—Few changes in older models; "light six" is new throughout and is shown for the first time.



Selling Features—High-class construction; Marmon motor and distinctive Marmon force-feed oiling system; easy riding qualities; power; speed; durability; ease of operation; long springs; choice of models; three-point motor suspension; Marmon front axle.

Equipment—Electric starting and lighting system; top; speedometer and clock combination; electric light to illuminate entire dash; electric emergency lamp with long extension cord; electric horn with button on steering wheel; shock absorbers front and rear; tire carrier and one extra demountable rim; tools; oiler; jack; tire repair kit and pump. Larger "six" has in addition: Metal box on left side containing three suit cases.

Vaughan—Vaughan Car Co., Kingston, N. Y.



Models—Four models on one six-cylinder chassis having cylinders measuring 3¾ x 5½ inches. Transmission elements include dry disk clutch, four-speed gearset with direct on third, drive to bevel gears in full-floating rear axle. Wheelbase is 138 inches.

Price—Five-passenger touring model, $2,750.

MORE VARIETY, SHOWING THE TENDENCY TO CENTRALIZE DEVICES THAT FACILITATE OPERATION

Digitized by Google

CONTRASTING "GAS" AND ELECTRIC COWLBOARDS—CENTURY ELECTRIC AND NATIONAL "SIX"

Changes from Previous Construction—Car is new throughout.

Selling Features—Block motor; low center of gravity; four-speed gearset with direct on third; dry disk clutch; Mea magneto; Bijur lighting and starting system; large brakes, both expanding; extreme accessibility of power plant and chassis details; full streamline body with narrow radiator and tapering hood; triple worm thread steering gear; left steering with center control; Lemoine floating cantilever rear springs; no shock absorbers; close fitting fenders.

Equipment—Top with boot and curtains; windshield; speedometer; electric lighting and engine starting system; horn; jack, tools, tire repair kit, pump.

Velie—Velie Motor Vehicle Co., Moline, Ill.

Models—Seven models on one six- and two four-cylinder chassis, the "fours" measuring 4⅝ x 5½ inches and 4 x 5½ inches, respectively, and the "six" 3¾ x 5¼ inches. Transmission elements include dry plate clutches, four-speed gearsets in the larger models and three in the smaller, shaft drive to bevel gears and floating rear axles. Wheelbases are 113 inches on 34 x 4-inch tires for the smaller "four"; 121 inches on 36 x 4-inch tires for the larger four"; and 126 inches on 37 x 4½-inch tires for the "six."

Prices—Smaller "four," $1,500; larger "four," $2,000; "six," $2,-50.

Changes from Previous Construction—Starter changed to front and drive; springs widened; larger "four" bore increased from 4½ inches.

Selling Features—Freedom from mechanical difficulties; ability; low upkeep cost; superior equipment; service.

Equipment—Mohair top; Collins side curtains; ventilating rain-vision windshield; speedometer; five demountable rims; coat rail; electric horn; complete set of tools; tool chest under front seat.

Voiturette—American Voiturette Co., Detroit, Mich.

Models—Three models on one four-cylinder motor having L-head cylinders measuring 3⅛ x 3¾ inches. Transmission elements include disk clutch, three-speed gearset, shaft drive to semi-floating rear axle. Wheelbase is 104 inches; tread 48 inches; tires measure 30 x 3 inches.

Changes from Previous Construction—This is a cyclecar and is new throughout.

Prices—Roadster, $495; roadster, tandem seats, $510; four-passenger touring car, $520.

Selling Features—Light weight; streamline bodies; wire wheels; center control; electric lights; V-type radiator; 104-inch wheelbase.

Equipment—Oil head and tail lamps, with tools.

Vulcan—Vulcan Mfg. Co., Painesville, O.

Models—Two models on one four-cylinder chassis with cylinders measuring 3⅜ x 5. Transmission elements include cone clutch, three-speed gearset and bevel gear drive to semi-floating rear axle. Wheelbase is 105 inches in roadster and 115 in touring car, tires measuring 32 x 3½ inches.

Prices—Roadster, $750; touring car, $850.

Changes from Previous Construction—One four-cylinder chassis, new throughout.

Selling Features—Unit power plant with cane-handle control to gearset; large bearings; combined force and splash oiling system; large cone clutch with spring inserts; three-speed selective gearing; semi-floating rear axle; five pinion differential; rack and pinion steering gear; whole of manufacturing operations carried on in Vulcan plant.

Equipment—Top with boot and side curtains; windshield; speedometer; gas head lamps with Prest-O-Lite tank; tools; compound tire pump; jack; tire repair kit.

Briscoe—Briscoe Freres, New York City.

Models—Two models on two four-cylinder chassis, the smaller model being a cyclecar. The motors measure 2¼ x 3¼ inches and 3 5/16 x 5¼ inches, respectively. Transmission elements include three-speed selective gearset with shaft drive to bevel gears in the larger model and friction transmission with final drive by chain in the cyclecar. The wheelbase is 105 inches on 30 x 3½-inch tires for the larger model; the cyclecar is fitted with 650mm. x 65mm. tires.

Prices—Larger touring model, $900; cyclecar, $390.

Changes from Previous Construction—Both cars are new throughout and are exhibited for the first time.

Equipment—Complete.

Mondex-Magic—Fischer Motor Corp., New York City.

Models—One six-cylinder model demonstrating the Fischer sliding valve motor.

Davis—George W. Davis Motor Co., Richmond, Ind.

Models—Four-cylinder gasolene automobiles.

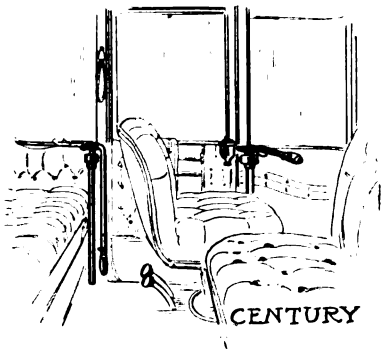
Convincing Proofs of Progress In Electric Cars

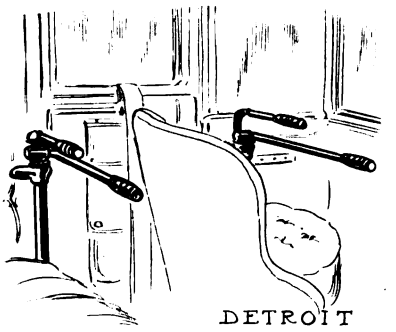
Dual Control Systems Will Be Conspicuous at Show—Worm Drive Gains Slowly; Worm Bevel Appears—Paul Poiret Designs Interiors and Luxury is Rampant—Magnetic Control Finding Favor

Luxury; more luxury; still more luxury. There isn't a better way of compressing into half a dozen words the impression conveyed by a quick, comprehensive review of the array of electric pleasure cars prepared for the great shows, bringing with them all the marks of all the skill that could be brought to bear in their construction. To be sure, it is nothing new for electrics to be luxurious; they always were top-notchers in that respect. But this time all previous efforts have been outdone and the electrics are more—well, more everything you can think of, than they ever were before. All right; smile if you like; you've heard the same expression, with variations, a good many times before. But it always has been true, and it is truer now than ever it was before.

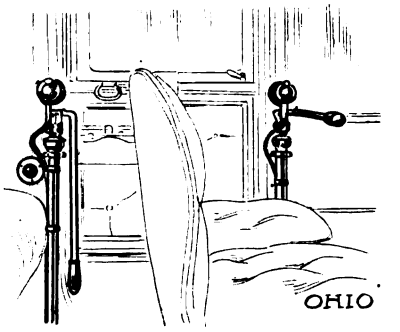
Real Style in Interior Designs.



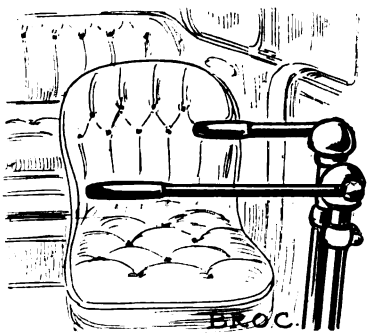
Don't imagine for a moment that these electric vehicle people stop short of the uttermost heights in their search for the ultimate in luxury, for they don't. Isn't it pretty near the limit when M. Paul Poiret —yes, yes; the minaret man himself—designs car interiors and decorations? Ask any one of the fair sex if it is possible to go further in search of the esthetic. The famous Frenchman has lent his skill to the finishing touches of the interiors of some of the Baker cars, and it's safe to say that when such a pace is set the standard of excellence is high all along the line.



And just as much attention has been paid to the exteriors of the cars. It would need a thoroughgoing coach builder to appreciate the fine points of the bodies on these cars, just as it takes a true artist to perceive the beauty of a fine painting; but anyone can appreciatae that the latest bodies, though perhaps not radically changed, have been made more beautiful by far than ever before by the indefinable refining touches that are put on after the main features of design have been thoroughly worked out and found not wanting. For one thing, angles are becoming less conspicuous, and curves, which eliminate the division of the car into more or less well-defined blocks, are much—very much—in evidence. The rounded door-top of the Chicago, the curved drop sill of the Waverley and its rounded roof, are rather conspicuous examples of a tendency toward curves that is more or less general but is anything but obtrusive—in which lies one of its beauties. Speaking of roofs, by the way, one wouldn't imagine, to look at the Century roof, that there was anything remarkable about it, apart from the fact that it's distinctly a good-looking piece of work. It is out of the ordinary, however, for it is formed from a single piece of aluminum, and it is hard to imagine anything better in the way of a roof.



Douple Control in Many Models.



Luxury in an electric means more than looks, important though they be. Getting inside the car again, there is every evidence that nothing has been left undone to make the driver's task a regular sinecure. For instance, there is the double drive idea, which means that the car can be controlled from either front or rear seat, the levers being in duplicate. No less than nine cars—Broc, Baker, Borland, Century, Detroit, Ohio, Rauch & Lang, Woods and Waverley—are built in double-drive models in which the driver can steer from whichever seat his fancy—or more material considerations—may dictate. And almost ridiculously simple

TWO ELECTRIC RUNABOUTS WITH "GASOLENISH" LOOKS—BORLAND AND OHIO

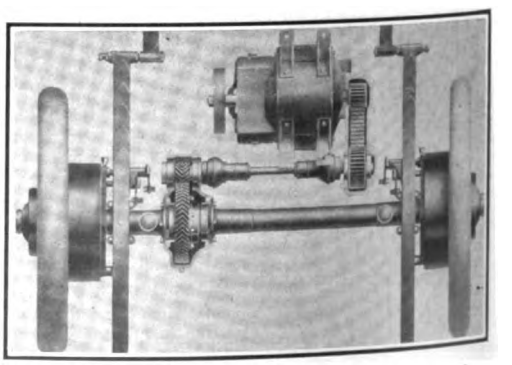
though the operation of the ordinary type of controller is, there are at least two machines in which the power of electricity is invoked to make the speed changes, the driver's part being merely the turning of a sort of indicator that twists as easily as a door knob—oh, easier than that, even! In the case of the Ohio the magnetic controller—that is what it really is—is by no means new. The other car with this mechanical luxury is the Century. And on these same cars braking is reduced to the mere act of indicating what is needed—the willing current applies the brake.

Electric Cars With a Gasolene Look.

Of course chain drive—that is, the ordinary side or single roller chain drive—is a thing of the past in electrics, and the highest types of gears do their work with so little sound that one is sorely tempted to make use of that abused and overworked word "silent." Worm drives are in evidence, though none of the exhibiting makers use the worm exclusively; Woods, Detroit, Baker and Rauch & Lang build both worm and bevel gear driven models. Waverley and Argo are staunch adherents of the herringbone gear system, and it must be admitted that they have the very best of reasons. Different from all the others, while partaking of some of their features, is the Borland-Grannis final drive, which is through worm bevels—gears that look exactly as if they had been twisted in the making so that their teeth are parts of spirals instead of lying in straight lines. And, being half bevel and half worm, the drive is credited with possessing the best points of both. The bevel gear final drive of the Standard, with its spur gear reduction in the same rear axle housing, is a standard feature in that car in more than name.

One brand new car rises above the horizon, just in time for the show—the Ward coupe. Only one model is built as yet—a four-passenger car with a wheelbase of 96 inches and a whole-souled battery equipment that spells mileage capacity and vitality. All the passengers face forward—which, incidentally, has come to be a common arrangement and one that needs no arguments to prove its advantages.

While the "gasolenish" tendency has not spread to any great extent, it has been carried further than ever before in the latest Baker runabout and in the runabout and the limousine of the Borland-Grannis make. In fact, it is hard to suggest how the likeness could be carried much further, especially in the Borlands—for the omission of the crank doesn't mean anything in these days of self-starting engines. And the Century people have adopted a gasolene car feature in a way that does them credit. At the front there is a regular instrument board under the window, and on it are ranged the speedometer, clock, volt-ammeter, main switch and its lock and the buttons for the various electric lights. There is obvious merit in assembling these things within easy reach of hand and eye.



The springs of the electrics of the near past have left little room for improvement and most of the makers have stuck to what they have found good; the Waverly system, with its four full elliptic springs and their peculiar arrangement remains unchanged. The Rauch & Lang cars, however, show evidence of the exercise of engineering skill in the evolution of a spring system that includes rear springs of the so-called seven-eighths-elliptic type. The lower member is extraordinarily long, extending forward further than it extends back, and the peculiar system of hanging is such as to give the flexible leaves fully play.

Topping Off the Equipment List.

The electric, always eminently a lady's vehicle, has become more distinctly so than ever, at the same time, however, taking on such masculine attributes, so to speak, as increased strength, endurance and speed—the last two features owing much to recent advances in battery and motor construction. The complete, not to say lavish, equipment that is the rule is designed, clearly, to meet the requirements of the ladies, excepting, of course, the mechanical section. And, yes; there undoubtedly should be a question mark after that smoking set—or should there? Anyway, smoking sets loom rather large this year and, really, it's nobody's business who uses them.

RAUCH & LANG OVERHUNG WORM DRIVE

WAVERLEY HERRINGBONE GEAR DRIVING SYSTEM

Digitized by Google

Resume of the Electrics and Their Characteristics

Argo—Argo Electric Vehicle Co., Saginaw, Mich.

Models—Three models on two wheelbase lengths; four-passenger roadster and four-passenger brougham on 108½-inch wheelbase, both having 38 x 4 cushion tires or pneumatics and 40 cells, 11 plate battery equipment; and five-passenger front drive brougham on 110-inch wheelbase with 38 x 4 cushion or pneumatic tires and 40 cell, 11 plate battery. All have herringbone gear drive.

Prices—Roadster, $2,500; four-passenger brougham, $2,800; five-passenger brougham, $3,100.

Changes from Previous Construction—Minor changes only. Body lines slightly changed to improve appearance; trimmings, accessories and fixtures improved; new type of steering gear; foot control details improved.

Selling Features—Extra long wheelbase; distinctive body with Renault type hood in front; all metal parts sterling silver plated; interlocking foot control system; swivel spring seats; irreversible wheel steer.

Equipment—Roadster: head, dash and tail lamps, ampere-hour meter, hub odometer, electric horn, tire chains, bumper, top, side curtains, windshield, tools, hydrometer, charging plug, jack, and tire outfit. On enclosed models all the foregoing except top, and in addition toilet case, smoking set, flower vase, arm loops, eight-day clock, rear vision mirror and cravenette slip covers to match upholstering.

Baker—Baker Motor Vehicle Co., Cleveland, O.

Models—Seven models, one a roadster and all others enclosed. Double-drive brougham, front drive brougham with lever steer and front drive brougham with wheel steer, on 92-inch wheelbase; front drive coupe with wheel steer, and rear drive coupe with lever steer, on 88-inch wheelbase; roadster with either lever or wheel steer on 88-inch wheelbase.

Prices—Double drive brougham, $3,250; front drive brougham, lever steer, $3,150; front drive brougham, wheel steer, $3,000; rear drive brougham, lever steer, $3,000; front drive coupe, wheel steer, $2,850; rear drive coupe, lever steer, $2,800; roadster, wheel or lever steer, $2,300.

Changes from Previous Construction—Worm drive with imported Lanchester-Daimler worm and gear; new roadster model.

Selling Features—Exceptitonally light weight and easy running, with long-distance capacity; worm drive instead of bevel for brougham when desired; forward or rear drive; fine upholstery and trimmings; roomy bodies; quiet and smooth running.

Equipment—On roadster: Weston volt ammeter and shaft odometer; full kit of tools; clear-vision windshield; tuto horn; side curtains. On enclosed models: One dome lamp, which lights automatically when the door is opened; two inside rear corner lamps; two ornamental side lamps; two head lamps; tail lamp; silver mounted cut glass flower vase; complete toilet case; combination lighting switch, giving operator complete control of all lights from seat; complete outfit of tools.

Borland—Borland-Grannis Co., Chicago, Ill.

Models—Five models: Five-passenger coupe, front or rear drive, 96-inch wheelbase, 34 x 4 pneumatic or cushion tires; 40-cell battery; gasolene type limousine; five-passenger Colonial type coupe on 93-inch wheelbase; five-passenger brougham, rear drive, 40-cell battery; and two-passenger gasolene type roadster with wheel steer, hand power control and foot accelerator increasing each speed 10 per cent., and 42-cell 11-plate battery.

Prices—Coupe, $2,900; limousine, $5,500; Colonial coupe, $2,700; brougham, $2,500; roadster, $2,550.

Changes from Previous Construction—Borland worm bevel gear drive; improved lubrication means; folding revolving front seats in forward drive coupe.

Selling Features—New worm bevel drive, smooth and quiet; both worm bevel and standard bevel gear drive systems; fine balancing of machines and proper distribution of weight; low current consumption and high mileage; safe and effective braking and controlling system; large braking surfaces.

Equipment—Complete.

Broc—Broc Electric Vehicle Co., Cleveland, O.

Models—Eight models on two chassis, which are practically alike except for wheelbase lengths, one measuring 96 inches and the other 98 inches. In all models battery is 40 cells, 11 plates; tires are 34 x 4 pneumatic or 36 x 4 cushion.

Prices—Range from $3,900 to $3,200.

Changes from Previous Construction—Double control steering lever and controller handle lock in idle position when lowered, preventing interference; only one key required to lock doors, controller and steering mechanism; idle brakes are impossible of control except by driver, and idle brake pedal is not in the way of car occupants; foot brake cut-out shutting off power when brake is applied; a cut-out that protects controller from burning even with unskillful driving, as it is not possible to drive with controller contacts between speeds; corner lights that are operated by opening of door; all lamps under independent control; wider bodies, making all models large enough for three persons on rear seat.

Selling Features—Bodies of unusually graceful design; ample head- and knee-room; sliding tool box under rear seat accessible without taking up cushion; all improvements considered excellent selling points.

Equipment—Carpet and rubber mat; Klaxet or electric bell; two side-lights; two corner lights; tail light; meter light; odometer; volt and ammeter; cylinder door-locks; cut glass flower vase; toilet case with mirror; eight-day clock; pump; tire repair outfits; charging plug and tools.

Century—Century Electric Car Co., Detroit, Mich.

Models—Two models; a four-passenger brougham on 96-inch wheelbase with notch-tread tires 36 x 4 inches, battery 30 cells, shaft drive; and five-passenger duplex-control brougham on 104-inch wheelbase with 36 x 4½-inch notch-tread tires; battery 42 cells.

Prices—Four-passenger brougham, $2,650. Five-passenger duplex control brougham, $3,250.

Changes from Previous Construction—Practically no changes; only refinements in details.

Selling Points—Underslung chassis; duplex control in larger model; handsome appearance and easy riding qualities; long distance on battery charge; oiling required only at long intervals; improved controller; dynamic brake.

Equipment—Complete.

Chicago—Chicago Electric Motor Car Co., Chicago, Ill.

Models—Three models; two four-passenger coupes on 96-inch wheelbase, tires 36 x 4 inches, battery 40 cells; and one five-passenger limousine on 104-inch wheelbase, tires 36 x 4 inches, battery 40 cells. All bevel gear drive and lever steer. Limousine has forward drive; the coupes rear drive. The coupe models have an extra emergency seat for a fifth passenger.

Prices—Limousine, $2,800. Coupes, each $2,500.

Changes from Previous Construction—Practically no changes have been made.

Selling Points—Popular prices, which have been considerably reduced owing to the company's expansion; long wheelbase and easy riding; ample battery equipment; smooth, quiet running, bevel gear drive; easy springs; accessible battery of high capacity type; low speed motor; arched doors.

Equipment—Complete.

Detroit—Anderson Electric Car Co., Detroit, Mich.

Models—Six models on chassis differing only in wheelbase length and minor details. Four-passenger brougham on 94-inch wheelbase; tires 34 x 4 pneumatic or 36 x 4 cushion; battery, 40 cells, 11 plates; bevel gear drive; Victoria on 85-inch wheelbase;

Digitized by Google

tires 34 x 4 pneumatic or 36 x 4 cushion; battery 40 cells, 11 plates; bevel gear drive. Forward drive five-passenger brougham on 98-inch wheelbase; tires 34 x 4 pneumatic or 36 x 4 cushion; battery, 40 cells, 13 plates; bevel gear drive. Two-passenger roadster on 100-inch wheelbase; tires 34 x 4½ pneumatic or 36 x 4½ cushion; battery, 40 cells, 13 plates; worm drive. Four-passenger brougham on 100-inch wheelbase; tires 34 x 4½ pneumatic or 36 x 4½ cushion; battery, 40 cells, 13 plates; worm drive. Duplex drive five-passenger brougham on 100-inch wheelbase; tires 34 x 4½ pneumatic or 36 x 4½ cushion; battery, 40 cells, 13 plates.

Prices—Four-passenger brougham, bevel gear drive, $2,550, Victoria, bevel gear drive, $2,300; forward drive five-passenger brougham, bevel gear drive, $2,800; roadster, worm drive, $2,500; four-passenger brougham, worm drive, $2,850; duplex drive five-passenger brougham, worm drive, $3,000.

Changes from Previous Construction—Worm gear axle, with imported worm and gear; longer wheelbase; shorter turning radius, greater battery capacity; electric hand brake; roomier interiors; duplex drive system, enabling car to be driven from front or rear seat; double brake system; more luxurious fittings.

Selling Features—Worm gear axle; duplex drive; electric hand brake; long wheelbase; roomy interiors; moderate price.

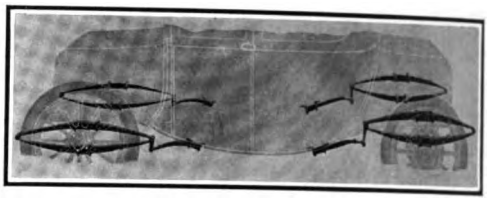
Equipment—On Victoria: Head, side, tail and inspection lamps; speedometer; complete set of tools. On roadster, the same, with the addition of interior lights, flower vase, toilet case, rain vision window and, in duplex-drive brougham, sunburst dome light and smoking set.

Ohio—Ohio Electric Car Co., Toledo, O.

Models—Six models on a single chassis, which, however, is made in wheelbase lengths to suit body. All models enclosed. Two five-passenger cars on 98-inch wheelbase with 34 x 4½ pneumatic or 36 x 4 cushion tires; one four-passenger brougham on 98-inch wheelbase, same tire equipment; one four-passenger car on 85-inch wheelbase with 34 x 4 tires, either pneumatic or cushion; and two 5-passenger double drive cars on 98-inch wheelbase with 34 x 4½ pneumatic or 36 x 4½ cushion or solid tires. Standard battery, 40 cells, 13 plates.

Prices—Five-passenger double-drive models, $2,900 and $3,200; five-passenger single-drive models, $3,200 and $3,500; four-passenger brougham on 98-inch wheelbase, $2,900; four-passenger car on 85-inch wheelbase, $2,700.

Changes from Previous Construction—Sashless windows; one-piece front window that can be lowered to any desired point; rain vision windshield adjustable from inside; electric heater in metal pedestal supporting right front seat. The short wheelbase car is a new model.



Selling Features—Double drive; magnetic control operated by hand-disk; magnetic brake; shaft drive without universal joint; motor suspended on end of torsion tube which hangs on ball-and-socket joint in center of car; handsome body lines in all models; double external brakes that will not freeze.

Equipment—Electric heater; side, tail and head lights; reading and meter lights; morocco bound toilet case; morocco bound smoking set; eight-day clock; flower vase, silk roller curtains, anti-rattlers on all windows; mirrorscope; speedometer-odometer; tools; tire repair outfit and charging plug.

Rauch & Lang—Rauch & Lang Carriage Co., Cleveland, O.

Models—Six models on three chassis. Roadster and club roadster (enclosed) on 92-inch wheelbase, bevel gear drive, tires 32 x 4 pneumatic or cushion, battery 40 cells 11 plates. Demi-brougham, on 86-inch wheelbase, bevel gear drive; tires, 32 x 4 pneumatic or 34 x 4 cushion; battery, 40 cells, 9 plates. Town car, 105-inch wheelbase, bevel gear drive, 33 x 4½ pneumatic or 36 x 4 cushion. Brougham on 92-inch wheelbase, worm drive, 33 x 4½ pneumatic tires or 36 x 4 cushion; battery, 41 cells, 11 plates. Coach on 96-inch wheelbase, worm drive, tires 33 x 4½ pneumatic or 36 x 4 cushion; battery, 42 cells, 11 plates.

Prices—Roadster, $2,600; club roadster and demi-brougham, $2,800; town car, $3,800; brougham, $2,950; coach, $3,100, with single control, and $3,200 with double control.

WAVERLEY ELECTRIC SPRING SUSPENSION

Changes from Previous Construction—Worm drive in brougham and coach with overhung worm; double control mechanism; seven-eighths elliptic rear springs on worm driven models.

Selling Features—Worm drive system; dual control mechanism, direct drive; improved rear spring system.

Equipment—On roadster: Head, side and tail lights; windshield, odometer; clock; tools. Brougham and town car: Same, with the addition of dome and corner lights; mirror and memorandum book in case; speaking tube and flower vase. Brougham and coach All items enumerated, and auxiliary rain-vision windshield.

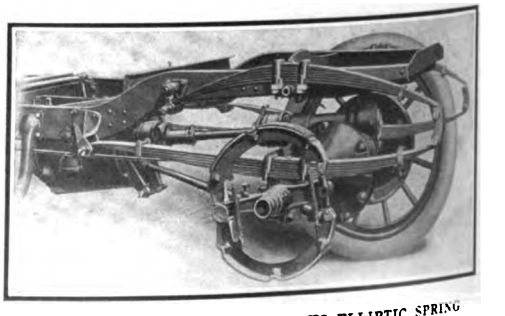
Standard—Standard Electric Car Co., Jackson, Mich.

Models—One body—coupe—on one chassis with Westinghouse motor; battery 30 cells, 11 plates. Wheelbase 96 inches and tires 32 x 3½ front and 33 x 4 rear pneumatic, or 34 x 3½ cushion all around.

Price—$1,990.

Changes from Previous Construction—Longer springs, larger bearings in axles; improved brakes and refinements in coach work

Selling Points—Popular price; unit construction system, straight line drive without universal joints; double reduction drive with gear system built into rear axle; light weight, high efficiency motor; ample battery equipment; non-vibrating steering mechanism; very flexible springs and easy riding; excellent finish throughout.



Equipment—Two front lamps; tail lamp; toilet case; flower vase; burglar-proof locks; jack; complete set of tools.

Waverley—The Waverley Co., Indianapolis, Ind.

Models—Thirteen models on what is practically a single chassis, differing in wheelbase length from 89 inches to 109 inches, and with details made to suit bodies, with Waverley noiseless drive system with shaft parallel with axle and herringbone gears. Battery equipment from 32 cells, 11 plates, to 42 cells. 13 plates, according to body.

Prices—Front drive "four," $3,000; rear drive "four," $2,800; double drive brougham, $3,000; limousine "five," $3,500 with 109-inch wheelbase and $3,150 with 106-inch wheelbase; four-chair brougham, $3,150; Georgian brougham, $3,250; Empire brougham, $2,800; Colonial brougham, $2,625; two-passenger coupe, $2,150; Victoria phaeton, $1,850; sheltered roadster, $2,250.

Changes from Previous Construction—Except for body refinements and the addition of five new models—which are new chiefly in the matter of body arrangement and include the front and rear drive "fours," the double-drive brougham, the four-chair brougham and a five-passenger limousine—there are practically no changes.

RAUCH & LANG SEVEN-EIGHTHS ELLIPTIC SPRING

Digitized by Google

Selling Features—Exceptionally wide range for choice; forward, middle double drive; comfortable arrangement of chairs and seats; efficient and quiet driving system; low cost of maintenance; high-efficiency motor; non-arcing controller; excellent weight distribution; accessibility; simplicity.

Euipment—Lamps; charging plug; meters; flower vases in enclosed models; toilet articles; tools.

Ward—Ward Motor Vehicle Co., New York.

Models—One model, a four-passenger coupe on a 96-inch wheelbase; tires, Ward cushion, 33 x 2½; battery, 42 cells, 11 plates.

Price—$2,100.

Changes from Previous Construction—New model throughout. Exhibited for the first time.

Selling Features—Moderate price; ample battery and mileage of from 60 to 100 miles per charge; passengers all facing forward; optional painting and upholstery.

Equipment—Head, side and tail lamps; toilet case with watch; flower vase; speedometer; ampere-hour meter; set of tools and jack.

Woods—Woods Motor Vehicle Co., Chicago, Ill.

Models—Full information not available. Several large cars are built on 106-inch wheelbase chassis in addition to three smaller machines; all enclosed models with lever steer. Both front and rear seat control is employed, as well as dual control. Final drive by worm in some models and bevel gears in others. Frames of inverted U-shaped steel. Dual tread cushion tires. Motor and batteries hung from sub-frame; motor supported on ball-and-socket joint. Battery 40 cells, 13 plates, 16 cells in front and 24 cells in the rear, every cell accessible when hoods are raised.

Prices—Three smaller models, from $3,100 to $3,600. Other prices not available.

Selling Features—Ample battery capacity; choice of worm or bevel drive, front, rear or dual control; dual tread tires; accessible battery; exceptionally good battery and motor suspension; roomy bodies with wide seats.

Pointing the Way to the Many Accessories

Exhibits Will Contain Many New Things—Motors Somewhat Standardized But Lighting and Starting Systems Vary Widely—On-Coming of Hand Operated Horns and Auxiliary Spring Shock Absorbers.

Accessories! Never was there a more shamefully overworked word. Ever stop for a moment to think just what "accessories" stands for? Well, it stands for everything that is in an automobile, on an automobile and of an automobile—that's all. Everything that has anything to do with an automobile is an accessory, when it is by itself, whether it is a six-cylinder motor with a four-speed gearset built onto it, or a patent polishing rag to shine up the nickel-plated trimmings. Yes, and even the portable garages are shoved under the umbrageous branches of the wide-spreading word, to say nothing of clothes, and insurance policies and medicine bottles—the flat kind with the leather cover—and a thousand other things that line the aisles of the space devoted to accessories. And it is doubtful if there is a more educational phase of an automobile show than the accessories section, for there the hidden things are brought to light, and many an owner who never would know what was inside his car otherwise finds out by wandering through the mazes of exhibits and examining the marvels of mechanical anatomy that are spread before his eyes.

The lordly and more or less ponderous motor has just as important a place in the accessories section as it has in the car and, be it said, its importance as a part of an automobile show has increased along with the importance and the excellence of the car that is made up of parts manufactured by specialists and built by engineers who are experts in figuring out what parts make the best combinations. It is an undeniable fact that this method of building cars has greatly stimulated the manufacture of motors—to say nothing of other parts—and the supply has met the demand at least half way in every respect. As for things that are out of the ordinary, they are not lacking, though—Heaven be praised!—the days when "something out of the ordinary" meant a freakish curiosity have gone into the discard—for good.

Blocks, "Sixes" and Smaller Bores.

While the Magic motor with its crescent sliding valves really is a motor exhibit, the fact that it is shown in a car with other cars rather takes it out of the accesories category. Still there is the latest thing the Model Engine people have brought out—the Carter, a slide-valve motor in which the functions of the usual cylinder head and the valves are performed by what amounts to a second piston in the top of the cylinder, reciprocated by an extremely heavy camshaft, which is as strong as it is for the simple reason that it takes the thrust of the explosions. The valve-pistons are arranged to move in the direction of least resistance—that is to say, when the thrust is upward the valve-piston is moving up, and vice versa. The makers say that in a six-cylinder motor the camshaft moves without absorbing any appreciable amount of power from the "silent" driving chain, which serves mostly as a speed regulator or timer.

The light six-cylinder motor is much in evidence, just as are the light "six" cars; and practically all the better known makers are offering them. And it goes without saying, almost, that block casting for both four- and six-cylinder models is in high favor, the majority of the motors shown being of the block-cast type. Continental, Rutenber, Buda, Model—all have fine examples of block casting and light six-cylinder models. It cannot be said that there have been any startling changes in construction since the last big shows. Rather, there is a continuation of the policy of making good things better that results in finer finish, more accurate workmanship, better accommodation for various ignition and lighting and starting systems and so on. With the tendency in cylinder bores leaning toward smaller measurements has come a slight increase in speed and a corresponding increase in power without additional weight. In short, each pound of iron is made to produce more work than a pound of iron was asked to produce last year. As for unit power plants, suffice it to say that it is possible to obtain almost any combination of motor and gearset, or any motor separately. Of course, the center control feature is conspicuous—or, rather, it is almost alone in unit power plants.

Digitized by Google

There has come to be a good deal of agreement among the makers of motors as to what is and what isn't right, and therefore there are not many radical differences between the engines of one maker and those of the others—with a few notable exceptions, of course. But when it comes to that comparatively new group of apparatus—the electric lighting and starting systems—it is another story altogether. While there are a few points upon which there is some unanimity of opinion, there are more upon which there is none. The single-unit systems in which one machine answers for both motor and dynamo, are holding their own, and so are the double units, which separate motor and generator. Voltages run all the way from 6 to 24, despite the obviously vital importance of the proper potential, and so far it is a question as to what voltage is making the best showing in service.

Wherein Starter-Lighters Have Changed.

The high-speed Hartford starting motor, with its energy-accumulating flywheel, is changed only in matters of detail. Rushmore is decreasing size and weight, having built a little on the safe side, so to speak—in fact, there is a general inclination to bring down weights somewhat, it having been found quite practicable to do so without interfering in the least with performance. The Vesta magneto generator has been lightened and more thoroughly protected. The Ward Leonard system appears with only detail improvements and refinements that increase its efficiency and reliability.

There is one tendency that is rather marked, and may be said to be quite logical, and that is the employment of the current generated by the lighting dynamo for ignition purposes, with the storage battery as a reserve for starting; the elimination of the magneto is the natural result of such an arrangement. The Delco, Autolite and Westinghouse are excellent examples of dynamos adapted to do ignition duty by the use of a quick breaking device, high-tension distributer of the magneto type and non-vibrator dashboard coil. Another example of rather unusual unanimity is found in the fact that the North East, Westinghouse and Autolite systems, where they drive through the flywheel by a shifting pinion, incorporate the starting switch and gearshifting mechanism in the motor unit, though the details of the arrangements differ considerably. The North East was a pioneer in the use of an automatically shifting pinion. The Rushmore starting motor is unique in the matter of gearshifting, for it shifts its pinion without the addition of any apparatus whatever, the shaft being allowed longitudinal play and the magnetic pull on the armature bringing the pinion into mesh with the flywheel gear against a spring; of course, as soon as the current is shut off and the magnetic pull ceases, the spring does its work and draws the pinion back into its idle position.

Ignition Starter Now Past History.

A new thing in the Gray & Davis line is a lighting and starting outfit that is of the two-unit type, but has the motor and generator superposed—double-decked, so to speak. The characteristics of the machines are those of the other Gray & Davis products, which is "'nuff sed." They also are making two sizes of starting motors instead of only one—that is, in the separate motor designs. A new lighting system that has yet to be "uncovered" will be exhibited by the Splitdorf people.

The ignition starter, while not an unqualified success as a motor starter, must be given credit for starting something else—to wit, the desire for an honest-to-goodness substitute for the hand crank. Having served its purpose, it has painlessly passed on. But before the ignition starter was launched on its "short, sharp and decisive" career there flourished, more or less, another cranker that was independent of human muscle—the air starter. And still it is doing its work, remaining on the job with a persistence that must have something substantial behind it in the way of merit.

Pneumatic Devices Which Find Favor.

The Thurber starter has been greatly improved and now appears as a unit—two-cylinder compressor and rotary air motor—adapted to be mounted at the front of the car and connected to the end of the engine shaft. Thus the former necessity for arranging a separate chain or gear drive for the compressor is eliminated and the system lightened and made more efficient. The Kellogg outfft, which has long been a standard apparatus, has been brought nearer to perfection by detail improvements, including a new all-metal air pump, and a six-cylinder compressor finds its place in big installations. Of more recent origin, and deriving not a little glory from its association with the Gray pneumatic gearshifting system, is the Gray pneumatic starter, which works as one department of the mechanism that controls both gears and motor; the starting motor, which is of the reciprocating type, is not incorporated with the gearshifter, but is located at the front of the engine.

There will be at the show a good deal that is of more than passing interest in the lamp line. There are at least two radical departures from ordinary materials in lamp construction, as shown in the J-M and the Arbeco products. The first is a lamp made in a variety of styles and shapes of hard rubber, intended for use in connection with dry batteries, and are fitted with bulbs of the proper kind for the service. They are light, substantial and good to look at. One is inclined to look askance, however, at lamps that are made wholly of glass, as are the Arbecos. But not only do they "stand the racket" on pleasure cars, but special models are being made for truck service. These lamps are made with an interior parabolic reflector of glass silvered inside, an exterior or body part of glass colored on the inside to match the car, and a metal ring connecting the two parts at the front where the door is attached. Between the inner and outer sections is an air space which is said to have a decided effect in rendering harmless the shocks received in service.

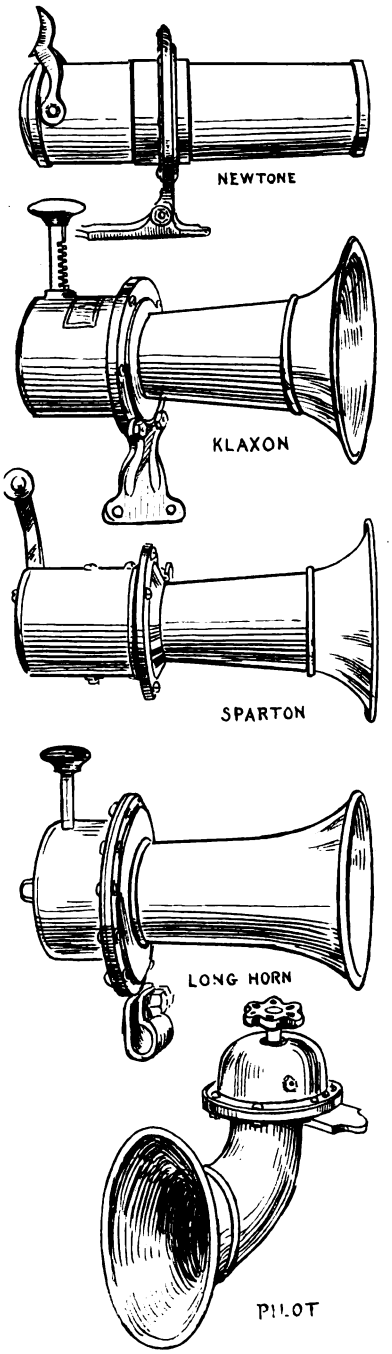
Little Lamp But Strong Illumination.

Among the electric lamps the latest arrival is the Roffy-Grace lamp, which is peculiar in that it throws a perfectly defined disk of light, like that of a magic lantern; and unless the eye is within the circle the light is not visible. As the light at no point is much more than four feet from the ground the chances of being dazzled are remote. The device is in the form of a vertical tube with a mushroom-shaped tungsten bulb at the bottom. Passing through a series of imported lenses, the light is reflected forward by a mirror. An opening around the bulb with a glass cylinder around it permits the emission of light to illuminate objects close to the front of the car.

Along the firing line of the army of ignition systems things are not much changed. To the line of Remy magnetos, heretofore all of the inductor type—that is, without rotating armature coils—have been added two models with wound armatures of the shuttle type. These are semi-high tension machines with induction coils for pushing the current up to the required voltage for ignition work. And the Splitdorf people have added a line of high-tension magnetos with breakers in which centrifugal force is utilized to assist the action of the breaker spring and make possible the use of lighter parts than could be or would be practicable otherwise; also a new low-tension Splitdorf magneto has been added to the line. But for the most part things are about as they were—that is to say, as far as can be discovered in advance of the actual opening of the doors of Grand Central Palace, which may reveal—no one knows just what.

Carburetters? There isn't one that isn't recognizable from a quick glance at its

Digitized by Google



exterior, though a few have been dressed up in black nickel and enamel finishes that enhance their appearance in no small degree. The good old Schebler is on hand with the standard models, changed little or not at all; but there also is a brand new one with a single jet and an automatic control system that is new as a Schebler feature. The flow of gasolene from the spray nozzle is controlled by a needle valve, and the needle is, in turn, controlled by the automatic air valve, there being a connecting link between them. Obviously, it was no joke to work out the proper balance between the air valve, its spring, the movement of the needle and the nozzle opening; but it has been done, and the Schebler people ask nothing better than to let the carburetter speak for itself. A dashboard control for starting, which lifts the needle and at the same time, chokes the air intake, ensures a good, rich mixture for starting.

A brand new Stromberg will be shown that can be used either as a single- or a double jet instrument for four- or six-cylinder motors. The second nozzle is directly in the path of the auxiliary air and is opened or closed by a small screw that must be turned with a screwdriver. The needle-valve is over the center of the float. The two spring adjustments remain as in the older Strombergs; there is no hot-water jacket, a hot air horn being standard equipment. For easy starting there is a dash-controlled choke on both auxiliary and main air inlets, so that a very rich mixture is supplied when the motor is cranked. This carburetter is known as model G and differs radically from the well known models, especially in the matter of control, and miserable indeed will be the gasolene that they will not handle satisfactorily. Incidentally, they have become somewhat weary, up at the Stromberg place, of having their carburetters "cussed out" for faults that lie wholly in the intake manifolds; and so they're taking the bull by the horns and designing—though not making—manifolds with special reference to special motors.

Details That Have Improved Carburetters.

Dashboard carburetter control is one of those things that must be tried to be thoroughly appreciated; but once tried, the appreciation is apt to be whole-souled. This is reflected in the fact that dashboard controls are numerous and convenient, the carburetter makers and specialty manufacturers coming forward to meet the demand.

There is a tendency, not by any means amounting to a landslide, toward incorporating strainers in carburetters rather than attaching them separately in the gasolene line; the Breeze is a typical example. And dashboard control of air, too, is more common. The Rayfield carburetter has been a little altered inside by putting the needle-valve for controlling the flow of gasolene to the float chamber right on the float, in the foreign fashion. An adjunct to the Flechter is a Bowden control on the dash for regulating the air, which is particularly useful in starting. A newcomer is the Eiker carburetter, the chief characteristics of which are a horizontal spray nozzle and a simplicity so marked that it is said "any idiot" can take the carburetter apart and put it together and adjust it.

FIVE HAND-OPERATED HORNS

The chorus of horns is stronger than ever, if such a thing be possible. Undoubtedly one of the most noticeable developments in accessories is the large number of hand-operated horns, most of them built along the lines and on the same fundamental principles as the electric motor-driven horns. Less than a year ago, the Long was the only exponent, but now Klaxon, Newtone, Sparton, Clero and Pilot all have hand-operated horns.

"Shower" of Auxiliary Spring Devices.

Shock absorbers are as thick as blackberries; there is no end to their numbers. Rather suddenly, shock absorbers have increased and development has been along the line of auxiliary springs—the kind that are interposed between the two parts of a spring, or between the spring and the frame, in place of the shackle. The shock absorber that set the fashion for the world, the Truffault-Hartford, appears in an improved form, having three different degrees of friction and automatically adjusting itself to the weight of the car; but there is a brand new Hartford, too—one of the auxiliary spring kind with enclosed helical springs, made for various sizes of shackle-bolts and for various weights of cars, and, needless to add, it is worthy of the name it bears. The J. H. Sager Co., another shock absorber pioneer, also has swung over to the enclosed spring type. Then there's the Cox "Rebound E-zer," which is a recent addition to the flock and consists of a spring in a cylinder and a connecting strap attached to the car spring, the resistance of the spring and the friction of the strap calming the too exuberant action of the springs. The Cox people make the shackle type, too, and then there's the J. M., the Ely, the Rex, the Velvet and others. The Mondex is of the "friction hinge" kind, with a strong individuality; Le Telesco is a combination of the spring and hydraulic principles, in which respect it it different from all the others; the Flentje is straight hydraulic, though it mixes air with its oil to form a softer cushion; the Hertz gets its friction from a substance—don't ask what it is—in an iron box, resisting the movement of a vane; the Ames is of the reversed leaf spring kind; and so on and so on and so on.

There has been something akin to a stampede on the part of speedometer makers to get their instruments down flush with dashboards. The majority of makers will show instruments designed to be set in with nothing but a metal ring above the dash surface, the resets taking the form, in many cases, of little milled wheels projecting just far enough to be rolled under the thumb.

Wealth of Accessories That Will Be Displayed

MOTORS

Rutenber Motors.

Rutenber Motor Co., Marion, Ind.

Models—Model 27, "four"; Model 28, "six"; Model 38, "four"—a new motor.

Features—Model 38, "four": 4⅛ x 5½; L-head; pair-cast; enclosed valves; three-point suspension, with detachable rear arms; front support fulcrumed. I-beam section for main or sub-frame; adjustable chain drive for starter and water pump; pump and starter on left side; valves, magneto and exhause and intake manifolds on right side; right or left steer optional; crankcase in two horizontal sections; 1⅞-inch valve opening and ⅜-inch lift; centrifugal cooling pump; lubrication by gear pumps submerged in oil driven off end of cam shaft by two 45-degree spiral gears; filter between reservoir and pump; dash connection for pressure gauge.

Model 27, "four," is a unit-type, 3¾ x 5¼ motor, block-cast. Model 38, "six," which was developed in 1912, has been improved for 1914 by the adoption of silent chain drive for the starter and by other alterations; it is 3¾ x 5¼, L-head, pair-cast, pump-circulated; pump, magneto and starter drive on right side.

Continental Motors.

Continental Motor Mfg. Co., Detroit, Mich.

Models—Model 6-C is a "six" and was shown last year. Model N is a new "four," characterized as the "Continental Baby" and designed for cars in the $1,000 class.

Features—Model N: Bore, 3½; stroke, 5; A. L. A. M. rating, 20.2 horsepower; brake test at 2,000 r. p. m., 32 horsepower; L-head, block cast; furnished in unit form or in independent construction; will accommodate any standard carburetter or magneto and several different starting and lighting systems; thermo-siphon cooling; designed for three- or four-point suspension. Extra large bearings. Inlet and exhaust valves interchangeable. Light reciprocating parts. Splash and force-feed oiling.

Waukesha Motors.

Waukesha Motor Co., Waukesha, Wis.

A new 4¼ x 5¾ "four" will be exhibited; ample horsepower; economy and endurance; motors built for heavy work; chrome nickel steel in highly stressed parts; spiral bearings; non-hunting governor; high-power at low speeds.

Buda Motors.

The Buda Co., Harvey, Ill.

Models—M, Q and T, "fours"; and S-S, a "six."

Features—Model M; 3¾ x 4½; thermo-siphon cooling; block-cast; nickel-plated trimmings; for truck use. Model Q; 3¾ x 5½; pump-circulated cooling system; block-cast; for truck use. Model T; 4¼ x 5½; for pleasure cars; block-cast. Model S-S; placed on market a year ago; 3¾ x 5½; block-cast. All except the model M are made in unit form or otherwise, according to specifications.

Model Motors.

Model Gas Engine Works, Peru, Ind.

Complete line of four- and six-cylinder motors in both unit power plant and separate types. Provision is made for the installation of almost any electric lighting and starting or ignition system. The latest addition to the line is the Carter motor, in which there are no stationary cylinder heads, but instead a piston-like member which is reciprocated by a camshaft and acts as a valve, covering and uncovering ports. The camshaft runs through slots in the valve-pistons and is driven by a "silent" chain.

De Luxe Motors.

F. W. Spacke Mach. Co., Indianapolis, Ind.

De Luxe motorcycle motors are made in four models—two singles and two twins; two models of motors for cyclecar use also are produced, both of ten horsepower, and one adapted for chain and the other for shaft drive. Both are air cooled and of the V type. A shaft drive assembly for cyclecar use also will be shown. The cyclecar products are new.

SPARK PLUGS

Mosler Spark Plugs.

A. R. Mosler & Co., Mt. Vernon, N. Y.

Besides the full line of Spit-Fire spark plugs which always have been a Mosler feature, the Spit-Fire "Red Tag" platinum point plugs, which are designed for especial use with magneto ignition, are to be shown. The same chamber construction, which it is claimed renders the plug free from short circuiting from carbon deposit, is employed in all of the Mosler plugs. The Vesuvius type is exceptionally rugged and because of the fact that a steel washer with two radial projections is placed on the end of the stone insulator, so that the projections enter slots in the steel shell, the insulating member is prevented from turning when the locknut is being set, and as a consequence is relieved of all strain. At the same time, the nut can be tightened up sufficiently tight to ensure perfect contact of the copper-aspestos gasket on its seat in the shell without fear of fracturing the insulator, the strain being borne by the steel piece on the insulator, so that a gas tight fit is always obtainable. A feature is the new packing adopted for this plug; it now comes in a metal box held snugly in place by a miniature Mosler catalog and instruction book, ensuring that the plug reaches the buyer in perfect condition. A new type of priming plug, in which the gasolene is squirted into a channel on the top of the shell to drain through a small passage which is controlled by a needle valve, also will be shown as well as a new plug designed for especial use with Ford cars and which goes under the name Superior. It is of the usual Mosler type, save for the length of the shell, which adapts it perfectly to the needs of the Ford motor.

Red Head Spark Plugs.

Emil Grossman Mfg. Co., New York City.

Models—Four. Regular, with porcelain insulator; Combination, with porcelain and mica insulation; Priming, with priming cup attached to shell; and Platinum Point with platinum-tipped electrodes, which will stand 3,000 degrees of heat.

Features—Porcelain guaranteed not to crack from motor heat; roomy firing chamber guards against short circuits from carbonization; metal disks that take care of expansion and contraction of center electrode are sealed in a brass cap, eliminating loss of compression; flexible cone under bushing; shell from one piece of steel; heat-treated, non-rusting.

Prices—Regular, $1; Combination and Priming, $1.50; Platinum Point, $2.

Line also includes cable, connectors, mirrorscopes, tire holders and tire locks, license tag holders, demountable rim lugs, spring bumpers, pedals, etc. Company has added long body priming plugs, commutator wiring and spark plug wiring sets, electric lighting outfits, robe rails, wheel pullers and hub caps for Ford cars.

Champion Spark Plugs.

Champion Spark Plug Co., Toledo, O.

Thirty-six sizes included in the styles—Regular, Long, Extra Long, X, Conical Mica, Porcelain Motorcycle, Mica Motorcycle, Priming Plug, Motorcycle Priming Plug, Special Small Conical, Special Small Petticoat, Champion X for Ford cars and Champion O for Overland cars. Strong plug; over-size; up-to-date machinery and careful workmanship in plant; inspection from raw to finished material.

Prices—75 cents to $1.25.

AC and AC Titan Spark Plugs.

Champion Ignition Co., Flint, Mich.

The AC Titan plug is a new model. A very large porcelain makes the insulation hard to break; the center electrode is screwed into the porcelain and cemented; a special washer is fitted on top of the porcelain and pressed down with a closed nut to prevent leakage through the center electrode. The wide seat at the bottom of the porcelain has a special corrugated washer which conducts heat from the in-

Digitized by Google

sulator. Substantial side and center electrodes. The side electrodes are blade-shaped and have an increased diameter at the point of contact, which prevents overheating. Price—Plug, $1.25; corrugated gasket, 3 cents; porcelain, 40 cents.

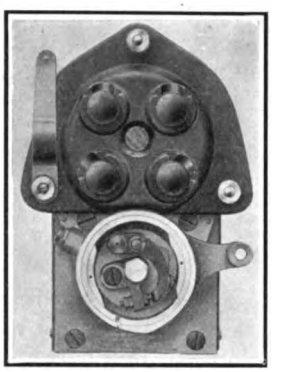
The line also includes five other AC plugs and a large assortment of special plugs for Ford cars, motorcycles, etc; also priming plugs. Unbreakableness is a feature of all plugs. Price of most regular sizes is $1.

Master Spark Plugs.
Hartford Machine Screw Co., Hartford, Conn.

Models—To fit all motors.

Features—The extremely heavy porcelain core which is used makes the plug uncommonly durable and is seated on a seat that is amply wide and amply cushioned to allow for expansion and contraction under heat; the plug is very easily taken apart for cleaning.

Prices—Ordinary length, $1; extra long, $1.25.

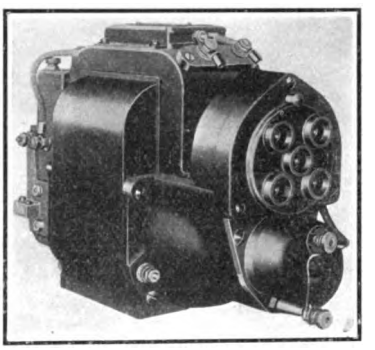


IGNITION DEVICES

Remy Magnetos.
Remy Electric Co., Anderson, Ind.

Four new magneto wheels are included in the Remy line and all of the four embrace the use of a shuttle-wound armature, a distinct departure from former Remy practice when the inductor type of magneto was adhered to. Models P and 31 are designed for use on high-speed automobile motors, the former being used with Model P transformer coil and supplying single point ignition, while the latter is used with Model 40 coil and can be used with double point ignition; the Model 40 coil includes a high-tension switch, so that either of the two plugs can be used separately or both together. Models 32 and 30 are intended for slow-speed, heavy-duty motors used on motor trucks and tractors, and the respective models are intended for single and for double spark ignition. The magnetos are dust and moisture proof and so designed that the circuit breaker is instantly accessible. The coils are of the tubular type and are claimed to be impervious to the action of either oil, water or heat; all have mounted on them a three-position kick switch fitted with a lock. Also new to the Remy line is an ignition distributer which includes a quick-action circuit breaker and is intended for use in connection with battery and non-vibrating coil ignition in place of magneto ignition.

Splitdorf Magnetos.
Splitdorf Electrical Co., Newark, N. J.



The line of Splitdorf magnetos has been increased by a new high-tension type known as Model EU-4, which is made for especial use with light high-speed four-cylinder motors. The magneto is an adaptation from the high-tension motorcycle magnetos but arranged to spark the multiple cylinder motor. The condenser is mounted on the forward end of the armature in the most approved manner and rotates with the armature. The platinum points on the circuit breaker are held together partially by the action of centrifugal force when the

SPLITDORF HIGH TENSION

armature is in rotation, so that the breaker spring can be lighter than is usually employed for the service and decreased wear results. The magnetos are fully enclosed and waterproof, and the face block being moulded with a recess in such a position that the terminals on the secondary wires cannot possibly get together, eliminates short circuits from that derangement. The magneto with suitable attaching brackets is put up for use on Ford cars and in this form is sold under the name "Ford Special."

The line of low-tension magnetos has been increased by the addition of a new model—Model A. Of the same general type as the low tension types which preceded it, the new model is made easily demountable

REMY LIGHTING-IGNITION SET

and the parts of the circuit breaker have been made interchangeable. The distributer parts are well protected from moisture so that the enclosure of the magneto has not been found necessary. The model is made only for four-cylinder motors and sells for $60 with the transformer coil.

Herz Magnetos.
Herz & Co., New York City.

Herz magnetos are made in two types—R and F—and each type in four models for 1-, 2-, 4- and 6-cylinder motors. The type R magnetos are for medium powered motors, the type F devices being intended for use on large motors. But a single permanent magnet is used for the generation of the field by which interference of the magnets of various strengths is avoided and the whole device is tightly enclosed against the ingress of moisture or oil by means of plates ground to it; no felt or other packing is used, all joints are machined to a snug fit. The prices vary from $50 to $95.

Herz spark plugs are insulated with double stone insulators the inner insulator being ground to a gastight fit in the steel shell. The stone tapers toward the electrode, forming a chamber. The outer stone, which is called blue enamel stone, relieves the inner member of all strain. The plug is made in two types for automobile motors, the ordinary length selling for $1.50 and the extra long plug selling for $2.

The Herz automatic time adjustment is designed to attach to any magneto, serving in place of the usual coupling. In its simplest aspect it comprises a pair of plates with recessed openings or channels which are tangent to the shaft, and these end plates or disks are faced to each other and balls being placed in the channels. As the speed of the rotating disks increases, the balls are thrown out by centrifugal force, and since the channels in the plates cross each other, they cause the plates to move with relation to each other so that the spark is advanced. Low tension timers and high tension distributers will be shown in a variety of forms, as well as other devices incidental to the ignition system.

Simms Magnetos.
Simms Magneto Co., Bloomfield, N. J.

Simms magnetos are made in open and waterproof types for use with four and six-cylinder motors; both independent and dual types are made. The leading feature is the patented extended pole shoe which, it is claimed, tends to produce an exceptionally hot spark at low speeds with the spark fully retarded, facilitating starting and making the use of a battery superfluous. Of course, as the speed of the engine increases and the spark is advanced, the intensity of the spark is increased so that a spark of the same intensity is available over the complete range between full advance and full retard. The contact breaker cam ring is said to ensure perfect synchronism, or uniform firing in all of the cylinders, resulting in the maximum power and a "sweet" motor.

Hi-Fre-Co. Ignition Systems.
Dean Electric Co., Elyria, O.

Hi-Fre-Co. ignition systems depend for their operation on the fact that an oscillatory current of high frequency is more effective in jumping air gaps and more effective in igniting gases under compression than the ordinary high-tension current. The system comprises a low-tension magneto in which is incorporated a special condenser, which when discharged produces

Digitized by Google

the oscillating current, but at low voltage, so that it can effectively be insulated. This low voltage oscillating current is led to the respective cylinder plugs in the orthodox manner by means of a distributer. Before the coil enters the plug, however, it passes through a special Tesla induction coil or transformer coil, where it is stepped up to a potential where it can easily overcome the resistance of a 3/32-inch gap in the cylinder. The resonator coils are attached to the spark plugs. The advantage of the system lies in the fact that low tension wire can safely be used to lead the current to the respective cylinder plugs without any fear of short circuit, and the fact that the discharge is made up partly of invisible heat waves which are said to aid greatly in the igition of the mixture.

Rhodes Unit Spark System.
New York Coil Co., New York, N. Y.

The Rhodes Unit spark system comprises a very rapid circuit breaker mounted in the same housing with a high-tension distributer. It operates on the primary of a non-vibrating coil and the distributer guides the secondary discharge to the proper cylinder.

New in the Nyco line is a master vibrator for use on Ford cars. The device is enclosed in a wooden box which attaches to the dash of the car and is said to be very economical of current and at the same time free from trouble. A two-switch system, also for use on Ford cars, is also a new Nyco development. It is intended to permit the car to be operated either by the master vibrator or on the separate vibrators on the unit coils providing a double ignition system. While it is not in the ignition line, the new Ford accelerator which is made by the same company is interesting. It comprises an auxiliary air valve which is put up in the form of a flange gasket so that it can be interposed between the carburetter and the flange of the inlet manifold. At high speeds, the valve is opened by depressing a pedal on the floor of the car, admitting the necessary amount of added air for high speed work.

Atwater Kent Ignition Systems.
Atwater Kent Mfg. Co., Philadelphia, Pa.

Two new models of the Atwater Kent Unisparker have been developed during the past twelvemonth—one, which is known as K-2 and is supplied to manufacturers only, is similar to the automatic spark system K save in a very few minor details, and the other, which is a type F system, with the hand spark advance but with special fittings to adapt it for use on Ford cars. The Atwater Kent unisparker comprises a quick break device and a rotary distributer, both of which are shaft driven from the motor and are mounted on the same vertical shaft, and a suitable induction coil of the non-vibrating type mounted on the dash. The current is supplied either by an ignition battery, in the case of a car not provided with dynamo electric system, or from the lighting battery in the case of an electrically equipped car. The advantages claimed for the system are absolute synchronism of the sparks in the various cylinders, positiveness, durability, effectiveness and low current consumption.

Mea Magnetos.
Marburg Bros., Inc., New York City.

Mea magnetos are made in three types for various types and sizes of motors and for use with motors with one, two, four, six, or eight cylinders; they are also made for dual ignition. The principal feature is the shifting permanent bell-shaped magnet which is rotated as the spark is advanced and the circuit breaker is caused to function earlier, so that no matter at which point the spark occurs, the relation of the armature to its field is such that a spark of maximum intensity is produced. The newer Mea instruments are suitably enclosed against the ingress of dirt and moisture. The magneto is said to be very efficient at low speeds, so that the use of a battery is unnecessary.

National Magnetos.
National Coil Co., Lansing, Mich.

National magnetos are of the high-tension type and are made in several models for use on all sizes and types of motors. High and low tension coils, switches, circuit breakers and other ignition devices also will be shown.

Heinze Magnetos and Ignition Devices.
Heinze Electric Co., Lowell, Mass.

Magnetos in various types for all sorts of motor vehicle motors, together with a full complement of spark coils, dash coils, switches, vibrators, terminals and other ignition specialties.

K-W Ignition Specialties.
K-W Ignition Co., Cleveland, O.

Low-tension generators and other lighting and ignition specialties. A new generator of the induction type has been added to the line.

BATTERIES, ETC.

Exide Batteries.
Electric Storage Battery Co., Philadelphia.

Besides the usual line of Iron-Clad Exide batteries put up in suitable form for electric vehicle work, and Exide batteries for ignition work, the exhibit will comprise a new type of Exide battery which is expressly designed for use in connection with electric lighting and starting systems. Chief among the improvements in this battery, which is known as Type X, is the adoption of unit cell assembly, each cell being a complete and accessible unit in itself and not sealed in a case along with the other cells which go to make up the complete battery. The adoption of a new form of seal has opened the way for an increase in plate area, and consequently in capacity, because practically all of the space formerly used for the seal is now filled by the plates. With the filler opening as now fitted, it is impossible to overfill the batteries, for the air space necessary for the expansion is automatically preserved and overflowing and loss of electrolyte are prevented. Terminal posts are of hard bronze of ample carrying capacity with a lead protective coating and fitted with lead encased nuts and washers; the positive and negative posts are of different diameters, which precludes the possibility of making wrong assemblies. The connectors are made of roller copper ribbon lead coated. The plates are of usual Exide construction with the embodiment of minor improvements and are separated by specially selected and treated wood separators. The cells are assembled in a variety of forms and voltages to meet all conditions.

Wotton Battery Charging Sets.
Electric Products Co., Cleveland, O.

The leading feature of the Wotton line is the rotary rectifier for converting alternating current to direct current for charging storage batteries. The apparatus comprises an alternating current motor, made for either single, two or three-phase circuits and for either 110 or 220 volts, which is directly connected to a direct current dynamo. The shaft which carries both armatures is mounted vertically, to economize space, and runs on ball bearings which are submerged in oil. The motor is of the squirrel cage induction type and starting is effected by means of a solenoid-operated switch; battery current is first turned on starting the generator as a motor, the solenoid switch in the meantime coming into play until the speed of the shaft is such that the alternating current r has sufficient torque to pick up. A f course, the dynamo delivers current to charge the battery either at a steady rate, for use with Edison batteries, or in the form of a tapering charge for use with the ordinary lead plate battery. For special use with batteries which need special charging and discharging to restore them to condition, a "soakometer" attachment is fitted as extra equipment.

LBA Storage Batteries.
Willard Storage Battery Co., Cleveland, O.

Batteries for ignition, lighting and starting systems and for motor vehicle work. The batteries are of the lead plate type, are rugged and so designed that spilling or slopping of the electrolyte is impossible. A new improvement is the fitting of bolted terminals or connectors in place of the burned-on connectors formerly used.

Edison Storage Batteries.
Edison Storage Battery Co., Newark, N. J.

The newness in the Edison nickel-iron alkali storage battery line is an intermediate size, known as A-5, which has a rated capacity of 187½ ampere hours. Save for the size of the elements and consequently the size of the cell, the battery is the same as those previously made, and is intended for

Digitized by Google

any sort of electric vehicular work. Batteries for ignition, lighting and starting will be shown in two sizes—40 and 80 ampere hours—made up in trays and connected to give 6½ volts. The vehicle batteries will be shown in the Edison special tray which permits easy loading and unloading but keeps the weight down to a minimum.

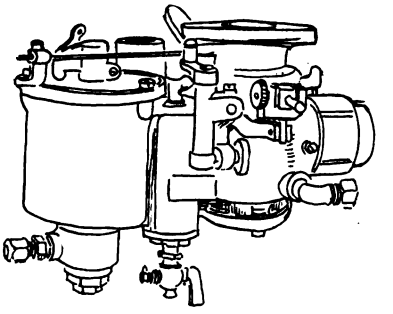
Philadelphia Batteries.

Philadelphia Storage Battery Co., Philadelphia, Pa.

Thin plate batteries for electric motor vehicle work and special assemblies for electric starting and ignition work.

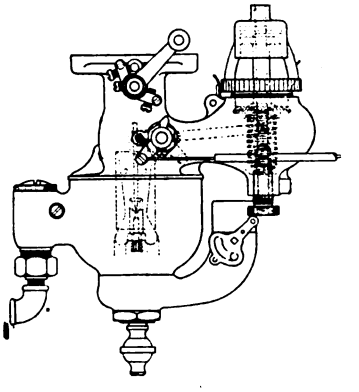
CARBURETTERS

Newcomb Carburetters.



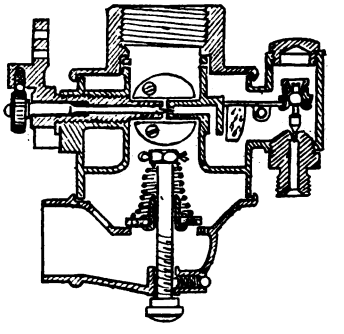
Holtzer-Cabot Elec. Co., Brookline, Mass.

Newcomb carburetters are made in a single model, in all the more common sizes. The carburetter is of the single jet type in which the amount of air admitted is controlled by the suction of the motor and the gasolene needle valve controlling the supply from the single jet is integral with the air valve, so that the gasolene supply is increased according to the increase in the air supply. The result is brought about by having the air inlet passages normally closed by a floating plunger which is raised by atmospheric pressure when the motor causes partial vacuum to be formed in the inlet manifold. The plunger is raised, therefore, in accordance with the degree of vacuum and consequently with the speed of the motor The ,· ,er is hollow and projecting into it jet, normally closed by a very long and slightly tapered needle. As the plunger rises, opening the air passages, the jet is also opened admitting more gasolene, which the suction of the motor causes to flow from the jet and through a multitude of fine holes at the bottom of the floating plunger into the mixing chamber, where it is incorporated with the incoming air. A by-pass leads around the throttle and enters the fuel passage just above the butterfly and through this gasolene is drawn at low speeds and for starting, providing a rich mixture. The carburetter is water-jacketed to provide additional heat and has but a single adjustment.



Rayfield Carburetters.

Findeisen & Kropf, Chicago, Ill.



The most important change in the Rayfield carburetter is the fitting of the gasolene check needle valve directly to the float instead of to a lever, so that the needle now operates on a seat that is concentric with the float instead of offset as heretofore. This arrangement opens the way for the employment of a smaller needle and a smaller seat and a cylindrical strainer set in a vertical position is provided to keep foreign matter from entering the float chamber. Other minor improvements have been made on existing models, and a new model made expressly for use on six-cylinder motors has been added. The marking on the adjustment has been made more easily legible and a new type of float adjustment has been fitted. One of the "little" changes is the fitting of a frictional hold to the screw on the throttle stop so

RAYFIELD NEW MODEL "A"

SCHEBLER "R" SECTION

EIKER HORIZONTAL NOZZLE

that all tendency for it to work loose is obviated. As heretofore, the carburetters are made in several models to suit the needs of all motors and in all the common sizes.

Breeze Carburetters.

Breeze Carburetter Co., Newark, N. J.

A simplified form of carburetter has been added to the Breeze line since the last show. The device is without the orthodox auxiliary air inlet and is fitted with a priming device which facilitates starting the motor during the cold weather. The carburetter is claimed to be positive in action, insuring at all times a correct proportion of gasolene in the mixture.

A novelty in the way of a fuel shut-off valve also will be shown. It is known as a four-in-one valve and, as the same would imply, performs four functions. First of all, it is a stop-cock and at the same time answers the purpose of a drain. A strainer is incorporated in the device and it serves also, when the control is placed in one position, to trap a certain quantity of gasolene in the tank, serving the purpose of an auxiliary tank.

Flechter Carburetters.

Trenton Brass & Mch. Co., Trenton, N. J.

With the exception of the fitting of a steering column control for closing the air shutter across the auxiliary air inlet and at the same time keeping the main inlet valve on its seat for the purpose of providing a rich mixture for starting, the Flechter Locomotive carburetter has undergone no change since last show season. The steering column control operates through the intermediary of Bowden wire and is intended for use on those cars which are provided with automatic engine starters to facilitate the starting of the motor in cold weather. As heretofore, the carburetter is put out in four models, two of which are fitted with hot water jackets and two of which are not. One of each type is fitted with the easy starting device. All models are put out in all common sizes between 1 and 2½ inches.

Kingston Carburetters.

Byrne, Kingston & Co., Kokomo, Ind.

New in the Kingston line is a special model Y carburetter intended for use on Ford cars. The carburetter works on the same principle as the regular model Y carburetter, but the manifold opening and the controls are specially arranged to fit the Ford car. The model Y carburetter is a single jet carburetter with the control of the auxiliary air effected by the suction of the motor acting on four bronze balls of varying diameter which when seated close the auxiliary air passage. An extra choke throttle closes the air inlet for the provision of a rich mixture for starting and a well surrounds the jet so that a puddle is formed for the same purpose. When the motor has started this puddle soon disappears. The carburetter is made in both horizontal and vertical form and in all the common sizes.

Motsinger Carburetters.

Motsinger Device Mfg. Co., Lafayette, Ind.

Mechanical detail of carburetter has been improved and black nickel finish with brass trimmings substituted for brass finish. Carburetter is a single variable jet instrument, the opening of the jet being controlled by the air inlet valve, which is of such formation—inverted dome—that the air which passes is proportional to the life of the

Digitized by Google

valve. For low speeds a by-pass around the air valve takes the form of a modified venturi. Is claimed to be economical of fuel and to give perfect mixture.

Schebler Carburetters.
Wheeler & Schebler, Indianapolis, Ind.

The Schebler carburetter line has been increased by the addition of two new models—Model R, which is new throughout and operates on a principle which is different from the principle of any other of the Schebler devices.

The new Model R is of the single jet type with the opening in the jet controlled by means of a needle which is linked to the air valve so that when the air valve opens the needle is raised from its seat and the amount of gasolene admitted is increased in proportion to the increase in the air supplied to the motor. There are but two adjustments on the carburetter ,one a low-speed needle adjustment effected by revolving the air valve cap and an air valve spring adjustment. For use in cold weather starting a dash control is fitted which lifts the needle from its seat providing the necessary amount of gasolene and a choke is fitted to the auxiliary air supply tube.

The other carburetters in the Schebler line are continued practically without alteration.

Eiker Carburetters.
Eiker Carburetter Co., New York City.

The Eiker carburetter is a new product. Its feature is a needle valve which forms the hub on which the butterfly throttle is pivoted, so that as the valve is rotated the needle is opened; thus the amount of gasolene is increased in accordance with the throttle opening and constancy of mixture approximated. The needle, contrary to usual practice, is mounted horizontally and is readily adjustable by means of a thumbscrew. The level of the fuel in the carburetter is maintained by the usual float and check valve.

Stromberg Carburetters.
Stromberg Motor Devices Co., Chicago.

Without departing from their original principles, the Stromberg carburetters have been greatly improved with a view to handling the heavy gasolene that now is common. Types A, B and C are retained with detail improvements and two new models have been added, types D and G. Both have double jets. The former is for "sixes" and big "fours" and the latter for smaller "sixes," as is indicated by its designation—the "little six" carburetter. Type G has a cut-out for the second nozzle, so it can be used with either one or two sprays, the cut-out consisting of a small screw turned with a screwdriver. In both cases the secondary nozzles are in the auxiliary air passages. Dash-operated chokes operate on both air inlets for starting. There is no hot-water jacket but hot air horn is standard equipment. Type D is made in 1¼ and 1¾ inch sizes, costing $35 and $46, and type G in five sizes, from 1 inch to 2 inches, costing from $17 to $35.

Stewart Carburetters.
Detroit Lubricator Co., Detroit, Mich.

New in the Detroit line is the Stewart carburetter. Details as to its mechanism are withheld until after the opening of the show.

LIGHTERS AND STARTERS

Westinghouse Lighting Outfits.
Westinghouse Companies, East Pittsburgh.

Westinghouse electric lighting outfits are put out in two forms, either with the contact breaker and the high tension distributer built in unit form with the lighting generator, or without the ignition devices. In both cases the basic principles of the dynamo are the case. It is compound wound with the shunt coil always in circuit and used primarily to build the voltage up to the point where the main switch or cut-out will be closed, owing to the pull of an electro-magnet in the shunt field circuit. The main switch closed, the machine is connected to the battery and lamp circuit, and also to the ignition circuit in the case of the compound instrument, and the series field comes into play to build up the field strength and increase the output of the machine. The series field current also passes through the electro-magnet which closes the main switch holding the armature in place and preventing "chattering." Regulation is inherent, being brought about by the connection of the battery through the reversed compound field winding, so that the field strength is altered under various loads to maintain the voltage constant or practically constant. The generator is fully enclosed against the ingress of dirt and dust, and the ignition system is likewise protected. One feature which is emphasized is that the system is grounded, requiring the use of only a single wire.

Westinghouse starting motors are intended to operate on six volts, and can be used in connection with the generator units which charge the starting battery. Two types are available either for gearing to the flywheel or an undergeared type for application to the crankshaft of the gasolene motor. The flywheel type is provided with a gear shift for engaging the driving pinion, which also embodies the starting switch; on depressing the starting plunger which protrudes through the dash or the floorboard, as the case may be, current first is passed through the motor through a resistance, to get it turning over at low speed to facilitate meshing of the gears; then, after the pinion is meshed with the gear wheel, the full current is introduced to start the engine. This is all accomplished by the single movement of depressing the pedal. The other type is fitted with an overrun clutch, so that the motor will drive the engine, but power is not transmitted the other way. Motors are fully enclosed and are so constructed as to draw a minimum of current and are easily mounted because of the rectangular frame. All sorts of fittings for electric systems, including bulbs, switches and connectors, as well as rectifiers and vulcanizers, also will be shown.

Remy Starting and Lighting Sets.
Remy Electric Co., Anderson, Ind.

The Remy line of starters includes both the separate and the single unit types. For use with the separate unit starters or simply as electric generators for lighting or ignition work, four dynamos are produced, two for use on light engines and two for heavier motors. For either type of motor, one of the generators is provided with a rotary high-tension distributer and with a circuit breaker so that the generator can be used in connection with a transformer coil for ignition work. On the two for high-powered motors, a reverse current relay or cut-out is incorporated with the generator, but the device is supplied as a separate unit to attach to the dash with the other types. All of the generators are bipolar shunt-wound machines with drum-wound armatures and have been designed with a special care to make the brushes and other wearing parts accessible regardless of the disposition of the apparatus on the car. Regulation so that the output will remain substatially constant regardless of the armature speed—which, by the way, is the same as the crankshaft of the motor—is effected automatically by means of a third brush, a method that has been tried and proven in railroad work, and which embraces no mechanical complications.

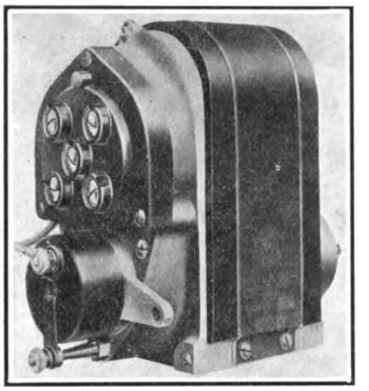
Four sizes of starting motors are made. One single-unit type of starter is supplied and it is novel in that while the pole piece is common both to the starting motor and the generator, each has its separate armature. The armature of the starting motor is mounted above the armature of the generator, which is not essentially different from the separate unit generators. The starting motor drives the generator through the intermediary of an overrunning clutch, which disengages when the engine takes up its own cycle of operations. There is but a single connection between the gasolene motor and the starter motor and generator. As with the other devices, it operates on six volts.

Auto-Lite Starters.
Electric Auto-Lite Co., Toledo, O.

Two-unit electric starting and lighting systems. In one system, the starting motor drives through the flywheel, through the intermediary of suitable gear teeth, the under gearing and the switch being built in unit form with the starting motor. The switch control is by means of a button on the dash which is connected to the switch by means of rods so that when the button is depressed the switch is closed, and at the same time the motor pinion is thrown in engagement with the teeth on the flywheel

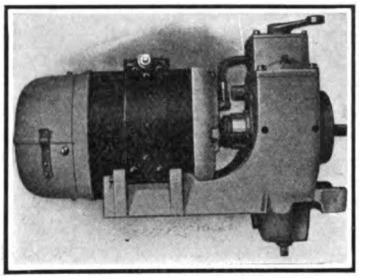
Digitized by Google

so that the motor starts the engine. When the button is released, the switch is opened and the pinion withdrawn, but should the button be kept depressed after the engine starts, an overrunning clutch in the reduction gear train precludes all possibility of harm overtaking the motor. With this system, the charging dynamo is mounted so that it can be driven in connection with the magneto, both ends of the armature shaft being tapered after the manner of a magneto shaft, so that it connects to the magneto drive shaft through an Oldham coupling and the armature of the magneto through similar means, the ignition device being driven through the dynamo. In another system, the use of the magneto is dispensed with altogether, the dynamo being provided with a suitable quick break device and with a high-tension distributer working in conjunction with a non-vibrating coil on the dash. In this case, the dynamo installation is the same, save that the armature shaft is not tapered to drive the magneto, the end serving to rotate the distributer instead. When this type is used, the starting motor is mounted in front of the engine, with the shaft vertical, and drives the engine through the intermediary of the timing gear train.



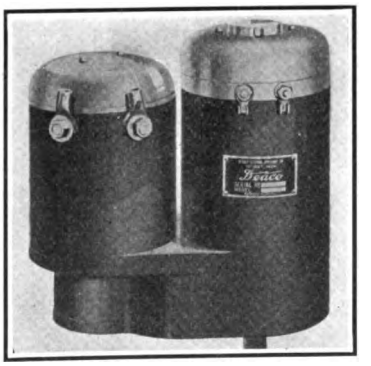
Deaco Electric Lighters and Starters.
Detroit Electrical Appliance Co., Detroit.

A single unit electric starting system which will operate on either 12 or 16 volts for starting and 6 or 8 volts for generating comprises the "newness" of the Deaco starting line. The combination is very compact, being but 5½ inches in diameter and 8 inches long. It is intended for use on light cars up to 25 horsepower and on cyclecars. With a special bracket it is supplied for use on Ford cars, either new cars or used ones. As a motor the device is, of course, series wound, but when operating as a generator it is a shunt machine. A magnetic cut-out connects the dynamo into the battery circuit when its voltage reaches the potential of the storage battery and serves also to disconnect it when the voltage drops off.



The Model C starting motor, operating on 6 volts, which was made last year, as well as the Model GF starter, will be continued practically unchanged, as will the "Baby Giant" starter, which is a two-unit type, both the motor and the generator being 5½ inches in diameter. The motor and the generator are also put out in tandem unit formation, with the motor geared to the generator shaft through the intermediary of a run over clutch. On all the Deaco generators, the control of the output is effected automatically by means of armature reaction, the effect being brought about by means of a third brush effect from the main brushes. At high speeds, part of the armature current is deflected through this third brush and through the field, counteracting the effect of the field current and weakening the field strength as a matter of course.

Hartford Electric Starter.
Hartford Suspension Co., Jersey City, N. J.



The Hartford electric starting and lighting system is a two-unit system operating on 12 volts. The motor is exceptionally small and is provided with a weighty flywheel; the gearing to the engine is 75 to 1, being effected through a worm gearing, so that the speed of the armature is normally

REMY SHUTTLE WOUND

NORTH EAST UNIT

DEACO COMBINED UNIT

about 5,000 r. p. m. This high speed, together with the energy stored up in the flywheel, provides the necessary torque to throw the pistons over compression at high speed. A clutch is interposed between the flywheel and the motor, so that the latter is disconnected from the engine immediately the engine fires. The starting motor can be installed in any of a number of places, and owing to its extreme lightness and compactness is adaptable to used cars, being attached in place of the usual starting crank. The Hartford dynamo is designed to furnish 100 watts, and this output is maintained, no matter how the car speed fluctuates, by means of a centrifugal governor which releases the armature shaft when the drive shaft speed increases above a predetermined point. The speed of the armature, therefore, is maintained constant at all times. A simple magnetic cut-out connects the generator with the battery and lamp circuit when the voltage has reached its maximum and opens the circuit again when the speed falls off. The two-wire system is adhered to, and although the starter operates on 12 volts, the batteries are split so that the lamp voltage is but 6.

Gray Pneumatic Shift and Starter.
Gray Pneumatic Gear Shift Co., Chicago, Ill.

Two units are included in the Gray pneumatic starter and gear shifter—a compressor and reciprocating air motor which starts the motor, which are built integral and are mounted at the forward end of the crankshaft, and the shifting mechanism which is mounted convenient to the gearset, to which it attaches through the interme diary of actuating rods. The compressor is a double-acting two-cylinder pump and it compresses air to a pressure of 300 pounds to the square inch into a suitable steel container located at any convenient place on the chassis; a pressure regulator disconnects the pump when the pressure reaches the proper point. The starting motor is capable of spinning the engine at a speed of 300 revolutions a minute and is controlled through the intermediary of a simple valve.

The shifting unit comprises a double-acting cylinder, with the piston rod arranged to throw the gear desired either into or out of engagement when pressure is admitted to either end of the cylinder by depressing the clutch pedal. The selection of the gear is made by a selector dial mounted on the steering column over which a pointer lever works; this lever operates a crankshaft, and the shifting mechanism so that the cylinder rod is connected to the proper gear actuating lever. Auxiliary apparatus, consisting of a gauge, compressor control, starter valve, shutoff and tire inflation outlet is mounted on a suitable plate on the dashboard of the machine.

Gray & Davis Starting and Lighting Sets.
Gray & Davis, Amesbury, Mass.

Gray and Davis dynamos are built in two sizes, the smaller of which develops 8½ amperes at 6½ volts and the larger 10 amperes at the same potential. The machine is compound wound, the series field coming into play only when the lights are burning to take care of the additional load which the lights throw on the circuit. The dynamo is of the constant speed type, the speed being controlled by means of a friction clutch which operates on the centrifugal force principle, so that the armature is released when the speed, on the smaller machine, reaches 1,000 r. p. m.; on the larger machine the clutch begins to slip at 700

Digitized by Google

r. p. m. The clutch, which is Raybestos faced, is contained in the instrument itself and provision is made for cooling it by means of radiating fins. An automatic magnetic cut-out serves to disconnect the dynamo from the battery line when the voltage falls below that of the battery; this is a separate unit and is placed on the dash.

The starting motor is a four-pole 6-volt series-wound machine and is arranged to drive the gasolene engine through a pinion which engages with teeth on the periphery of the flywheel. The motor is fully enclosed and will turn the motor over at 100 r. p. m. The system complete with the battery switch and necessary wiring and appendages sells for $250.

Jesco Electric Starters.

Jones Electric Starter Co., Chicago, Ill.

Following the trend toward electrical systems which perform all three functions—of starting, lighting and supplying the ignition current—the Jones Electric Co. has brought out a new system which embraces both the dynamo and the starting motor, as well as the distributor and the quick break device, all in a single unit. As is the case with the other systems which are produced by the same company, and tending toward limiting the total weight of the installation by reducing the battery weight to a minimum, the system works on a maximum voltage of six. The new unit system is made very compact and light and is intended primarily for use on light and medium weight cars. The various other types of Jesco starting and lighting outfits will also be shown, together with a new 6-volt system for heavier work, but in which the ignition function is eliminated.

Kemco Generators.

Kemco Electric Mfg. Co., Cleveland, O.

The Kemco generator is combined with a cooling fan and is intended to replace the cooling fan on the car, the same bracket or special bracket being used for its installation, as the case may be. The generator is all embraced in the hub of the fan, and is belt driven in the orthodox manner of driving the fan. The field is stationary, the armature being arranged on the outside of it; the construction opens the way for rapid dissipation of heat and for large brush contact surfaces, both tending to make the device more efficient. The fan is driven at 2½ times the crankshaft speed and develops its maximum output—15 amperes—at a car speed of about 40 miles an hour. The generator is so constructed that further increase in speed is accompanied by a drop in the output, so that all fear of burned-out generator or bulbs or damage to battery through too high charging rate, is removed. The output of the generator can be regulated to suit the batteries installed, and when batteries are used an automatic cut-out to disconnect the generator when its speed is too low, is supplied. All parts of the generator which can be formed of non-magnetic metal are formed of aluminum for the sake of lightness, the whole device weighing only 10 pounds.

Kellogg Starters and Pumps.

Kellogg Mfg. Co., Rochester, N. Y.

An air starter designed especially for use on Ford cars is the newest Kellogg development. It comprises a pump which forces air to a steel tank carried at any convenient point on the chassis and a cylinder in which is a piston which is attached through suitable connections to the crankshaft of the motor. When air is admitted to the cylinder, the piston is driven toward the other end and power is transmitted to the crankshaft, which is turned over at a high rate of speed. The system offers the additional advantage that the air can be used in the tires.

The regular Kellogg air starter is supplied in three sizes: For light cars, a two-cylinder compressor being used; for medium-weight cars, in which type a four-cylinder compressor is used, and for heavy cars, with which a six-cylinder compressor is used. The system includes simply the pump, a steel air reservoir and a distributing valve which distributes the air to the cylinders; this is built in unit form with the pump. The system has been improved by the fitting of an all-metal pump and the six-cylinder air pump, quite new and revolutionary. Also new in the Kellogg line is a priming device for use in cold weather. The line also includes foot and power pumps, pressure indicators, valve grinders, tire gauges, grease guns and other devices.

Ward Leonard Electric Starters and Lighters.

Ward Leonard Electric Co., Bronxville, N.Y.

Models—Made in various sizes and forms for application to different makes of cars.

Features—Whereas the Ward Leonard system last year was made in but a single size, the new line comprises dynamos and motors in several different sizes and several varying types of mounting, making the set more versatile. The basic principles of the system, however, are unaltered, the governing system remaining intact and comprising simply a single step of resistance which is inserted when the current tends to mount above a certain limit; the resistance is only inserted intermittently, however, by means of a vibrating relay operated by suitable electro-magnets. The greater the current, the faster the vibrator operates and the longer the resistance is in line.

U. S. L. Starters.

U. S. L. & Heating Co., New York City.

While no improvements of a radical nature have been made in the U. S. L. system, minor changes which tend to make the device more nearly ideal for the service have been made. Thus, for instance, while the motor generator still is incorporated in the flywheel, the carbon disk regulator has given way to a simpler regulator which is devoid of mechanical appendages and which is incorporated directly in the machine. It comprises special field windings which make the regulation inherent with the generator. Following the trend toward the production of lighter starting equipment, the voltage of the system has been cut to 12 volts instead of the 24 which formerly obtained, opening the way, of course, for lighter battery equipment. One other minor fitment has been added; it is a hand-operated cut-out switch for cutting the batteries out of circuit when fully charged or when the machine is travelling at high speeds with lamp load off, preventing gassing and overheating of the cells. The U. S. L. batteries have been changed only in the dimensions of the cells, the construction and the capacities of the respective models remaining to all intents and purposes the same.

North East Electric Starter.

North East Electric Co., Rochester, N. Y.

The North East electric starter and lighting outfit will be shown in three new models. Model B is for use in connection with large four-cylinder cars and six-cylinder machines; model D, for use on four-cylinder models with cylinder bores of up to four inches, and a model build expressly for use on Ford cars. The basic principles of all three models are the same, the difference being chiefly in the size and the manner of drive. The model B embraces the use of an automatic gear arrangement, which engages the proper gear for use of the single unit as either starter or charging dynamo. The starting necessitates only the pressing of a button on the dash, which serves to operate the switch, which breaks no main line currents and is therefore free from contact troubles. When the motor starts, the button is released and the gears automatically alter to provide the correct drive for the dynamo. On the other two models, direct drive, through the intermediary of a silent chain driven countershaft is provided. The battery always is charged in series and a neat switch lock is provided to prevent tampering with the mechanism.

Vesta Lighting Outfit.

Vesta Accumulator Co., Chicago, Ill.

The Vesta magneto generator has been improved only in minor details, the size having been reduced slightly and the weight proportionately; the batteries have been improved, however, the plates being made by a new process and the size and shape of the jars altered, while the battery line now includes a full complement of batteries for use in electric vehicle work, which also are made by the new process. The Vesta generator, as heretofore, is governed by means of a simple ring type centrifugal governor mounted directly on the armature shaft, which serves to cut the instrument into the battery circuit when the armature speed is such that the output is about 1 ampere in circuit with the battery. As the speed increases, the output builds up to 9 amperes, when a single step of resistance is inserted by the action of the governor cutting the output down again to 6 amperes, from which it can build up to 9 again. The whole

Digitized by Google

apparatus is enclosed against the ingress of dirt or moisture. A new two-volt electric lighting system, which is similar to the larger type but is made expressly for use on motorcycles, will be shown.

Thurber Starters.

Thurber Rotary Starter Co., Detroit, Mich.

The Thurber starter is a compressed air starter, the air being compressed into a suitable steel cylinder by means of a two-cylinder air compressor, from which it is drawn to a rotary air motor which supplies the starting power. The system has been improved to the extent that the pump and the air motor now are contained in a single unit, necessitating but a single connection to the gasolene motor in place of the two connections which were necessary with the separate unit system; the pump has been made silent in action. Installation is made in very much the same manner as with the electric starters, through the intermediary of flywheel gears, a gear train to the crankshaft or other suitable means. A smaller unit, but exactly the same in principle, which is intended for use especially on Ford cars, is being developed.

Holtzer-Cabot Electric Lighting System.

Holtzer-Cabot Elec. Co., Brookline, Mass.

The Holtzer-Cabot system comprises a variable speed shunt-wound dynamo which delivers its current under normal conditions at 8 volts. The dynamo is substantially a slow-speed instrument and is rugged in construction and adapted to meet any or all conditions. Regulation is inherent, the happy result being brought about by the shape of the pole shoes, so that with speeds above normal part of the magnetic field is deflected and the field strength weakened; a drop in the voltage is the natural result. The Holtzer-Cabot instrument is made with particular care to make the working parts—the brushes and the commutator—easily accessible and is entirely enclosed against the ingress of dust and moisture. It is sold either with or without the storage battery.

Rushmore Starting and Lighting Systems.

Rushmore Dynamo Works, Plainfield, N. J.

Electric lighting systems and combined lighting and starting systems.

The Rushmore generator is of the shunt wound type in which output regulation is governed by a "bucking" coil, the insertion of which in the field, in turn, is governed by the temperature, and therefore the resistance of a small coil of iron wire contained in a housing on the top of the generator. In the combined lighting and starting system the motor is separate and is geared to the gasolene engine through the flywheel. Its gears are automatically thrown in and out of engagement by the depression of a button.

Disco Starting and Lighting Systems.

Disco Co., Detroit, Mich.

Disco electric lighting and combined electric lighting and starting systems. One of the conspicuous features of the Disco always has been narrowness, permitting installation in places where space is scarce. In the dual unit system the generator and motor are mounted one above the other, maintaining the narrow feature. There is but one gear connection with the engine; when the engine is driving the generator the starting motor is freed by an overrunning clutch. A new form of automatic cutout prevents the battery from discharging back through the generator.

Dyneto and Entz Starters.

Dyneto Electric Co., Elbridge, N. Y.

Besides a new electric lighting and starting system, the details of which will not be divulged until the show opens, the Dyneto combined electric lighting dynamo and ignition system will be shown. The dynamo is a slow-speed generator and is fitted with a cutout which disconnects the device from the battery when the voltage drops below the voltage of the cells. The high-tension distributer and a suitable circuit breaker are incorporated in the instrument. The Entz starter also is a Dyneto product.

SIGNALING DEVICES

Tuto, Rexo and Maxo Warning Signals.

Dean Electric Co., Elyria, O.

Tuto horns, which are of the electro-magnetic type, are distinguished by the fact that by proper manipulation of the button either a low tone or a loud, clear warning note is produced. The effect is brought about by the use of a double contact button which is positioned on the steering wheel and which in one position inserts a resistance in the line, reducing the amount of current and lowering the volume of the sound; in the other position, the resistance is cut out and the full blast is produced. Finished either in brass, nickel or black enamel and furnished with the necessary wire, button and brackets, the horn sells for $15.

The Rexo II is designed to take the place of the Rexo horn. The mechanism has been simplified and the cost of production greatly reduced, so that the revised mechanism sells for $3.85. Like the Tuto, it operates on the electro-magnetic vibrator principle, but the two tone feature is lacking. The Maxo II horn likewise is designed to replace the Maxo motorcycle horn and is simplified in the same manner as the Rexo horn and sells for the same price. A special Rexo model for use in connection with Ford cards is also a new product.

Newtone Horns.

Automobile Supply Mfg. Co., Brooklyn, N. Y.

Models—M, N, Torpedo, Superior, Combination, Motophone and bulb.

Motophone—A new model; mechanically operated. Mechanism consists of a push handle, a spring governor and a notched wheel which strikes a button on a diaphragm and vibrates the latter; the governor prevents the wheel from revolving at more than its proper speed, no matter how fast the lever is moved. Price—$12.

Type M—Operated by armature which actuates a notched wheel which strikes a button on a vibrating diaphragm; has long, narrow projector and flared end. Features claimed for all electric types are loud, penerating sound, low current consumption and accessibility. Price—$20.

Type N—Short, flared projector; electrically operated. Price—$18.

Torpedo—Similar to Type M. Price—$20.

Combination—Consists of a bulb horn combined with a Torpedo. Price—$30.

Rubes Bulb Horns—Made in 17 models and sizes; fitted with non-corrodable reeds. Prices—$1.25 to $5.

Klaxon Horns.

Lovell-McConnell Mfg. Co., Newark, N. J.

Hand Klaxon—A new model. Operates on the Klaxon principle of a steel diaphragm set in violent vibration by means of a toothed wheel; toothed wheel is set in motion by a train of gears which receive their initial motion from a hand push rod. Price—$10.

Klaxon—In four types; same vibrating diaphragm principle as in hand horn is employed, except that the notched wheel is operated by a small motor. All electric horns are finished in brass, black enamel, nickel, gun metal, black enamel and brass or black enamel and nickel. Price—$35, with exception of a combination horn, which is $50.

Klaxonet—A smaller horn; four models. Price—$20; combination, $30.

Klaxet—A still smaller horn; in one type only. Price—$12.

Monoplex Signals.

Atwater Kent Mfg. Co., Philadelphia, Pa.

Monoplex horns, which are of the electro-magnet vibrator type, embracing but one moving part which responds to the influence of the electro-mognet setting the steel diaphragm in vibration, are made in two styles—with a long and with a short projector. With a long projector, the horn sells for $10, while the short projector type sells for $8, the mechanism being identical in both cases. The horns are furnished in three finishes—black enamel with polished brass bell; black enamel with nickel bell, and all black enamel. Push button and the necessary cord accompanies the instrument.

Sparton Horns.

Sparks-Withington Co., Jackson, Mich.

Models—D, U, B, J; motor-driven. J and B; lever operated.

Features—In the motor-driven types a notched crown cam on the end of the armature shaft actuates a button on a tungsten steel diaphragm, causing the diaphragm to vibrate and emit a loud sound. Low current consumption and loud sound are claimed. Off-centering of the motor is a new feature. The lever-operated type—

Digitized by Google

known as the Sparton Echo—is the same in its sound-producing mechanism except that a lever actuates the cam. Wearing parts have been made durable and it is claimed that adjustments can be made with a screwdriver without taking the horn apart. A new push button has been brought out for the electric horns; it can be operated by pressure from any direction, thus making it easy for the driver with heavily-gloved hands.

Prices—D, $15; U, $14; B, $10: J, $10. Echo—J, $7; B, $8.

Olympic Horns.

Electric Spark Appliance Co., Inc., New York City.

Models—A, B, C, Ford, and Mechanical. First four are electric.

Features—Electric vibrator horn; sparkless; no spark thrown when magnet comes in contact with the vibrator; no delicate contact points to burn; perfectly insulated; all springs steel-leaved; no parts to break off or work loose; self-adjusting; tuned by turning diaphragm screw in mouth of projector; penetrating, powerful tone; current consumption less than two amperes; ironclad three-year guarantee. Weights, A, 5¼ pounds; B, 5; C, 4.

Prices—A, dash type, complete with button and wiring; black and brass, black and nickel or all black; $7.50. B, hood type; button and wiring; in black only; $6.50. C, Olympic Junior; button and wiring; black and nickel, black and brass, or all black; $6.

Reacto Horns.

Holtzer-Cabot Elec. Co., Brookline, Mass.

Reacto horns are of the hammer blow type, the hammer being actuated by an electro-magnetic device and acting directly on the diaphragm of the horn. The horn is said to be economical of current, and free from trouble and is made in but a single size. Without equipment the signal sells for $10. With push button and the necessary cable it sells for $11.50, while with flexible brass tube to carry the cable up the steering colmun, the price is $12.50. The horn is finished either in black enamel with the throat polished nickel or in black enamel with a polished brass throat.

Sireno Signals.

Sireno Co., New York City.

Sireno signals comprise a motor-driven siren in a casing at the back of the projector. Power to operate the motor is obtained from either dry or storage batteries. The signals are made in a variety of different styles and sizes to accommodate them to all needs.

Gabriel Exhaust Horns.

Gabriel Horn Mfg. Co., Cleveland, Ohio.

Single tube horns are made in four sizes —25, 28, 32 and 34 inches long. Trumpet horns with four tubes are made 28 and 32 inches long. Trumpet horns with four tubes are made 28 and 32 inches in length. The Musical Wonder is made with ten tubes and a keyboard. The horns are easily attached and are claimed to be free from clogging and sooting. The single tube models sell for $15, $18, $25 and $35 each. Trumpet models, $75 and $80. Musical Wonder, $175.

Clero Horns.

Fitzgerald Mfg. Co., Torrington, Conn.

Models—Three. Clero Vibrator, Clero Ford Magneto and Clero Hand.

Features—A new product. Sound in all three is produced by a steel diaphragm which is set in violent vibration. In the first two named models the vibration is effected by electrical means. In the Clero hand horn the diaphragm is actuated by ball-bearing wheels, easily set in motion by a slight pressure of the hand or elbow. Horn contains but one moving spring. Is simple in construction. Is guaranteed for one year.

Pilot Signals.

Nonpareil Horn Mfg. Co., New York City.

The Pilot signal is a mechanically operated diaphragm horn which is operated by means of a hand wheel in one type or through the intermediary of a Bowden wire transmission system in another. The signal is put out with several different projectors, but the mechanism in all models is the same and comprises a revolving cam wheel which actuates the diaphragm. Bulb horns in a variety of styles and sizes also are made.

Jericho and Jubilee Horns.

Randall-Faichney Co., Boston, Mass.

Features—Of the exhaust-operated type; give musical and chime notes; controlled by a heel pedal. Jericho and Jubilee have different musical combinations. Prices—Jericho, $7 to $10; Jubilee, $8 to $10.

A special Jericho for Ford cars have been placed on the market this season. Motorcycle models are provided. Price—$5.

SHOCK ABSORBERS

Truffault-Hartford Shock Absorbers.

Hartford Suspension Co., Jersey City, N. J.

Hartford Cushion Springs—A brand new product. They are of the enclosed helical spring type and are designed to replace the spring shackle on full- or three-quarter elliptic springs and are made in a variety of sizes to accommodate varying widths in the springs and varying diameters of the shackle bolts. They are made in five sizes: For cars of 3,000 pounds or over; for cars between 2,400 and 3,000 pounds; for cars between 1,800 and 2,4040 pounds; for cars of less than 1,800 pounds and special springs for Ford cars. The respective models sell for $35, $30, $25, $20 and $20 a pair.

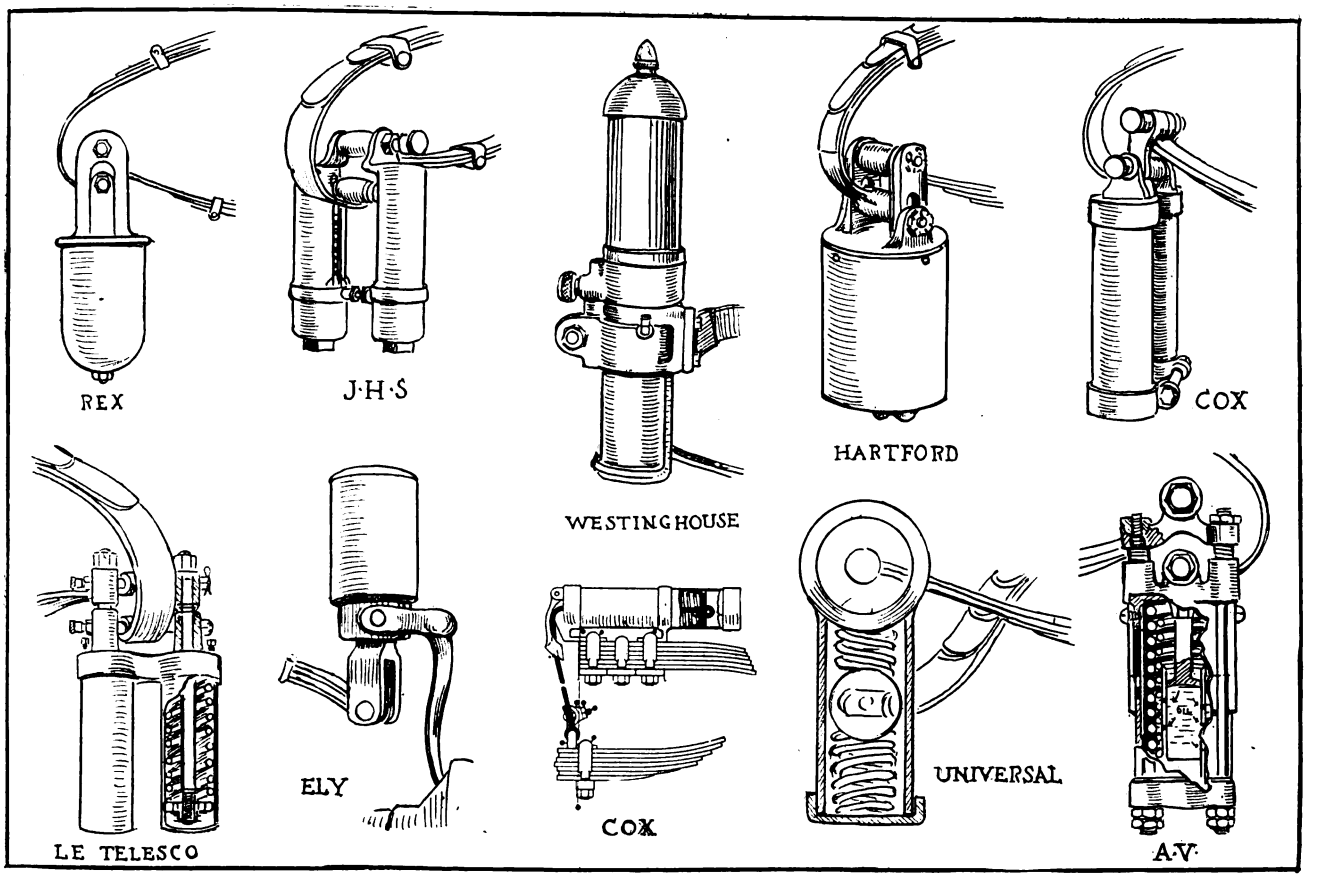
Truffault-Hartford Shock Absorbers—Are made in five sizes, the leader of the line being the new automatic model with three degrees of friction which automatically accommodates itself to the weight of the car. The shock absorber comprises a pair of arms pivoted together at approximately right angles with frictional surfaces interposed, the bearing of the surfaces upon each other being controlled by means of springs. The ends of the two arms are pivoted to the axle and to the chassis frame, respectively, and their resistance to movement in either direction tends to damp out excessive oscillation of the springs. They are easily attached and are trouble-proof. Besides the automatic type, four others are made for cars of the following weights: Over 2,500 pounds; from 1,800 to 2,500 pounds; below 1,800 pounds, and for Fords.

Prices—$60, $50, $40, $25 and $15, respectively, for set of four.

Universal Shock Absorbers.

Universal Shock Eliminator Co., New York City.

Universal shock absorbers are a brand new product. They are intended to replace the link shackles on the rear springs and are made in three forms to accommodate full or three-quarter elliptic springs, or for use in connection with platform springs. In the latter type, the side spring is pintled to a ball which is enclosed in a suitable housing so that the whole makes a ball and socket joint giving very great freedom of movement. The ball is held in place by means of a light helical spring which is contained in a tube which attaches to the housing and which is slotted for the reception of a second ball. The end of the cross spring is pivoted in this second ball. A heavier coil spring also bears down on the second ball and is held in place by means of an end cap over the tubing. The slot in the tubing is sufficiently large to allow plenty of room for the spring action. In the other type the same principle obtains, but a lever attaches to one of the spring ends while the other terminates in the ball, the lever acting directly on the enclosed springs. The absorbers, which are very easily attached in place of the orthodox shackles, sell for $50 a pair.



Cox Shock Absorbers.

Cox Brass Co., Albany, N. Y.

Cox Rebound E-Zer—A new product; consists of a cylinder, enclosing a spring, which attaches to the top of an upper spring near its center; a four-ply, 1¼-inch canvas belt runs out the end of the cylinder and attaches to the center of the lower spring. When the springs are compressed, the spring in the cylinder draws the slack belt in and when the springs tend to rebound the strap retards action. Attaches with special clips. Belt will withstand any weather. Price—$15 per set.

Cox Shock Absorbers—A new product; consists of a pair of cylinders in which two pistons run, a slightly tapered helical spring being positioned between the piston head and the upper end of the cylinder; the cylinders attach to one spring member and the piston to the other; the tapering of the spring is designed to give range of action, the smaller end responding to weaker

Digitized by Google

DIVERSITY IN SHOCK ABSORBERS SHOWING THE TREND TOWARD ENCLOSED SPRING SHACKLE DEVICES

shocks; made for front and rear springs; an original feature is the offsetting of the connecting bar, making it possible for the absorber always to maintain an upright position. Price—$25 to $35.

Rex Shock Absorbers.

Mechaley Auto Co., Stamford, Conn.

The Rex shock absorber consists of a double volute spring within an oil tight case, so positioned that it takes up the up-and-down vibrations of the car; a single steel rod passes through the absorber vertically and a single nut permits adjustment. Is made in different sizes for different weights of cars. An air cushioning device has been incorporated as a new feature, the spring in this model being single volute.

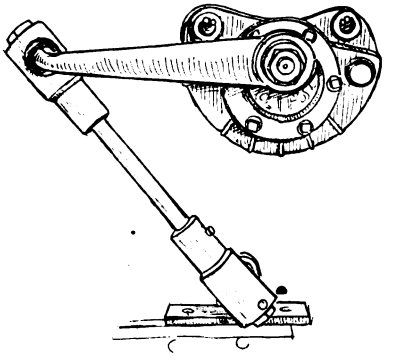
A. V. Shock Absorbers.

Hudson Export & Import Co., New York City.

Made in Europe by A. Vermersch & Cie. and is new in America.

Features—Hydro-pneumatic-spring type. Has two telescoping, air-tight, cylindrical sections, encasing two spiral, concentric springs of different-sized wire, and has inside the springs, attached to the bottom of the chamber and extending half-way to the top, an oil chamber. A piston which attaches to the upper half of the cylinder casing of the device works in the oil chamber. Small passages permit the oil to be forced out of the oil chamber when the absorber is compressed and drawn back in when the absorber is extended; the oil level in the device casing is always at about the height of the small oil cylinder. The springs, pneumatic action and oil all combine to damp out shocks of every proportion. Simple and fool-proof. Easily attached.

Prices—$35 to $55 per pair.



Flentje Shock Absorber.

Ernest Flentje, Cambridge, Mass.

Models—Made in one model to fit all cars.

Features—Consists of a piston working in a cylinder; no springs. Cylinder heretofore contained oil and ground mica, but in 1914 models air and oil have been successfully combined. Also, the valve, piston and stuffing box have been improved. On even roads the air in the cylinder remains on top of the oil, allowing the car springs free play, but on rough roads the oil is forced through a four-port by-pass. Former models contained but two ports. The four ports are opposite each other and on rough roads the oil takes the air from the top of the chamber and in forcing it through the four ports causes it to take a bubble form. This is designed to make the absorber more flexible and automatic than previous models.

Price—$100 for a set of four, attached to the car.

HERZ SHOCK ABSORBER

J. M. Shock Absorbers.

J. M. Shock Absorber Co., Philadelphia.

Models—Four. Model A; two spring containing members and attachable to cars with platform or three-quarter elliptic springs. Model B, single spring containing member, attachable to cars with full- or three-quarter elliptic springs. Model C, adaptable to cars with single springs attached to rigid spring hangers. Model F, for Fords only. Models A and C are made for use on cars up to 2,000 pounds, between 2,000 and 3,000 pounds, and over 3,000 pounds. Model B is made for cars above and below 3,000 pounds.

Digitized by Google

Features—Helical springs enclosed in metal cylinders; resiliency of the suspension increased; easily applied in place of shackle.

Prices—Models A, B, C and F, for light cars, $35 a pair. Models A, B, and C, for medium-weight cars, $42 a pair. Models A, B and C, for heavy cars, $50 a pair.

Velvet Shock Absorbers.

John W. Blackledge Mfg. Co., Chicago, Ill.

Models—No. 1, for cars less than 2,200 pounds; No. 2, 2,200 to 2,800; No. 3, 2,800 to 4,800; No. 6, above 4,800. Ford model, for Ford cars.

Features—Attach in place of the spring shackles; consist of four springs, encased, which take up road shocks. The Ford model is new and is now being placed on the market. Velvets are claimed to be the only absorbers using 16 coils to the set. Neat and compact. Whereas the cases in former models were attached by means of a bolt which passes through the case at the top by way of its shortest thickness, a firmer positioning has been accomplished by the addition of set screws at the ends of narrowest width.

Price—$35 per set.

Gabriel Rebound Snubbers.

Gabriel Horn Mfg. Co., Cleveland, O.

Rebound snubbers comprise a loop of belata belting which goes around the axle and which is wound around a compressible hub held stationary in a casing fastened to the chassis frame. When the belt is slacked by the axle approaching the frame, as in the case of a bump, the hub expands and tends to take in the slack; when the belt is brought taut again, the hub "snubs" the belt, the friction tending to damp the action of the spring on the rebound. The snubbers are put out in five sizes: For cars lighter than 1,400 pounds; for cars between 1,400 and 2,200 pounds; for cars between 2,200 and 3,500 pounds; for cars over 3,500 pounds, and for motor trucks from two to five tons in weight. The prices of the respective models are $25, $30, $35, $40, and $50 a set of four.

Herz Shock Absorbers.

Herz & Co., New York City.

A foreign device, the manufacture and distribution of which has recently been taken up by Herz & Co. Has been used several years abroad.

Features—A cast iron box, containing an inalterable specially compounded substance, is attached to the frame of the car; in this box between two bearings swings a lever to which, on the outside, is attached a lever with a ball socket on the end; a rod connects the socket end to a ball joint fastened on the spring of the car; a small resistance is produced within the cast iron box and a greater resistance is automatically generated by a greater spring oscillation; this ability to meet every vibration with proportionate resistance is claimed as an exclusive feature; holds the wheels to the road.

Le Telesco Shock Absorber.

Le Telesco Co., Baltimore, Md.

Models—Three.

Features—Le Telesco shock absorber is a French product, the American rights to which were secured less than a year ago. It operates on the spring and hydraulic principle. The device consists of two cylinders, the piston rod of which attaches to one spring end and the cylinder to the other. Oil is contained in the bottom of the chamber; the spring is between the piston head and the cylinder head. The first portion of a shock—when the body goes down—is taken up by the spring, while the oil and by-pass effect a slackened reaction. Company claims to have the only spring-hydraulic device on the market.

Price—$50, $55 and $60 per set.

Mondex Shock Absorbers.

Fischer Motor Corp., New York City.

Models—One, for all cars.

Features—Consists of two arms which attach to the axle and side frame and meet at an angle; change of angularity is resisted by the friction of steel and brass disks and compressed rubber. Can be adjusted to wear or to suit conditions.

Price—$50 for set of four.

Company also makes and will exhibit the Mondex-Helix gas saver and a body polish which has been brought out within the last year; the polish is claimed to be not affected by water and to give a luster.

J. H. S. Shock Absorbers.

J. H. Sager Co., Rochester, N. Y.

Features—J. H. S. shock absorbers comprise a piston and coiled spring enclosed in a metal case, containing grease; they have been newly placed on the market by the Sager company; for three-quarter elliptic springs, the absorbers consist of two sets of springs; for Fords and light cars and for semi-elliptic springs one coil is used. Guaranteed for one year from date of purchase.

Prices—Single tube (for Fords only), per pair, $15; per set, $25. On all other cars: Twin tube, per pair, rear, $25; single tube, per pair, front, $15.

Ely Shock Absorbers.

Donnelly Motor Equipment Co., New York City.

For Ford cars.

Features—Consists of a spiral spring encased in a metal cylinder; spring attaches to end of car spring; cylinder attaches to spring seat; takes up all vibrations and renders riding easy; of high-grade steel; finished in specially prepared black rubber; guaranteed for one year.

Price—Set of four, $12.50; set of two, $7.

Ames Shock Absorbers.

Clarence N. Peacock & Co., New York City.

Features—Consists of a reversed three-leaf chrome vanadium steel spring which is attached to the lower spring member at the center; the three reversed leaves are separated from the lower spring member by a spacing block; tend to retard rebound when body of car moves upward through road irregularities; claims to be only absorber utilizing the principle of leaf construction; operates on two contact surfaces.

Price—$45 for set of four.

Westinghouse Air Springs.

Westinghouse Air Spring Co., Pittsburgh.

Device consists of an air chamber made up of two sections, one of which telescopes into the other. The outer section is attached to the car frame by means of a bracket; the inner attaches to the spring. The chamber is partly filled with oil which keeps the chamber air-tight and which also moves through a by-pass, avoiding jerky motion. As the oil collects in the lower part of the spring it is pumped back to the upper part by a pump which is actuated by the spring motion. The air within the spring may be put at any desired pressure by pumping with an air pump. Maximum vertical movement of six inches.

BUMPERS

Hartford Bumpers and Jacks.

Hartford Suspension Co., Jersey City, N. J.

Hartford bumpers are sprung by means of two four-leaf friction spring arms which clamp to the front of the frame, being held solidly in place by a single U-bolt provided with lock nuts. The bar, which is made of steel tubing covered with the brass sheathing for the sake of appearance, is filled with a cement-like composition which is said to add considerably to the strength of the bar and at the same time to prevent the denting of the bar. The bumpers are easily attached and the bars are adjustable simply by loosening a single bolt. Hartford bumpers are put out in four sizes: For cars of 3,000 pounds or over; for cars from 1,500 to 3,500 pounds; for cars below 1,500 pounds and for Ford cars. The prices of the respective sizes are: $20, $16, $12 and $12.

The Hartford jack is of the rack-and-dog type, the rack being on a wheel and the dogs being carried on the lever. Because of the fact that the device is geared with spur gears, the leverage is greatly increased and the labor involved in raising a car considerably lessened. The jack is made of the best materials obtainable for the purpose, is compact and practically indestructible and sells for $6.50.

Sager Bumpers.

J. H. Sager Co., Rochester, N. Y.

Models—Eleven.

Features—Diamond and Protection attach with a special spring shackle bolt; Diamond has a brass bar reenforced with steel which is rectangular in section; Protection has round bar with wood filler; both made in five different finishes. Universal Diamond, Universal Channel and Universal Diamond attach without drilling frame; helical springs are concealed in bracket which supports

Digitized by Google

bar; Universal has round steel bar; Universal Channel a channel bar; Universal Diamond a rectangular bar; each made in four finishes. The Fit-On is a clamp-on type and fits all save Fords; made in three finishes. Simplex, Simplex Channel and Simplex Diamond clamp on and have concealed springs. Packard Special and Ford Special are applied without machine work. Durability and ease of attachment are claimed.

Prices—$7.50 to $27.50.

E. G. Bumpers.

Emil Grossman Mfg. Co., New York City.

Types—Made in 8 models—with 1¼-inch tube bar, 2-inch tube bar, 2-inch channel bar, Swivelaction Clamp-On, Commonsense Clamp-On, Cadillac Clamp-On, Ford Bolt-On and Ford Clamp-On.

Features—Attractive design; sturdiness of construction; clamping types obviate the necessity of drilling frame; adjustable to width of chassis; concealed springs; will not touch tires.

Prices—$5.50 to $15.

Commonsense Bumpers.

William E. Pratt Mfg. Co., Chicago, Ill.

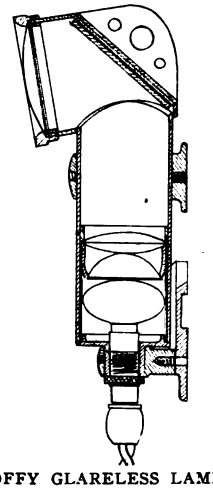
Features—Instead of relying upon a spiral spring, the support is in the form of an "S" spring; claimed better to withstand shock from any direction.

LAMPS

Arbeco All-Glass Lamps.

Reynolds-Browne Co., Chicago, Ill.

Models—B and C.



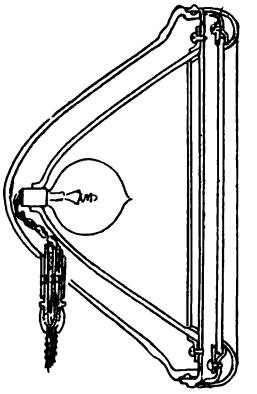
Features—The Arbeco lamp has an inner and an outer shell, both glass, with an air chamber between, acting as a pneumatic cushion; the inner shell is a parabolic, silvered reflector, the silver being on the outside—that is, on the inside of the air chamber between the shells; the enamel of the outer shell also is within the air chamber, thus making it impossible for the finish of the lamp to be scratched off, as is possible with the ordinary way of enameling lamps. The edges of the two cells are set in cement, and an iron bezel—the only piece of metal in the lamp—holds the front glass. The air cushion is claimed to absorb the shocks of vibration and accidental blows. Not only lasting beauty and a neat appearance but efficiency are claimed.

Prices—Model B: 5½-inch side light, $15 per pair; 9-inch head light, $25 per pair. Model C: 6½-inch side light, $18 per pair; 12-inch head light, $40 per pair.

E. & J. Lamps.

Edmunds & Jones Mfg. Co., Detroit, Mich.

Electric head lamp, Model 274, $10; Electric side light; Model 51, $6; Model 52, $5. Electric head lamp; Model 382, $13; Model 374, $10. Electric head lamp; Model 366, $8. Electric side lamp; Model 342, $5.50. Electric side lamp; Model 343, $4.50. Electric tail lamp; Model 21, $3. License holder tail lamp; Model 22, $3.75. Electric dash inset lamps; Model 01, $7.50; Model 02, $7. Gas head lamp; Model 766, $7. Gas head lamp; Model 66, $6. Oil side lamp; Model 6, $7. Oil tail lamp; Model 7, $350. Truck lamp; Model 19, $5.50. Oil side lamp; Model 30, $3. Oil tail lamp; Model 10, $3.25. Electric searchlight; Model 2,740, $17. Electric connectors and plugs. Five per



ROFFY GLARELESS LAMP

cent. extra for black enamel and brass; 10 per cent. for black enamel and nickel; 15 per cent. for full nickel.

Gray & Davis Lamps.

Gray & Davis, Amesbury, Mass.

Electric headlights are made in a single type and in four sizes: 9½, 10¼, 11⅜, and

ARBECO GLASS LAMP

12⅜ inches in diameter. On all of the models provision is made for easily shifting the bulb to focus the lamp, a small screw mounted over the reflector and accessible when the door is opened being provided for the purpose. The screw shifts a lever which, in, turn, shifts the bulb forward or back, according to the direction of rotation of the adjusting screw. The prices are $10, $12.50, $15 and $17.50 for the respective models. The electric side lamp is 6⅛ inches in diameter and sells for $6. Decorative limousine lamps, flush dash lamps, tail lights, searchlights, sign lights and a full line of gas and oil lamps are also included in the line; likewise and for the first time a motorcycle lamp.

B. & L. Lamps.

B. & L. Auto Lamp Co., New York City.

New designs which have been added are: Electric headlight, French type body, with octagon front; prices, $9 and $11.50. License tail lamp; $5. Electric tail lamp, torpedo type; $2. Electric spot-light, torpedo type, diamond door; $10. Four motorcycle lamps.

Line includes: Four models of electric headlights, $6.50 to $11.50; four electric side lights, $4 to $5.50; two searchlights, $9.50 to $11; two dash lamps, $2 and $5; four electric tail lamps, $2 to $5; four gas headlights, $5.50 to $22; one gas searchlight, $9.50 to $10.50; seven motorcycle lamps, $3 to $6.50. Company features the harmony of design in its sets of head, side and tail lamps.

Roffy Glareless Headlights.

Roffy-Grace Corporation, New York City.

Models—Two. For attachment to dash or radiator.

Features—A new product. Main body is tubular and vertical; at the bottom is a mushroom-shaped tungsten electric bulb, above which is a condensing lens, above the latter being a double combination projecting lens which throws the light on a French reflecting mirror set at an angle in the top of the lamp; the mirror reflects the light forward and downward through a plano-convex lens; light is cast over a restricted but sufficiently large and well-defined area; light does not strike the eyes of a pedestrian directly, but is sufficiently illuminative.

Solar Lamps.

Badger Brass Mfg. Co., Kenosha, Wis.

For the 1914 season this company is presenting several new styles of lamp, offering original designs. The line includes gas and electric head lamps, gas and electric swiveling searchlights, electric and oil side lamps, electric and oil tail lamps and generators.

Features—Lustre of finish; double ray projection and eclipsing; short focus lead glass lens mirror; quality and attractive design of models and durability. Many lamps are made to special order to harmonize with lines of different cars.

Jaco Lamps, Horns and Mirrors.

J. Alexander Mfg. Co., New York, N. Y.

Electric lamps in a variety of styles and sizes for automobile illumination will be shown, including a new "sign lamp" which is intended to attach to the side bar of the windshield and is so swiveled that it can be directed either up or down or to either side, so that the beam can be utilized for illuminating the road signs. A short handle at the back of the lamp, which is of torpedo shape, serves for turning the device. The Jaco horn is of the "buzzer" type and is claimed to produce a loud tone on a very small current consumption.

Digitized by Google

Sol Lamps and Fittings.
Hawthorne Mfg. Co., Bridgeport, Conn.

Old Sol lamps are made in a variety of forms and sizes for both automobile and motorcycle use. For the motorcycles, acetylene generators and a new storage battery lighting outfit also are shown.

Neverout Lamps and Fittings.
Rose Mfg. Co., Philadelphia, Pa.

Neverout lamps are made in all shapes and sizes for use with both oil and electricity. License tag brackets and a radiator heater also will be shown.

SPEEDOMETERS

Elyria-Dean Speedometers.
Dean Electric Co., Elyria, Ohio.

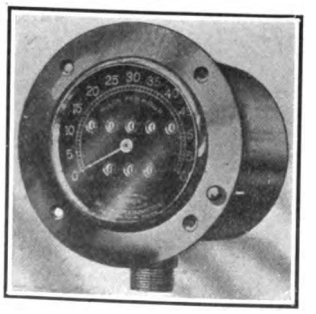
Elyria-Dean speedometers operate on the centrifugal principle, four steel balls which are held in a raceway under an inverted cup tending to fly outward when the shaft is rotated, and in doing so they contact with the curved sides of the cup and it is raised as a consequence. The contour of the cup is such that the cup is raised an equal amount for equal changes in speed of the vehicle, regardless of the fact that the force tending to move the balls increases as the square of the speed. This being the case, the divisions on the dial are equal and the reading of the instrument is facilitated. Also tending toward the same end is the non-reflecting coloring of the dial. The instruments incorporate the usual season and trip odometers, and the resets which facilitate the keeping of records on trips or in touring.

Stewart and Warner Speedometers.
Stewart-Warner Speedometer Corp., Chicago, Ill.

Two new models are included in the Stewart line of automobile speedometers. One model, which enters into combination with clocks and lamps and is provided with either bracket or flush mountings, is known as the B-Z type; is somewhat similar to what was Model C, but with improvements. The improvement includes the fitting of a heavier magnet which opens the way for the employment of a larger dial and the use of larger and more easily read figures and at the same time the elimination of all tendency for the dial to "float." The other new model, which is known as Model G, is entirely new. It is similar to the B-Z model and enters into the same combinations with the clocks and with the lamps, but it is slightly smaller, having a four-inch dial; it sells for $40 plain, whereas the B-Z type sells for $50, when not in combination form.

Also new in the Stewart line is a hub odometer, which is designed to match the hub on the car and which reads to 10,000 miles. The dial is recessed slightly in the hub to guard against accidental breakage. The odometer is put out in practically the same form for use on motor trucks. It sells for $15. A motor boat tachometer and a cream separator "speedometer" also are new to the Stewart line.

The Warner line has been improved slightly by the provision of direct drive odometers on Models 30 and 50; on Model



WARNER FLUSH AUTO-METER

30, the new odometer supplants the Veeder mechanism which formerly was used, and its use opens the way for the employment of larger and more legible indicating figures. On the model 50, the direct drive odometer replaces the ratchet driven one which formerly was used. Either of the models can be had in either vertical or horizontal clock combinations combined with either Chelsea or Waltham movements, and either can be had either plain or in combination with the flush mounting.

Corbin-Brown Speedometers.
American Hardware Corp., New Britain, Conn.

Save only for the adoption of a flush mounted type to fill the demand for that sort of an instrument, and the development of a new front drive for the motorcycle speedometer, Corbin-Brown speedometers remain unaltered. For automobile use, they are made in eight models, as heretofore.

CORBIN-BROWN FLUSH TYPE

which combine with clocks to make double that number. Model A has a three-inch dial, reads to 60 miles, and has a season odometer; model B is practically the same but is an inch larger in diameter and has a trip odometer; model C is similar save that a maximum hand is provided; model D is the same but also has an electric light; model E has season and trip odometers and reads to 80 miles; model F is the same as E, save that it mounts a maximum hand; model G mounts both the maximum hand and the electric light; model H reads to 100 miles, has season and trip odometers and electric light. Chelsea clocks are used in all the combinations. The prices range from $25 for model A to $120 for model H; the motorcycle model sells for $15.

Veeder Odometers and Tachometers.
Veeder Mfg. Co., Hartford, Conn.

Besides a more or less complete line of the regular Veeder odometers, liquid tachometers and liquid speedometers, the new Veeder hub odometer will be shown. The instrument is made considerably more compact than the former model and is driven by the revolution of the wheel, the odometer actuating shaft being held stationary by means of a pair of "lazy tongs" which engage with a slot in the axle of the wheel and which are adjustable to fit varying axle lengths. The dials in the instrument revolve on comparatively small shafts or studs, thereby reducing friction and wear to a minimum. The dials are locked so that they cannot be turned save by the proper mechanism, the purpose being accomplished by means of the orthodox Veeder Geneva construction. The device reads up to 100,000 miles. The shaft is made of polished steel and is journaled in bronze or composition bearings and a packing gland prevents the axle grease from working into the recording instrument.

Standard Speedometers.
Standard Thermometer Co., Boston, Mass.

Models—24 automobile and 3 motorcycle speedometers. Automobile models range from 40 to 100 miles in dial readings, with and without clocks. Three- and 4-inch faces. Motorcycle models have 3-inch faces and read from 60 to 80 miles.

Features—Centrifugal principle. Sliding-weight governor; evenly spaced dial; within 2 per cent. of absolute accuracy; driving gear with five-pitch teeth, affording excellent action and wearing qualities; ball bearing ends on flexible shaft; extra wide flanged swivelling surfaces on pivot joints, which, it is claimed, may be run quite loosely without seriously affecting alignment of pivot gears; disk type odometer with extra large figures. Principal change in construction is the use of nickel steel instead of ordinary steel in gears and bearings.

Prices—Range from $25 to $95 for automobile models and from $12 to $16 for motorcycle models.

Hoffecker Speedometers.
Hoffecker Co., Boston, Mass.

Made in a variety of styles and sizes, with either bracket or flush mountings and in either side or vertical combination with clock. The device operates on the centrifugal principle and is novel in that the governor requires no compensating springs. The shocks which would tend to cause the

Digitized by Google

hand to "wobble" are absorbed within the instrument itself.

American Taximeters and Instruments.
American Taximeter Co., New York City.

Recordograph—A new instrument; a device which records the movements of a vehicle, including distance traveled, time stopped and started, time of all stops, and speed at all times of day. Designed to permit owners of commercial vehicles to have a record of car movements. Makes record on a tape.

Tail and License Lamp—A new device; consists of a combined tail lamp and license bracket, so arranged that tail lamp also illuminates the license number.

Taximeters—Company also will exhibit its line of taximeters; these are made up for the most part to meet the special requirements of different cities.

Pierce Speed Controller.
Pierce Speed Controller Co., Anderson, Ind.

Pierce speed controllers and Pierce motor controllers are intended to limit the speed of the vehicle and the speed of the motor respectively. In either case a flywheel governor is caused to rotate and the governor acts to close the throttle when the speed reaches the maximum. In one case the governor is driven by the road ball governor is caused to rotate and the while in the other it is connected to the motor and limits its speed. The governor is entirely enclosed and is adjustable.

TIRES AND TUBES

Overman Tires.
Overman Tire Co., New York City.

Types—Cushion and pneumatic cushion tread.

Features—Cushion tire; consists of tire with small opening through center and cuts in tread and sides to permit flow of rubber under road pressure. The Pneumatic Cushion Tread tire is a new product. In this provision is made for the regular sizes of inner tube, but the tread is of unusual thickness, protecting the fabric and giving long tire life. Claimed to be the only tire in which the non-skidding feature is built in and not an added element. Cushion tires guaranteed for 10,000 miles; pneumatic cushion tires for 5,000 miles.

Essex Tubes and Specialties.
Essex Rubber Co., Trenton, N. J.

Essex Red Rubber Tubes—A new product. Made of high-quality rubber and fitted with Schrader valves and caps. Thick walls; 3 and 3½-inch sizes are 3/32-inch thick; 4-inch sizes and larger, ⅛-inch. Price of 34 x 4 size, $6.55.

Essex double blow-out patches, $1 to $2. Essex inside blow-out patch, Style C, 48 cents to $1. Style D, 50 to 70 cents. Style A tire sleeve, 35 to 55 cents. Style B blow-out patch, 40 to 50 cents. Style E, unvulcanized shoe liner, 28, 56 and 70 cents. Laced outer boot, $1 and $1.40. Style H, hook-on boot, $1.50 to $2.50. Style H tire plaster, 12 to 36 cents. Essex Standard Reliner, $3.30 to $7.45. Asbestos metallic gas engine packing, 78 and 80 cents a pound. Pyramid matting, 50 cents a pound. Hose, generator tubing, goggles, asbestos brake lining and rubber spring bumpers.

Prowodnik Tires.
Columb Tyres Import Co., Inc., New York City.

Manufactured by the Russian-French India Rubber, Guttapercha & Telegraph Works, of Riga, Russia. Imported by the exhibitor.

Features—High quality and reasonable price are claimed because of manufacturing facilities in Riga and the material put into the tires. India rubber is used. The Prowodnik is a plain tread; the Prowodnik-Columb is the company's non-skid, which is claimed to be efficient because of the angular "slashes" on the tread. A steel-studded non-skid is made, also.

Prices—34 x 4, Columb, $42.80; 34 x 4, steel studded non-skid, $47.50; 34 x 4 tube, $8.40.

Interlock Inner Tires.
Double-Fabric Tire Co., Auburn, Ind.

Interlock Inner Tires—An inner tire in which overlapping flaps protect the tube from the rim, cause the Interlock to lock at this junction and to be held firmly in place on the rim. Prevents chafing of tube and strengthens the tire walls, thereby giving increased mileage. Prices—28 x 3, $4.50; 42 x 5½, $18.75. For motorcycles, $3.

Besides this product, the Double-Fabric line includes Junior moulded patches, Hook-on outer boots, Lace-on outer boots, Jumbo double-length outer boots, Leader inside blow-out patches, Vulco blow-out patches, reliners and Endless inner shoes.

Cataract Tires.
Cataract Rubber Co., Boston, Mass.

Automobile and truck tires; gray and Invincible red tubes. Carcass is made of plies of combed Sea Island fabric, 17¼ ounces, with a breaking strength of 430 pounds to the square inch; fabric is strengthened with Upriver Para rubber; perfect flux; double breaker strip; wrapped tread; single cure; built by Thropp system; guaranteed for 4,000 miles.

Miller Tires.
Miller Rubber Co., Akron, O.

Plain and non-skid treads; red and gray tubes. One-cure, wrapped tread; best rubber; heavy layers of rubber between the plies of fabric. Non-skid adheres to the road. Tubes made of best quality rubber. Also a full line of tire sundries—reliners, blowout patches, etc.

Thermoid and Nassau Tires.
Thermoid Rubber Co., Trenton, N. J.

Types—Clincher and Dunlop; plain treads. Merit red inner tubes.

Features—The Thermoid De Luxe, the leading brand of this company, is guaranteed for 4,000 miles; comes in plain tread only and is furnished for any standard rim. Nassau tires are guaranteed for 3,500 miles. Merit tubes are made of high-quality red rubber.

Globe Tires.
United & Globe Rubber Mfg. Cos., Trenton, N. J.

The Globe line comprises extra heavy tires and inner tubes which, because of the amount and quality of the materials which enter into their construction, are said to give exceptional service. Also shown by the same maker is a full line of repair stocks, together with a line of Globe brake lining.

Dykes Tire Reliners.
J. L. G. Dykes & Co., Chicago, Ill.

Dykes reliners have been improved and strengthened for the coming season; it is claimed they remain firmly fixed when placed in a tire; they are guaranteed.

Marathon Tires.
Marathon Tire Sales Co. of New York, New York City.

Made of Sea Island fabric; tough tread stock; only new gum and rubber used; red tubes are included in the line; made by hand only; also motorcycle tires.

Braender Tires.
Braender Rubber & Tire Co., Rutherford, N. J.

Braender plain treads; Bull Dog Non-Skid tires; red and gray tubes with patchless valve base; base is reinforced and made integral with tube.

NON-SKID DEVICES

Weed Chain Tire Grips.
Weed Chain Tire Grip Co., New York City.

Dobbins Blow-Out Chains—A new device. Consists of a mesh of cross chains, about four in number, which are anchored at each tire bead to a metal casting; these castings, or bases, are attached at the tire base and a heavy patch is placed over the tube at the point of blow-out; it is claimed that many miles can be obtained with this device before a vulcanized repair is necessary; however, they are intended more as an emergency repair device; easily attached; for clincher and straight-side tires. Prices, including patch—For 3 and 3½-inch tires, $1 each; for 4 and 4½, $1.50 each; for 5, 5½ and 6, $1.75 each.

Lyon Grips—The manufacture of this product was recently taken over by the Weed company; device is designed for use on solid tires; consists of a series of four solid cross bars and side bars which bolt together at the side; surfaces are concaved to afford traction on ice and snow; easily attached; adjustable for wear; cannot cut

Digitized by Google

tire. Prices—Single tires, $11 to $26; dual tires, $20 to $40.

Weed Chains—Consist of a side chain encircling the tire at each bead and connected at short intervals by cross chains; creep, therefore, cannot remain in one spot and cut tire; afford traction on all occasions; light weight; neatly and cleanly packed in canvas bags; adjusters are provided, consisting of a spring combination across face of wheel, which holds chains to tread, but not too tightly to prevent creeping. Prices—28 x 2½ to 40 x 6 tires, respectively, $3.50 to $15 per pair. Cross chains, 5 to 18 cents each. Adjusters, $1 and $1.50 per pair. Motorcycle chains, $2.50 to $3. Cross chains, 6 to 10 cents. A line of chains called Rid-O-Skids is provided at a slightly less price; the main difference is that these are not brass-plated, while regular Weeds are brass-covered.

Woodworth Treads.
Leather Tire Goods Co., Niagara Falls, N.Y.

Models—Made to fit all standard tires.

Features—A new "double grip" tread intended for use on ice and snow and provided with sharp studs to provide a gripping surface, and a new motorcycle tire grip which can be attached without removing the wheel from the machine are being featured. The method of attaching the treads to the tires by means of exposed helical springs is new and is said to be distinctive; it facilitates the fitting of the treads and also their removal, yet it is impossible for the wheel to shed the leather covering.

TANKS AND PUMPS

Stewart Pumps.
Stewart-Warner Speedometer Corp., Chicago, Ill.

Stewart air pumps are a new product. They are made in three sizes—a single pump of the diaphragm type, a two-cylinder pump and a four-cylinder pump, all being intended for application to the motor to serve either to compress the air necessary for the operation of an air starter, or for tire inflation. The cylinder pumps have a bore and stroke of 1 7/16 and 1⅛ inches, respectively, and are made for either air or water cooling. The four-cylinder model measures 8 x 4 x 7 inches and the two-cylinder type about half that length. The pistons are provided with tight-fitting ground piston rings which prevent the passage of oil to the air hose and as an extra precaution against air entering the tires, an oil separator is inserted in the air line. Splash lubrication is adhered to and the inlet valves are in the form of ports which are uncovered by the piston on its down stroke. The exhaust valves are in the head, are ground to a perfect fit and held in place with stiff springs. A gauge, ten feet of tubing and a crank for use in case the machine is to be hand driven, accompanies the device. The four-cylinder model sells for $25, the two-cylinder model for $20 and the diaphragm pump, $25.

Brown Pumps.
The Brown Co., Syracuse, N. Y.

Virtue Foot Pump—A new product. Durable and simple; double acting; leather valves, no springs; smooth action; pressure of 200 pounds to the square inch can be exerted with two fingers of one hand; outer cylinder of heavy tubing, making denting unlikely; can be readily disassembled. Price, $3; gauge, $1 extra.

B'Co Spark Plug and Spark Plug Pump—Plug has a core which is removed by a half turn; impulse tire pump is inserted in place of the core. For any four-cycle motor. Price, $15. Plug and connections, $2.

Brown, Jr., Tire Pump—For Ford cars; a new model; screws in in place of regular spark plug; or for $1 over list a B'Co quick detachable plug and connections can be secured. Price, $7.

B'Co Gasolene Vulcanizer—Attaches to tire or tube; weighs 3 pounds; simple in operation. Price, $2.

The impulse tire pump and quick-detachable plug is claimed as an exclusive feature of the Brown line. Company also makes a headlight deflector, priming plugs for Ford cars, and a four-cylinder opposed air pump, which is new.

B. B., Minimax and Universal Pumps.
Herz & Co., New York City.

The B. B. pump is a double cylinder air-cooled compressor designed to attach to the motor for use in connection with an air-starting system or for pumping up the tires. Its speed is 375 revolutions a minute and it will store air under any pressure up to 200 pounds a square inch, a safety valve being provided which can be regulated to open at the required pressure. The pump is splash lubricated and can be belt or chain driven, according to conditions. The Universal pump is a single cylinder friction tire pump, which is brought into play by causing its frictiton wheel to contact with the flywheel of the motor when the latter is in operation. The Minimax pump is a portable garage inflation set comprising an electrically driven compressor mounted with the requisite gauges in a hand shop wagon. The tank is provided with a safety valve and an automatic cut-out serves to stop the electric motor when the pressure in the tank attains the desired point. Suitable tubing is provided with the outfit.

Abell Tire Pumps.
Standard Thermometer Co., Boston, Mass.

Models—One attachable to engine and one portable for garage use.

Features—Both pumps have three cylinders. Ball bearing drive; emulsified oil does not become mixed with the air which is pumped into the tire. Close piston fit. Can be run at 500 revolutions per minute and at this speed will pump a 34 x 4 tire to 75 pounds in 60 seconds. The garage pump mechanism is the same as that of the engine pump, but is operated by a ¼-horsepower electric motor from a lamp socket. Will inflate a 34 x 4 tire to 80 pounds in two minutes. For both are claimed lightness, compactness, durability and efficiency. Both are water-cooled.

Prices—Engine pumps with hose and gauge, $25 and $30. Garage pump, $100.

Imperial Pumps and Specialties.
Imperial Brass Mfg. Co., Chicago, Ill.

Imperial Air Pumps—2 D, brass barrel, 5 x 1¼ inches; round handle; price $4. 3 D, same as 2 D, except 8 x 1½ inches; price, $5. 4 D, same, except 10 x 1½ inches; price, $5. 8 D, same as 3 D, except tee handle; price, $5. 9 D, brass barrel, 5 x 1½ inches, three-way cock; price, $6. Imperial-Wixon hand pumps; $5, $6 and $8.50.

Imperial Oil Pumps—1 D, glass barrel, 4 x 1½; $6.50. 5 D, celluloid barrel, 13/16 x 3½; round handle; $5. 7 D, brass barrel, 8 x 1½; $5.

Line of priming cups, copper tubing, gasolene cocks, gasolene shut-off cocks, needle valves, solderless couplings, solder connections, flared tube unions, compression couplings, pipe fittings, hood fasteners, gasolene strainers, grease cups and accelerator pedals.

Master Tire Pumps.
Hartford Machine Screw Co., Hartford, Conn.

Models—Two; single and double cylinder.

Features—The pump is a single-stage, air-cooled, fully enclosed unit and is distinguished by the fact that the pistons are devoid of piston rings. The advantage claimed for this construction is that the oil—the pump is splash lubricated—cannot work past the piston and pass with the air into the tire. The two-cylinder model, it is claimed, will inflate a 37 x 5-inch tire to 100 pounds pressure in 2½ minutes, while the smaller model will inflate a 34 x 4-inch tire to 85 pounds in three minutes, the revolutions per minute in each case being 600.

American Fuel Pumps and Tanks.
American Tank & Pump Co., Cincinnati, O.

Models—Measuring pumps are made in six styles, two of which are for curb dispensing. Ordinary pumps and underground tanks are made in a variety of sizes and styles to suit individual needs. A portable 50-gallon tank mounting a measuring pump also is made.

Features—The feature of the line is a new double-acting pump providing a continuous flow of the liquid and on which all of the valves are readily accessable. The pump measures the liquid as it is transferred and is adaptable for either long or short distance work. The double acting feature is said to be new and exclusive to American products.

Bowser Pumps and Tanks.
S. F. Bowser & Co., Ft. Wayne, Ind.

Types—Sidewalk, garage and portable.

Features—The Red Sentry sidewalk pump which was placed on the market a

Digitized by Google

year ago has a new electric lighting attachment which lights up a "Gasolene" sign and also throws light down upon the pump, making plain its readings and operations at night. Another new product is a five-gallon plunger pump with intermediate stops and a quick return feature; meter reads up to 100,000 gallons. Pumps are built of heavy metal, are neat and graceful in design and occupy a minimum of space. They are trimmed in black and red and nickel. A one-gallon, quick-return pump is also new. The remainder of the line includes a variety of fixed and portable pumps and oil and gasolene storage systems.

Wayne Pumps.
Wayne Oil Tank & Pump Co., Fort Wayne, Ind.

Models—Portable gasolene pumps and stationary pumps for interior and sidewalk use. Oil and gasolene storage systems.

Features—Quality and up-to-dateness is featured. Accuracy of gasolene measuring pumps is emphasized; one sidewalk model is painted red and is surmounted by an electric lamp and globe, a sign on the globe reading "Filtered Gasolene." The Wayne Oil Storage System protects the oils from dirt and dust and provides a means for the easy handling of barrels. A pump for each demand of the garage will be exhibited.

Mayo Tire Pumps.
Mayo Mfg. Co., Chicago, Ill.

"Skinner" tire pumps and Mayo impulse pumps. The latter are intended to be inserted in the spark plug opening, the free piston in the pump operating in accordance with the pressure in the motor cylinder, compressing pure air into the tires.

TIRE SUNDRIES

Newmastic Tires and Newmastic Rims.
Newmastic Co., New York City.

Newmastic is a composition for filling the inner tube of a tire, which is said to be extremely resilient, and to be unaffected by temperature changes or moisture. It is injected into the tire which, once treated, needs no further care until it is worn out. No-felloe rims are made with a demountable felloe which also mounts the rim. In case of tire trouble, the whole wheel felloe is detachable from the spokes with a minimum of labor and another felloe bearing a perfect tire attached in its place.

Tire Repair Materials.
Charles O. Tingley & Co., Rahway, N. J.

Blow-out patches, vulcanizing fluids, Gum gum, valve bases, Gum Gum and vulcanizing fluid sets, tire solder sets, concentrated cement, red rubber gas tubing, lamp connectors, soapstone, iron work varnish, rubber rougheners, top dressing, waste, tire tape, rim shellac, rim cement, tire plugs, Diamond aluminum and Special rubber cement.

Tire Repair Materials.
Paul G. Niehoff & Co., Chicago, Ill.

Century reliners; Nemo hard rubber air-drying enamel, gloss black and dead black; Nemo enamel leather dressing; Nemo radiator cement; Nemo mohair top waterproofing; Nemo tire life.

Narco Tire Repair Materials.
National Rubber Co., St. Louis, Mo.

The National line includes cement, tire cut fillers, rubber reviver and rubber refinisher; is marketed in small cans for the use of the individual car owner.

Shaler Vulcanizers.
C. A. Shaler Co., Waupun, Wis.

Electrick vulcanizers, which operate on electricity, and various other steam vulcanizers, both portable and for garage use, in many models and sizes.

Edelman Gauges and Fittings.
E. Edelmann & Co., Chicago, Ill.

Tire and gasolene gauges, priming cups, grease cups, gasolene tank couplers and reducers, radiator drain cocks, relief cocks, screwdrivers and hydrometers in several models and sizes.

Ideal Sleeves and Casings.
Voorhees Rubber Mfg. Co., Jersey City, N. J.

Ideal sleeves and casings for prolonging the life of tires; made of standardized, high-grade material.

Schrader Tire Valves.
A. Schrader's Son, Inc., New York City.

Schrader tire valves are made in a variety of styles, both plain and incorporating Twitchell pressure gauges.

United States Gauges.
United States Gauge Co., New York City.

Invincible tire testers; gasolene, oil and pressure gauges; tire pump gauges; compressometers; sight feed oil gauges.

Tire Repair Materials.
Hall-Thompson Co., Hartford, Conn.

Tire cement, tire paint, patches, etc. Polishes, soaps and similar materials.

OILS AND POLISHES

Dixon's Graphite Lubricants.
Joseph Dixon Crucible Co., Jersey City, N.J.

A special lubricant for each use. A flake graphite. High price and high quality are featured. Product includes: Motor Graphite, for general lubrication; in ½-, 1- and 5-pound tins. No. 677, for transmissions and differentials; in 1-, 5- and 10-pound tins. No. 676, for parts of great heat; in 1-, 5- and 10-pound tins. Graphite Cup Grease, No. 3 and No. 5, for bearings; in 1-, 5- and 10-pound tins. Graphite Wood Fibre Grease, for noisy gears; in 1-, 5- and 10-pound tins. Graphitoleo, for packing bearings and housings; in 1-, 5- and 10-pound tins and 8- ounce tubes. Graphite Motor Chain Compound; 3-pound cakes. Chain Graphite, No. 678; in bars, 2 x 8 inches. Graphite Pipe-Joint Compound; in 4-ounce tubes and 1- and 5-pound tins.

Gargoyle Mobiloils and Greases.
Vacuum Oil Co., New York City.

Vacuum products include a line of lubricants for every make of car, the Vacuum company recommending a specific lubricant for each individual case.

Features—Quality and efficiency are claimed, the result of long experimentation. The line includes: Gargoyle Mobiloils, A, B and E, for cylinders; price, 55 cents to 80 cents per gallon, according to quantity. Mobiloil C, for transmissions and differentials; 35 to 60 cents. Mobiloil D, for steam automobiles: 65 to 90 cents. Mobiloil Zeta, Light, Medium and Heavy; medium priced products; 40 to 70 cents. Mobilubricant, Motogrease and Autosponge; for use in transmission, differential and other gears.

Acheson Graphites and Lubricants.
International Acheson Graphite Co., Niagara Falls, N. Y.

Graphcoat—A graphite mixed with a quick-drying, fluid carrier for use on rims and springs; applied with a brush; prevents sticking after parts have been in contact for long lengths of time; requires no painted surface as ground work; will not cake, gum or attract or hold dirt; not affected by temperature. May also be used on bolt threads, pipe joints, etc.

Oildag—Claimed to be the only lubricant containing deflocculated graphite suspended in oil.

Gredag—Claimed to be the only grease containing pure Acheson Graphite.

Tulc.
Universal Lubricating Co., Cleveland, O.

A petroleum lubricant; made in seven grades; for use wherever a heavy consistency lubricant is required; will work satisfactorily at 340 degrees Fahrenheit or 40 degrees below zero; is economical; contains no acid and no filler; will not harden; leaves no residue or gummy substance; its low moisture makes it a rust preventive.

Polishing Cloths.
Gem Supply Co., Waterbury, Conn.

Features—Consists of a chemically treated cloth for dusting and polishing automobile bodies and other similar surfaces; chemical treatment has been improved; claimed to be the only cloth which will adapt itself so satisfactorily to a wide range of uses.

Harris Lubricants and Body Soap.
A. W. Harris Oil Co., Providence, R. I.

Harris motor cylinder oils are made in three consistencies—light, medium and heavy; Transcompound, a lubricant for gearsets and differentials, which is said to be an oil reduced to the consistency of grease and not grease, is made in a single

Digitized by Google

weight. All of the lubricants are refined from the best grade of Pennsylvania crude oil and are not acid treated. The body soap, which is free from alkali or other substances injurious to the paintwork, is a new addition to the Harris line.

Frazer Lubricants.
Frazer Lubricator Co., Chicago, Ill.

All kinds of lubricants for motor car use; company features the fact that its business dates back to the early part of the last century, when it had its inception in a small axle grease industry. Quality of products is a claim.

U-Kan-Plate Silver Polish.
A. R. Justice Co., Philadelphia, Pa.

U-Kan-Plate is a polish which may be applied to brass, copper or German silver surfaces, and when rubbed down will give a silver-like finish. Is especially convenient for refinishing old parts.

Havoline Oils.
Havoline Oil Co., New York City.

These oils are made in various grades and with various characteristics to suit different motor and other conditions.

Features—Non-carbonizing and does not harden or gum up.

Non-Fluid Oils.
New York & New Jersey Lubricant Co., New York City.

"K-000" oil for grease cups, differentials, universal joints, etc. "K-00" oil, a special grade for use in transmissions.

Albany and Cook's Lubricants.
Adam Cook's Sons, New York City.

Line includes Albany grease, Albany oils and Cook's lubricants. Albany oils are being put out for the 1914 season in a new package.

Panhard Oils and Greases.
George A. Haws, New York City.

Panhard cylinder oils, gear lubricants and greases.

Features—Will not carbonize or congeal.

Baum's Automobile Body Soaps.
Baum's Castorine Co., Rome, N. Y.

Product is a soap for washing automobile bodies; claimed to be neutral; will not injure paint or varnish; produces good lather and makes cleaning easy.

Mobo Auto Cleanser.
John T. Stanley, New York City.

Mobo is a cleansing material for use on automobile bodies; especially effective in removing grease and dirt. The line also includes other soaps and polishes.

Oilzum Lubricants.
White & Bagley Co., Worcester, Mass.

Oilzum products include several grades of cylinder oils; transmission lubricants; fibrous lubricants; cup lubricants; gear lubricants; oil soaps.

Amalie Lubricants.
L. Sonneborn Sons, New York City.

Amalie lubricants include oils, greases and soaps; a product is produced for practically every automobile use.

Blue Ribbon Metal Polishes.
International Metal Polish Co., Indianapolis, Ind.

Polishes for all finished metal surfaces.

Soaps and Polishes.
J. Eavenson Sons Inc., Camden, N. J.

Soaps and polishes for use on cars and in garages.

MANUFACTURERS' DISTRIBUTERS

H. W. Johns-Manville Co., New York City.

J-M Mobilite—Manufactured by the company, which makes some of the products it distributes. Mobilites are a new product and consist of a hard rubber dash or tail lamp, claimed to give efficient service on dry cells; hard and durable; not likely to dent; do not require polishing; powerful reflectors and lenses intensify light; concealed switch; three types, for insetting in dash, for tail light and a portable type attachable to dash connections. Six No. 6 dry cells will run four lamps intermittently from 80 to 120 hours.

J-M Non-Burn brake lining, J-M Permanite packing, and J-M Mobilene packing for gas engines; J-M Mogul packing for valve stems and piston rods; J-M Asbestos yarn, J-M asbestos fire felt, J-M Leak-No, J-M asbestos motor cement, **J-M dry powder and Fyro fire extinguishers**, J-M Success fire extinguishers for garages, J-M dry batteries, J-M ammeter, J-M Noark fuses, friction tapes, rubber tubing and metal polish are other manufactured products.

Jones Speedometers—Made by the Jones Speedometer, New Rochelle, N. Y.; operates on the gyroscope or mechanical principle; simple; has few parts; accurate in every temperature; steady hand; immovable dial and large speed figures; accurate at all speeds. Made with and without clocks. Prices—$60, $75, $100 and $125.

Mezger Soot-Proof Spark Plugs—Made by C. A. Mezger, Inc., New York City. Double chamber which gives a large area of carbon surface inside and outside the porcelain, making a path of resistance several times greater than that in other types of plug; current must take path of least resistance, the air gap; small diameter of the porcelain chamber radiates heat so rapidly that carbon is burned as fast as it is formed; cannot short circuit, leak, collect soot or clog under any condition of speed, temperature, oiling or pressure.

Carter Carburetters—Made by the Carter Carburetter Co., St. Louis, Mo. The chief peculiarity of the Carter carburetter is that instead of the ordinary type of one-orifice jet it has a vertical tube in which are drilled a large number of extremely small holes. The suction of the engine draws the gasolene up in the tube and it is sprayed through the holes in quantities in proportion, of course, to the level in the tube. As the holes are arranged spirally each gets a separate air supply. The float is a hollow sphere and the valve lever is under it and is operated only by the weight of the float, there being no attachment.

Long Horns—Made by G. Piel & Co., New York City. A hand operated warning signal; notched hand push rod engages gear and causes another gear to strike a button on a diaphragm. Models S, J-S and J-M. Prices—$10 to $19.

Arnold Electric Vaporizers and Arnold Electric Heating Plugs—Made by Arnold Electric Co., Boston, Mass. Vaporizer consists of a hollow electric heating coil connected to the carburetter intake. Heating plugs are designed to be set in the "gas" manifold and connected with a battery and special resistance coil which develops a high degree of heat in a short time; permits starting in cold weather.

Spark-No Car Locks—Made by Swyers & Lorch Mfg. Co., Pittsburgh, Pa. A device which attaches to the dash and resembles a clock; it contains an ignition lock which sets with a combination, the combination being worked by moving the hand of the clock, as a safe knob is worked; a thief desiring to steal a car so equipped would be unable to start it because of the lock and would be unlikely to recognize the clock as the lock and would be unable to work the combination if he did recognize it. A motorcycle model is made.

Asch & Co., New York City.

Halladay Bumpers—Three models: Imperial, Universal and one for Ford cars. Features—Attachment quickly effected and without drilling the car frame. Helical springs enclosed in telescoping tubes. Prices—$10 to $20.

Hoover Shock Absorbers—Three models: one for Ford cars. Features—Device consists of a rebound strap and a spring, the strap caring for the lesser shocks and the spring for the greater road inequalities. The spring formerly was located midway between the axle and the car, but a new model has been brought out wherein the spring is positioned at the top. Prices—$10 per pair.

De Luxe Grease Cups—Models Nos. 101 and 105. Features—Plunger screw does not travel in and out of the grease chamber, but is fixed, the leather plunger working up and down on the threaded plunger screw. Finished in brass or nickel. Prices—15 to 40 cents.

Presto Inspection Lamps and Cigar Lighters—Lamps and lighters are made separately or in combination. Holders are provided. Prices—$2 to $3.50.

Anchor Edi-Swan Type Connectors and Lamp Sockets—An assortment ranging in price from 20 to 50 cents; also, extensions ranging from 90 cents to $1.35.

Edelman Gauges—Tire, oil and compres-

Digitized by Google

sion. Features—Tire gauges are designed for use at valve or in hose line. A red hand is a feature, remaining stationary until reset. The Reliable Gauge is a new model in watch form; smaller than a watch; reads to 120 pounds and is guaranteed correct within 2 per cent. Prices—Reliable, $1; others, $1 to $4.

Hoover Rim Removers—For Q. D. and clincher rims. Claimed to be capable of use even when it is so dark operator cannot see the tool; simple in operation. Price—$2.50.

Hoover Leather Specialties—Mud hook, consisting of a traction plate strapped to the tire and felloe; price, $1.50. Bow rests; 70 cents to $2 a pair. Front and hold-down straps. Rebound straps. Speedometer coil protectors. Crank holders. Door stops. Trunk straps. Hat racks. Roll-up straps.

Meiner Emergency Wheel—Designed to take the place of a wheel which is incapacitated. Consists of a 15-inch wheel, set in a fork, above which are arms which bolt to the under side of the spring of a car. Bearings are babbitted and the whole device is of cast steel. Weighs 50 pounds and is designed to carry a maximum of 50,000 pounds. Price—$25.

Ralph Waldt, New York City.

Healy valve reseating tools, Healy valve spring removers, Koeth's interchangeable tools, Weaver jacks, Motorists' warm grips, Ray socket wrenches, Peerless heaters, Hi-Po battery connectors.

Healy Valve Seaters—Will face up both the valve surface and the seat of any valve between 1¼ and 2½ inches. The valve head dresser will taper the bearing surface either at 45 degrees or 60 degrees, at the option of the user. Both are hand-operated and do the work accurately and in a minimum of time.

Healy Valve Spring Tool—Comprises but two pieces, and is very light and easily carried in the pocket. In use it simply is necessary to make the motor cam compress the spring, then set the tool in place. When the cam is released, the tool holds the spring compressed so that the pin and washer are easily removed.

Koeth's Interchangeable Tools—Comprise a pair of screw jacks mounted on a triangular frame on castors, both jacks being operated with a single crank provided with a universal joint for freedom of movement. The jack comprises at once a lifting jack, a turn table, skids and tire rest.

Ray Socket Wrenches—Comprise a handle with a universal joint which permits of its use in tight places and a complete set of interchangeable sockets, together with a large and a small screwdriver bit, 1 long and 2 short extension bars and a spark plug socket. The set comes packed either in a wooden case or in a tool roll.

Motorists Warm Grips—Comprise a pair of leather grips intended to lace onto the steering wheel and which are provided with suitable resistance coils and leads to the battery and a dash switch for making or breaking the circuit.

Peerless Heater—Is a hot water heater, comprising a housed coil radiator which is piped to the cooling system of the car so that the warm water from the motor enters the radiator and gives up its heat. The heater is very easily installed and is said to operate perfectly without in any way interfering with the cooling of the motor.

Hi-Po Battery Connectors—Are provided with spring clips intended to prevent the terminal nuts from working loose under the vibration.

Schaefer Sales Corporation, Detroit, Mich.

The-Tel-Tale Gasolene Gauge — A new device. Consists of a registering hand and dial on a metal part which screws into the filler hole of a gasolene tank; the metal part contains a filler hole and cap so that the gauge may always be left in place; from the metal part a twisted flat strip of metal extends to the bottom of the tank, also a round metal wire. A float, containing a rectangular hole which fits the twisted rod, is attached by a slotted projection to the round wire so that the float cannot turn. As the float rises and falls it causes the twisted rod to turn and this actuates the hand upon the dial. Is manufactured for all cars that include as standard equipment a round, oval or square gasolene tank without an offset and which is made in any considerable quantity. Price, $2.50.

Kumalong—A new device. For the purpose of attaching chain grips to tires in case of muddy roads or other conditions which render it undesirable to get out in the road or mud to put on chains; attaches to the wheel; a cross chain is hooked to the Kumalong and the car pushed or run forward until the chains are in position to hook together. Price, 50 cents a pair.

Smalley Daniels, Detroit, Mich.

Sly perfect pressed steel tire holders, including a new double holder for Ford cars, which attaches to the back and combines a license tag holder and lamp bracket; Mitchell tool boxes, the feature of which is the presence of very short legs which serve to keep the bottom from the floor, the air space thus formed preventing the formation of rust; New Era replacement springs, for replacing broken springs on very many makes of automobiles and a new collapsible bucket, water and gasolene funnel combination which makes a package but a half-inch in thickness when folded and can easily be carried under the seat cushion.

Herbert F. L. Funke Co., Inc., New York

Coventry Silent Chains—For automobiles and motorcycles; a new type has been designed for use on camshafts, magnetos, pumps and auxiliary drives on engines; also a new chain exclusively for use in transmission boxes.

White & Poppe Carburetters—For automobiles; an improved type has been added.

Brown & Barlow Carburetters—For motorcycles.

Charles E. Miller, New York City.

Excel Auto Jack—A new device. Will go under anything from 5 to 20 inches high and lift 4 inches in 2 seconds; one downward motion of lever; for cars up to 8,000 pounds; weight 50 pounds crated; of low carbon steel with casehardened pins. Price, $16.

M & M Controller and Economizer—Attaches to the manifold and regulates mixture properly; operated from the seat. Price, $10.

Line also includes for the first time a tail lamp bracket and license carrier; Ford windshield ventilator; Romort engine cleaner; Romort automatic air valve and the Dead Easy tire pump. Company handles large line of other materials and supplies.

Stewart & Co., New York City.

Ahco Ford Exhaust Whistles—A new device; made by the Arnold-Hough Co., of Providence, R. I. Consists of a square brass whistle which attaches to the rear end of the exhaust pipe; made in one- and two-tone models. Flexible valve removers and Russell valve grinders, made by the same company.

Allen-Friction Wrenches — Also socket wrench sets; made by the Allen Wrench & Tool Co., of Providence, R. I. Consists of a wrench which is made tight as it is turned.

Gryndyn—A valve grinding compound made by Stevens & Co., which also manufactures the Owen valve grinder.

Stevens & Co. New York City.

Bryant Valve Lifters—Fits any car and spring; does not slip; holds spring while valve is being ground; operates between the coils of the spring, releasing all pressure from the valve stem and leaving the valve, spring, disk and key free to be removed; spring can be compressed out of the motor, replaced and released.

Pioneer Grease Gun, Victor Gaskets, spark plugs, horns and reeds, air pumps, pump connections, burners, tubing, nipples, cocks, switches, tools and other articles are included in the Stevens line.

J. H. Faw, New York City.

Red Seal priming plugs, Red Seal closed-end plugs, Ford short valve grinders, Improved oil adapters and Ford lighting sets are to be shown this year, in addition to the line of other automobile accessories and supplies distributed by Faw; line includes shim stock, piston rings, motor parts, etc.

Peter A. Frasse & Co., New York City.

Shelby seamless steel tubes; American distributer of Poldi tool steels; maker of Hildreth's folding steel horses or trestles; machinery, supplies, tools and factory wipes.

Donnelly Motor Equipment Co., New York City.

National tire pumps, National vulcanizers, Gladrag polishers, body soaps, and "steersman" attachments for steadying steering.

Digitized by Google

PORTABLE GARAGES

Taylor Sectional Steel Garages.
Taylor Mfg. Co., Montclair, N. J.

Sizes—10 x 12 feet to 20 x 42 feet.

Features—Complete garage includes two windows in each side, four front doors with window in each, two Sunburst gable ventilators, 12 corner shelves, chain bolts, night latch, etc. Company did not exhibit last year. Ease of assembly and durability of structure are features claimed. For 1914 the window movement, the ventilating systeh, the window guards and the double and single combination front doors have been improved. The distinguishing features are: Ventilated ridge, keeping garage cool in hot sun; windows raise by window springs on the side, effecting a space economy over the swinging window; window guards on the outside; combination doors, permitting entrance for a man without opening doors the full width; shelves; interlocking system for steel sections; no frame; can be put up by one man in 10 hours. Design and most of the features patented.

Prices—$166 to $720.

Pruden Portable Garages.
Metal Shelter Co., St. Paul, Minn.

A line of portable garages constructed of sheet metal; can be easily erected and can be easily taken down and moved.

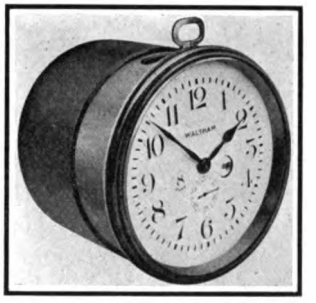
Portable Garages.
J. R. Ashley Co., New York City.

Light garages made of sheet metal; designed to be easily erected and taken down.

CLOCKS, ETC.

Standard Thermometers.
Standard Thermometer Co., Boston, Mass.

Features—Is a development of the line of this type which the company has manufactured for 30 years but has only now been adapted for automobile use. The meter registers by a needle and dial, reading up to 400 degrees Fahr. The device is attached to a car by means of a ⅞-inch hole bored in the radiator cap, the thermometer having a lamina which extends on down into the radiator but not to the tubes. The casing of the lamina is screw-threaded and the thermometer is held in position by a check nut.



Price—$5.

Waltham Clocks.
Waltham Watch Co., Waltham, Mass.

Models—B, D, O, S, W, M, N and a limousine set.

Features—Double main spring in the 8-day movements installed in automobile timepieces; this avoids a "drop," one spring stepping in and taking up the load when one approaches a run-down condition. Will run eleven days. Only automobile timepiece adjusted to temperature. Winding indicator which signals three days in advance on the running down of the clock. Models are designed especially for automobiles. Quality, reliability, accuracy and up-to-dateness are claimed as general features.

Model W is a new model; the bezel sets on a sleeve which telescopes into the clock

WALTHAM TELESCOPING CLOCK

casing and locks with a bayonet lock by turning the bezel. The winding and setting keys drop down out of sight and when locked the clock presents a flush surface. Model M's feature is that it attaches to the dash by means of two flanges.

An additional feature is a photographic method of producing dials; this gives a white figure without an underlying black base, which is likely to weaken the strength of the white.

WALTHAM "FLUSH MOUNT" TYPE

Motometers.
The Motometer Co., New York City.

Two new models of the Boyce Motometer have made their appearance since the last New York show. The Junior model, which is intended for use on small cars, operates on exactly the same principle as the heavy car type, but is of simpler design and is smaller in size. The dial is marked so that the driver is informed when the motor is operating at the highest efficiency, when the heat approaches the danger point and when the motor is too cold. The second new model is just the same as the Junior save that a special cap for use in connection with Ford cars is fitted. The price of the largest model is $10; the Junior model, $5, and the Ford model, $5.50.

CAR COMPONENTS

Schwarz Wheels.
Schwarz Wheel Co., Philadelphia, Pa.

Wood wheels and wheel spiders.

Features—Mortised and tenoned construction at hub which interlocks spokes; this construction is patented. Tight assembly which cannot loosen. For 1914 the company has added heavy truck wheels with spoke shoulders shaped by special process to exact arc of felloe, making a perfect bearing on entire spoke. Work is done on new machinery of company's own design.

Wheel spiders, a new product, consist of a set of spokes with the hub ends interlocked but without hub or rim attached. The mortised and tenoned feature causes them not to fall apart. These spiders are designed for repair work, and can be used by manufacturers in building new wheels.

Dunlop Wire Wheels.
Dunlop Wire Wheel Corporation of America, New York City.

Types—Detachable; to take clincher, Q. D. or straight-side tires. Non-detachable Ford model, interchangeable with Ford artillery wheels.

Features—This wheel is a counterpart of the English Dunlop wheel, the American rights to which recently were secured by the American Dunlop company. Principal feature is the ease and quickness with which the wheel can be detached; no loose parts; dust-proof locking device, devoid of ratchets, pawls and delicate springs; quadruple lacing; pressed steel wheel shell; spoke seat holes countersunk on the inside, giving rigid seating; no back lash; attractive appearance.

Stanweld Rims.
Standard Welding Co., Cleveland, O.

Model 60—a new, demountable, quick-detachable type. Differs from previous Stanweld rims principally in that the side flanges and the locking wedge ring are continuous and the inner band is split transversely; this permits the inner band to be removed without disturbing the side flanges; if flanges are "set" on the tire the inner tube can be removed without disturbing them; rim is slightly heavier but much stronger than ordinary rim. Company also makes other rims which have not the collapsible inner band construction.

The line of products also includes tubing for various purposes and other metal construction.

Houk Wire Wheels.
Houk Mfg. Co., New York City.

Manufactured under the English Rudge-Whitworth patents covering triple-spoke lacing and a positive automatic locking device; triple lacing affords resistance to side thrusts and gives greater carrying strength; the locking device, which is one

Digitized by Google

of the important constructional features, consists of a ring lock nut which is threaded internally to engage the fixed hub; the ring nut also is tapered to clamp the hub shell of the demountable portion; the whole wire wheel is easily removed by removing the nut and is as easily locked in place. Ease on tires and the whole car is claimed; also greater strength and safety.

Warner Gears and Axles.
Warner Gear Co., Muncie, Ind.

A new multiple-disk, dry-plate clutch has been brought out; has Raybestos-faced disks of large diameter; adaptable to unit power plants with rear axle or midship transmission; the clutch housing is bolted to the motor housing; extra heavy double-coil springs; drive is taken on hardened steel studs and hardened keys; all bearings of ball type; arrangement has been made for clutch braking and pedal adjustment. Assembly neat, light and compact.

T-38 transmission, a new product; a unit type assembly with three forward speeds and a reverse; designed for light "four" or "six." Case is aluminum; gears 6-8 pitch and ¾-inch face; main drive and sliding gears on annular bearings; countershafts on Hyatt bearings; gears and shafts of heat-treated steel. Clutch of dry-plate, multiple-disk type; clutch brake provided. Pressed steel cone clutch will be furnished with certain quantities.

Lanchester-Daimler worm gear for electric vehicles is a new product. The company's line includes a variety of other similar products.

Presto Demountable Rims.
Presto Inter-Rim Co., Boston, Mass.

Models—Made in all standard sizes and will fit straight-side, clincher or solid tires.

Features—Demounted without the use of tools. Operates by a locking device which, by the pull of a lever, causes a locking ring to contract, giving passage to the tire-carrying section. Impossible for the tire to creep. Rim is self-centering Rims will be shown for the first time on wire wheels.

Ideal Resilient Wheels.
Ideal Steel Wheel Co., Cincinnati, O.

A steel wheel of resilient construction; makes the use of airless tires possible without the sacrifice of easy riding; claimed to increase the life of the motor and car and to add to the mileage per gallon of fuel or charge of electricity.

E-Z Rims.
E-Z Rim Co., Boston, Mass.

Rims, a feature of which is their quick demountability; a special rim for Ford cars is manufactured.

Internal Gear Drive Truck Axles.
Torbensen Gear & Axle Co., Newark, N. J.

Types—R. 1,500 pounds capacity; R-1, 1 ton; S. 1½ tons; S-1, 2 tons; special axle for 1,500-pound electrics.

Features—I-beam construction; one solid member for carrying the load and a separate one for transmitting the power to the wheel; carrying member of drop forged steel; wheels on tapered roller bearings; all driving mechanism enclosed, affording cleanliness, quiet working and efficient lubrication; solid one-piece I-beam forging; compact internal gear drive. All gears and other parts of best quality material. Large range of gear ratios offered.

Cotta Transmissions.
Cotta Transmission Co., Rockford, Ill.

Gearsets for either shaft or chain drive; three forward speeds; gears always in mesh, the changes being made by shifting dog clutches. Made in various sizes to transmit from 15 to 130 horsepower. The features are the all-around substantial construction, the use of the best of materials and the adaptability of the device for either right, left or center control. The prices vary from $180 to $265 for the shaft drive devices and from $180 to $625 for the chain drive assemblies, which include the differential and suitable housing.

Brown-Lipe Gears.
Brown-Lipe Gear Co. and Brown-Lipe-Chapin Co., Syracuse, N. Y.

Brown-Lipe Gear Co.—Four-speed, unit power plant transmision is a new product; is equipped with a new type of socket center control for left-hand drive; built in two sizes for pleasure vehicles and has direct drive on either third or fourth speed; built in both sizes for subframe construction. Will also show three-speed transmissions.

Brown-Lipe-Chapin Co.—Will show differentials and bevel drive gear sets, including types of differentials for worm gears.

Warner Gears.
Warner Mfg. Co., Toledo, O.

Three and four-speed selectively operated gearsets which are adaptable for either right, left or center control; unit power plant combinations; steering gears; differentials, clutches, motors and electric starters.

Cleveland Worms and Gears.
Cleveland Worm & Gear Co., Cleveland, O.

Accuracy in cutting of worms and gears are features; company will exhibit two worms and gears which have been run, respectively, 50,448 and 50,000 miles.

Hess Axles.
Hess Spring & Axle Co., Cincinnati, O.

New products are a double internal expanding brake, external and internal brakes and new adjustments on the differential, both sides and on the pinion shaft bearings.

SRO Ball Bearings.
Marburg Bros., Inc., New York City.

Three new series of combination radial and thrust SRO ball bearings are embraced in the Marburg offering. As is the case with the single and double row bearings and the self-aligning bearings, which are not new to the SRO line, the newer series employ an electrically riveted ball retaining cage to guide the balls at their axis of rotation, and it is said that the arrangement practically eliminates friction of the balls at the point of contact with the retainer. Thrust bearings also are included in the line.

Marburg-Hagen springs are made to manufacturers' specifications from exceptionally high grade special steel having an elastic limit of at least 190,000 pounds to the square inch. They are imported from Germany.

U. S. Ball Bearings.
U. S. Ball Bearing Mfg. Co., Oak Park, Ill.

Types—Radial and thrust.

Features—Outer and inner race rings of imported ball bearing steel, specially heat-treated; equipped with Hoffman balls; retainers allow large number of balls; withstand great strain; smooth running; great accuracy; a new retainer is being brought out and will be exhibited for the first time at the Chicago show.

Automobile Brand Gears and Bearings.
Light Mfg. & Foundry Co., Pottstown, Pa.

A complete line of three- and four-speed transmissions has been added to the company's products, as has a patented bronze back, double locked bearing, which is made on entirely new lines. Products also include aluminum, manganese bronze and bearing metals and castings and a complete assortment of die-cast finished parts and motor bearings.

Bock Bearings.
Bock Bearing Co., Toledo, O.

Types—Roller; radial and thrust.

Features—A tapered roller, the dimensions of which have been scientifically determined; will revolve with minimum of friction; roller shouldered at base end only; ability to carry heavy loads. Company but recently entered the field.

Rhineland and Fanfir Bearings.
Rhineland Machine Works Co., New York.

Both Rhineland and Fanfir bearings are made in all the more common sizes and types for automobile work. Single and double row bearings and combination radial and thrust bearings will be shown.

Bearings and Universals.
Universal Machine Co., Bowling Green, O.

Ball bearings and three-piece universal joints.

Duplex Brakes and Raybestos Lining.
Royal Equipment Co., Bridgeport, Conn.

Duplex brakes are of the external contracting band type and because of the special form of linkage which causes the contraction of the band, the brake is equally effective whether the vehicle is moving forward or backward. Raymond brakes are also of the external contracting type. Raybestos is a friction material made of asbestos woven with copper wire. It is claimed to be heat, oil and water proof and is extremely durable; it is used for brake linings and clutch plate facings and other

Digitized by Google

frictional surfaces. The Gyrex gasolene mixer also will be shown. It comprises a small perforated freely mounted rotary fan which is positioned in the manifold. The movement of the gases causes the fan to spin and the movement tends to thoroughly mix the gases.

Multibestos.
Standard Woven Fabric Co., Framingham, Mass.

A spiral-woven clutch facing is a new addition to the Multibestos line this season; instead of being woven in a straight piece and then forced into a circular band upon the clutch it is woven in a spiral of the diameter required by specifications; it is then heat-treated to render it durable and wear-resisting. Another new product is a Multibestos facing for a friction transmission wheel; this is designed especially for cyclecar use. Is used also for brake linings.

Multibestos is of asbestos and brass wire interwoven; company claims to be the only one to make 3/16 and ¼-inch sizes of material respectively in 3- and 4-ply and without using "stuffers." Weave is bound all the way through.

Motobestos and Asbestos Products.
Asbestos & Rubber Works of America.

Motobestos, for brake linings, is leader of company's line. It will not pack, is waterproof, will not get hard and glaze and always remains soft and gripping, due to special compound and treatment. Other asbestos products include Ajax brake lining, a special wireless lining for Ford cars, Asbestolith, Motobestos packing, gaskets and spark plug yarns.

Whitney Chains and Tools.
Whitney Mfg. Co., Hartford, Conn.

Types—Silent, block and roller chains in all sizes; hand and weight-feed milling machines, water tool grinders, Presto chucks and collets and friction tapping devices.

Features — Silent chains and correct sprockets give long service with silence and efficiency; roller and block chains have deep side plates which add strength; cotter detachable chains can easily be lengthened, shortened or repaired without the use of special tools. The detachable type and a riveted type are interchangeable.

Silent Chains.
Link-Belt Co., Nicetown, Philadelphia, Pa.

Link-Belt Silent Chains—For operating cams, fans, magnetos, pump shafts and other parts ordinarily operated by trains of gears.

Features—Company claims use of semi-circular, case-hardened bushings and case-hardened pins in the joints causes the chains to run a long period without elongation.

Baldwin Chains and Sprockets.
Baldwin Chain & Mfg. Co., Worcester, Mass.

Baldwin drive chains are made riveted and detachable; high quality of material and workmanship gives strength and durability. Sprockets are claimed to be strong and durable.

Diamond Power Chains and Sprockets.
Diamond Chain & Mfg. Co., Indianapolis.

Block and roller power transmission chains; made of high-grade material; sprockets of high quality and durability.

Brown Top Lifter.
Brown Trafilog Co., Cleveland, O.

A new device; makes a one-man top out of any top.

Features—Consists of two poles—one on each side of the car—which attach to a collapsed top at the upper end of the vertical front bow, the lower end of the poles being at the running board; after loosening the top at all points the operator stands in the tonneau, grasps the top and pulls; the poles carry it upward and forward with but little effort on the part of the operator and the poles, being inclined forward when the top has reached its extended position, hold the top until the operator fastens it. The device is arranged for being easily stowed away. Another form of the lifter consists of a bar across the top at the point of attachment and but one pole, this being positioned in the center. Device is adjustable to any top.

Solitaire Tops and Pantasote.
The Pantasote Co., New York City.

An easily raised and lowered top. Claimed it can be "Raised with 2 Fingers in 10 Seconds." Top is supported at the back of the body only; no bows attach to the front seat to impede entrance and exit. No cotter pins, nuts or parts to be placed or shifted. Mechanism simple and cannot get out of order or cut the covering material. Solitaire sockets are formed in a variety of sizes, to fit any length of car. Company states that any top maker can construct the top when supplied with the sockets. Company also makes Pantasote, a substitute for leather.

Numotor Fabrics.
L. J. Mutty Co., Boston, Mass.

Numotor products include mohairs, coverts, serges, twills, etc., leathers, and double and single rubber clothes.

Features—Numotor fabrics are made from high-grade cotton, dyed in the fiber, insuring fast and even color. They are fiber-dyed with "Indanthrene," a standard dye used by the United States and German government. For tops—double texture, with a high-grade Para rubber interlining. For curtains—single or double texture. For seat covers—single texture, to match top. Can be removed and cleaned.

Neverleek Top Materials.
F. S. Carr Co., Boston, Mass.

Neverleek Top Covering — Guaranteed leak-proof without limitations; claimed to be the only material made especially for use in automobile tops; absolutely waterproof; not affected by constant folding; retains shape and appearance; easily cleaned; claimed to be the only covering waterproofed with new live rubber so processed that it retains its waterproof qualities for years. Company also makes materials for upholstering and other uses.

Sharrer One-Hand Top.
Sharrer Patent Top Co., New York City.

Made to fit any style or size of body; no hinges, levers, pivots, springs, nuts or cotter pins are used; an invisible flexible cable arranged in bows makes possible the one-hand operation of the top; is rigid, has no bows or sockets at the front seats, cannot scratch the body finish, is light in weight and folds automatically back into position to take the envelope. Bows are of steel tubing and attach at rear seat only.

Golde One-Man Top.
Golde Patent Mfg. Co., New York City.

The Golde top is so designed that it can be raised or lowered by one man; is bowed at rear only. A new feature is a removable top case of wood or metal, or both, which can be fitted to any car; it takes the place of an envelope; with this, it is necessary only to lift the cover of the case and swing the top out; extends but a few inches beyond the rear of the body.

Budd Steel Bodies.
Edward G. Budd Mfg. Co., Philadelphia, Pa.

Steel sections formed in dies, reinforced only where necessary, giving a lighter and stronger construction than is obtainable with wood. Bodies can be cleaned out with a hose without the danger of warping and cracking which lies in wood bodies.

Laidlaw Automobile Fabrics.
William R. Laidlaw, Jr., New York City.

New process has been devised for rendering cloths waterproof, gasolene-proof and sun-proof; materials for upholstering and tops. Special line of Laidlaw "Halo" trimming cloths. Harmonious blending of colors.

Automobile Leathers.
P. Reilly & Son, Newark, N. J.

Company's product includes a complete line of patent and enameled leathers for use in trimming automobiles. Durability and quality of materials are features claimed.

Chase Top Fabrics.
L. C. Chase & Co., Boston, Mass.

Chase leather; genuine mohair mackintosh cloth; Chase rubber goods; quality and serviceability of materials; variety of weights and colors.

Springfield Metal Bodies.
Springfield Metal Body Co., Springfield, Mass.

Aluminum and steel bodies; made in convertible and non-convertible types and to special order. Convertible types may be open or enclosed; windows are carried hidden frim view, out of the way, secure from breakage and rattle; windshield is one-piece construction, giving clear vision without

Digitized by Google

sacrifice of ventilation; top, when raised, meets windshield and side window construction in a secure, weatherproof joint; folding method of storing glass window.

Non-Gran Bearing Metal.
American Bronze Co., Berwyn, Pa.

Non-Gran is a special bearing bronze which, because of the method of manufacture, is of a fibrous nature and free from grain, which, it is claimed, is chiefly responsible for its wearing qualities. The greatest care has been taken in the alloying to make the metal of uniform texture and free from weak or bad spots. The metal is especially recommended for high-speed bearings carrying steady loads, and bearings of the sort are cast to manufacturer's specifications. For use in the garage and in general repair work, Non-Gran is put up in cored-bar form and in assortments of various diameters which make for convenience.

Cramp's Metal Products.
William Cramp & Sons Ship & Engine Building Co., Philadelphia, Pa.

Cored bars for bushings; 17 sizes, 6 and 12 inches long, 1 to 3¼ inches in outside diameter and ½ to 2½ inches in inside diameter. Solid bars up to 2 inches in diameeter. Furnished either in Parsons White Brass or Cramp's Special Bearing Bronze. Parsons White Brass for main engine and crankpin bearings. Cramp's Special Bearing Bronze for wristpin, camshaft and transmission bearings, valve stem guides and similar bearings.

Chrome Vanadium Steel Products.
Carnegie Steel Co., Pittsburgh, Pa.

Company will exhibit products which illustrate the scope of application of the grades of steel produced; tests for various grades will be illustrated.

Krupp Steels.
Thos. Prosser & Son, New York City.

Steels and completed steel parts made by Fried. Krupp cast steel works, Essen, Germany; consists of axles, crankshafts and other steel forgings.

National Tubing.
National Tube Co., Pittsburgh, Pa.

Seamless tubing for axles, torsion rods, windshield, piping and other purposes.

Features—Quality of material and excellence of workmanship.

Flexible Metal Tubing.
Schoen-Jackson Co., Media, Pa.

Flexible metal tubing in a variety of styles and sizes for use as exhaust pipe, hot air leads, air hose or gasolene piping.

Auto-Flex Conduit.
Nat'l Metal Molding Co., Pittsburgh, Pa.

Auto-Flex—A new flexible material for encasing wiring in automobiles; is marketed with a complete line of fittings; made in Types A and B; Type A is made of selected fiber cord coiled upon itself in the form of a helix and tightly interwoven with very tough thread to form a tube which is treated with moisture-proof compound and over which a rugged covering of yarn is woven; the completed tube is impregnated with special fire- and moisture-proof compounds and is finished with finely ground mica. Type B is made in the same way as Type A, except that the outer covering is braided instead of woven and the ground mica is omitted.

Type A is recommended for wiring under the hood and upon the chassis and Type B for wiring to headlights or to any point where the tube is exposed. as the surface of this type is left smooth for the application of paint or enamel. Fittings have been standardized for attachment to practically any car, and particular attention has been paid to centralizing control and distribution of the lighting circuits in one box and to the separation and arrangement of contact strips, simplifying connections, testing and locating trouble.

Yale Mufflers.
Yale Steel Stamping Co., Oostburg, Wis.

Sizes—5, 7, 10, 14, 20, 24 and 28 inches; all diameters 6 inches. Cyclecar mufflers are made in any desired length, with diameters of 3½, 5 and 6 inches.

Features—Made from sheet steel, assembled by an electric welding process, all parts being stamped in presses instead of being cast, thus allowing for expansion and contraction; no back pressure. Guaranteed against defective material and workmanship for one year.

Jasco Seamless Steel Tanks.
Janney, Steinmetz & Co., Philadelphia, Pa.

A new seamless steel gasolene tank in a square model has been added to the line; it is made 13 inches square and 30 to 36 inches long; also 12 inches high and 14 inches wide, with convenient lengths. Company claims this tank is especially convenient for rear underhanging. The line of products also includes round tanks for gasolene, air and oil; and other pressed and seamless drawn steel specialties.

Dann Oil Cushion Spring Insert.
Dann Oil Cushion Spring Insert Co., Chicago, Ill.

Device consists of a thin, perforated strip of special alloy steel which fits between the spring leaves for their whole length and carries in its perforations a heavy, fibrous grease; claimed that the retention of the lubricant in the perforations ensures absence of squeaks and avoids rusting and sticking.

Soss Invisible Hinges.
Soss Mfg. Co., Brooklyn, N. Y.

Model No. 121 is a new hinge of which the feature is that it requires a door pillar but ⅞-inch wide and is detached by removing two screws. The whole Soss line features its invisibility; non-corrosive cases cover the mechanism and prevent water reaching the wood of the car through the hinge. Strength, long wear and rigidity are claimed.

McCord Radiators.
McCord Mfg. Co., Detroit, Mich.

Cellular and tubular type radiators to meet all requirements; fans and force-feed lubricators in a variety of sizes; McKim copper asbestos gaskets in every shape and size for motor car use.

Concealed Hinges.
English & Mersick Co., New Haven, Conn.

A drop-forged concealed hinge with a drawn-brass, non-rusting casing; all forged parts case-hardened. Company also manufactures other metal trimmings for automobile use.

Valentine's Varnishes and Colors.
Valentine & Co., New York City.

Phenomenal Deep Green, a new color, has been added. Company features Vanadium Varnish, for chassis finishing, the only varnish which will resist the action of soap and water; also, Vanadium Quick Finishing Varnish, which dries hard over night.

Paints and Colors.
C. A. Willey Co., Long Island City, N. Y.

Manufactures colors especially for automobile work; also filling-up specialties for both wood and metal surfaces.

Electric Riveters.
Eveland Engineering & Mfg. Co., Philadelphia, Pa.

Models—Made in 16 models for various size work and different applications.

Features—The machine is claimed to be the only electric riveting machine on the market, and it is also stated that the electric machine does better work than the air-driven riveters and at one-quarter the cost. The rivet is heated to any desired temperature, according to the current passing through it, and because of the fact that it is electrically heated its temperature is said to be uniform throughout, eliminating strains due to unequal expansion and contraction. The machine also can be used for heating steel for bending or for tempering.

Baush Drilling Machines.
Baush Machine Tool Co., Springfield, Mass.

Multiple-spindle drilling machines; made of high-grade material; efficient and labor-saving; company also manufactures other machinery.

Die Castings.
H. H. Franklin Mfg. Co., Syracuse, N. Y.

Small and intricate parts are cast under pressure from a special babbitt metal; process assures accuracy which makes machining unnecessary. Small as well as large parts are produced by the same process.

Die Castings.
Doehler Die Casting Co., Brooklyn, N. Y.

Brass die castings; whereas die castings generaly are made of a babbitt metal or zinc

Digitized by Google

alloy, this company has developed a process for making die castings of brass, with a finish so accurate that machining is required in extreme cases only. Other metals are cast with accuracy, which makes machining unnecessary. Babbitt-lined bronze bearings are featured.

Die Castings.
National Lead Co., New York City.

Small and large and intricate parts cast accurately and without flaws; economy in casting more intricate pieces. Paints are also a part of this company's line.

Soss Die Castings.
Soss Mfg. Co., Brooklyn, N. Y.

Accuracy, uniformity and quality are claimed for Soss die-cast products. Company also manufactures and sells die casting machinery.

Spicer Universal Joints.
Spicer Mfg. Co., Plainfield, N. J.

Enclosed universal joints for use in transmission systems. The advantages claimed are durability and efficiency because the enclosure keeps the lubricant in and the dirt out, eliminating friction and wear. The joints are made in several sizes to transmit low or high power.

Sparton Safety Blade Fans.
Sparks-Withington Co., Jackson, Mich.

A fan in which the side of the blade toward the radiator is set in the plane of the rim, so that should the fan work loose the edges of the blades will not tear the radiator. Volume of air, by means of blade construction, has been increased 15½ per cent.

Wasson Piston Rings.
Wasson Piston Ring Co., Hoboken, N. J.

Peined concentric rings which are said to exert equal pressure on all sides are stocked in all sizes. The rings are formed of cast iron and are peined in a special machine so that the correct elasticity is obtained.

Automobile Parts.
Houpert Machine Co., New York City.

Specialties in cylinder grinding, making pistons and piston rings and grinding crankshafts. Also manufactures other parts as required. Company features high quality of its work and its ability to take care of any grinding operation.

Gould Electrical Apparatus.
Gould Storage Battery Co., New York City.

Besides various types of storage batteries for use on electric vehicles and in connection with electric lighting sets and starting systems, a combined lighting dynamo and ignition system and a new starter will be shown.

Metal Stampings.
Metal Stamping Co., Long Island City, N.Y.

To its line of metal products this company has added a number of specialties for Ford cars, including hub caps, wheel pullers, lighting outfits, grease cups and oil gauges.

B-T-K Parts.
Auto Parts Mfg. Co., Muncie, Ind.

Gearsets, clutches, control levers and steering gears in several different forms; clutches of several styles are produced. All kinds of electro-plating and gear-cutting is done at the special order of manufacturers.

Hayes Metal Parts.
Hayes Mfg. Co., Detroit, Mich.

Metal bodies, running boards, fenders, hoods, oil pans and various other sheet metal parts.

Steel Parts.
Detroit Steel Products Co., Detroit, Mich.

Forged and cast steel parts for motors, and standard parts for assembled cars.

Automobile Parts.
Auto Parts Co., Chicago, Ill.

Company manufactures parts for automobile use.

Clear Vision Windshields.
Cox Brass Co., Albany, N. Y.

Models—Models to fit any car in both the straight and the zig-zag types.

Features—Ease of attachment and manipulation. The hinge joint is so designed that the shiftable pane is held absolutely rigid in the position desired, yet it can be shifted with no trouble to suit conditions that arise. The shields are finished in brass, nickel or black enamel to suit.

Drop Forgings.
Cleveland Hardware Co., Cleveland, O.

Company features its stock of forgings which include a complete line of those most in use in automobile construction, such as hand levers, running board hangers, spring shackles, steering ball arms, tire holders, radius rod yokes, body irons, gooseneck irons and bow sockets. Others are furnished on specifications.

Detroit Lubricators.
Detroit Lubricator Co., Detroit, Mich.

Detroit mechanical force feed lubricators are made in sizes to suit both large and small motors. The devices are positive in action and free from trouble. Oil cups and grease cups also are shown.

Parts and Castings.
Manufacturers' Foundry Co., Waterbury, Conn.

Cylinders for automobiles and motorcycles and for power and air pumps; pistons for the same. Castings for various parts. Company features its ability to perform intricatea coring and accurate workmanship and to produce a smooth finish.

Machine Work.
Fort Dearborn Mfg. Co., Chicago, Ill.

Company's principal business is the production of special machine work.

Westinghouse Castings.
Westinghouse Machine Co., East Pittsburgh, Pa.

Air Furnace Iron, a particularly fine grade of material, is used in making Westinghouse castings, which are turned out rough and finished; company will exhibit a complete engine built from its casting as a demonstration of the wide range of its product.

MISCELLANEOUS SPECIALTIES

Gemco Specialties.
Garage Equipment Mfg. Co., Milwaukee, Wis.

Additions to this company's comprehensive production are: Gemco Cadillac bumper; $7 to $9. Gemco Overland bumper; $7 to $9; Semi-Automatic bumper, for full- or semi-elliptic springs; $7 to $9. Gemco rear end bumper; $6 to $8.75. Gemco dash carburetter priming control; $125 per hundred. Gemco dash lamp, No. 92; $9 to $14 per pair. Gemco searchlights; $2.50 to $15. Gemco combination light and license bracket; $2.50. Cyclecar tail lamp; $1.75 and $2. Gemco lamp bracket; 20 to 45 cents. Headlight forks. Acme rear end tire holders; $6.25. Gemco rear and "basket" tire holder; $7. Ford rear end tire holder; $3.50. Hupmobile rear end tire holder; $4. Torpedo tire and demountable rim holders; $4.75 to $5.50. Ford Torpedo tire holders; $2.25 to $2.50. Atlas running board tire holders; $2.25 and $2.75. Gemco spark plug air pump; $8 to $12. Gemco spark plugs; $100 per hundred. Gemco Ford shock absorber; $5. Also robe rails, valves, lamp and license brackets, etc.

Hans Motor Equipment.
Hans Motor Equipment Co., La Crosse, Wis.

New devices include: Dash priming device; $3.50. Dash crankcase oil level gauge; $5 and $5.50. Dash crankcase oil gauge for Ford cars; 50 and 75 cents. Remainder of line consists of air, oil and gasolene gauges of various sorts and sizes; filler caps and flanges; gasolene separators; flange connections for gasolene tanks; air pump, gauge and shut-off; hood locks; grease cups; air pressure pumps; special pump and pressure gauge; dash oil sight feeds; screwdrivers; an air pressure dash gauge, the face of which sets flush with the dash; is attached by means of a clamp on the motor side of the dash. Special line of products for Ford cars.

Townsend Grease Guns.
S. P. Townsend & Co., Orange, N. J.

Sizes—1-pound, 12 ounces, 8 ounces and 6 ounces.

Features—Consists of an inner and outer tube, the inner being removable by unscrewing the cap; the inner tube contains a slot the whole length of its side which per-

Digitized by Google

mits easy and rapid filling; plunger operated by a quadruple screw and crank handle which permits a pound of grease to be discharged in 15 seconds; is clean, operates rapidly, is easily filled and is exact.

Prices—1-pound, $5; 12-ounce, $4; 8-ounce, $3.50; 6-ounce, $3.

Monarch Lighters.
Benford Mfg. Co., Mount Vernon, N. Y.

Features—A single movement suffices to start the flow of gas to the headlights and cause a spark to jump the burner gaps, lighting the gas. The lever controlling the flow of gas and the switch at the same time is positioned on the dash convenient to the hand of the operator. To turn off the lights simply necessitates shutting off a single needle valve mounted on the same casing with the control lever. The lighter is very easily installed and is furnished with Alco burners with German lava tips, the necessary tubing and wire, besides the switch and valve.

Price—$6.

Chauphone.
Western Electric Co., Pittsfield, Mass.

The chauphone is a telephone for use on enclosed cars for giving instructions to the chauffeur without necessitating opening the door or window. The device comprises a regulation telephone transmitter in circuit with a loud speaking receiver fitted with a projector which is situated behind the driver. The directions can be heard without the driver putting the receiver to his ear.

Specialties.
Randall-Faichney Co., Boston, Mass.

Blitz Spark Plugs—A new product. Two-fold mica insulation completely encased in specially annealed porcelain; firing points of special alloy of platinum and iridium; simplicity of parts. Price—$1.

B-Line grease guns, Copley leather-packed guns, Jericho gas regulator, Webster gasolene gauges and Ranfac vulcanizing thermometers are other Randall-Faichney products.

Oliver Jacks.
Oliver Mfg. Co., Chicago, Ill.

Oliver jacks are made in three models—Peerless, Tire Saver and Sampson. The Sampson jack is the heaviest of the line and the Tire Saver models are made for jacking up the car when stored to keep the weight off the tires. The operation of jacking up is simplified so that a minimum of time is taken. The best of material and workmanship are put into the jacks, which are made in a variety of sizes to meet all needs.

Campbell Specialties.
Perkins-Campbell Co., Cincinnati, O.

Campbell waterproof seat covers; of olive drab jeans or brown or gray mohair. Campbell Little Steam Vulcanizer; a small, open-burner vulcanizer with steam chest; indestructible; simple in operation; price, $2.25. Campbell leather goods, boots for steering arms, magnetos, etc. Campbell Ford specialties; fan belt and steering arm boots.

Cowles Specialties.
C. Cowles & Co., New Haven, Conn.

The Fisher mechanical window lift, designed to aid in the elevation of a window from its enclosure, is a new product, as are: A windshield fixture with detachable part; channel moldings, metal and rubber, for frameless windows; dome lights; concealed toilet cases, and step lights. Besides these, the company produces foot warmers, lamps, fittings, trimmings and a variety of other accessories.

S. Breakstone, Chicago, Ill.

Hopewell tire cases, $3 to $6; inner tube bags, 50 cents to $1.25; Hopewell Bros. lamp covers, 75 cents to $2; square side lamp covers, 75 cents to $1.25; fleece-lined rubber cloth lamp covers, for various makes of lamps; Over-All lamp covers, 50 cents to $1.05; Russell tire cases, $2.50 and $3; Paos and Takoff soaps; Vibracator noise locaters; Hopewell Servall bags, 75 cents to $3.

Bethlehem Spark Plugs.
Silvex Co., New York City.

The Bethlehem plug is a mica-insulated plug and is a new product. Its leading feature is the fitting of five electrodes which converge toward the central electrode. The plug is made in both metric and standard threads and sizes, and in all the more common lengths. Glad Rags polishing cloths also will be shown.

Monarch Wheel Pullers.
Benford Mfg. Co., Mount Vernon, N. Y.

The puller is very light and easily carried in the tool kit; it is intended primarily for use with Ford cars. One important point is that it is possible to see through the device, the center being webbed, so that the progress of the work can be seen. With it it is possible to get a grip on the work without the use of a large wrench.

Slikup Specialties.
N. B. Arnold, Brooklyn, N. Y.

Slikup, for preserving rubber; Slikup engine enamel; Slikup aluminum paint; Slikup auto soap; Slikup body polish; Slikup metal polish; Slikup auto varnish; Slikup metal finish; Slikup enamel top dressing; Slikup mohair top cleaner; Slikup hand cleaner, and Slikup Kant Rust.

Coes Wrenches.
Coes Wrench Co., Worcester, Mass.

Company makes and will exhibit a full line of wrenches; also several automobile tool kits. Features fact that it has been in business since 1843.

Grinnell Gloves.
Morrison-Ricker Mfg. Co., Grinnell, Ia.

Grinnell gloves and gauntlets are made in a variety of styles, a special glove for motor car use being known as the Griptite. It has the palm of the hand stitched so that it is corrugated, affording a surface which is claimed will not slip on the surface of the steering wheel.

Steering Devices.
Modern Auto Appliance Co., Chatham, N. Y.

Little Steersman—Consists of a spring which attaches to the front spring seats and the center of the steering rod; designed to lessen the strains of steering and saves on tire wear. For this season a special Little Steersman for Ford cars has been brought out.

Hand-Warming Steering Wheels.
Warm Hand Steering Wheel Corp., Inc., Poughkeepsie, N. Y.

Steering wheel rims upon which are wound electric heating coils which when connected with a battery or other source of current, attain a temperature just high enough to keep the hands warm, the coils being placed where the hands naturally grasp the rim. Special model for Ford cars.

Ajax Trunks and Tire Cases.
Ajax Trunk & Sample Case Co., New York City.

Models—Made in a variety of sizes and styles for application to practically all makes of automobiles.

Features—"Newness" in the line comprises three models of fender trunks designed especially for use with Cole cars, a coat rail bag and a tire trunk also intended for Cole cars; one of the "high spots" of the line is a "restaurant" trunk which contains a compartment for ice and for victuals and a complete set of dishes. The trunks are formed of the best material, are absolutely dust and waterproof and conform to the lines of the car to which they are attached.

Globe Trunks and Boxes.
Globe Machine & Stamping Co., Cleveland.

New products include: Special Ford tool boxes; Strong or Security boxes; Automobile trunks which will carry two suit cases yet occupy small space; Auto Refrigerator, holding refreshments for seven persons. Line for the coming season includes 32 sizes of boxes. Company features its ability to supply a box from stock for nearly every make of car. Company also makes stampings and specialties to order.

Berg Automobile Trunks.
Berg Auto Trunk & Specialty Co., New York City.

Trunks are made in various sizes and styles and for various uses; line includes tire trunks, fender trunks and other styles.

Pyrene Fire Extinguishers.
Pyrene Mfg. Co., New York City.

Models—One.

Features—A non-corrosive, non-damaging, non-freezing, non-deteriorating liquid which forms a blanket over the fire when squirted upon it. Is contained in a small, easily portable metal container and is expelled by a small double-acting pumping

Digitized by Google

mechanism. Is attached to the car by means of a specially designed bracket. Company recently succeeded in having fire insurance companies offer a 15 per cent. reduction on cars Pyrene-equipped.

Prices—Brass, $7; nickel-plated, $8.

Simplex Fire Extinguishers.
David Kahnweiler's Sons, New York City.

Fire extinguisher which works without a pump, liquefied gases being forced out under pressure when a small capsule is broken. Will not injure surfaces with which it comes in contact and is easily handled.

Hydraulic Oil Storage Systems.
Hydraulic Oil Storage Co., New York City.

Oil and gasolene storage systems in which water is injected into the tank to displace the gasolene; the gasolene is drawn off from the top of the tank so that impurities settle to the bottom and are drawn off with the water when the tank is drained preparatory to filling. The arrangement is such that the inflow of water ceases the moment the last of the gasolene passes from the tank, so that there is no possibility of getting water into the tank of the car. Portable tanks, pumps and garage oil storage systems also are made.

Cox Welding and Decarbonizing Sets.
Cox Brass Co., Albany, N. Y.

Set comprises acetylene and oxygen tanks and regulators which automatically control the flow of the gases to the welding torch. The torch is provided with six interchangeable tips for various kinds of work, making the scope of the outfit exceptionally broad. The necessary flux, goggles and wrenches and also the flexible tubing for use as a decarbonizer accompany the outfit.

Price—$75.

Electric Sundries.
Fitzgerald Mfg. Co., Torrington, Conn.

A new line of spring and snap terminals as been added; line also includes Never-leak copper asbestos gaskets and other similar products. Pump hose bands are a new product.

Leak-Proof Piston Rings.
McQuay-Norris Mfg. Co., St. Louis, Mo.

Sizes—3½ x ¼-inch; 4½ x 5/16; 5½ x ⅜.

Features—Two-piece ring; concentric; equally distributed tension; continuous, no opening; leak proof; cannot wear leaky; made of special processed gray iron. Are made of two split-ring sections which fit into each other telescopically.

Prices—3½ x ¼, 11 to 29 cents each, according to parcel post zone; 4½ x 5/16, 12 to 41 cents; 5½ x ⅜, 13 to 53 cents.

Tools and Tungsten Steel Valves.
Rich Tool Co., Chicago.

Bits, chucks, drills, reamers, rivet sets and valves.

Features—Company claims to be the only manufacturer producing tungsten steel valves from one-piece forgings. Line of tools has been improved for the 1914 season and a valve-seating reamer has been added. The valve reamer is designed to save the manufacturer of motors the trouble of grinding in of valves; it is necessary only to ream the valve seat, which is a short operation as compared with the grinding-in method. The company's line of high-speed tools was not exhibited last year.

Brown Trafilog.
Brown Trafilog Co., Cleveland, O.

A device designed to record the movements of a car; is actuated by the vibration of the car; a hand records the time the car runs and the time it is stationary and also, by the mark recorded, indicates to a certain extent the manner in which the vehicle has been operated; is designed especially that an owner may know when and how his car has been operated by another than himself and when he himself has not been a passenger.

Perfection Springs.
Perfection Spring Co., Cleveland, O.

Thin leaf springs for touring cars; springs for 1-, 3-, 5- and 7-ton trucks. Oil tempered, heat treated and made of either American or imported Krupp steels.

Automobile Springs.
Tuthill Spring Co., Chicago, Ill.

Automobile body springs of vanadium, nickel chrome or carbon steel; excellence of workmanship; strength and flexibility.

Oils and Lubricants.
Platt & Washburn Refining Co., New York City.

Oils and lubricants for the various needs of automobile service.

Curled Hair.
Sulzberger & Sons Co., Chicago, Ill.

Curled hair for use in upholstering automobile bodies.

Motorcycle Accessories.

Majestic Sidecars.
Majestic Mfg. Co., Worcester, Mass.

Majestic sidecars for attachment to motorcycles, including a new Windsplitter model and a new commercial type, both of which are mounted on underslung chassis.

Motorcycle Parts.
Eclipse Machine Co., Elmira, N. Y.

Eclipse motorcycle clutches for both engine shaft and countershaft application, including a new two-speed model; Morrow and Eclipse coaster brakes and motorcycle band brakes and other parts.

F-N Motorcycle Accessories.
Fentress-Newton Mfg. Co., Detroit, Mich.

F-N tandem seat; foot rests fold up from front or bottom; waterproof Kant Pak cushion; price, complete, $10. F-N spring baggage carrier; consists of tandem seat stripped of cushion and holds; price $5.50. F-N tandem cushion; price, $2. F-N adjustable back rest; price, $2.50. F-N tool bag holder, back rail, Prest-O-Lite holder, license holder, T-bars and U-bars, luggage carrier straps and cushions, foot rests, side seat foot rest, Universal lamp brackets, extension nuts, shouldered nuts, piston rings, solid stock washers, F-N skirt guard.

F. A. Baker & Co., New York City.

Indian Motorcycles and Simplex Sidecars. Infallible lamps, horns, tires and tubes, and other specialties.

Dandy Motorcycle Tail Lamps.
Imperial Brass Mfg. Co., Chicago, Ill.

Model 8-B, with hose nipple; price, $1.50.
Model 9-B, with shut-off cock; price $2.

MOTORCYCLES

"Electrified" motor cars now are so common that the electrical equipment will attract but passing notice at the present show. But the "electrified" motorcycle is something new—at least, to the New York show But at least two of the even dozen motorcycles which will be on view at the Palace will be electrically equipped—the sensational Indian with even an electrical engine starter, while the Excelsior is fitted with an electric lighting system of the dynamo type. In both cases the design of the electrical equipment is adapted from motor car practice, the Indian machine being equipped with a compact motor generator, compound wound, which turns the motor over when the starter switch is closed and "churns up" the necessary current to recharge the battery and carry the lamp load and operate an electric signal when the switch is in the "charging" position. In the Excelsior application the generator is driven by an enclosed chain, and the batteries are "floated across the line," an automatic cutout being provided to open the circuit at low speeds, regulation being inherent with the dynamo.

Aurora Automatic Machinery Co., Aurora, Ill.—Thor.

Consolidated Mfg. Co., Toledo, Ohio—Yale.

Davis Sewing Machine Co., Dayton, Ohio—Dayton.

Emblem Mfg. Co., Angola, N. Y.—Emblem.

Excelsior Motor Mfg. & Supply Co., Chicago, Ill.—Excelsior.

Harley-Davidson Motor Co., Milwaukee, Wis.—Harley-Davidson.

Hendee Mfg. Co., Springfield, Mass.—Indian.

Miami Cycle & Mfg. Co., Middletown, Ohio—Merkel.

Pope Mfg. Co., Hartford, Conn.—Pope.

Reading-Standard Co., Reading, Pa.—R-S.

Schickel Motor Co., Stamford, Conn.—Schickel.

Henderson Motorcycle Co., Detroit, Mich.—Henderson.

GETTING MOST FROM EMPLOYES BY BEING HUMAN

Reilly and the Sales Manager Encounter a Manufacturer Whose Idea of Maintaining Efficiency Is a Periodic Grouch—Things It Doesn't Accomplish—Reilly's Salesmanship Methods of Handling Workers.

"——and don't forget it! I told you about that once before—and once ought to be enough."

"Yes, sir; yes, sir," said the foreman of the assembling department in the windshield factory, and he looked humbled and nervous as he assumed a cowed attitude in the presence of his employer.

The owner of the business was adding this finishing touch to his tirade when the Sales Manager and Reilly walked in. When they appeared the foreman was dismissed with a wave of the hand and the previously clouded face of the manufacturer lost its foreboding aspect; to the Sales Manager it seemed that their entry had torn a rift in the clouds and let the sunshine beam through.

Reilly Meets the Windshield Maker.

"This is Mr. Reilly, Mr. Rumner; he helps us help you on your way to fortune."

"Oh, yes! Yes! Heard of you before, Mr. Reilly," exclaimed the manufacturer as he grasped Reilly's hand. "And I never heard anything I wouldn't just as soon tell you to your face." The manufacturer laughed heartily at his—to him—joke, and the two visitors had to make believe it was a joke, too, and managed to force a little laugh.

"Things going wrong in the shop?" The Sales Manager nodded in the direction taken by the foreman.

"No, nothing in particular; just had to call him down; that's all. I do it every so often."

"Sort of a fixture, eh?"

"Yes," rejoined Rumner, "I think it's good business. I call 'em all down regular."

"Whether they do anything or not?" asked Reilly.

Gets a Grouch on Regularly Every Week.

"Yes," replied Rumner, "I have to keep 'em tuned up." He couldn't see what the active little mind of Reilly was thinking about him, so Rumner went on. "I think that's the best way I know of to keep the shop going at top speed. Every week or so I get a grouch on, no matter whether I feel grouchy or not, and go through the place and call 'em down. It keeps 'em smart and makes 'em jump around. It certainly gets the most out of the men; makes 'em earn their money."

When the Sales Manager and Rumner began to get down to business Reilly strayed through the shop, which made windshields for the cars he sold; when the business was ended Rumner bade them a cheerful farewell as the Sales Manager threw in the starter and the two whisked back toward the Sales Manager's office.

"Great system, that of old Rumner's," exclaimed Reilly, while the Sales Manager slowed down at a street car crossing.

"Funny old duck, that boy; he's got some queer ideas," admitted the Sales Manager.

"I don't think 'queer' is an exaggeration," remarked Reilly. "I should say that was within two per cent. of absolute accuracy."

"Evidently you don't like him."

"The old cuss seems to be all right—but his system! His system! That gets me!"

"Don't like it?"

The Fault of the "Tuning Up" Plan.

"He thinks he's working out a great efficiency plan, I suppose," continued Reilly, "but it's plain to be seen he doesn't know human nature or men. He may have known once, but he's forgotten; or else he doesn't stop to think."

"He's making money," asserted the Sales Manager.

"I know it, Jim, but if he thinks he's making all he could make he's mistaken. The idea! Calling the men down every so often to keep them 'tuned up'! Who ever heard of such a thing?"

"It's done, isn't it?"

"I suppose it is," admitted Reilly, "and the men who do it think they are getting more out of their help by wielding a club over them periodically, but I never could see it. That's not the way to get a man to do his best."

"No?"

"Certainly not. You never had the jobs that I've had, Jim, and you don't know what it is to be one of a force of men under a nasty boss. I've had all kinds of them in my way, and I never will be able to agree that there is any efficiency in such a professional system as old Rumner has."

"Don't you do it?"

"I do not! I worked in an electrical supply place once when I was a young lad and I never have been able to blot from my mind the boss who used to keep us on the anxious seat. He thought he was producing efficiency, I suppose, but the most his crabbedness ever did for me and the rest of the lads who worked near me was to produce a fine lot of defective work.

How Censure Reduced Shop Efficiency.

"This boss apparently thought he was earning more money himself by doing more bossing. He used to tear around the shop and bawl the life out of everybody. He would rip up and down and every now and then he would fire some one; he had us scared to death. I don't know why I should have been, but I was; I didn't absolutely have to hold the job but, boy like, I hated to get canned.

"But some of the workmen were men with families and had to hold their jobs, so they used to swallow it and do the best they could. Whenever the boss would come through and read the riot act it would leave its impression as plain as day; when the men would see him coming they would try to speed up and look as busy as possible, but the nervous tension was terrific and the result generally was that they cracked tubes and other pieces and didn't do as well as they would have had they been left alone.

Keeps Men's Minds on Pleasing Boss.

"When he was out of earshot, what some of them called him was full of brimstone, and when he disappeared they would slack up a bit and try to get their old nerve back, but it left them nervous; in fact, they always were in a high-strung condition. Some of the work required care, and a nervous man isn't fit for that. One of the boys on a tube machine lost a finger one day just because he got frightened at the boss. That meant a loss in dollars to the company instead of an increase in efficiency. The fact was that instead of the men going along in their own way and doing the most that could be expected of them, their minds were on avoiding a call-down, not on turning out work."

"I think that's true, too."

"What?"

"That being in dread of the boss causes a man to concentrate his energies on avoid-

Digitized by Google

ing censure, not on his work," replied the Sales Manager.

"I know it's true from experience, and that's the reason why I try not to be that way in my own shop. I know that a man can do his best if he feels that he is getting a square deal and is not working for a slave driver. I may be a little bit stuck on myself—some folks say I am—but I think my men like me rather well; at least, I have tried to have them. And I believe it pays me financially not to treat them as Rumner treats his employes."

"I'll admit, Reilly, that things do run smoothly in your place."

When and How to Criticize the Employe.

"Fairly so. One thing I do not believe in is berating a man when he has made a mistake. Everybody is entitled to make a few mistakes; we all make 'em; it's impossible not to do so. If a man doesn't get into the habit of making errors and doing things he shouldn't do I don't consider that he's doing anything but acting like an ordinary human being, and therefore he isn't entitled to be called up on the carpet. The man who makes an error should be reminded of it, as a general rule, but that doesn't mean that you have to rush up and shout at him. It's quite possible to talk with a man about such a thing and not make what you say offensive to him.

"Look at young Tommy Trumbull! Since he came in to work for me as a salesman Tommy's done several things that weren't just in accord with my ideas of salesmanship, but do you think it would help matters if I ripped him up the back and made him think he was going to lose his job the next time he did something in a way that didn't agree with my ideas? I don't think so. Several times I have told Tommy the way I think things should be done and have tried to have him understand that I am trying to help him on in the right way, not chastise him for having done things the wrong way."

"What do you think of the Old Man, up at the shop?"

Likening Employes to Customers.

"He's one of the best managers of men I ever knew," replied Reilly. "There isn't a man in the shop who wouldn't give the Old Man his shirt; they'd fight to see who had that privilege. And you never see the Old Man around bawling out the men, do you?"

"If he does I never caught him at it."

"No! And you never will! Did you ever notice the inconsistency in some people and some organizations, Jim?"

"Just how?"

"Well did——" Reilly caught at the edge of the seat as the car bumped over a railroad crossing. "Did you ever realize that old Rumner, for instance, is treating his customers one way and his men the other way and that his men are nothing but customers, after all?"

"You'll have to explain that, I'm afraid."

"The men," Reilly explained, "are customers in that they are exchanging their labor for Rumner's money and he is trying to get as much for his money as he can. It works both ways, of course, but for this occasion let the men be customers. As to what his other customers are there is no need of explanation.

"But, now, here's the point: He comes into contact with those who buy his goods and in endeavoring to persuade them that they want his stuff he uses his best salesmanship; he treats them courteously and tries to lead them rather than to force them; the result is that he gets much more from them than he would if he tried to handle them the way he handles his men. He knows salesmanship pretty well and can handle his customers right.

Tries to Drive, Not Lead, His Men.

"And, now, here's the other side: Instead of trying to lead his men into giving more work for his money and in paying him a larger toll of loyalty he casts away his selling ability and tries to drive them into it. If he put one-half the salesmanship into handling his men that he does in handling his customers he would be worlds better off. Customers and men are made of the same material; there isn't an iota of difference, and there isn't much difference, basically, in the way they should be handled. As a matter of fact, Jim, the whole game of life is one big piece of salesmanship; you want somebody to give you something for something, and the more you apply your salesmanship the better you will come out."

"Old Rumner, then, according to your definition, is only half a salesman."

"Old Rumner is like a man who tries to whale his kids into being affectionate. The only case I know of in which that works is with a dog."

Foreign Body Makes a Whole New Car.

Even though the chassis were originally manufactured in this country, if its body has been built abroad, it must pay the full 45 per cent. ad valorem duty under the completed car classification when it is brought back into the United States, according to a ruling made this week by the Board of United States General Appraisers; this body, which decides duty questions, disallowed the claim of the General Motors Export Co., of New York City, that the chassis had not been improved, and the board furthermore declared that the company had failed to comply with the regulations governing the return of American goods.

Makes Owner Liable for Dealer's Employe.

The driver who is delivering a car to a buyer is acting for the buyer and not for the dealer, in the opinion of Circuit Judge Murphy, of Detroit, who was called upon last week to render an opinion in an action brought against the Ford Motor Co. by Jan Janick; the Ford company was delivering a car to a buyer outside the city limits and the car struck Janick as he was alighting from a street car. He sued, but the case was decided against him after two half days of argument, the court holding that at the time of the accident the driver really was acting for the owner of the car and not for the Ford company, although it paid him his salary.

Cincinnati to Have Two Dealers' Shows.

The differences among the automobile dealers in Cincinnati, O., which led to the formation of the Cincinnati Automobile Trade Association, a rival to the Cincinnati Automobile Dealers' Association, has led to plans for rival shows in February; the new organization, which is made up of dealers who objected to the manner in which the Dealers' Association conducted past shows, has decided to hold an exhibit of its own in the Music Hall. It will be held the same week or the week preceding the older organization's show, which is scheduled to open February 21.

Kissel Branch Moves into Palatial B.

The Kissel Motor Car Co. last week possession of the new building in San Francisco erected for its Pacific Coast branch and which is reputed to be one of the most palatial automobile establishments west of the Mississippi. It is a two-story structure with a frontage of 60 feet on Van Ness avenue and a depth of 137 feet on Gerry street. The floor of the salesroom is of white inlaid tile, which, with hardwood trim and tinted walls and ceiling makes the place an uncommonly attractive one. The second floor is devoted to the Kissel service department.

Must Pay for Repairs on Borrowed Car.

Because Walton C. Bunce, of Hartford, Conn., took Dr. N. J. Goodwin's car to Robert R. Ashwell's garage for repairs after it broke down while in the possession of Bunce, the latter must pay the repair bill; Ashwell claimed he performed $191.96 worth of repairs on Bunce's order, but when he came to collect he had trouble. He promptly sued Bunce and, although the latter denied having ordered the repairs, the jury gave the garageman a verdict of $205.88.

STRIPPING THE TRADE-MARK OF ITS MYSTERY

Member of Patent Office Force Gives "Inside" View on What a Trade-Mark Is and the Rules That Govern it—Cites Instances Showing Value of Priority—Light on Simple But Often Misunderstood Points

Those who manufacture and those who sell are probably well aware that there is such a thing as a trade mark, but when the man who makes or sells finds himself concerned with a trade mark he is quite likely to regard it as a vague and mysterious matter which has more kinks and angles in its makeup than any one man is capable of comprehending.

There are also the allied questions of patents and copyrights. One may think they are much alike, but such is not the case. The trade mark lasts forever under the common law, while the patent and copyright are valid only during a fixed period. It may also be of interest for those who are concerned with trade marks to know that:

The trade mark does not have to be registered to become effective.

The man who first registers a mark has not necessarily an undisputed right to it.

The right to a trade mark depends upon priority of adoption and use.

The man who uses the trade mark need not be the maker of the goods.

Attorney's Advice an "Outside View."

A responsible patent attorney is able to furnish advice on the trade mark question—some advice being better than others—but when all is said and done the attorney's opinion is an "outside view." The "inside view" is that held by the Federal government, and it is likely to differ from the varied views of various attorneys. To make plain the "inside view" William L. Symons of the United States Patent Office recently stated in Printers' Ink the status of the trade mark as viewed by the government itself. Symons went into the many phases of the matter and in defining a trade mark called it "one's commercial signature, or the commercial substitute for one's autograph."

That the trade mark is designed for the protection of the public as well as for the protection of the manufacturer, was his statement. "We must not lose sight of the fact," he said, "that it is not only the first who adopts and uses on an article of commerce an arbitrary sign who is to be protected, but the public also is entitled to be protected from fraud and imposition."

Taking up a question that perpetually puzzles many manufacturers and advertisers, the Patent Office official said: "The distinction between a trade mark, a copyright and a patent should be recognized. Only by keeping the difference between these three classes of property clearly in mind can a comprehensive and satisfactory idea of a trade mark be obtained.

Wherein Patent and Trade-Mark Differ.

"A patent is granted for an invention. A trade mark has no necessary relation to invention. It may be the most common object, such as an arrow or a star. Or, if it is the product of an inventive faculty, such as a coined or fancy word, the protection granted is not accorded because of the ingenuity or skill which was required to product it. If such a word is not used, it will not be protected.

"Both a patent and a copyright are limited in duration; a trade mark is not. It is unlimited as to time and probably as to place. In this country no protection to an invention can be given except under the patent laws, nor to copyrightable matter except by virtue of the copyright laws, while a trade mark is protected under the common law. This indicates a very vital distinction, which is emphatically in favor of the trade mark, inasmuch as no right exists in an invention or in a published literary or artistic work except by virtue of a statute."

Trade-Mark Not Considered Monopoly.

Symons contends that property in a trade mark is not a monopoly—a mooted question in some quarters just now. Said he, "Although the Supreme Court in deciding a case some time since spoke of the use of a trade mark which would give the user practically a monopoly in the sale of any goods other than those produced by him, this probably was not intended to convey the idea that the right to the use of a proper trade mark was in the nature of a monopoly. It does not restrict the right of any member of the public to manufacture any particular article of commerce. It merely prevents anyone from marking his goods in simulation of the mark used by another upon the same kind of goods.

"Registration of a mark under the law gives usually some additional rights and advantages in addition to those which exist under the common law. In some cases registration dispenses with the necessity of certain proof; or it may give certain advantages in procedure; or in preventing infringement; or in recovering damages.

"Under our laws, however, the right to the exclusive use of a trade mark depends on adoption and use. The date of registration is of minor importance, the right depending upon proof of priority of adoption and use. This is a point which it appears difficult for many persons, including some good lawyers, to grasp. It appears to them that after a mark has been registered, especially after contests, the validity of the registration should not be questioned by an applicant for registration who comes in five or ten years after the date of registration. This erroneous view, however, takes no account of the fact that in the United States title depends on priority of adoption coupled with continued use and not upon registration."

Meeting Classification Requirements.

Manufacturers are frequently troubled by the requirement that the class of merchandise to which goods belong must be specified in making application for registration. Questioned with regard to this, Symons explained that the purpose of such specification is to facilitate the examination in the Patent Office to determine whether the same or a similar mark has been registered.

"But," he continued, "I will admit that whereas the general basis of classification is either the material of which the article is made or the purpose or construction of the article, classification is not an exact science. Some classes have not very clear lines of demarcation. For example, it is often difficult to determine whether goods should go in the class of 'Clothing' or the class of 'Fancy Goods, Furnishings and Notions.' Or, again, very often an article of hardware is a receptacle and then it becomes a puzzle whether it belongs in the class for 'Receptacles' or in the class for 'Hardware and Plumbing Supplies.'

"If the Food and Drugs Act requires goods to be labeled in a certain manner, it is the practice of the Patent Office to require the particular description to agree with the labels. Whether whiskey is straight, blend, compound or imitation must be stated. If the syrup on which the mark

Digitized by Google

is used is made of corn and maple syrup it should be described as a compound of corn and maple syrup."

What is the "use" of a trade mark upon which registration depends? Symons answered the question in this wise: "The courts have clearly pointed out that the use of a mark and not adoption was the test. Where it has been shown that there was a clear intention to adopt a mark, but no actual use due to circumstances over which the party had no control, it has been held that no right to the mark has been established; actual use in trade is necessary. It is the person who first uses a trade mark who is entitled to protection, not the one who first thought of using it, but did not use it first. The law deals with facts, not intentions.

Use of Mark Necessary to Title.

"However, the Patent Office and the courts are inclined to be liberal on the question of what constitutes use of a trade mark if there is an evident intention to make use of some form of mark.

"In deciding a case some time since, the Commissioner of Patents said that it was not necessary to affix or attach the trade mark to the goods with which it was used to make it a valid trade mark. It was sufficient if the mark is associated with the goods in a manner to distinguish them by the particular mark. In that case the mark claimed had been used on lithographs which were put in the boxes of knit goods, or in some form accompanied the goods. On the other hand, the mere use of an alleged trade mark in a trade list has been held not sufficient to identify it with the goods.

"In another case the Patent Office held that the fact that an applicant advertised his goods in a periodical under a certain name, in the absence of any evidence that the name or mark was attached to the goods, did not constitute trade mark use. A mark used on letterheads, cards and circulars in connection with a business is not used as a trade mark, and a name used in a business, such as the real estate business, is not subject to registration, for the reason that it is not used on or in connection with an article of manufacture. It is fundamental that the trade mark must have been used on an article of commerce.

Necessity of Independent Marks.

"What constitutes the use of a mark is often the subject of controversy in the Patent Office. In one recent case the applicant filed specimens in which the alleged mark appeared as a part of the reading matter at the bottom of the label, but the words claimed did not appear anywhere on the label as an independent or separate mark. When the examining division refused registration on the ground that the use of a trade mark had not been shown an attempt was made to carry the case to higher authority, but ultimately the applicant filed proper specimens. Another case in point was the refusal to register the word 'Fussy' as a trade mark when it appeared only in the legend 'A Fussy Package for Fastidious Folks,' a refusal that provoked ineffective protest.

"Yet another rule which has led to a great deal of controversy—which may not even yet be closed—is that provision of the Act of 1881 which required an applicant to distinguish between the essential and non-essential features of his trade mark. The applicant would specify certain features as the essential features whereas the Patent Office would regard others as the essential. The same question has come up in other forms under the new law which requires a description of the trade mark, but not of its essential features. Difficulty sometimes arises, too, when public insignia constitutes a part of a trade mark, interwoven with the fanciful features of the mark so that it cannot be removed without mutilating the mark."

Character Determines Infringement.

Touching upon a phase of the subject of vital interest to manufacturers, this governmental authority on trade marks said: "It is not necessary that the user of a trade mark produce the goods upon which it is used. One who selects and sells goods may acquire the right to the mark. Likewise a customer acquires the right to a mark by ordering goods put up by a manufacturer under a certain brand or name.

"The question whether one trade mark so nearly resembles another as to cause confusion is one of some difficulty. Not only is the question of similarity hard to decide but persons equally familiar with the subject of trade mark law will differ on many cases. Some courts, too, have applied a strict test, others a more liberal rule. One class of judges will not protest purchasers of goods who do not exercise ordinary caution; another class of judges will protect the incautious or unwary. The courts fairly agree, however, that it is not the expert who is to be considered in determining infringement but the ordinary purchaser. The character of the goods must also be taken into consideration. In the case of engines or dynamos the intelligence and caution exercised by purchasers will prevent confusion, even if the marks are somewhat alike, while an equal degree of similarity between marks on cans of tomatoes would confuse. The Patent Office always resolves a reasonable doubt on the question of similarity against an applicant and in favor of a registrant, unless the consent of the registrant has been obtained.

"The Patent Office does not concede the right of an owner of a very valuable mark to that mark on any and all goods. No absolute right to a trade mark can exist, and the right to its use on one particular article does not give a right to its use upon different articles. This invests with great importance the question of whether goods have the same descriptive qualities, for registration cannot be secured for a trade mark already applied to goods of the same descriptive properties."

Father Liable for Son's Use of Car.

Although the courts in New York City recently decided that a car owner is not liable for negligence of the chauffeur when the chauffeur has borrowed the car for his own use, the exemption from liability does not include those times when the car is being used by members of the car owner's family other than himself, according to an opinion rendered this week in the Appellate Term of the Supreme Court for New York county.

Abraham Cohen, an infant, had sued Louis Borgenecht for injuries sustained when the Borgenecht car, driven by the Borgenecht chauffeur and having Borgenecht's sons as passengers, struck him; the lower court directed a verdict for Borgenecht and then set it aside and the Appellate Court upheld the order which set the verdict aside. It was held that so long as Borgenecht's sons had permission to use the car when they wished the father was liable.

New York Streets No Longer Rentable.

There is more than one way out of a dilemma. New York City has been involved in a tangle of litigation in its attempt to enforce its taxicab ordinance which abolishes rented cab stands in front of hotels, and this week the State of New York came to the rescue. A State law was passed making it a misdemeanor for anyone to rent street space for taxicab stands, which nicely covers the New York City situation and will put the State back of the city in the enforcement of the ordinance and, incidentally, strike a blow at a fine line of hotel keepers' "graft."

Gray Hair Brings Judgment of $250.

A fine head of gray hair netted Mrs. Celia Comings—her name is not Combings—$250 in a suit in the New York City Court this week against the Connecticut Cab Co. which she had sued for $2,000; she claimed she was struck by a taxicab February 22, 1912, and that since that time she has been so troubled with insomnia that her hair turned gray.

MAINTAINING THE CONDITION OF HIBERNATING BATTERIES

Equalizing the Cells and Judging Condition—How to Use the Hydrometer—General Suggestions for Wintering Accumulators.

What should be done with storage batteries that are laid up for the winter? The question has been answered more than once in Motor World, but the man with a car usually is like the hero of the popular song in that he "wants what he wants when he wants it," and if he is on the point of putting away his battery the fact that the information already has been given doesn't interest him much.

Be it said, therefore, that while the best possible treatment for a battery is to keep it at work under normal working conditions —that is, normal from the battery maker's point of view—it is by no means difficult to prevent material depreciation during the idle months. The equipment on the car is all that is ordinarily required, with the exception of a hydrometer, which is neither expensive nor difficult to get.

A good start means a good deal—in fact, there are cases in which a good start is everything in the sense that an abnormal condition may get worse, as abnormalities often will, and ultimately have a more or less deteriorating effect on the battery. Therefore it is well, before putting the battery on a strict winter diet, to examine it and find out just what it needs before it goes into hibernation.

The cells should be examined and all dust and dirt cleaned away from the tops and the terminals cleaned, if they need it, and smeared with vaseline. Distilled water should be added to bring the level of the electrolyte above the tops of the plates and, incidentally, to make the level the same in all the cells. The electrolyte should be tested with the hydrometer; and this should be done only after the battery has been under charge for half on hour or so, to make certain that the fresh water has thoroughly mixed with the fluid. With the battery in a fully charged condition, the electrolyte should be carefully tested, taking a reading from each cell and taking particular care to eject all the fluid from the hydrometer syringe and from the testing cup, if a separate one is used, so that there will be no mixing of electrolyte and of results from separate cells.

When the battery is fully charged the electrolyte in all the cells should show the same reading, and should test 1.280, though on this particular point different battery mokers differ slightly. However, if the cells read 1.280 all round there need be no worry. If there is a discrepancy in the readings, some cells reading lower than others, the battery should be given an "equalizing charge," which is a long, slow charge at a rate considerably below the normal charging rate. If the readings are within two points of being alike they may be considered satisfactory—that is, if the highest reading is not more than two points above the lowest. For instance, if the high cell reads 1.281 and the lowest 1.279, it may be considered that the electrolyte is sufficiently uniform in density for all practical purposes.

It may be remarked, incidentally, that hydrometer readings are the best possible indication of the condition of a battery charge. If, during the charging of a depleted battery, readings are taken at intervals of half an hour, it will be found that there is a steady increase in the readings up to the maximum, when the increase will cease, indicating that the charge is complete. Two successive readings that are exactly alike may be taken to indicate a complete charge. When a battery is in need of equalizing, however, the high cells will have reached a fully charged state before the low cells, and if the difference is not excessive the continuation of the charge at a low rate will not hurt the high cells, and will bring up the low ones. If there is an excessive difference the procedure is to cut out the low cells and bring them up separately. This usually indicates, however, that the battery is rather the worse for wear or otherwise is in an inefficient condition, and the wisest thing to do under the circumstances is to let the maker, or someone who is qualified to cure battery ills, have the whole set of cells and bring them to a uniformly normal state.

Assuming that the cells are in good condition and that they are properly equalized, the only attention required to keep them healthy through the winter is to give them a charge every two weeks to keep them up, on the principle that a fully charged battery will stand idle with but little deterioration, while one that is more or less discharged will deteriorate more or less, according to the amount of charge lost. The battery will gradually become completely run down if allowed to stand without the reviving charges.

As has been stated, the best way to gauge the state of a charge is to check it with the hydrometer. So, if one wants to be really careful, the thing to do is to run the engine and so drive the dynamo and charge the battery until the hydrometer readings cease rising, and then continue the charge for half an hour at half the speed. The motor should be run at a speed equal to a road speed of about 20 miles an hour during the first part of the charge. If a hydrometer is not used the time should be extended to make sure, and a total time of two or three hours should be allowed.

There is another way of keeping up the battery that certainly has points of advantage. The charge may be put in through a rectifier, which may be plugged into the electric light socket. This is for use with alternating current and its office is to convert it to direct current, which only can be used for battery charging. If the lighting current is direct—or D. C., as it is commonly called, to distinguish it from A. C.—the rectifier is not needed, but a rheostat or its equivalent is required to bring the current down to the proper value. Just what is necessary will depend upon the circumstances, and the battery people can furnish suitable apparatus if the details as to battery and current available are given. With such an outfit the battery can, if so desired, be taken out of the car and kept on a bench or other convenient place.

There are a few precautions that should be observed in battery work that are quite simple, but should not be neglected. A storage battery in course of charging gives off a gas, which rises through the electrolyte in the form of little bubbles and has a sharp and unmistakable odor. This gas is inflammable, and its ignition can cause a nasty explosion which may vary in violence from a mere puff that will cause a burn to a bang that will do real damage —the latter following an accumulation of the gas. Therefore, keep naked flames away from a charging battery. The gas is not of such a nature that the presence of a little in the garage is likely to cause trouble, but it certainly can be ignited if a flame is brought close to the battery.

More batteries are damaged from undercharging than from over-charging, ordinarily. Overcharging at a low rate for a reasonable time is practically harmless even when it is unnecessary, while an undercharged battery goes downhill, as has been stated. Overcharging at a high rate, however, is frightfully hard on the plates, loosening up the active material and causing it to be deposited at the bottom of the cells without doing any useful work.

While a storage battery is by no means a hard thing to keep in condition, it is rather easily spoiled if it is abused—in which it does not differ from most other things that man makes. Obviously, it doesn't make any difference to the battery whether the abuse is the result of ignorance or of the don't-care-a-whoop spirit that is careless of consequences. Therefore it is a good thing to ring up the battery people on the telephone if something comes up that is not understood, and ask for guidance.

1,068,097. Explosion Engine Governor. Reuben B. Benjamin, Chicago, Ill., assignor to Benjamin Electric Mfg. Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 1, 1912. Serial No. 723,421. (Governor with rotary fan.) 11 claims.

1,068,100. Headlight Controller. Romeyn W. Brace and Romeyn T. Brace, Victor, N. Y. Filed Mar. 1, 1913. Serial No. 751,623. (Headlight controlled by steering gear.) 1 claim.

1,068,107. Vehicle Wheel. Robert Edgar Cole, Highland Creek, Ontario, Canada, assignor of one-half to William Douglas, Toronto, Canada. Filed Apr. 27, 1911. Serial No. 623,725. (Resilient wheel with springs and linkage.) 2 claims.

1,068,112. Road Map for Automobiles. George A. Deardorff, Occoquan, Va., assignor of one-fourth to Howard M. Taylor, Canal Dover, Ohio. Filed July 8, 1912. Serial No. 708,334. (Automatically moving road map.) 5 claims.

1,068,129. Starting Device for Explosive Motors. Henry Hess, Wawa, Pa., assignor to The Hess-Bright Manufacturing Company, Philadelphia, Pa., a Corporation of Delaware. Filed June 3, 1909. Serial No. 499,966. (Means for temporarily cutting out magneto in starting.) 7 claims.

1,068,152. Dynamo Electric Machine, Particularly Applicable for Ignition Purposes in Connection with Internal Combustion Engines. Albert Henry Midgley and Charles Anthony Vandervell, Acton Vale, England. Filed Dec. 6, 1910. Serial No. 595,952. (Lighting dynamo and driving gear.) 2 claims.

1,068,168. Two-Stroke Cycle Motor. Andreas Radovanovic, Zurich, Switzerland. Filed Feb. 11, 1910. Serial No. 543,392. (Two-cycle motor with one end of cylinder acting as pumping chamber.) 17 claims.

1,068,173. Combustion Engine. Emil Schimanek, Budapest, Austria-Hungary. Filed Oct. 11, 1910. Serial No. 586,554. (Valve system.) 4 claims.

1,068,180. Tire Testing Machine. Karl W. Sonntag, St. Louis, Mo. Filed Oct. 10, 1912. Serial No. 725,084. (Power-driven roller for testing tires for wear.) 2 claims.

1,068,181. Resilient Wheel. George Edwin Sprague, West End, Ill. Filed Sept. 18, 1912. Serial No. 721,071. (Wheel with coiled spring suspension spokes.) 4 claims.

1,068,182. Shock-Absorbing Device for Vehicles. Klaus J. Steiner, Pittsburgh, Pa. Filed Oct. 26, 1912. Serial No. 727,918. (Spring-and-cable shock absorbing device.) 11 claims.

1,068,191. Setting Mechanism for Automobile Lamps. Joseph Watzelman, New York, N. Y. Filed Sept. 24, 1912. Serial No. 722,035. (Lamps moved by steering gear.) 10 claims.

1,068,204. Demountable Rim. Walter Charles Baer, Toledo, Ohio. Filed Jan. 11, 1912. Serial No. 670,537. (Screw and lever rim fastening.) 5 claims.

1,068,224. Vehicle Wheel. Ernest De Journo, Allentown, Pa., assignor to Stella Labe, New York, N. Y. Filed Jan. 17, 1911. Serial No. 603,052. (Demountable rim.) 7 claims.

1,068,246. Water-Cooling Radiator. William J. Kells, Jersey City, N. J. Filed Nov. 5, 1912. Serial No. 729,552. (Tubular radiator with integral fan mounting.) 1 claim.

1,068,250. Portable Battery Support. Mathew Koenig, New York, N. Y. Filed Dec. 14, 1912. Serial No. 736,767. (Shelf for pulling out battery on side of vehicle.) 3 claims.

1,068,278. Signal Device for Vehicles. Epilier E. Savage, Asbury Park, N. J. Filed Nov. 1, 1912. Serial No. 729,182. (Visible signal device.) 5 claims.

1,068,297. Revolving Cylinder Internal Combustion Engine. Andrew H. Baird and William J. Turner, Liverpool, England. Filed July 8, 1911. Serial No. 637,514. (Radial cylinder motor.) 13 claims.

1,068,310. Primer for Internal Combustion Motors. Gilman W. Brown, West Newbury, Mass., assignor of one-half to Harriet L. Maddock, Haverhill, Mass., and one-half to Horace W. Brown, West Newbury, Mass. Filed Sept. 18, 1912. Serial No. 720,964. (Priming device with separate tank and carburetter.) 8 claims.

1,068,322. Heater. Lloyd E. Church and John A. Cooney, Bartlesville, Okla. Filed Oct. 22, 1912. Serial No. 727,191. (Electric heater for air supply.) 1 claim.

1,068,329. Shock Absorber for Vehicles. Martin Derihon, Loncin-lez-Liege, Belgium. Filed Aug. 8, 1912. Serial No. 714,071. (Hydraulic shock absorber with vanes.) 5 claims.

1,068,330. Shock Absorber for Vehicles. Martin Derihon, Loncin-lez-Leige, Belgium. Filed Aug. 8, 1912. Serial No. 714,072. (Hydraulic shock absorber with vanes.) 3 claims.

1,068,366. Motor Plow. William N. Robinson, Canyon, Tex., assignor of one-half to Ben Y. Chambless, Canyon, Tex. Filed Nov. 19, 1910. Serial No. 593,172. (Plow control in motor plowing apparatus.) 4 claims.

1,068,379. Internal Combustion Engine. Charles Henry Thomas Alston and Percival Turner Houston, London, England. Filed Sept. 14, 1912. Serial No. 720,426. (Explosion motor with compressed air supply.) 2 claims.

1,068,457. Spring Wheel. Arthur O. Smith, Lakemp, Okla. Filed June 24, 1912. Serial No. 705,604. (Wheel with spring-cushioned hub.) 2 claims.

1,068,481. Multiple-Cylinder Explosive Engine. Everett S. Cameron, Beverly, Mass. Filed Apr. 21, 1911. Serial No. 622,525. (Rotary valves and actuating mechanism.) 1 claim.

1,068,495. Gas-Turbine. Judson D. Geiger, Bucyrus, Ohio. Filed Apr. 25, 1912. Serial No. 693,094. (Gas turbine with hollow shaft and rotor.) 3 claims.

1,068,532. Steel Spring Automobile Tire. Ole G. Rugtwet, Longmont, Colo. Filed Dec. 4, 1912. Serial No. 734,947. (Concentric rims with spacers and springs between.) 1 claim.

1,068,559. Frame for Motor Plows. Harry A. Bean, Leroy township, Barton county, Mo. Filed May 1, 1912. Serial No. 694,553. (Running-gear for motor plows.) 2 claims.

1,068,567. Valve for Internal Combustion Engines. Frederick William Coen, Los Angeles, Cal. Filed Mar. 27, 1912. Serial No. 686,638. (Disk valve and driving gearing.) 2 claims.

1,068,572. Wheel. William Homewood Dean, Newark, Del. Filed June 28, 1912. Serial No. 706,533. (Disk wheel.) 2 claims.

1,068,590. Wheel. Kazimier Jasiecki, Philadelphia, Pa. Filed Jan. 16, 1913. Serial No. 742,360. (Rubber block tread backed by pneumatic tube.) 2 claims.

1,068,595. Internal Combustion Engine. Charles M. Leech, Lima, Ohio. Filed Nov. 25, 1911, Serial No. 662,388. Renewed June 12, 1913. Serial No. 773,347. (Two-cycle motor with rotary crankcase valve.) 9 claims.

1,068,598. Tractor. William Clifford Martyn, St. Kilda, Victoria, Australia. Filed Apr. 27, 1912. Serial No. 693,697. (Power steering gear.) 1 claim.

1,068,619. Pneumatic Tire. Robert J. Wynn, Sault Ste. Marie, Mich. Filed Feb. 10, 1912. Serial No. 676,757. (Fire formed of annular sections.) 1 claim.

1,068,632. Valve Device for Internal Combustion Engines. Andrew C. Dam and Alfred Marshall, New York, N. Y. Filed June 19, 1912. Serial No. 704,561. (Disk valves in cylinder head.) 6 claims.

1,068,644. Shock Absorber. 5 claims.

1,068,654. Expander for Tire Vulcanizers. William A. Hinds, Reading, Pa., assignor of one-half to Sherman H. Hoverter and one-half to Harvey E. Eberly, Reading, Pa. Filed Aug. 16, 1911. Serial No. 644,439. (Expanding core.) 19 claims.

1,068,660. Vehicle Wheel. Joseph D. Ingram, Washburn, Tex. Filed Nov. 20, 1911. Serial No. 661,233. (Wheel with circumferential coiled springs.) 2 claims.

1,068,710. Internal Combustion Engine. Ole O. Storle, Tacoma, Wash. Filed Sept. 15, 1911. Serial No. 649,416. (Two oppositely moving pistons with explosion space between.) 6 claims.

1,068,720. Spring Tire. Charles A. Wheaton, Stockton, Cal. Filed Mar. 25, 1912, Serial No. 686,018. Renewed Dec. 21, 1912. Serial No. 738,0[illegible]. (Wheel with coil springs between inner and outer rims.) 3 claims.

1,068,724. Explosive Engine. Samuel Ybarra, St. Louis, Mo. Filed Nov. 25, 1911. Serial No. 662,278. (Rotary ring valve.) 3 claims.

1,068,725. Internal Combustion Engine. Samuel Ybarra, St. Louis, Mo. Filed Jan. 26, 1912. Serial No. 673,557. (Rotary cup valve.) 6 claims.

1,068,773. Fluid Control for Tanks. Allan G. Hurdman, Denver, Colo., assignor of one-third to William S. Iliff, Denver, Colo. Filed Aug. 15, 1910. Serial No. 577,348. Renewed Feb. 9, 1912. Serial No. 676,696. (Fuel tank under seat with interior valve exteriorly controlled.) 8 claims.

1,068,804. Dust Cap for Automobile Starting Crank Shafts. Alfred Moorhouse, Detroit, Mich., assignor to Hudson Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Aug. 3, 1912. Serial No. 713,080. (Cap for shaft-end from which crank has been removed.) 7 claims.

1,068,826. Vehicle Wheel. Albert N. Simmerly, Cleveland, Ohio. Filed Aug. 5, 1910. Serial No. 575,655. (Wheel with tubular spokes enclosing coil springs.) 1 claim.

1,069,109. Automobile Wheel. Frederick A. Bass, Polson, Mont. Filed July 24, 1912. Serial No. 711,318. (Springs between inner and outer rims.) 2 claims.

1,069,137. Antiskidding Attachment to Automobile Wheels. Edward E. Hosmer, East Lynn, Mass. Filed July 26, 1912. Serial No. 711,651. (Sharp pointed steel rods to engage road surface and prevent skids.) 3 claims.

1,069,154. Protector for Automobile Radiators. Arthur V. Maedje, Indianapolis, Ind., assignor of one-third to Virgin H. Lockwood, Indianapolis, Ind. Filed Mar. 4, 1912. Serial No. 681,405. (Radiator shield.) 3 claims.

1,069,182. Differential Speed-Changing Mechanism. Frank I. Remy, Benjamin P. Remy, and Arthur Berger, Anderson, Ind., assignors to Remy Brothers Company, Anderson, Ind., a Copartnership. Filed Dec. 13, 1912. Serial No. 736,524. (Friction mechanism.) 13 claims.

1,069,199. Steering Device. Arnold M. Squire, Cleveland, Ohio. Filed Mar. 29, 1912. Serial No. 687,151. (Screw-and-nut steering gear.) 1 claim.

1,069,239. Pneumatic Tire. Rally Ehle and Rex Ehle, Council Bluffs, Iowa. Filed Mar. 26, 1912. Serial No. 686,347. (System of fabric building.) 3 claims.

1,069,279. Motor Vehicle. Morris Moskowitz, Montclair, N. J. Continuation in part of application Serial No. 700,429, filed May 29, 1912. This application filed Dec. 18, 1912. Serial No. 737,484. (Power plant mounting.) 3 claims.

1,069,313. Demountable Tire Rim. Bert C. Ball and Lewis E. Younie, Portland, Ore. Filed Feb. 20, 1911. Serial No. 610,595. (Split rim and fastening lugs.) 6 claims.

1,069,334. Vehicle Frame. Gise H. Humphrey, Wilkinsburg, Pa. Filed Apr. 11, 1912. Serial No. 689,954. (Shock-absorbing suspension system.) 2 claims.

1,069,349. Demountable Rim. Frank Spranger and Nicholas M. Spranger, Detroit, Mich. Filed Jan. 11, 1912. Serial No. 670,683. (Rim with screw-and-wedge fastenings.) 3 claims.

1,069,365. Pneumatic Tire. Benjamin Wlademarowitsch Wittenberg, Riga, Russia. Filed Sept. 11, 1912. Serial No. 719,820. (Rivet-studded tread.) 2 claims.

1,069,410. Spring Wheel. Simon Gordon, Washington, D. C. Filed Jan. 22, 1913. Serial No. 743,681. (Spring-cushioned hub.) 5 claims.

1,069,427. Means for Controlling the Escape of Fluid from Tanks. Allan G. Hurdman, Denver, Colo., assignor of one-third to William S. Iliff, Denver, Colo. Filed Aug. 8, 1910. Serial No. 576,238. Renewed June 22, 1912. Serial No. 705,310. (Gasolene tank shut-off valve and adjustment.) 7 claims.

1,069,432. Internal Combustion Engine. Felix Jorwich, St. Paul, Minn. Filed Feb. 27, 1912. Serial No. 680,357. (Piston with extension sleeve for uncovering and covering ports.) 5 claims.

National

ANNOUNCEMENT

SIX—$2375

THOUSANDS of motorists have been waiting for the right six—at the right price—built and guaranteed by manufacturers with years experience and a reputation for quality products.

HERE it is, National Six, $2375.

IF this was not a good six we would not put it on the market. Our customers have faith in us. They know when we put our confidence in a car and stamp it with our guarantee with the name National, no better car can be bought no matter if they used a microscope.

WE sell National cars to people who do not have to bother about raising the hood, or worrying over what various mechanical things are in the car. This is because they know we put the right material in the right place; because they know that every part works harmoniously to produce a unit of satisfactory results.

WE build and sell whole cars,—not specifications. We give you results.

IF you have not read our POLICY write for a copy. It is worth while. It is a bold, frank, original stand we have taken. It tells you why we are able to sell National cars "sight unseen"; why the National guarantee is without a peer.

BECAUSE of this public confidence; because we have such a large per cent. of National owners who come back to us, we offer dealers the finest, safest and most prosperous proposition in the market.

THIS attitude upon our part is possible because of such reasons as follow:

WE are fourteen years old.

WE are experienced.

OUR cars have always made good.

OUR owners stay with us.

OUR dealers are successful and permanent.

LEATHER STOCKING MODEL

PATHFINDER

Read the Details of Our

$1,000 Prize Offer

Several new and important announcements await your approval at the New York and Chicago Shows this year. Here they are:

—Two new Pathfinder Sixes, embodying the most scientific principles of chassis construction that are now known and spectacular body lines that are unapproached in style, beauty and comfort features.

—A well-developed plan for perpetuating the investment of Consumer, Dealer and Factory by means of co-operation for mutual benefit and mutual service.

—A $1,000 PRIZE OFFER that will positively boost sales and put your business, as a Pathfinder dealer, on a more profitable basis than ever before.

You can "cash in" on the remarkable success Pathfinder owners are having with their cars by going to work on the New Plan and preparing for your most successful season in the sale of motor cars now. Get the details of our new models, the New Plan and the $1,000 Prize Offer at our New York or Chicago Show exhibits. Or if you can't come, write for particulars to the factory. Your name and address on the margin of this page will do.

The Hard Knocks of Time

Old Father Time hands out stunning blows. Some things are sturdy enough to stand his upper-cuts but the majority are counted out and sink into the depths of oblivion.

THE LBA TRADE MARK REGISTERED

Storage Battery

has received its full share of time's knocks and has always come up smiling, the better and sturdier for its buffeting.

In the race for the survival of the fittest among storage batteries the LBA has been returned as winner, which is amply proven by the fact that it is used as standard equipment by the great majority of automobile manufacturers.

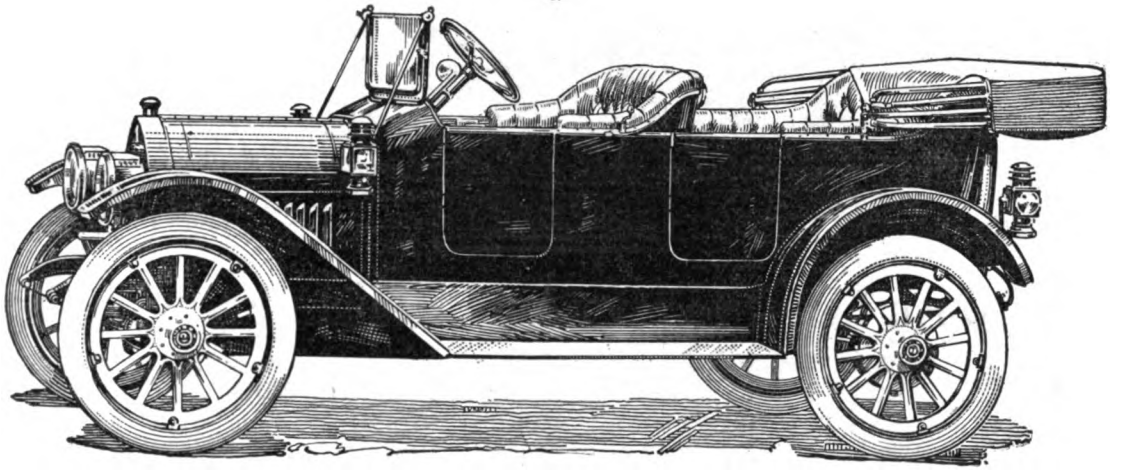
Spend a quarter for this book— save many dollars in repair bills

It is the motorcyclist's best friend because it is always on the job to help in time of trouble and you need not be a mechanical engineer to understand it.

It is brim full of practical advice and suggestions relating to every type of motorcycle.

The present edition includes free engine clutches, two-speed gears, mechanical lubricators and magnetos, together with special matter on motors, valves, carbureters, fuel and important general subjects, all plentifully illustrated



Dealers and jobbers in all parts of the country are selling "Care and Repair of Motorcycles" to both new riders and veterans as the best aid in correcting and avoiding motorcycle troubles.

Ask your dealer about it, or send a quarter to us for a copy to be sent you postage prepaid.

Special rates to Jobbers and Dealers in quantity orders.

EMPIRE

"The Little Aristocrat"

Completely Equipped

Now $900

With Remy Electric Starting and Lighting $1025

New Series Model 31 Empire, for the Season of 1914

A larger, more beautiful car with every luxury and equipment

Basic principles of design and construction unchanged; severest tests and hundreds of thouands of miles proved them right. *But a score of refinements and improvements* are incorporated in the new series Model "31" EMPIRE for 1914 that make it still a better car than last season's EMPIRE, and it sells for less.

Quadrupled output and quantity buying enables us to add to the beauty, size and value of the car and yet to reduce the price by fifty dollars—the biggest value yet offered to dealers and automobile buyers.

Dealers, there remains some open territory. Our broad, liberal sales plan offers a rare opportunity for a permanent connection. Tomorrow may be too late to secure territory. Write us at once.

"By This Sign Ye Shall Know It"

CHEVROLET

An Open Letter to Live Auto Dealers Everywhere

How many reliable makes of automobiles are there in the United States priced under $900? Can you name more than three?

CAN YOU NAME MORE THAN ONE (priced under $900) which equals in performance any $3000, $4000 or $5000 car in the market?
The Chevrolet "ROYAL MAIL" and "BABY GRAND" enjoy this distinction.

CAN YOU NAME MORE THAN ONE (priced under $900) that in mechanical detail, excellence of finish and easy-riding qualities, is equal to any $3000, $4000 or $5000 car in the market?
The Chevrolet "ROYAL MAIL" and "BABY GRAND" meet these requirements.

CAN YOU NAME MORE THAN ONE (priced under $900) that contains a motor built with the best and highest priced branze backed bearings made in the United States?
The motors in the Chevrolet "ROYAL MAIL" and "BABY GRAND" are built with Doehler bronze backed bearings.

CAN YOU NAME MORE THAN ONE (priced under $900) having a valve-in-the-head motor so constructed that the heads of the cylinders can be removed to permit grinding of valves and cleaning of carbon by hand in less than three hours?
The Chevrolet "ROYAL MAIL" and "BABY GRAND" have such motors.

CAN YOU NAME MORE THAN ONE (priced under $900) having axles of sufficient strength to carry 75% overload in weight and power?
Look at the size of the pinion gears and the thickness of the ring gears in the differential and the size of the axle shaft of the Chevrolet "ROYAL MAIL" and "BABY GRAND."

CAN YOU NAME MORE THAN ONE (priced under $900) that has a steering gear so designed, so re-inforced and of such quality of material that the maximum safety of the occupant of the car is at all times assured?
The Chevrolet "ROYAL MAIL" and "BABY GRAND" have steering gears costing twice as much as those used in any low-priced automobile made in the United States.

CAN YOU NAME MORE THAN ONE concern building a car (priced under $900) having a Branch Factory located in the heart of New York City, put there for the convenience of its dealers and their customers?
The New York Factory of the Chevrolet Motor Company is located at 57th Street and 11th Avenue, four blocks from Broadway, in the heart of New York City.

CAN YOU NAME MORE THAN ONE concern building a car (priced under $900) that has such confidence in its product that it does not require of its dealers a contract for any stipulated quantity, and that does not require a deposit from its dealers except to cover parts account?
The Chevrolet Motor Company requires a deposit of only $200 on any contract, regardless of size.

CAN YOU NAME MORE THAN ONE concern building a car (priced under $900) which gives its dealers a uniform discount of 20%?
The Chevrolet Motor Company has but one discount. The Chevrolet "ROYAL MAIL" Roadster lists at $750. The Chevrolet "BABY GRAND" Touring Car lists at $875, both beautifully finished and wonderful performers.

P. S.—The United States Government has recognized the names "ROYAL MAIL" and "BABY GRAND" and has conferred upon the Chevrolet Motor Company the exclusive right to the use of these names in connection with the manufacture and sale of automobiles.

We want clean and dignified representatives in all unallotted territory for this line of small cars of unusual merit. Are you in a position to represent us? If so, write today.

New Departure
Guaranteed
Ball Bearings
American Made for American Trade

The American made New Departure ball bearing is a logical development of American industrial progress—particularly in the manufacture of motor cars.

History has again repeated itself and the American manufacturer and mechanic is successfully fulfilling an important requirement of American trade—and that, too, with important advantage to the American manufacturer.

The success of the New Departure ball bearing is attested by the fact that ten and a half acres of modern machinery, operated by skilled artisans, are producing 10,000 ball bearings of unexcelled quality per day.

Cartercar

"The Car With the Gearless Transmission"

NEW MODEL "7" 5 PASSENGER $1250

Electric Starting

Electric Lighting

Valve Inclosed Motor

The Cartercar Gearless Transmission Twelfth Year of Success

FOR twelve years, or since the real beginning of the automobile business, we have been making Cartercars, the car with the gearless transmission. Far past the experimental stage, they are today a tremendous success, and their growing popularity shows the service that they give.

There are many reasons why the gearless transmission is the nearest perfect form of transmission on the market today. First, its simplicity. It has but two unit parts, a disk and a friction wheel. They roll together so smoothly that there is no jerk or jar in starting.

Second, its flexibility. It gives you any number of speeds instead of three or four, permits you to go from high directly into reverse without injury to the mechanism. The operation is merly moving a lever forward for greater speed and pull the same lever back to reverse the car.

Third, its power. The tremendous leverage obtained enables you even to climb 50 per cent. grades, should you so desire. It also proves its worth on a steep hill, in a sandy road or on a crowded street, for it permits the car to roll along on any of the low speeds without racing the engine.

The roomy bodies, the long wheelbase, the perfect upholstery, the superb finish, the big tires, the electric starting and lighting, all controlled from the driver's seat, all these add touches that go to make the Cartercar the most satisfactory all round car on the market today.

It doesn't make any difference how many other makes of cars you have owner, or how exacting you are, or how hard you are on a car, if you purchase a New Model "7" Cartercar at $1250. You are sure to be more than pleased.

There Are Now Six Cartercar Models---Including Two New Ones--- Will You Let Us Tell You About Them?

We are proud of our Cars and naturally we want to tell you about them. To begin with, we will tell you about the newest model.

Model "7" is produced in two designs, full five passenger, fully equipped, including electric lights and starter, demountable rims with one extra. Model "7" roadster is equipped the same, is on the same chassis, seats two people, has large space in rear for luggage, extra tires, etc. Each model "7" sells for $1250 and is one of the best values ever offered to the public. Ask to ride in a model "7."

Model "5"-A, 5 passenger touring, 116-inch wheelbase, front seat 40 inches wide, rear seat 50 inches, completely equipped, including electric starting and lighting. Price $1700.

Model 5-B, 2 passenger roadster, 116-inch wheelbase, seat 40 inches wide, completely equipped. Price, $1700.

Model 5-C, 3 passenger Colonial Coupe, the ladies' favorite. Price, $1900.

Model 5-D, 5 passenger Colonial Sedan, an ideal winter car, warm and luxurious, fully equipped. Price, $2,000.

1914 Will Be Another

GRAY & DAVIS

THE SURVIVAL OF THE FITTEST

¶ Five years ago, when motor cars were still lighted by oil and gas, the Gray & Davis Dynamo placed electric lighting on a practical basis.

¶ Two years ago the production of the Gray & Davis starting motor made possible the combination of these two electric devices into the harmonious and effective Gray & Davis starting-lighting system.

¶ Fourteen years ago we began building automobile lighting equipment. During 1913-14 we shall produce 400,000 electric lamps.

¶ Motorists who want maximum light and power use Gray & Davis electric lamps in conjunction with the starting-lighting system.

Gray & Davis Year

STARTING LIGHTING SYSTEM

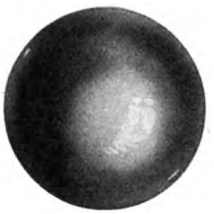
STARTING-LIGHTING EFFICIENCY

¶ Right here is the keystone of automobile service.

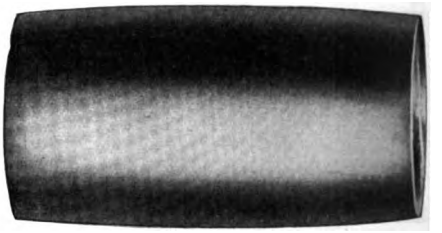
¶ No matter how handsome the car, no matter the kind of steel, the design, the size or horsepower.

¶ If the starting-lighting system halts or hesitates, if it lacks power, the service-value of the car diminishes in proportion.

¶ You can look at the question from any angle, but you come right back to power and efficiency on the part of the starting-lighting system and if the system will NOT deliver these requisites —the car is sadly handicapped no matter what it cost.



¶ Leading automobiles in each price class carry the Gray & Davis equipment.



Write for Catalog

GRAY & DAVIS, Inc., Boston, Mass.

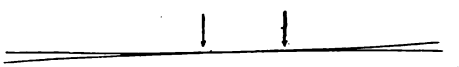
CAPACITY
GURNEY
ENDURANCE

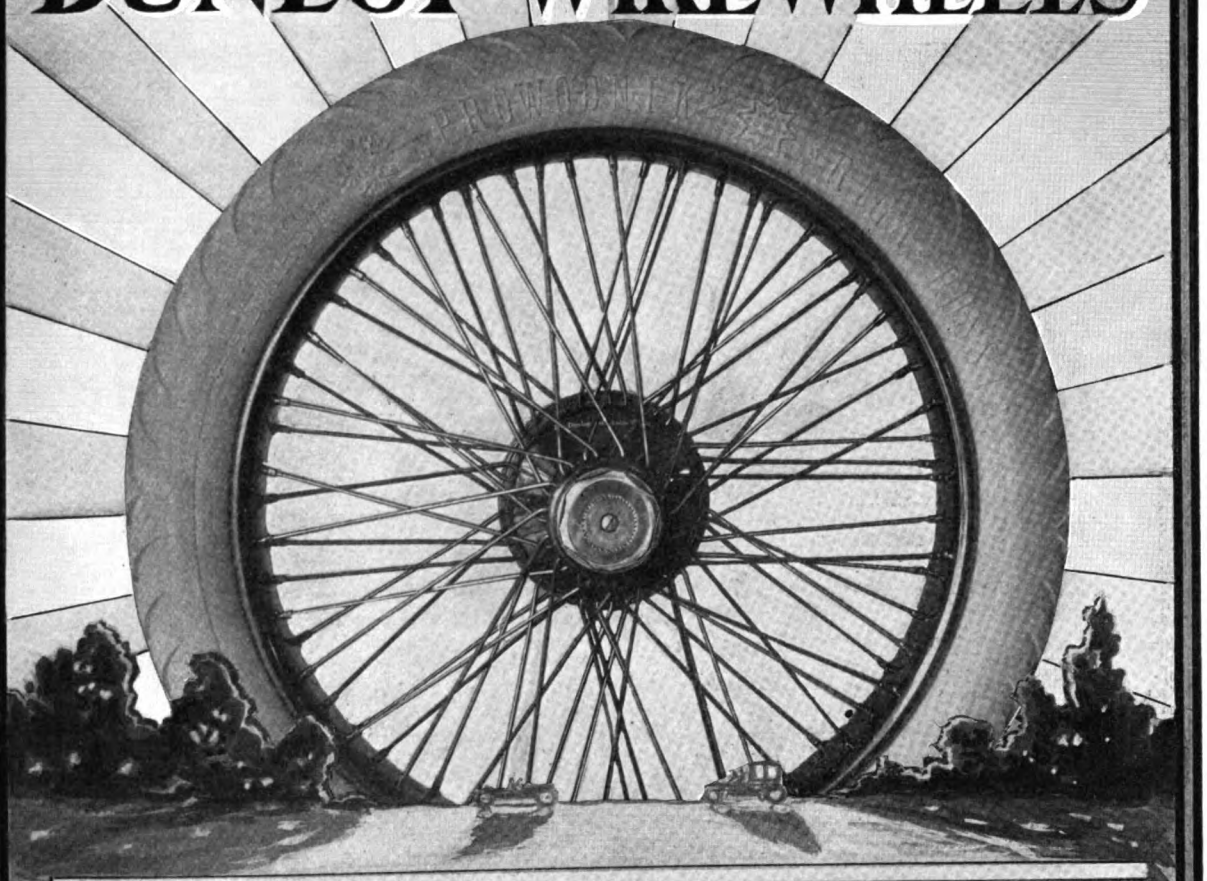


When the Ball Becomes a Roller

¶ The real meaning of the Gurney 4% Raceway may be made very plain if we take the diagram of a ball resting in a curve of 4% greater radius, straighten out the race curve until it becomes flat, and then increase the diameter of the ball circle until it bears the same contact relation to the straight line that the ball originally bore to the 4% race groove. This diagram shows graphically what is the advantage gained by this sort of raceway.

¶ The roller bearing makers elongate and straighten out the ball into a roller in the effort to get more contact. We close up the raceway close to the ball to accomplish the same end. We realize as much in getting ample supporting contact surface and we avoid the difficulties inherent in all roller bearings consequent upon the necessity of maintaining alignment, and retain the advantages of the simplicity and low friction of the ball roller.

¶ A ball in a 4% race groove gets about the same degree of contact that one twenty-five times as large gets on a flat surface. The physical equivalent of a ball in a 4% raceway is not a ball twenty-five times as large, but a barrel-shaped roller having the same diameter as the ball and a crowning or bulging surface, the radius of the crown being twenty-five times the radius of the ball. Such a roller will support just twenty-five times as much as the ball on a flat surface. That is, the advantage of the 4% raceway is to multiply the supporting capacity of the ball by something like twenty-five. Or, one row of balls in a 4% raceway will hold up as much as 25 rows on flat raceways.



¶ This affords some explanation of our insistent emphasis of race contour. It also partly explains why the alleged greater capacity of the roller bearings, which their advocates so vociferously claim, is not in evidence in actual service.

The Balls Are Better Rollers Than the Rollers, Especially When They Roll In Gurney Raceways

SPRINGFIELD Convertible Bodies

The folding method of glass storage not only gives greater protection to the glass but obviates any of the discomforts due to possible warping common to sliding windows.

SPRINGFIELD CONVERTIBLE BODIES are the most practical of the many types developed for various phases of automobile usage. They combine, in one unit, the protection and shelter of a closed car and the freedom of an open touring body. The change from one to the other can be made in a few moments. These paramount advantages are accomplished only in the Springfield Convertible Type Body.

Our facilities for the production of the convertible type body are ample to meet the demands of motor car manufacturers who are shrewd enough to foresee the extended market for their cars equipped with a single body possessing every one of the merits heretofore restricted to the man with resources sufficient to afford two cars or at least two bodies, interchangeable on the same chassis.

Contrary to what might be expected, and with good reason, too, for seldom do extreme practicability and good design combine well, Springfield Convertible Bodies make a superb appearance. They are the embodiment of the very finest of the coach maker's are and are unexcelled by any product of the American or European body builders.

AT EVERY STAGE OF THE CONVERTING PROCESS THE VARIOUS UNITS OF THE TOP AND WINDOW STRUCTURE SLIP INTO PLACE NEATLY AND READILY

Digitized by Google

SPRINGFIELD *Convertible* *Bodies*

After the windows are folded and stored away the top will come down into a neat shape ready for boot or slip covering.

OUR undisputed standing as the pioneer makers of metal bodies in this country, guarantees our statement that these bodies are absolutely practical and long past the experimental stage.

As a matter of special interest to those who make and sell American or imported cars, we are prepared to furnish estimates and specifications for single orders or in quantities, the only information required being a chassis blue print and a few measurements.

So general has become the demand for convertible bodies that we are prepared to enter into an arrangement with dealers upon virtually the same basis as that upon which the sale of complete cars is carried on.

Invariably the sum of profit on a chassis plus the profit on a Springfield body is greater than the profit on the sale of a complete car.

Not only will our proposition prove interesting to you from the financial side but the convertible type body will remove the objection many possible buyers raise—"Year around use requires two cars, closed and open, or two bodies for summer and winter conditions."

Springfield Metal Body Company

Our New Plant at Framingham, Mass.

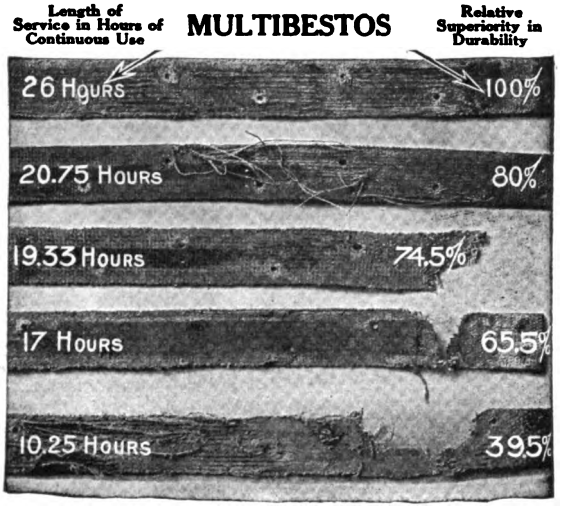
The Home of Multibestos

OVER a year ago, the increasing demand for Multibestos Brake Lining forced us to extend our facilities of production. To meet this growing demand we made a clean sweep of the situation by building a new factory and equipping it with looms and machinery which our Engineering Department had been developing especially for the manufacture of Multibestos. With this new factory and equipment we will make and sell five million feet of brake lining during the coming year. Not only have we increased our capacity but we have improved our quality as well, and our new factory and equipment have enabled us to extend the scope of our products to include clutch facings and friction bands in any special form or size.

Constant Reliability

In the long run any product which has superior merit is bound to dominate its field, price notwithstanding.

With brake lining, for instance, constant reliability is the crux of the whole situation; the brake lining having this feature in the greatest degree is not only the lining of superior merit, but is the only brake lining fit to use where human safety may depend upon its reliability.



Regardless of how other brake linings are made—a matter, by the way, which can be determined exactly—the design or the plan on which Multibestos is made provides for the use of materials best adapted for brake linings. Only the purest of long fibre asbestos and brass wire are used. In the first place, these materials are the best that the market of the world affords; they are tested for their strength and uniformity; and after it is proved that in quality they come up to certain high standards, they are firmly and closely woven into a solid fabric which has no layers or plies or stuffers which can pull apart or become separated.

Digitized by Google

Long experience in treating and waterproofing mechanical fabrics has enabled our experts to produce a compound for treating the asbestos fabric which adds greatly to its natural vitality and frictional qualities. By our own method of treating, this compound permeates every fibre of the fabric. A special process gives a smooth, even, contact surface, unchanging and non-glazing which will not granulate even under the most severe conditions. There is absolutely no chance for Multibestos to crack or develop uneven surfaces. It is heat proof, dust proof, oil proof, water proof and neither grease nor gasoline has any effect upon it.

Multibestos will neither char or burn with the heat of friction, nor will it soften or harden. It will stand the most severe pressure and will not injure the brake drums, and however great the friction, the resulting heat will not create the slightest disagreeable odor. Multibestos can be machined readily, taking a countersink as easily as metal or wood. The very homogeneity of the fabric gives it the body to hold rivets perfectly. In action Multibestos grips the drums without jolt or jar. It sets quickly with slight pressure and stops the car no matter how fast it is going; in emergencies locking the wheels instantly.

Below is shown the results of a series of brake down tests conducted at the Worcester Polytechnic Institute.

The truths brought out by the test need no elaboration for it is quite clear that if you are looking for 100% efficiency—if you want the cars you sell equipped with brakes of constant reliability—you should specify Multibestos and insist on having no other.

At the Shows

We will have a mechanical exhibit in which we will back our every statement with substantial proof. Don't miss seeing it.

Push Button and Cable Attachment

MOTOPHONE

Mechanically Operated

The Greatest Sensation in Auto-Horn Industry

Operated exactly the same as an Electric Horn EXCEPT

NO Adjustments Motor Troubles

NO Battery Expense Electrical Wiring

Just push the button (the same as in a Motor Horn) and a loud, continuous blast is emitted—as powerful as any warning signal made.

REMEMBER

The First Cost is The Last Cost

Guaranteed for *Two* Years

The **Cable Attachment** of the Motophone has been devised and perfected to offer to the trade a mechanical horn having all the characteristics of motor driven (electrical) horns **without** the care of the electric motor, the cost of maintenance, adjustments and the numerous petty annoyances to which the user of the motor horn is subjected.

Its Action is Positive, Instantaneous, Certain at All Times

The Motophone is made in five models as follows:

Type A (Torpedo), 11" $12
Type B (with Oval Bell), 9" . . . 10
Type C (for Motorcycles) $8.00
Type D (with Cable Attachment), 11" $15
Type E (with Cable Attachment), 9" 12

BOOTH BRAND

Shipment Guaranteed on Day Ordered

"Shoddy"

"Booth Felt"

What kind of service can be expected from washers which can be pulled to pieces with the fingers? Try to do the same thing with Booth Quality Washers.

The way we conduct this business is appreciated by our customers in the automobile industry quite as much as the quality of Booth Felt Goods.

We never insist upon holding manufacturers to contracts when conditions arise to make strict adherence to delivery specifications impracticable, nor do we trump up claims for goods made up on contract and not actually shipped. With our facilities we can wait until three or four days of delivery dates before making up an order, and in so doing we protect ourselves and the manufacturers as well. In all the years we have been furnishing several manufacturers with all their requirements in the line of felts, this has been our policy, and it is worthy of special note that we never have missed a scheduled delivery.

No order possibly could be given which we could not make up and ship on the same day it is received, if necessary.

N. E. BOOTH, 642-44 Pacific St., Brooklyn, N. Y.

FELT GOODS

Shipment Guaranteed on Day Ordered

"Shoddy Used"

"Booth Felt Used"

This is the final test. Shoddy quickly grinds to pieces when used as rear axle grease retainers. Booth Felt is the only material that will stand up.

Ability to deliver the goods on schedule has become a matter of pride with us. We keep a stock of about thirty thousand dollars' worth of special felts on hand, each numbered so that a customer can duplicate an order without samples to order from.

Booth Automobile Felts are cut exactly to blue print dimensions. Our equipment of dies is probably the most complete in existence. Our preparedness for large or small orders, however rigid the delivery, never makes it expedient even to think of substituting cotton mix felts for wool goods. Our integrity in all business dealings has won for us the confidence of manufacturers of almost every high grade car in the country.

Booth Felts are used for:

Washers of every size for hubs, rear axle grease retainers, steering gears, speedometers, carburetors, and for every other purpose where a washer is needed in a motor car assembly; strips for radiator cushions; squeak preventative between chassis and body; strips for sashless limousine windows; bumpers; plugs and washers for magnetos; oiling wicks for spring bolts. We also make all kinds and shapes of gaskets without expensive dies.

Magnetic vs. Centrifugal } Speedometer Service

Stewart-Warner Service

Car Owner: (entering a Stewart-Warner Service Station located in all large towns and cities): I have just taken my car out of storage, and I would like to have my season odometer set back to zero. I would also like a large gear changed as I have put on oversize tires.

Manager of Service Station: Won't take but a few minutes; delegates trained mechanic to set back odometer and another to install the new gear. Job completed in a very few minutes. Car Owner leaves remarking, "That's real service." He's pleased with his car, and gives the manufacturer credit for having selected accessories backed by such real service.

"Other" Service

You've sold me a car for the last time. When I gave you the order I liked the car so well that I never questioned the accessories on it. I thought they would surely be the equal of the car.

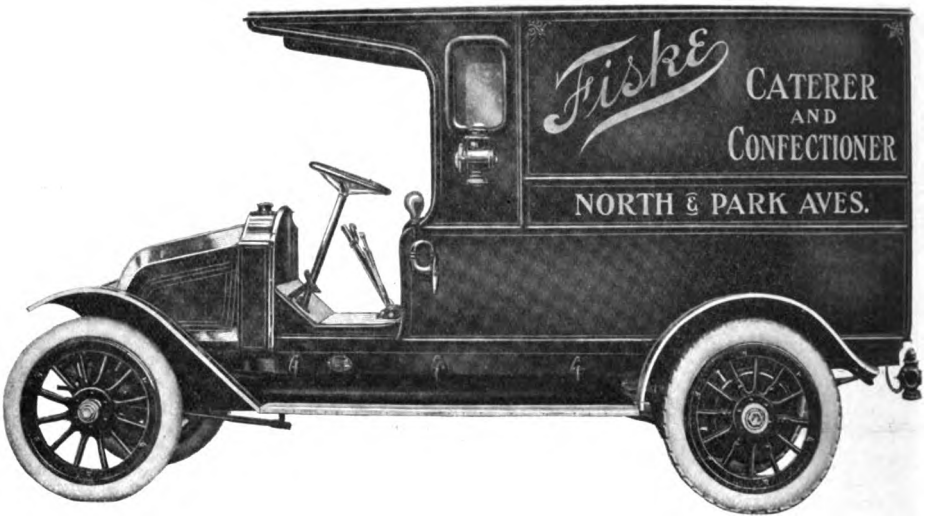
I have just got back from a long tour and am disgusted with my Centrifugal Speedometer. First, I put on oversized tires and tried all over this big city to get a correct sprocket to take care of this change of tires. I find the makers of this Centrifugal Speedometer have no service station, so I had to start out with the old gear on the wheel, which was all the while indicating wrong mileage and speed. Hadn't gone far before we had an accident which, with other damage, broke the speedometer shaft. Was able to get the other work done in the first garage, and expected to pick up a speedometer shaft in the next big town, but no one carried them. It was the same story in every town I visited. They all offered to sell me material for a "Magnetic Speedometer," but I told them mine was Centrifugal. I also found a lot of service stations that could do any class of work on Magnetic Speedometers, but they carried no parts for Centrifugal instruments. Much to my disgust, I completed the trip without the use of my speedometer. Now, what will I do about this shaft, and where will I get a new sprocket?

Car Dealer: I guess you will have to write to the manufacturers of your Centrifugal Speedometer and send them your old shaft. It will probably take another week or more before you get it on your car. I am sorry that in the meantime you will be without any speedometer or mileage record.

Car Owner: Why don't your factory use a Stewart-Warner Magnetic Speedometer? I could have gotten service in any city I went through. They seem to be the only people doing a big enough business to run real service stations. I have also been reading a lot of car advertisements lately and I note that nearly every car is equipped with a Magnetic Type instrument.

Car Dealer: Well, when I heard that my factory was going to use the Centrifugal Speedometer I begged them to equip with a Magnetic Type speedometer—we would then not have to "explain." I guess the real truth is that they were able to save money in buying the Centrifugal Speedometer. They have promised, however, that next year they will use the Magnetic Type Speedometer and other first class accessories throughout, which will be the equal of our car. If they don't, I am going to get the agency for some other car, for I am not going to lose you and other good customers.

NOW—WHICH SERVICE DO YOU WANT?



Stewart-Warner Speedometer Corporation, Factories: Chicago, Illinois Beloit, Wisconsin

Sole manufacturers of the magnetic speedometer

Delivering the Goods In More

IN more than 60 lines of business Stewart Delivery Trucks are serving daily—and delivering the goods. They are doing it in scores of American cities, in Canada, in South America. They are proving their economy on the level streets of New York, of Buffalo, of Los Angeles; in the hilly sections of Albany, of Montreal, of Baltimore.

To be used in more than 60 different lines of business is a record unusual in the light delivery field. It is a record uncommon for a delivery vehicle that is built on one model of chassis.

Here are some of the businesses where the Stewart is making good:

Bakers	Grocers
Banks	Hardware
Butchers	Ice Cream
Caterers	Laundries
Cigars	Liquor Dealers
Department Stores	Mail Service
Dyers and Cleaners	Newspapers
Fire Departments	Park Commissions
Fish and Game	Provisions
Florists	Street Railways
Furniture	Telephone

Promptness and Prestige

Each of these businesses requires a light truck that covers the ground quickly—covers a lot of ground—and "gets there" on time. In each the satisfied customer is important.

Consider, too, the prestige that attaches to the merchant who operates a Stewart—or a fleet of Stewarts, depending upon how extensive are the particular hauling requirements. To operate a Stewart stamps the owner as alert, progressive, quick to adopt improved methods. Outward appearances count for much.

Quick delivery makes for popularity just the same as the courtesy of clerks. A good looking delivery truck wins favor and gains attention just the same as an attractive show window.

Stewart
Delivery Trucks

A Direct Corner-Cutting Method

Rapid delivery is the same sort of utility as the telephone, the cash register, the adding machine. It saves time and labor—and it reduces the cost of hauling. It is a corner-cutting device. And the most direct method is always the best method.

The Stewart is a good truck for the dealer to handle, just as it is a good truck for the merchant to buy. It affords a wide range of activity. It can replace two horses at a smaller cost in hauling. It can replace four horses at less than one-half the delivery cost.

Big Stewart Features

30 horsepower Continental Motor, 3¾ inch bore by 5¼ inch stroke.

Timken Axles, front and rear.

Brown-Lipe Selective Transmission.

Multiple Disc Clutch, proven best for light trucks.

Bosch Magneto, no batteries, no trouble.

Gemmer Steering Gears.

Up-to-date improvements, such as foot accelerator, dash adjustment for carburetor, left-hand drive, etc.

Every unit accessible and easily removable.

Digitized by Google

Than 60 Lines of Business

Six essential features provide in the Stewart a staunchness and ruggedness uncommon among light delivery trucks. These features combine to make the Stewart "stand up" in the face of severe service over all sorts of roads and under all weather conditions.

These features make the Stewart a truck of long life, of economy in operation.

These features have been developed to a high point of perfection through the experience of the men who have designed the Stewart, and the skill of the men who build it.

You owe it to yourself, as a dealer or as a merchant, to consider these features —in choosing a light delivery truck to handle, or in choosing a light delivery truck to purchase.

Stewart
Delivery Trucks

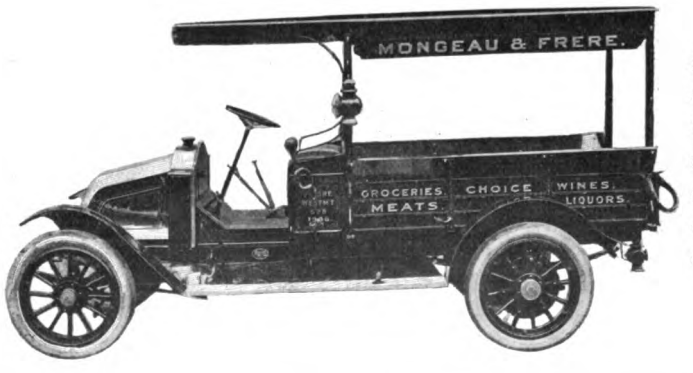
SIMPLICITY — As applied in the Stewart, simplicity makes for the elimination of unnecessary parts in design. It means the absence of complications in construction. Thus, the Stewart is easy to operate. A horse driver can quickly learn how to drive a Stewart. Easy to care for, too —a mechanic's knowledge is not compulsory. There are no batteries, timer, coil, spark lever, belt-driver fan or other complex devices to get out of order.

UNIT DESIGN—However perfected it may be, any piece of mechanism may sometimes need adjustments or repairs. In the Stewart the important parts are designed in separate units—and so placed and supported in the frame that any one can be removed and replaced without disturbing any other unit, or the load.

LUBRICATION—No consideration is more important than lubrication. It is the life of a truck. In the Stewart the motor is lubricated automatically. Other parts are fitted with large grease cups, conveniently placed on the outside of the frame and accessible to the driver. The Stewart requires a minimum amount of lubricant.

ECONOMY—In every feature that makes for economy the Stewart excels. The motor is comparatively small, with long stroke, very quiet and extra powerful—all tending to a lower consumption of gasoline and oil and a minimum vibration. By making a gear reduction of 5 to 1 in the rear axle, the motor has practically the same weight-moving ability as an engine twice its size with the ordinary touring car reduction. Notable in the Stewart also are the bearings, crank shaft and cam shaft of generous size.

STRONG AXLES—The axles used in the Stewart are of the most modern construction, and of the highest quality known. They are good for years of service with a minimum of attention. The axles are of unusual strength and wearing qualities. We have adopted the shaft drive rear axle, thus eliminating many parts, requiring less power from the motor, doing away with replacements of chains, and gaining silence and smoothness in operation.



QUALITY OF MATERIALS—Not only is the Stewart design logical. Not only is the car built with unusual care. What is equally important, the materials that go into the Stewart are the highest quality—for upon the quality of materials depends largely the life of a motor truck. The materials used in the Stewart must measure up to Stewart standards—and are particularly selected with these standards in view.

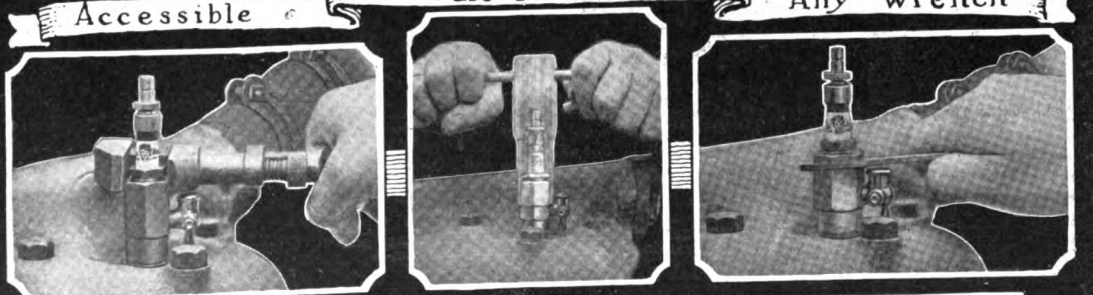
Red Head Priming Plug

$1.25

The RED HEAD Ford Special Priming Plug is the logical evolution of the successful long body RED HEAD Ford Spark Plug.

There never was a real Ford priming spark plug until the RED HEAD was placed on the market—the demand for Red Heads proves it.

The porcelain is guaranteed not to crack from heat—the points will not fuse—carbon cannot choke the firing chamber—will not lose compression—the long steel body overcomes the recess in the cylinder head of the Ford motor and renders the plug accessible and safe to handle with any wrench.



Service also guaranteed—money back from the dealer if RED HEAD Priming Plugs disappoint you.

One set of RED HEAD Wrenches free with every set of four RED HEAD Plugs.

PATENT NOTICE TO THE TRADE

The manufacture of RED HEAD Priming Plugs is licensed under patents dated January 30th, 1900, March 23rd, 1909, and the Canfield patent.

Accessible And Safe To Handle With Any Wrench

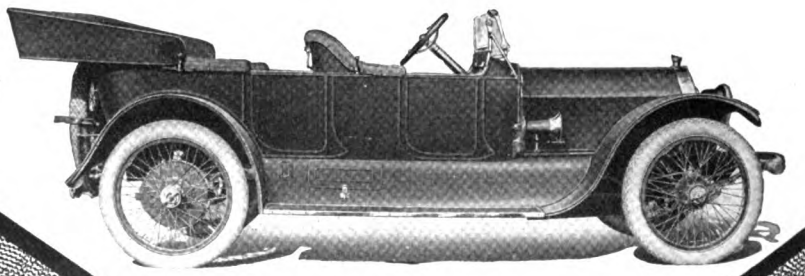
HAVERS SIX

Havers Dealers Are Money Making Dealers

The Havers Six-Sixty is the biggest value in the entire six field. A car that is not out-ranked in any automobile assemblage.

It is beautiful in design, rich in finish, powerful and dependable in operation.



It is the most completely equipped car to be found on the market today.

It is an easy car to sell, a profitable car to handle and a wonderfully satisfying car to operate.

We will be glad to talk over the Havers proposition with responsible dealers in unoccupied territory.

A Statement by The Waltham Watch Company *regarding* Waltham Automobile Timepieces

The excellence of Waltham Watches has never been questioned and the Waltham factory is now generally accorded clear pre-eminence for extent and quality of equipment and expertness in the manufacture of fine timepieces.

Up to the time we began to make automobile timepieces ***no timepiece had ever been designed especially for automobile service.*** This may sound incredible but it is true. There were a few good timepieces ***adapted from other purposes*** on the market and a great quantity of cheap timepieces which were scarcely more than toys.

We proposed to take automobile timepieces seriously, and we designed one for that particular purpose. Now we ask that automobile manufacturers and owners also take automobile timepieces seriously, and we are starting an aggressive campaign with that end in view.

The Waltham Automobile Timepiece is the only one adjusted for temperature. It is the only one with two mainsprings, insuring a regular rate; it is the only one which will run eleven days, giving a warning signal three days in advance when it needs winding.

These are only three of many technical items but they indicate the mechanical superiority of our timepieces.

The Waltham Automobile Timepiece has been adopted for standard equipment by the Detroit Electric, Lozier, Ohio Electric, Oldsmobile, White, Winton and Rauch & Lang Electric Cars, and others.

The interests of manufacturer and dealer and owner are mutual in having a timepiece as good as their cars.

See our exhibits at the New York and Chicago Automobile Shows.

THE ALLEN MOTOR CO. Allen FOSTORIA, OHIO

ALLEN

GREATEST MOTOR CAR

$1395---The ALLEN 40

THE Allen 40 is fundamentally correct. It is designed on sound mechanical lines. Around this has been built a car of graceful and pleasing appearance with a world of endurance and reserve power, and to these have been added the maximum of modern luxury and comfort.

AND THE LIST PRICE:

Five Passenger Touring Car, $1395
Two Passenger Roadster - $1395

With Complete Equipment

This is our second year in the automobile business. Our 1913 car was a pronounced success but we have gone way beyond it with the 1914 Allen 40. Our business is on a sound basis. The combined capital employed in the manufacture of Allen Cars and parts is considerably over $5,000,000.00. We have eliminated every unnecessary item of overhead expense in the production of our cars. That is one reason we can list the Allen 40 at $1395 and still keep our business healthy. Such an attractive price is bound to eliminate a lot of selling expense and to distance competition.

The Allen 40 at $1395 is far greater value than any other car selling at the same price, and it is lower in price than any other car equal to it mechanically or in point of appearance and refinement. There is no car at any price more up to date in details of chassis or body design, construction and equipment.

Here are the detailed specifications upon which to base your ideas of the car before you see it.

GENERAL SPECIFICATIONS

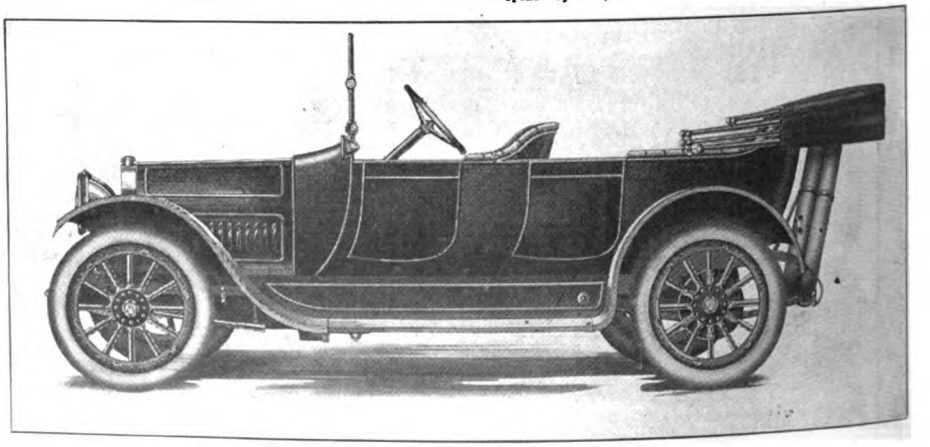
MOTOR—Allen, four cylinders, 4¼-inch bore, 5-inch stroke.

CYLINDERS—Cast en bloc.

VALVES—Nickel steel, 2 inches in diameter, operated by extra large push rods which may be easily removed. Valves enclosed.

PISTONS—Are carefully ground to size. Extra long so as to distribute the side thrust between cylinders and pistons and carefully balanced before assembly to lessen vibration of the motor.

CONNECTING RODS—Of generous "I" beam section, drop forged from special steel, heat treated.



CRANK SHAFT—Three bearings, carefully balanced, of liberal size, made of best nickel babbit.

CRANK CASE—Aluminum, rigidly constructed. The upper half carries the crank shaft bearings, and the lower half can be removed without interfering with the bearings.

CAM SHAFT—Is made of special steel hardened and ground. Cams are integral with the shaft.

TIMING GEARS—Helical type to insure silent running. These gears have 1-inch face and are enclosed in dust-proof case in front of motor and run in oil.

LUBRICATION—The motor is lubricated by a constant level splash system, the oil reservoir being in the lower half of the crank

Digitized by Google

FORTY

VALUE OF THE SEASON

THE ALLEN MOTOR CO. Allen FOSTORIA, OHIO

Challenges Competition---$1395

Centralized and Convenient Arrangement of Controls

case. A pump furnishes oil to the timing gears and to the connecting rod troughs for splash to the pistons and crank shaft bearings.

CARBURETOR—The Schebler carburetor with dash adjustment.

IGNITION—Is furnished by Splitdorf Dual Magneto.

STARTING—The motor is cranked by an electric starting motor which spins the motor at the speed of 120 revolutions per minute, which assures a positive start at all times.

GENERATOR—Is located on the right hand side of motor in front of the magneto, and driven by the same shaft as the magneto. It supplies current to the storage battery for operating and starting motor and electric lights, and it supplies current at all times regardless of the speed of the motor.

CLUTCH—Multiple disc, faced with special Raybestos friction material, driven discs steel with ground faces. This clutch should be run dry.

TRANSMISSION—Warner, three speeds forward and reverse, transmission in unit with three-point suspension motor.

DRIVING SHAFT—The power is transmitted to the rear axle through a propeller shaft and two universal joints.

FRONT AXLE—One piece drop forging from special steel, heat treated; "I" beam type.

REAR AXLE—Pressed steel, full floating with annular ball bearings. The driving gears and differential are mounted as one unit. The driving pinion shaft and differential unit are mounted on combination annular bearings. The rear wheels also are mounted on annular ball bearings. The whole load is carried in the axle housing, and not by the driving shaft. A torsion arm relieves all strain from the end of transmission shaft and universal joint. Gear ratio is four to one.

BRAKES—Two sets of internal expanding brakes all acting on the rear wheels. Brake drums 14 inches in diameter. Each brake has 2-inch face, affording a very large braking surface.

FRAME—The frame is pressed steel, heat treated. The side member channel is 4 1-16 inches high, and 2¾ inches deep, and 5-32 inch thick. The side members are narrowed in front to allow for clearance of wheels in turning, giving a short turning radius. A kick-up of 3½ inches at the rear of the frame gives ample clearance for rear axle and plenty of spring action.

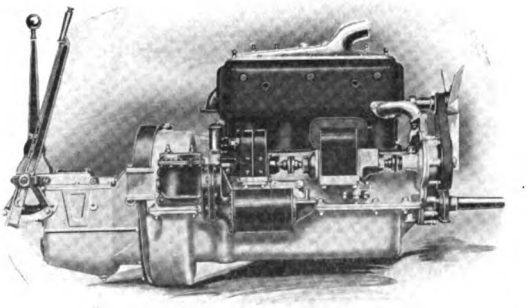
SPRINGS—Front springs semi-elliptic, 36 inches long and 2 inches wide. The rear springs three-quarter elliptic, 50 inches long and 2¼ inches wide. All spring bolts furnished with grease cups.

STEERING—Is non-reversible worm and gear type, made by Warner Gear Co., with worm gear integral with the shaft. An 18-inch corrugated walnut wheel is provided with aluminum spider. Spark and throttle controlling levers on top of steering post.

GASOLINE TANK—Is located in shroud dash giving positive flow of gasoline on the steepest hills. Filler goose neck and gasoline gauge on instrument board show quantity of gasoline in tank at all times.

WHEELS—Artillery type with 1⅛-inch spokes. Twelve spokes in front and rear wheels. Wheels fitted with demountable rims.

TIRES—34 x 4, oversize 35 x 4½, furnished at extra charge.



WHEELBASE—118 inches.

BODY—Five passenger, large roomy body, luxuriously upholstered with 10-inch cushions.

ROADSTER—Two passenger. Same specifications as touring car.

REGULAR EQUIPMENT—Consists of electric starter and 13-inch electric headlights, 6-inch bullet side lights, cowl light and tail light, all operated by a switch on the instrument board; speedometer, horn, Baker demountable rims with extra rim; windshield, tire irons, 34 x 4 tires, genuine Mohair top, carefully fitted; quick adjustable curtains, top boot, complete set of tools, jack, pump, tire repair kit, trouble light.

Meet us at the Shows and talk matters over with us: In the meantime write us for any particulars you may require as to territory, terms and deliveries. There is an Allen booklet awaiting your request

Four cylinder, four cycle, en bloc Motor, unit with Clutch and Gearset. Electric Starting and Lighting units housed with motor

The man who uses shock absorbers WITHOUT rebound straps

If he tightens his shock absorbers to save his springs he is nearly jolted to death—if he loosens the absorbers to make an easy riding car he may break his springs.

If shock absorbers actually performed the functions they were sold to perform, there would be no need of rebound straps.

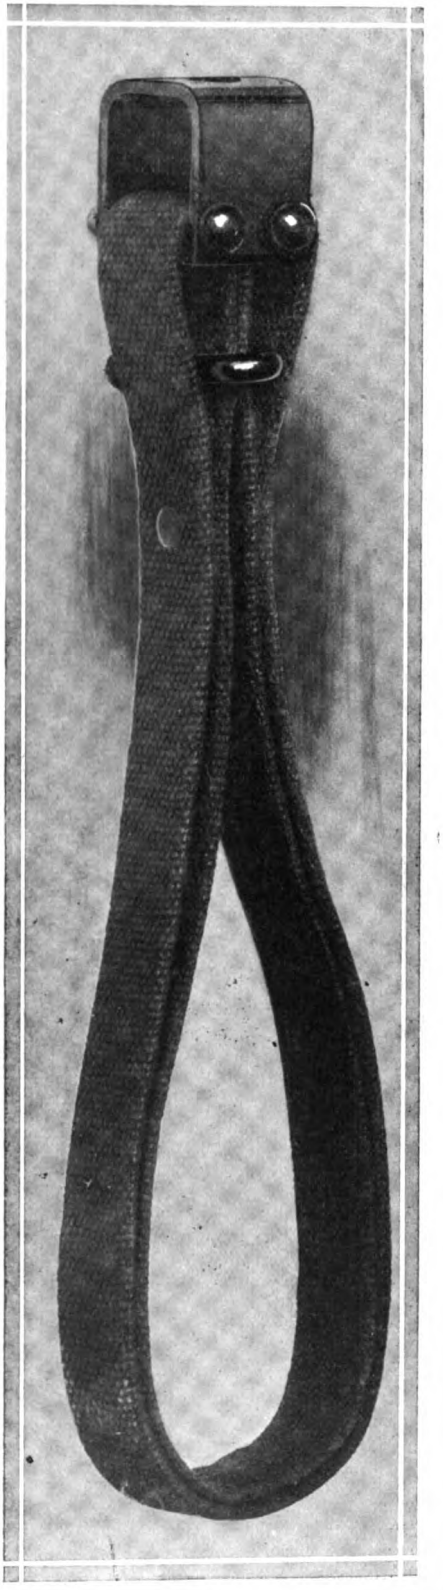
It is doubtful if there is anybody who has ever ridden in an automobile long enough to become used to riding who does not know that shock absorbers only partially perform the function of absorbing shocks—when we say shock absorbers we mean those devices commercially practical which are generally in use today.

And please remember also that we are not speaking of equalizing springs or devices which interpolate coil springs some place in the suspension system. In the first place, most every shock absorber requires a great deal of attention and adjustment if you would get any results from it whatsoever. In addition to this fact, if your shock absorber be adjusted so as to make your car ride easy, it is so flexible that it offers little or no protection against spring breakage. In order to protect your springs you must tighten your shock absorber. If you tighten your shock absorber enough to protect your springs you make the car so rough riding as to minimize the good results of the shock absorber. There is no gainsaying the truth of these facts for they are known not only to car owners but to dealers and manufacturers as well.

As ample evidence of the truth of our statement, we have to recite only the fact that a great many of the most progressive manufacturers are adopting both shock absorbers and rebound straps in the spring equipment of their cars.

L. H. Gilmer Company,

Digitized by Google



The Gilmer Rebound Strap

Rebound straps are as much an essential as any shock absorber or equalizing spring ever produced, because of the fact that no engineer has ever yet been able to devise a means of taking care of unequal loads and unequal stresses with the same set of springs. A set of springs of a certain thickness, width and length will perform certain functions under certain conditions of use. But if a car be equipped with springs dimensioned to carry satisfactorily a load, say, of 2,000 pounds, over fairly smooth roads, that same spring equipment becomes hopelessly inadequate if the load be diminished to 500 pounds. Or the reverse is equally true, if more than the 2,000 pounds, for which the springs are designed, be added. In other words, the spring will satisfactorily handle only the exact weight for which it is built under ideal conditions.

It is the truth of this statement that has made necessary the use of shock absorbers, equalizing springs, bumpers, rebound straps, etc. Without these added facilities it would be impossible to build a car the springs of which would allow enough flexibility to enable any sort of pleasurable riding—because the design of the car would have to plan on the maximum carrying capacity and maximum unfavorable road conditions. As a result, the car would be stiff and tiresome to its occupants.

Up to a certain point shock absorbers take care of these unequal conditions, but like the springs they, too, have their limitations, and it is where their limitations commence that the valuable functions of the rebound strap begin.

This advertisement is written in direct answer to a shock absorber advertisement which was a manifestly unfair, unjust knock on rebound straps. This advertisement is not meant as a knock. We are broad minded enough to come out openly and admit the desirability of the use of shock absorbers. But if the shock absorber is desirable—or in some minds even necessary—so are rebound straps necessary, and we are willing to submit our contention of this necessity of rebound straps to any board of engineers or car makers in this country or abroad.

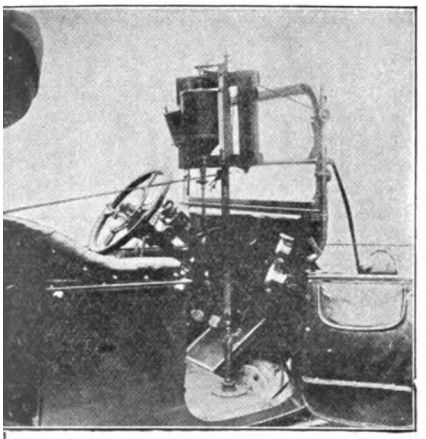
DON'T GUESS

TIRES inflated to forty pounds look and feel exactly like tires containing eighty. The only way to tell the air pressure in your tires is by means of a

NEW POSITIVE LOCK-STOP
TWITCHELL
AIR GAUGE



Insist upon getting the NEW Twitchell. It possesses a positive lock stop feature that renders absolutely impossible the registration of any but the exact air pressure in your tires. This construction permits the use of the gauge no matter in what position the tire valve rests. You no longer have to turn the wheel around until the valve is at the bottom. Another improvement to be found in the NEW Twitchell is the lengthened base which permits of an airtight connection being made with the valve no matter how small the space between the rim and hub. The NEW Twitchell is accurate, simple, durable, easily applied and easily read.

Packard equipped with auxiliary gasoline tank and measuring instrument

If it takes 5 per cent of the power of a big Packard engine to run the electric system—

Packard motor with dummy replacing generator used in no-generator test

How about YOUR car?

(From Automobile– Dec. 4, 1913)

"In a test conducted by the Packard Co., on Long Island Parkway, on Saturday, it was found that the Bijur generator, on the new 38 model, consumed from 3 to 5 per cent, of the power as represented by the gasoline supplied to the engine. These figures are of great interest at the present time in that much discussion is taking place as to the real efficiency of the electric system of lighting and starting automobiles."

This Is Added Proof

The results of this Packard test show that in ordinary conditions at average speed, at least 5% of the power is consumed by the electric system. 3.3% of the power was consumed by the electric system at a speed of 40 MILES PER HOUR.

How often do you drive at 40 miles per hour? If you have any respect for speed laws most of your driving is at less than 20 miles per hour.

In this test the car was loaded with passengers, the top, windshield and side curtains up, carrying extra tires. The extra weight naturally decreased the percentage by increasing the *total* amount of gasoline used.

But at the speed of 20 miles per hour—even with the extra weight—the big 38.4 horsepower Packard engine used a good 5% of its power to run the generator.

Electric lighting manufacturers claim that the electric generator uses only 1-2 of one per cent of the power.

Add the Packard test to our figures showing 5 to 12% of power consumed by electrical equipment. Here are the figures:

38.4 h. p. Packard.....5%
32.4 h. p. Car Test.....6.9%
25.6 h. p. Car Test.....10 to 12%

The complete report of tests similar to the Packard test, together with tests of owners in actual service and other valuable information on lighting will be sent you promptly. Use the coupon.

One Point More

Even if it were possible that the engine of YOUR car was big enough, powerful enough so that you would never miss the 5 to 12% power used in running the electrical system—

Even if you did not care how much your lighting cost—

Consider one more point.

Safety

Here's what one paper says—

"Seventy-five per cent. of the collisions that have taken place in the night time in San Francisco of late, can be laid to the glare of the electric headlights of the modern car."—Pacific Motor, San Francisco.

The coupon brings added proof. Use it!

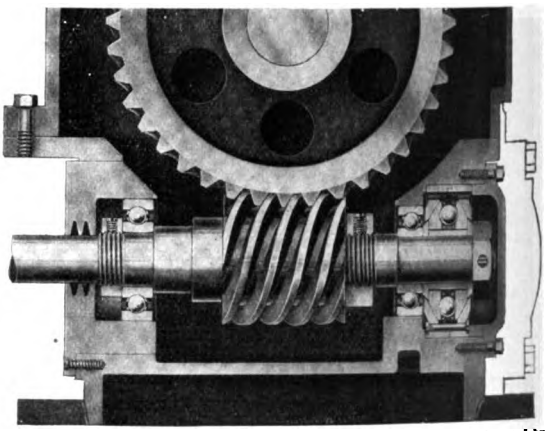
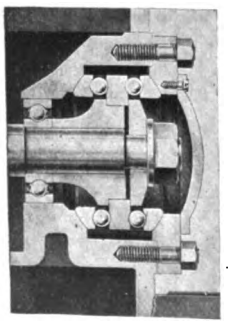
See What You Gain by Usiug the Rhineland Donble Thrust Bearing

The Rhineland Double-Thrust Bearing, Self-Inclosed, compact, protected from dirt, ready to be installed in one piece and without having to machine any collars or spherical seats. Easily demounted and reassembled.



CONSISTENT provision for double-thrust DEMANDS this Rhineland Bearing for many reasons.

First, it does with ONE row of balls what in every other ball type of thrust bearing requires TWO rows, and it goes into much less space than will any other double thrust bearing that does equivalent work.



Reference to the above typical installation shows the space saving and the reduced overhang. Note also the saving of expense for the two spherical seats and for the spacing and locking collars which are required with a plain two-row bearing.

Handling operations are greatly reduced as the Rhineland Bearing is put in as a single piece, and does not fall apart when the cap is removed.

Further, the adjustments and the automatic and perfect compensation to shaft spring are fixed BY US. This not only saves much labor, but makes US responsible for these important matters. It's better to have experts seat the aligning discs and get the backing of a firm with reputation at stake, than to take the judgment here of an erecting man or operative who may be little experienced with ball bearings.

The Rhineland way. Saves the space indicated by light lines and seated by shoving into place and tightening one nut.

The old way. Many parts, much careful and expensive machining and danger of bad seating. Bearing falls apart in removing.

The Rhineland Double Thrust Bearing is made in types and sizes to assure durability and splendid service under a wide load and speed range. It is accurate in the extreme and absolutely right as to material, workmanship and design.

The power saving and ultimate economy obtainable are worth most careful investigation by every designer. Send your blue prints and our engineers will show you how to apply this bearing best IN YOUR PARTICULAR CASE.

At least write for literature.

Elyria-Dean
TRADE MARK

$3.85

REXO II

THE REXO II is the best and sturdiest warning signal that can be bought for less than Ten Dollars.

Sixty Thousand have been contracted for as standard equipment by thirty motor car manufacturers. Its wonderful retail price is based on a production of 100,000 during the 1914 season.

REXO II's are in the hands of the dealers ready for delivery. Look up one for your car.

REXO II Warning Signals are electrically operated.

Are of ELYRIA-DEAN Quality.

Same high grade material and workmanship used as entered into the original Eight Dollar REXO—more than 80,000 of them sold during 1913 season.

Operates on six volts.

One adjustment yearly the total care required.

Horn furnished in Black and Nickel, or Black and Brass.

Finished with two coats of baked enamel (not air dried, which chips), developed by years of study in the telephone business.

Six-inch bell, quadruple plated.

Furnished in triple corrugated paper box, complete with cord, button, and instruction book, ready for mailing or expressing.

Also Special FORD-REXO II . . . $3.85

Coliseum, Chicago, January 24-31

"32" Touring Car or Roadster $1050 f. o. b. Detroit

In Canada, $1230 f. o. b. Windsor factory

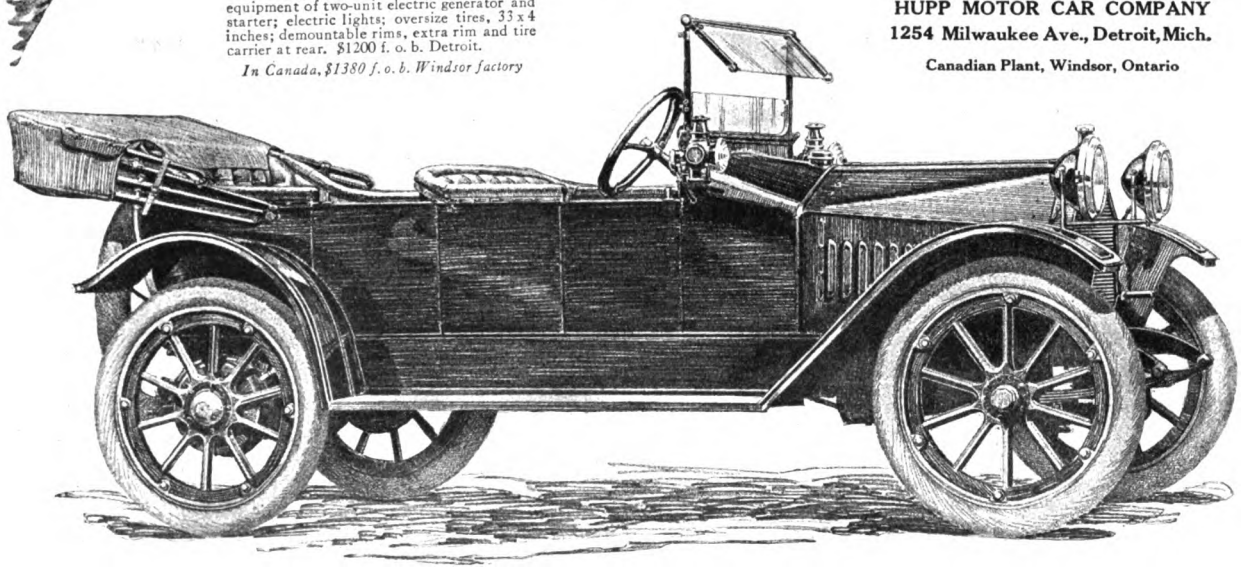
EQUIPMENT—Electric horn; rain vision, ventilating windshield; mohair top with envelope; inside quick adjustable curtains; speedometer; cocoa mat in tonneau; gas headlights; oil side lamps; trimmings, black and nickel.

With regular equipment and additional equipment of two-unit electric generator and starter; electric lights; oversize tires, 33 x 4 inches; demountable rims, extra rim and tire carrier at rear. $1200 f. o. b. Detroit.

In Canada, $1380 f. o. b. Windsor factory

Haven't you found, in your travels, that a Hupmobile family in one town thinks and talks about the car exactly like a Hupmobile family in any other town?

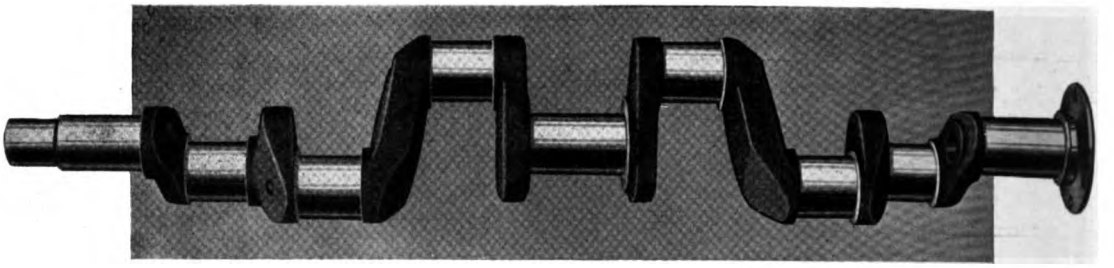
Isn't it one unbroken chain of kind thoughts and kinder words, from Montpelier to El Paso—in every nook and corner of the nation?



And what finer assurance can you have than this of value that is built deep down into the very vitals of the car?

We would rather have this country-wide good-will toward the Hupmobile than to sell a volume ten times as great on price alone.

We are trying to build every Hupmobile as though we were building only one—as though the one man who was to buy it must be satisfied at all hazards.



Isn't that better—to satisfy each one intensely and completely—than to sell twice or three times as many and please the buyers only half as well?

When it comes to Finishing Crankshafts deal with Headquarters

There is no mystery about machining crankshafts. The path seems straight. The operations mechanical. The chance for variations slight.

Yet, it is common knowledge that two concerns, working from exactly the same blue-prints, under duplicate instructions, will produce varying results.

Delays of a serious nature, retarding production, causing loss of time, losses of stock and losses of money are not unknown.

Competition is eager; promises are many, but—promises don't make crankshafts; don't help production; don't stop losses; don't satisfy.

That's why we urge you to come to headquarters for finishing crankshafts. We specialize on finishing crankshafts—do nothing else—and are pioneers in the business.

Experience, "know how" and splendid equipment are at your service when you deal with us. We make deliveries according to schedule—no excuses, no failures. Our percentage of rejects HAS NEVER GONE ABOVE TWO PER CENT.—has frequently been below that.

Low overhead enables us to make right prices. Shipping facilities are excellent.

Business will soon open up with a rush. You will want crankshafts finished and want them quick. Better get in touch with us now while there is still a chance to avail yourselves of Michigan Service.

The New KRIT

$950

(With Electric Starter $1050)

An Instant Success—Everywhere

By the thousands—yes, literally thousands—inquiries have poured in since the announcement of the 1914 Krit.

The verdict is unanimous—that the 1914 Krit at $950 is the greatest automobile value ever offered at or near the price. Those who have viewed the new Krit say they have never seen anything like it—have never thought so many big features were possible in a car under the $1200 mark. They have been surprised at the rare combination of good looks, mechanical excellence, easy riding comfort and tasteful appointments.

Dealers Say It's a Wonder

Wherever it has gone the new Krit has been an immediate hit. One dealer wires to say it will go "big" in his territory. Another orders 50 Krits, earliest possible delivery. A third wants his allotment increased. And so on.

These dealers are on the firing line. They know what the motoring public wants—what is required in a motor car to meet the public demand. They tell us the 1914 Krit has the features that insure for it a wave of popularity.

Thus the way is pointed out for other dealers.

The body of the new Krit is up-to-date, with the beautiful streamline effect. It is complete to the last detail in modern features and conveniences. Tapered bonnet, rounded radiator, graceful fenders and handsome beveled electric lights give the 1914 Krit an appearance of style and class found elsewhere only in the higher-priced cars.

Little Things that Create Big Value

Electric lights, electric starter and electric horn make it a pleasure to drive the Krit. Left drive, means convenience in entering and leaving the car and safety when on the street.

Driving compartment entered from either side gives extra convenience and service. Gasoline tank in dash, giving gravity feed; underslung rear springs; demountable rims; Stewart speedometer—all help to make the Krit a car of exceptional value.

Write or Wire Today

Because our production is larger this year than ever before, we have some territory still open. If you are interested in the big dealer opportunity offered by the 1914 Krit, write or wire today.

Some Opinions From Dealers

Needs a Bigger Allotment

"Hope you will be able to increase our allotment as sales are being closed pretty nearly every day. New Krit more than comes up to our expectations. Our first advertising in Sunday's paper brought crowds to see it."
F. A. Dutton Motor Co., Boston, Mass.

Center of Interest at Show

"Sensation at Toledo motor show is the new Krit. It is surely a beauty."
Cornelius-Hohly Co.

"A Banner Year"

"The new Krit had our competitors on the anxious seat. Have a live bunch of prospects and expect a banner year."
C. E. Whitten, Providence, R. I.

50 Ordered By This Dealer

"We are enclosing herewith a signed order for 50 more cars to be shipped to Minneapolis just as fast as you can ship them. We congratulate you on the great improvements you have made in the 1914 Krit."
Northwestern Automobile Co., Minneapolis, Minn.

"Absolutely Beyond Expectations"

"The entire Philadelphia Branch wants to extend you every congratulation on the new Krit. The new car is absolutely beyond all expectations, not only in appearance, but in power and silence of motor."
W. D. Shepherd, Krit Motor Car Co., Philadelphia, Pa.

Makes a Hit in Europe

"Krit car is the most European-like American car at the Paris show. We are very much pleased with the appearance of this new body."
Deutsche Compo Rubber Gesellschaft, Strassburg, Germany.

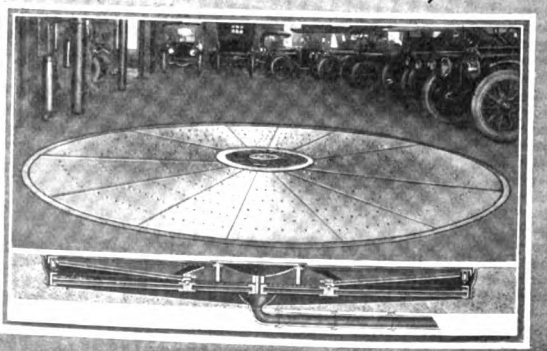
UNIVERSAL

AUTO TURNTABLE
and the
PORTABLE FLOOR CRANE



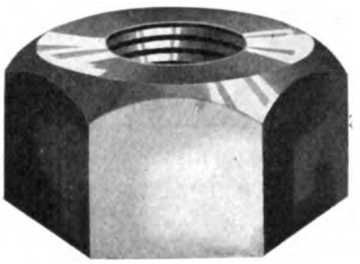
IF you are aiming toward efficiency and Economy your garage needs the Universal Auto Turntable.

These tables are built in sizes to accommodate long or short wheel base cars—with or without a wash rack extension. As an aid to more efficient service you could not get a more useful machine. Not only does the table aid you in checking cars in and out and in washing, but it relieves all necessity of backing and pushing cars about with the attendant danger of accidents.

Send for full details of the tables, their foundations, drainage, etc. Also ask for booklet "E M" describing the "Handy Tool" Portable Crane. Its usefulness and efficiency will cut the cost of labor in your garage or service station one half.

The Canton Foundry & Machine Co., Canton, Ohio, U. S. A.

Universal Auto Turntables are adapted for installation in private or public garages, service stations, shops and factories, either in or out of doors. Ask for folder giving the experience of "Universal" owners.



The "Handy Tool" Portable Crane has a capacity far in excess of a car's weight. If it is required to lift a car, motor or body one man is required—not four or five. The "Handy Tool" is used and recommended by hundreds of garages as saving its cost every few months.

Special Parts made up Quickly

Plain Milled "V," U. S. S. and A. L. A. M. Nuts

Standard "V," U. S. S. and A. L. A. M. Screws

Castellated Nuts—Soft or Hardened

An Automobile Maker who used 500,000 Parts like these this year said:—

"The maker of small parts who gets our business has got to show me something in addition to quality. The certainty that he can and will make deliveries, I figure as a part of my insurance."

The fact that the total amount that this man used is about half of a day's output of NAMCO products **means something.** It means that there are many other big makers of Automobiles and Auto Accessories who specify "NAMCO" when they order parts. And here are three reasons why—because they know that

Specifications will be followed to the letter:—because

NAMCO equipment is so large as not to be flustrated by a spurt of orders:—and because

Their work will go thru on schedule and with careful attention to details.

In other words, the service we offer you is not only to get the work right but to get it out **on time** and make it fast enough to keep the price right also—that's **NAMCO Complete Service.**

If it's special parts you use, we can take care of anything in brass, iron and steel up to 2¼ inches diameter and 10½ inches in length. Send your samples marked for "Estimating Dept." For Standard Screws and Nuts in the A. L. A. M. "V" and U. S. S. varieties write either of the warehouses or factory.

Over 30% More Cars Sold to Farmers Than to City Buyers in 1912!

¶ Is the result of very accurately checking up registrations in the State of Illinois—and records for 1913 to date show a still greater percentage of sales in the country.

¶ To top this off Willys-Overland are advertising: "The largest percentage of our 1914 output of 50,000 cars will be bought by American agriculturists, the men who are substantially the backbone of America."

¶ More than twenty-five automobile manufacturers and all tire manufacturers advertising have used and are using The World's Greatest Farm Papers, *The Farmers' Review* and *The National Stockman and Farmer*—because

¶ They realize through these mediums they reach more than 230,000 big, substantial, enterprising farmers, men who have the backing to buy when they are convinced—and

¶ They realize these two papers cover the wealthiest agricultural sections in the United States:

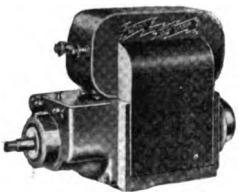
What's back of it?

MR. DEALER, you know that no matter how much the manufacturer of a car says to the consumer about backing up the parts, the consumer looks to you to make good if anything goes wrong and the manufacturer looks to the part maker. So it's of vital importance for you to know what is back of the car you sell and what **is back** of every important part and accessory on the car.

Nothing is more important than the electric system.



We do not have to remind you of the troubles that have arisen from inefficient and impractical electric lighting and starting installations.

It behooves you therefore, to look well into the relative merits of the different systems on the market, find out **what is back** of each system, and make your contracts accordingly.

Experience

The Auto-Lite System has back of it five years of experiments and tests, five years of usage which have enabled us to discover every imperfection and through gradual changes in our designs to produce a system which is entirely free from mechanical and electrical defects.

We were one of the first companies to design and build an electric system. We built and had

The Auto-Lite Electric Lighting Generator Standard Equipment on many 1914 Cars

adopted as standard equipment the first six volt system. This voltage is now in use in over 90% of the systems on the market.

The building of electric systems for automobiles is not a side line with us—not a speculative venture embarked upon temporarily and claiming only the partial attention of an organization building other accessories.

If experience behind the manufacturer of an article means anything, the fact that our system has behind it the longest and most varied experience of any system on the market today goes a long way towards proving its efficiency and reliability.

A Splendid Organization

The Auto-Lite Electric System has behind it an organization of men who know how to manufacture electric apparatus for automobiles—men whose entire interests are tied up in the success of the Auto-Lite Company, which depends upon the success of the Auto-Lite System on American cars.

When a body of men are gathered together with the sole purpose of producing the best possible article in any given line, when these same men continue to stick together with hardly a change of personnel in the life of the organization and continue to turn out apparatus to the best of their trained abilities, it is only reasonable to assume that the machines they turn out will be right and the organization will stand back of them absolutely.

The record the Auto-Lite System has made in the past five years on over 20,000 different cars, which means under 20,000 different conditions, proves this to be a fact.

Service

Our Service Department with branches in the large centers looks after all trouble resulting from ignorance or abuse on the part of the car owner.

Men are constantly traveling out from these Service Stations, calling on dealers, helping them out of difficulties and explaining the care and operation of the system.

All complaints from any cause on the part of the car owner are given the personal consideration by the service head in Toledo, and satisfactory adjustments made.

This kind of service is expensive, but it spells satisfaction, it is one of the little things that make for resales.

Good Will

The Auto-Lite System has back of it the good will of thousands of automobile owners and dealers. Ask any man who has owned a car equipped with the Auto-Lite System. They are all boosters.

Hundreds of letters in our files telling us of long usage and perfect service prove that the good will of the car buyers is behind our system. There is no better advertising.

Ask the dealers who sell the cars equipped with the Auto-Lite System. Their opinion is the same as that of the car owners. Ask the manufacturers. They will give the Auto-Lite System the biggest boost of all, for they above all appreciate perfect service and lack of trouble.

All this good will means something to the dealer selling a car equipped with the Auto-Lite System.

Advertising

Back of the Auto-Lite System is the power of publicity. Our advertising campaign covers the American Continent. Our advertisements reach and influence millions of people every month.

The public is having the advantages of the Auto-Lite System impressed upon them constantly to the advantage of the dealer selling a car so equipped.

In selling a car equipped with the Auto-Lite System you find the prospect previously impressed with the value of the system and prejudiced in favor of the car it is on. The Auto-Lite equipped car is easier to sell.

Our Engineering Department

The Engineering Department of the Auto-Lite Company is at your service. No matter whether you are a big manufacturer in the market for 50,000 systems or a dealer desiring practical information about one.

Ask us about any points that may come up.

It will be our pleasure to give you the benefit of our experience on the subject.

The Auto-Lite Combination Electric Lighting and Ignition Outfit

Manufacturers

For the manufacturers' benefit we state that our financial and manufacturing facilities are adequate to handle contracts of any size. Every part of the system with the exception of the standard igniter we use with our ignition equipment is made in our own factory.

We are designers and manufacturers, not assemblers.

We have sent most of the dealers in the United States copies of the practical Auto-Lite literature. If you have not received yours, let us know today and we will mail you complete data tomorrow.

THE ELECTRIC AUTO-LITE COMPANY

Toledo **Ohio**

Digitized by Google

As sure as the Whirl of the World

A *Capable* Starting Motor

SO rugged and powerful that it will spin a big six-cylinder automobile engine faster than 100 revolutions per minute with the ease of a Hercules and on less than 100 amperes of current, the Auto-Lite Starting motor can be relied upon to perform its function faithfully and fully — compelling positive starting day in and day out, winter or summer.

Strong—compact—**capable**—fully enclosed—protected from the deteriorating effect of water, dirt and grease, it is built for hard, continuous service and should last longer than the car to which it is attached.

Look for this efficient starter on your 1914 car.

The manufacturing and financial facilities of the Electric Auto-Lite Company are adequate to handle contracts of any size, not only for starters but for complete electric lighting and ignition systems as well.

An Explanation to Owners

While the complete Auto-Lite electric lighting system may be attached easily to the average car, it is more difficult to install a starting motor because space and structural limitations sometimes necessitate material alterations and considerable machine work before a satisfactory application can be made—hence orders from individual owners for starting motors are not solicited.

You can have the complete Auto-Lite equipment on your new car however.

Manufacturers can furnish it if you so specify.

The Electric Auto-Lite Company

"The Pioneer Makers of the 6-Volt Electric System"

NORTHWAY

The New Northway's *14 Features That An Ideal*

Auto Star Motor Car *Make OHIO Automobile*

R. E. NORTHWAY
of the Manufacturing Department

OHIO

C. D. PAXSON
of the Sales Department

Talk to you thru the OHIO on the Keynote of Automobile Success, Concentration and Elimination:

To manufacture the most perfect Automobile at the least possible cost is the one great aim of Automobile manufacturers, and to do this it requires, above everything else, knowledge, ability, experience, capital, and concentration.

After years of experience and exhaustive tests and expensive experiments as the founder of the Northway Motor Company and original designer of that Company, I am now producing my very latest and what I believe will be my greatest success. I am endeavoring to produce in our two 1914 models, cars that both you and I will be proud of. I am using nothing but the very best material obtainable, employing the most skilled mechanics, and, above all, I am concentrating my ability, efforts, resources and capital on two models only, for I believe we can and are producing a better car at $1,275.00 by concentrating on it than we or any other factory could build for even $1,500.00 if we undertook to build four or five models.

My greatest aim is to make this one of the most efficient production factories in the country, so as to make it possible for us to produce a car of quality and reliability at a popular price, such as is being demanded by the public, and I honestly believe that no better cars are built for the money than we are producing in our ROYAL OHIO models for 1914. We have the facilities, the ability, and the capital to produce and manufacture the car.

Yours very truly,

R. E. NORTHWAY, Gen. Mgr.

Crescent Motor Company, Cincinnati, Ohio.

W. T. Hunter, Pres.
Wm. Pabodie, Sec'y-Treas.

The two vital points in connection with the marketing of Automobiles at the present condition of the business are the quality of the car and the price. We believe that the keynote of Automobile success for both dealer and manufacturer is concentration and elimination.

After twelve years of selling experience covering the entire United States, and by having my finger on the pulse of the trade all this time, I feel that I know just what the public wants, and that is, A car of Quality and Reliability at a popular price. I have had experience in every stage of the industry, passing up every rung of the ladder as Driver, Repairman, Racer, Owner, Agent, Distributor and Manufacturer, and as such I know that there are just fourteen things that constitute the ideal Automobile, and these fourteen things are: Material, Construction, Power, Reliability, Simplicity, Durability, Lines, Finish, Riding Quietness, Service, Design, Co-operation, and Price, all of which are concentrated in the ROYAL OHIO Models for 1914, and the production of such an ideal car will give to the Agent a car that will be an easy and ready seller. For a car to be a ready seller it must have behind it some striking feature that stands out prominently, and I don't think there is a factory in the world that is making a popular priced car who has the valuable asset that we have in the person of Mr. R. E. Northway, for he is today recognized as one of the greatest engineers in the country; his name is an absolute guarantee of quality and reliability.

His knowledge and experience has brought our factory up to the highest plane of efficiency by concentrating all his efforts and ability on two models, thus eliminating all unnecessary expense from a manufacturing standpoint. From a marketing standpoint we have eliminated three-quarters of the selling expense by one selling organization handling the entire output of four different factories, and consequently we are able to place on the market a car for $1,275.00 that cannot be duplicated at the price, and producing a Six-cylinder Model for $1,985.00 that is the equal of any car on the market at $2,500.00.

C. D. PAXSON.

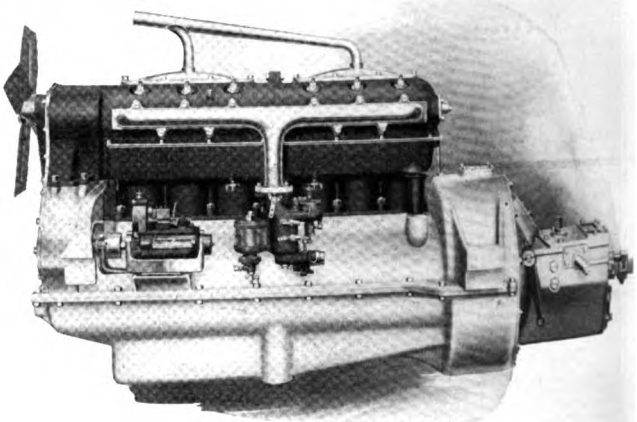
The eyes of the entire motoring world are centered on the----------

Speedwell Rotary



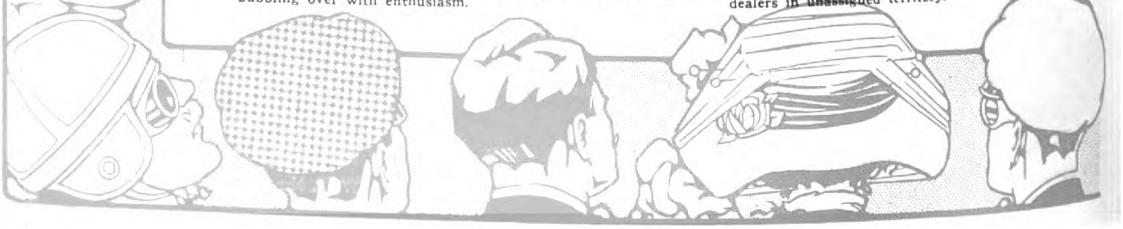
For years the possibilities of a new type of motor employing neither poppet nor sleeve valves has been hinted at. Many hopes of such a motor have arisen from time to time but in almost every case they proved false alarms and died aborning. Here in the Speedwell Rotary Valve Motor is at last the realization of motorists' dreams—

a motor without poppet or sleeve valves—
a simpler motor—
a more powerful motor—
a higher speed motor—
a motor of longer life—
a motor of absolute valve silence—
a motor without vibration even at extreme high speeds.

This motor is unlike any other, is perfect and precise in its action and so simple that the wonder is that its introduction and perfection should have been postponed so long.

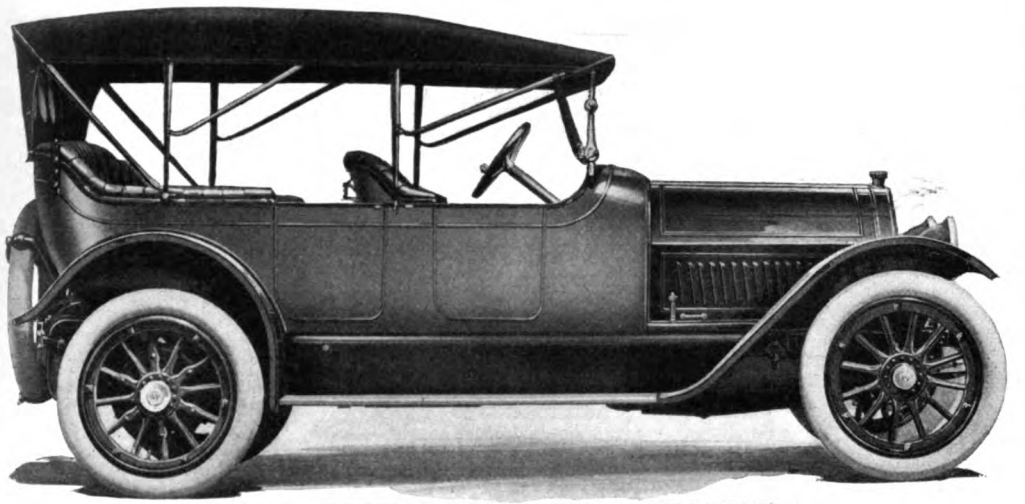
Seven Years Spent In Thorough Test and Development

For seven years we have been working on this motor—developing it, testing it out on the road, always sure its principle was right but seeking by refinement of details to bring it up to a point of highest efficiency. We appreciated how radical and revolutionary our action in bringing out a new type of motor would be regarded and we knew it would be fatal to market this wonderful power plant until every last detail had been perfected and refined and O. K.'ed by abnormally long, hard tests on the road.



SPEEDWELL ROTARY SIX

Speedwell Rotary Deliveries Start January 1st



The time of the Speedwell Rotary has arrived. It is right in every detail. Deliveries of cars driven by this six-cylinder rotary valve motor start January 1st. The pity is that we can make so comparatively few of these Speedwell Rotary Sixes the first season. Speedwell dealers who have been at the factory and driven this Speedwell Rotary have gone home bubbling over with enthusiasm.

Two Thirds of Output Already Sold

What has been the result of this dealer enthusiasm? They have told their customers about the motor and within the few weeks past, since we showed this motor to a portion of our own dealers they have sent us definite orders and delivery dates for two-thirds of all the cars we can build this season. The remainder of our output will no doubt be sold in a very brief period. We want these remaining cars well distributed throughout the country and will contract with a few more dealers in unassigned territory.

Digitized by Google

5 PASSENGER SPEEDWELL ROTARY SIX, $2850---7 PASSENGER $2950

Brief Specifications and Equipment of SPEEDWELL ROTARY SIX

Speedwell Rotary Six Motor—bore 4⅛ inches, stroke 5¼ inches; in unit with dry disc clutch and selective sliding transmission; mounted on three-point suspension.

135-inch wheelbase.

36 x 4½-inch tires all around on five-passenger, 37 x 5-inch tires all around on seven passenger.

Wagner electric starting and lighting system.

Dual ignition independent of starting and lighting.

Timken axles front and rear.

Pressure gasoline feed with 5 gallon reserve compartment.

The standard equipment furnished is complete and of uniform excellence. Mentioning the more important items in addition to those referred to above are—glass front, electric horn, Warner speedometer, top and top cover, engine driven tire pump, tire carriers, demountable rims, gear shift lever lock, a full compliment of tools, etc., etc.

To Car Buyers and Dealers

To car buyer and dealer alike, we say—if you are interested in this remarkable motor it behooves you to act at once. Once you learn all the wonderful facts about it, once you see it running you will become enthusiastic like all the rest who have seen it.

Get Speedwell Rotary Literature

Whether or not you can this season own a Speedwell Rotary Six depends upon your quickness to investigate and act—but whether or not you are too late, we want you to know all about this motor. We will gladly send literature upon request. We can't adequately describe this motor in this announcement—limited space cannot do it justice.

The Speedwell Rotary Six Will Be Exhibited at New York and Chicago Shows

The Speedwell Motor Car Co.

Dept. W, Dayton, Ohio

A Few Facts About The Speedwell Rotary Valve Motor

The primary advantages of this motor are silence, simplicity, freedom from valve wear and absence of vibration.

Its theoretically perfect combustion chamber form tends to increase power, decrease gasoline consumption, and avoids carbon deposit. The high efficiency is aided as well by the straight passage of gases into and out of the combustion chamber.

There are no reciprocating parts in the valve construction—rotation is continuous in one direction at one quarter crank shaft speed.

Not only is the motor capable of developing high power but attains and maintains extremely high speeds without vibration.

The motor retains its initial efficiency because there is practically no valve wear and the valves cannot get out of time.

The rotary valves are lubricated automatically by oil pumps with direct feeds, the volume of oil being controlled by the throttle opening.

The motor continues to rise in power as the speed increases to a much higher limit than the limit of poppet valve motors.

The Exclusive Sale

of Marathon Tires and Tubes for One Good Dealer in Every Town

THINK what it means to control the sale of the Marathon Tire in your town or city. This is not an ordinary tire. Its a most EXTRAORDINARY tire---a tire wholly in a class by itself. We guarantee every Marathon tire for full 4,000 miles. Yet that is a low estimate. The major average have proved the service to be far above 4,000 miles. Many give that mileage even before the angle tread wears off. Then the plain tread remains to double it. Below we will tell you how we build-in this great service. Right now, Mr. Dealer, you are figuring how to make more money next year. Consider this: Which tire is most profitable to you---a make that every other dealer in your town sells, or the Marathon 4,000 mile tire that you can sell exclusively?

Why You Haven't Made Money in Tires

The reason why you have made practically no money in tires is just this: You have handled what every other dealer handles. Competition is keen. Motorists are shrewd buyers. They shop around and buy where they can get their favorite make of tire at the largest discount. Your competitors want business and they begin to cut prices. To make a sale you must cut below their price. That's why you have not made money on tires.

Marathon Exclusive Sale Plan Eliminates Price-Cutting

To one good dealer in every town or city, we will give the **exclusive sale of Marathon tires and tubes.** He will absolutely **control the sale.**

That absolutely eliminates price cutting. It insures you of a good profit; and it insures the tire user of better service. No Dealer can sell any product at a fraction above cost, and give his customers proper service. You know that.

Our selling plan protects the dealer —protects you. Selling Marathon tires you have no reason to cut prices —no necessity. No one else in your territory can get the sale of Marathon tires. You can therefore make more money selling Marathons.

Motorists Want This Tire

There is a big and growing demand for the Marathon Tire. Motorists want quality—mileage—service. They will pay a fair price for a tire that gives it. Marathon costs motorists less money, because it gives more.

Here are just the reasons why it gives more:

MARATHON

Top-Notch Materials

Only top-notch materials are used in building Marathons. We use genuine Sea Island fabric. And we use the finest rubber—rubber we've proved to be the best and most wear-resisting.

Slow and Careful Hand Building

Using the finest materials, we build every Marathon Tire by hand, very slowly, very carefully. There's no question about hand building being the best method.

This tire is built with utmost care and accuracy through every step. That's one reason for its great service.

Construction Unitized

We single cure Marathon in live steam by a special wrapped tread process. That gives unitized construction—makes all parts one. This method also intensifies the wear resistance.

Factory-Insured 4,000 Miles

Thus you see how we actually factory-insure the Marathon tire. We absolutely build quality—long mileage—service into Marathon. And you see why we can guarantee this tire for 4,000 miles.

The Angle Tread

Note the great angle tread. It is the master of wet streets, slippery and sandy roads. The angles grip in all directions.

If the angle tread wears off after thousands of miles, the thick, plain tread remains underneath to double the service.

Get the Exclusive Sale

Mr. Dealer, why not get the exclusive sale of this tire in your city? It means a satisfactory business and a better profit for you. Write us today and get our proposition.

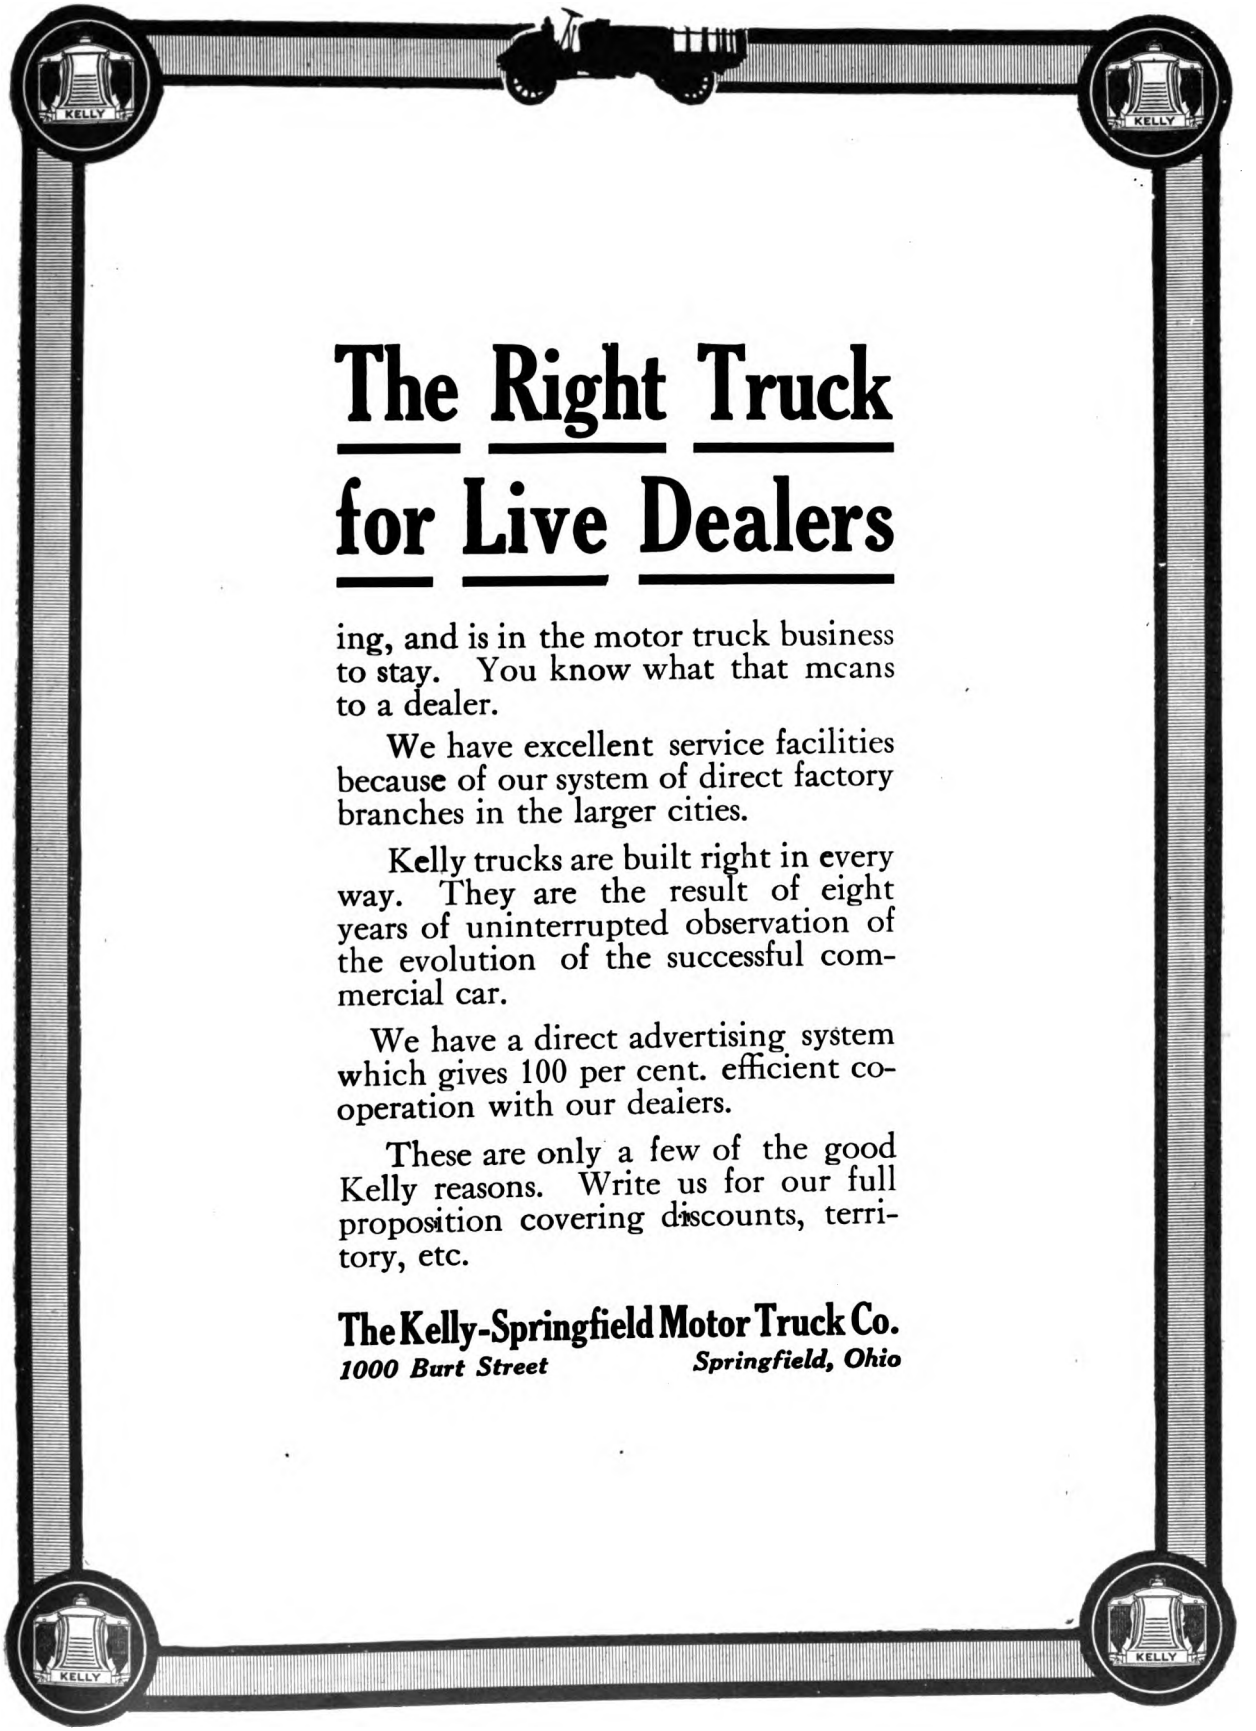
The Right Truck for Live Dealers

We want live dealers in several cities to handle Kelly trucks.

Naturally, you want to know why Kelly trucks are a good line for you to handle.

Below we give some of the reasons why Kelly trucks will be money makers for you:



We have a complete line. Beginning with January, 1914, our line will consist of 1, 1 1-2, 2, 3 1-2, and 5-ton models. This embraces every reasonable capacity, and no sales can get away from you because of lack of the right capacity truck.

The Kelly-Springfield Motor Truck Company has abundant financial back-

The Right Truck for Live Dealers

ing, and is in the motor truck business to stay. You know what that means to a dealer.

We have excellent service facilities because of our system of direct factory branches in the larger cities.

Kelly trucks are built right in every way. They are the result of eight years of uninterrupted observation of the evolution of the successful commercial car.

We have a direct advertising system which gives 100 per cent. efficient co-operation with our dealers.

These are only a few of the good Kelly reasons. Write us for our full proposition covering discounts, territory, etc.

The Car That Sets the Fashion

In the making of Society's vehicles—from the stately coach of 60 years ago to the finest Electric of today, Rauch & Lang productions have always set the fashion in each successive era.

Particularly is this true of this year's Rauch & Lang Electric, the first electric in America to embody the Straight Type, Top-Mounted Worm Drive. The superiority of the worm-drive method of propulsion is so pronounced as to win the immediate emulation of other makers.

No monarch's equipage was ever built with such painstaking skill, or with greater concern for the perfection of every detail. That is why the output of the Rauch & Lang Electric is always limited, and why it has always been Society's chosen car.

Any Rauch & Lang agent will gladly demonstrate.

THE RAUCH & LANG CARRIAGE CO., 2209 West 25th Street, Cleveland

New York, 1800 Broadway; Cleveland, Superior Avenue; Minneapolis, 1207 Harmon Place; Kansas City, 3501 Main Street

Three Types of Control: Front—Rear - Selective Dual

Select the position from which you desire to drive according to the number of passengers. Controls and Brakes are automatically interlocked by merely turning front seat to natural position required by driving conditions.

These features and the top mounted worm drive are exclusive to Rauch & Lang Cars and, as well as the design of the car and other details of construction, are fully covered by United States patents granted and pending.

Buy the Car When You Know the Springs —Not Before

YOU can judge the *beauty* of the car you buy at the first glance. You can tell something of its *power* when the demonstrator takes you over a hill. But you can't be sure of the *springs* unless you determine what springs they are and what their record is. Because a spring giving supreme comfort in a demonstration may, within three months, sag and settle until it bounces and jolts you at every slight depression in the road.

Avoid spring uncertainty and disappointment. *Specify Detroit Springs and be sure.* We protect you beyond that first demonstration, which can't tell you what the spring is worth. Every Detroit Spring is backed by a *guarantee* against settling or breakage for *two years* from date of manufacture. It is spring insurance for you.

Identify Detroit Springs by This Trade Mark

RESILIENT

Detroit Springs

TRADE MARK

SILENT =SELF-LUBRICATING

And by the Lubricating Cup Near the End of Each Leaf

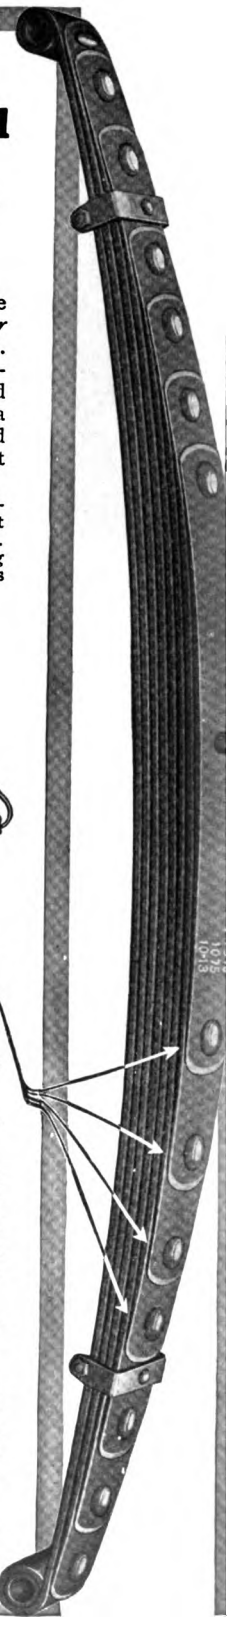
When you're looking the car over, watch for that Detroit Spring trade mark.

It means safety. Detroit Springs are almost impossible to fracture.

Comfort is certain.

Your tires will wear longer because Detroit Springs automatically assume a large percentage of this work.

That pest of the motorist—squeaking—is unknown.



These things require an inspection of the springs. And if you don't find the trade mark or the lubricating cups on the leaves, demand that your car be equipped with Detroit Springs.

You can get them. True, they cost the manufacturer a little more. But he'll give them to you, *if you insist.* Detroit Springs on any car are a strong indication of quality construction throughout the car.

How to Ride Comfortably and Safely Write for Booklet

It pays to know springs, *to know why you should insist on Detroit Springs.* The information can be yours for the asking. A booklet of remarkable interest will be mailed to you on request. It tells the story of spring making from your standpoint as a car owner. Explains how Detroit Springs insure your safety and lengthen the life of your car and tires. Write for it.

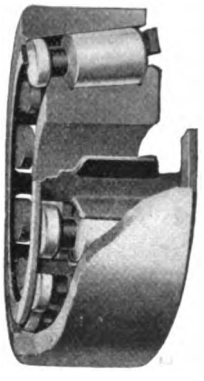
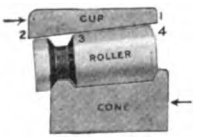
TIMKEN
ADJUSTABLE ROLLER BEARINGS



As Your Car Grows Old, Keep it Tuned Up



Retain its smoothness, its quietness and comfort. Retain its quick response, its effective power—its dependability. You bought it for these qualities—keep them in the car as it grows old in your service.

Tune up your motor, adjust the carburetor for weather and varying qualities of gasoline. Adjust the steering gear. Adjust the brakes.

And don't forget to adjust the bearings. For all bearings wear same as other moving parts and need adjustment if you are to keep the full power and efficiency of your car.

Timken Bearing partly cut away to show construction

If wear occurs, leaving slight space between cup and roller, adjustments can be made by moving the cup or cone in the direction of the arrows.

As 1-2 and 3-4 always remain exactly parallel, the adjustment brings the different surfaces into perfect line-contact, and no principle of the bearing's efficiency is impaired.

Inside Knowledge that will Help You

WHEEL bearings must turn easily of course—to eliminate friction. But they must fit snugly too—to prevent wheels from wobbling

As bearings wear—all bearings do—they get loose. A little looseness allows the pound that makes faster and faster wear—more and more looseness.

Bearings on shafts that support gears—transmission, driving and differential gears—when they wear (as all bearings do) allow the shafts to drop slightly out of line. The gears on those shafts get slightly out of correct mesh. Imperfectly meshed gears make noise and waste some of the power.

The trouble goes on *at an increasing rate* unless promptly checked by adjusting a type of bearing that can take up looseness when it develops.

Use of steels best adapted for bearings, extreme accuracy of manufacture, strict following of heat-treatment formulas developed by years devoted to concentrated study of bearings alone—these are producing bearing parts that have wonderful wear-resisting qualities.

And yet bearings—all bearings—do wear.

The Timken Tapered Roller Bearing is the one type of bearing that can be adjusted to completely eliminate the effects of its slight wear.

The Timken Tapered Roller Bearing carries the load and resists the shocks along the lines of its rollers instead of on the points of balls; its tapered construction enables it to meet side pressure and shocks in addition to direct load; its line contact distributes pressure and hence minimizes wear—*these are three great principles that are kept in constant operation for your benefit by the fourth great principle of adjustability.*

And beyond keeping the Timken Bearing itself always at full efficiency its great principle of adjustability keeps the shafts and gears up to their top notch efficiency

You can see how important it is to have adjustable bearings in your car if you are to retain its effectiveness as a power vehicle—as it grows old in your service.

Other Interesting facts about bearings are told in the Timken Primer No T-1 "On the Care and Character of Bearings" which, with the Timken Primer No T-2 "On the Anatomy of Automobile Axles," will be sent free, post-paid on request to either Timken Company.

The Gateway to Success

for more than sixty firms that manufacture motor vehicles (of which but a few are here indicated), is keyed upon the solid reputation of

Continental Motors

It arches high and reaches wide. Upon a fundamental truth its foundations rest—that the specialist can build best and most economically.

And its courses have been laid in ten years of unqualified success—both financial and mechanical.

An association with the Continental Motor Mfg. Co. is today one of the most valuable assets that any motor car or truck builder can possess.

Such an association fortifies the manufacturer's sales, because it assures unquestioned motor service to every owner.

Continental Motor Mfg. Co.

Many automobile bearings have been ruined by adjusting them too tight or too loose. Improper or careless adjustment is liable to cause serious trouble—scored shafts or stripped gears.

Hyatt Roller Bearings have flexible spiral rollers that give just a little under load and are less subject to wear, consequently the necessity of adjustment is entirely eliminated. This feature makes them "fool proof."

Two books, one about motor car bearings in general for prospective purchasers, the other for automobile owners, will be sent on request

LIST BOSCH PLUGS

Mr. Dealer

BOSCH Plugs in 1914 will be made more popular than ever—they will be the most advertised of Quality plugs. Bosch Plugs will be extensively advertised **FOR** the dealer in over a score of trade magazines, also in the best national magazines.

Whoever reads will be reading Quality arguments, will be learning to choose good workmanship and materials rather than low price; in consequence more motorists than ever will be influenced in favor of Bosch Products.

It is possible for every dealer to turn this selling force into sales. The method is simple—show that you sell Bosch Products, and Bosch Publicity, Bosch Reputation and Bosch Popularity will work for you. Connect with Bosch Advertising, is the sum and substance of it—a logical conclusion to get logical results.

List Bosch Plugs in your catalogues, your leaflets and in your mail inserts—that is the first move. We'll send you the cut shown here; clip the copy and hand it with cut to your printer. Get "hitched up" to a Quality line—it sells with minimum effort and gives a legitimate profit—that's the ideal line.

Do It Before You Forget It.

BOSCH PLUGS

A Quality Plug for Automobiles, Motorcycles, Motor Boats, etc.

The Bosch Plug is one of the well known Bosch Products and is fully representative of Bosch Quality.

Due to its popularity with racing drivers it has been thoroughly tried out under all conditions and has been found thoroughly efficient.

The Bosch Plug has three crescent shaped electrodes which are substantial in size and made of pure nickel. The insulator is Steatite, a stone that can not be even cracked by accidental blows. The method of construction eliminates all joints and in consequence no power loss can be experienced due to compression leakage, etc.

All in all, the Bosch Plug is one of the best designed plugs made, the materials used are carefully selected and satisfaction for a long period is assured.

Price, in all Standard Threads, $1.00 each

The car with the wonderfully FLEXIBLE MOTOR

The KisselKar is built up around a power plant that is a marvel of mechanical perfection. The motor is famous for its dependable power, silence, smoothness in action and responsiveness. It is the exceptional flexibility of the KisselKar motor that practically eliminates gear shifting and makes the Kissel Kar unusually safe and easy to drive.

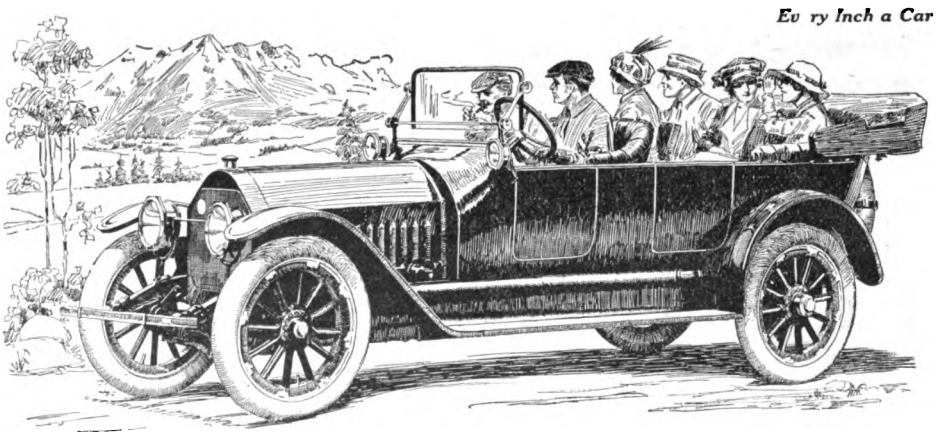
KISSELKAR

Engine vibration is reduced to the minimum. Even when clutch is out and engine is racing the oscillation is scarcely perceptible.

KisselKar comfort adds new zest to motoring. The liberal wheelbase, big wheels, oversize tires and large roomy seats eliminate the jolts and jars. You are free from the "lurches" and side-sways incident to motoring in average automobiles.

Our catalog describes all three models: 60 "Six" at $3150; 48 "Six" $2350; 40 "Four" $1850. Each fully equipped, electric lighted and started; left-hand drive and center control.

KISSELKAR SERVICE CONTRACT



KisselKars are sold under a specific guarantee of service to owners—a written contract that stipulates in detail the mechanical care that forestalls trouble and retards depreciation. The unusual facilities at our Service Stations are always at your disposal.

KISSELKAR TRUCKS—Six sizes, 1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Ask for Truck Catalog.

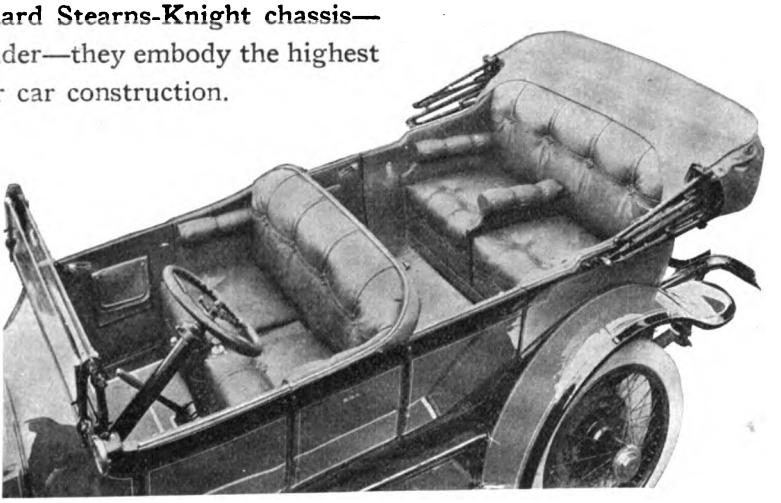
Once More the Stearns-K

BIG Feature o

Stearns-Knight Six-Cylinder Six-Passenger Touring Car

THE new four- and six-passenger Stearns-Knight Touring Cars, which will be exhibited at the Shows for the first time this season, differ so radically from ordinary standards of body design and treatment as to constitute an entirely new type. Not since Stearns brought out the famous Guy Vaughan, or Toy Tonneau model in 1907 has a body type been so extensively copied as this new type will be during the next year.

In the lines of the bodies themselves—in upholstery, trimming and detail refinements—these cars show what can be accomplished when master designers depart from the beaten path. The instantaneous success of the new models indicates the widespread demand for a body design which would combine individuality in the treatment of details with perfect harmony of the whole.



The F. B. Stearns Com a

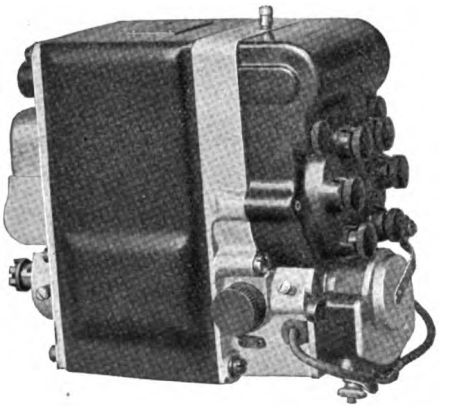
Digitized by Google

Knight Furnishes the of the Shows

Their many distinctive features—the leather-covered cowl-back of the front seats, emphasizing the straight sweep of the body lines—the low, rounded arm-rests—the absence of projecting upholstery—the new type of disappearing auxiliary seat used in the six-passenger model—the one-man top—and many other details make these cars exceptionally attractive and convenient. Mounted on the standard Stearns-Knight chassis—either four- or six-cylinder—they embody the highest developments of motor car construction.

Nothing else at the Shows will equal these new cars in interesting features. Be sure to see them at the Stearns exhibits.

Interior Stearns-Knight Four-Passenger Model, showing type of upholstery used in both Four- and Six-Passenger Cars



The new Stearns-Knight Coupe and Sedan models will also be exhibited for the first time at this year's Shows. Combining exceptionally attractive lines with the unsurpassed Stearns finish and appointments and the silent, efficient Stearns-Knight chassis, they form a notable addition to the Stearns-Knight line of luxurious closed cars.

A Straight Talk To Automobile Supply Dealers Who Are Not Handling GLOBE BOXES

RIGHT now as you stand on the threshold of another season—stop and ask yourself "What is to be my policy during 1914?"

If you have been a little more interested in prices than in recognized and standard quality—stop and consider. Where does price competition inevitably end?

You know your trade. You know what your customers want—because you have taught them to want the kind of merchandise you are selling.

As a dealer have you made a determined effort to trade up and to educate your customers to want the kind of supplies that give the most value? Or have you followed the line of least resistance and encouraged your customers to want lower and lower prices?

Thousands of supply dealers have taught their trade to want Globe Boxes. These dealers have done this, solely because the dealers have been convinced that it was good business.

It is always good business to sell the thing that makes a satisfied customer.

The dealer who sells a Globe Box knows that the customer will never regret his purchase. He knows that the Globe Box is built to last, that it will look well and wear well, that the sizes are logical and convenient.

The dealer who sells Globe Boxes does not have to prove their quality—for it is apparent to any eye. He does not have to apologize for imperfections of finish and then go over his stock to find a presentable one so as to close the sale. He does not have to scheme how to work off any boxes that are below grade—for there are no such Globe Boxes.

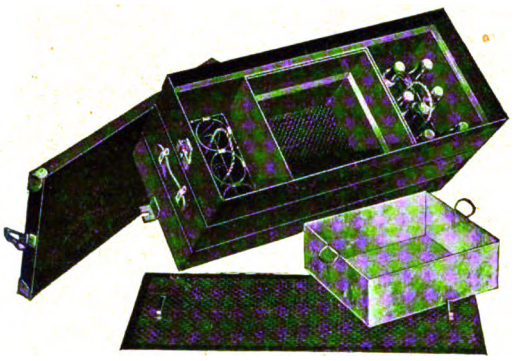
That the difference in price is not a bar to success with Globe Boxes is proved by the fact that in 1912 and again in 1913 there were more Globe Boxes sold to dealers than were sold of any other make.

The Globe line is a complete line including thirty-two different styles and sizes. The dealer who handles the Globe line can meet every car-owner demand and still do business on a smaller investment in boxes.

These things count. Price is not everything—nor even the most important thing.

If you have been more interested in box prices than in other phases of the box question—stop and consider carefully before you decide upon the line you will handle in 1914.

Turn over this page and see in detail what the Globe line offers for next season. Note the profit possibilities in the new trunk and refrigerator boxes—specialties that will sell quickly and at good prices and which will advertise you as a progressive in the supply business



See Globe Boxes at the Automobile Shows:
Space C-81 at the Grand Central Palace, New York. Space No. 2 at Coliseum Gallery, Chicago.

Here is The Globe Box Line For 1914

Globe Touring Refrigerator

THIS is a Globe specialty which will be in great demand this season. A practical refrigerator holding food and liquid refreshments for a party of six—yet the box is only a little larger than an ordinary tool box. Holds 25 pounds of ice and has room for plates, knives, etc. Two sizes—

A—27¾x11 wide x 14 inches deep. Has bottle compartment at each end. **List - - - $25.00**

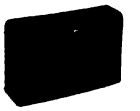
B—Seven inches shorter than size A. Has one bottle compartment. **List - - - $20.00**

Globe Auto Trunk Box

ANOTHER Globe specialty which will sell in large numbers. Carried at the back of the car or attached to the running board by Tee bolts. Toggle lock at each end and the eight brass corners are nickelplated. An unusually handsome box—and as strong as good looking.

Inside dimensions—30½ x 16 deep x 14½ inches wide. Weight 40 lbs. Holds 2 suit cases 30x15x7, but suit cases are not included. **List - $12.00**

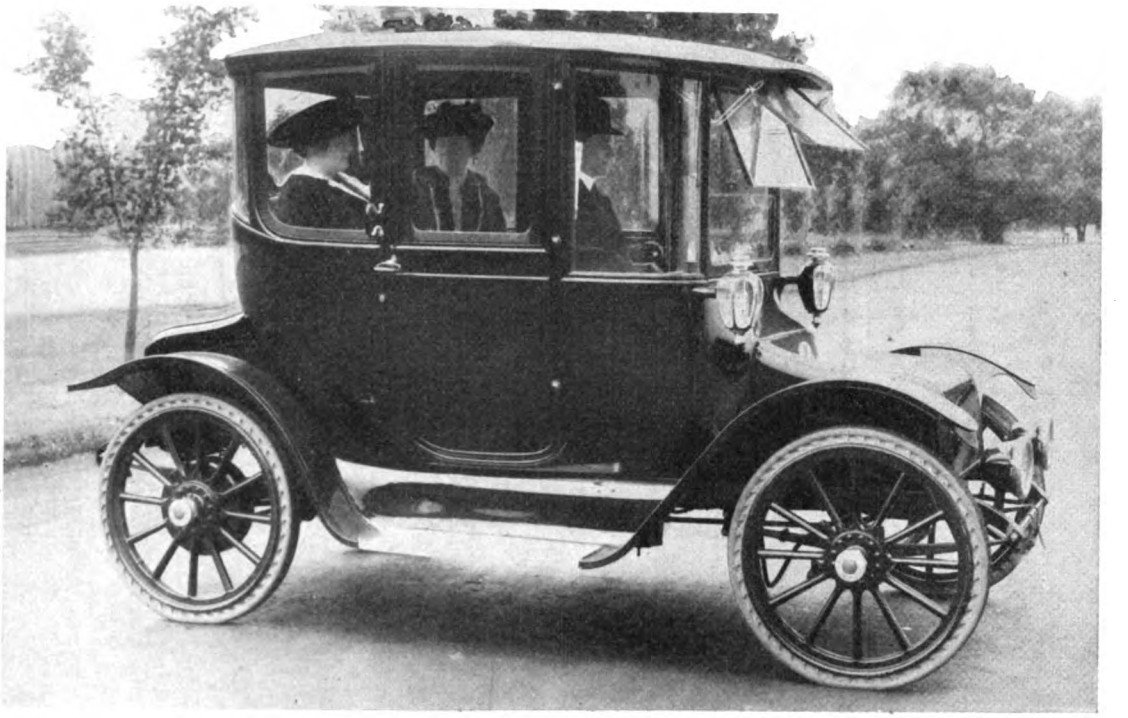
GLOBE Boxes include 33 sizes in two styles for pleasure cars and one style for trucks. All Globe Boxes are marked by graceful flowing lines and beautiful rich enamel finish.



All boxes may be had with Aluminum mats and all but two styles with insulating Wood Lining.

For Ford cars with fore doors there are three popular sizes.

All Globe boxes are packed in sealed cartons which protect the boxes in shipment and in stock. Each box has the Globe trademark inside the cover.



New Globe Catalogue Out December 20.

Highest Award to the Detroit Electric

First choice of the space allotted to electric automobile manufacturers has been awarded the Detroit Electric at the New York and Chicago National Automobile Shows.

This award is based on volume of business. Thus the Detroit Electric receives the premier honor. Its sales are two for one over the sales of any other electric.

Leadership has come to the builders of the Detroit Electric because of certain, definite ideals—to build quality cars, to keep ahead in improvements, to keep prices down. These ideals, adopted from the very beginning, have been rigidly adhered to—and proven right each year.

Why the Detroit Electric is Supreme

In the Detroit Electric is found the highest expression of quality. Large production enables us to replace near-accurate hand work and blacksmithing methods by absolutely accurate machine methods.

We have invested in the most modern and efficient machinery, much of it especially designed to meet our requirements. We have equipped our factory completely for building the Detroit Electric practically in its entirety. Out of the largest shops in the world devoted to the manufacture of electric pleasure vehicles comes the Detroit Electric.

We have secured the best mechanics and the highest skilled body builders. We are ideally located geographically to do this. We retain these experts year in and year out; they maintain the Detroit Electric standard of quality.

We have always bought the very best materials purchasable on the open market. We have tested these materials—and insisted on accuracy—before they entered into a Detroit Electric. We have eliminated unnecessary weight in construction, unnecessary complication in design.

THE Detroit ELECTRIC

The 1914 Leader

Each year the Detroit Electric has led in new features. For 1914 it presents an array of improvements to be found in no other electric. All of these features contribute to make the Detroit Electric the most luxurious car on wheels. All of them make for long life, beauty of appearance, silence in operation, and rare comfort.

For 1914 the Detroit Electric offers the widest choice both in body types and mechanical features—worm gear axle or bevel gear axle, front seat drive, rear seat drive, or Detroit Electric duplex drive. Note the prices:

WITH BEVEL GEAR AXLE		WITH WORM GEAR AXLE	
Victoria	$2300	Gentleman's Roadster	$2500
4-pass. Brougham, rear seat drive	2550	4-pass. Brougham, rear seat drive	2850
5-pass. Brougham, front seat drive	2800	5-pass. Brougham, Detroit Duplex drive	3000

(Prices f. o. b. Detroit)

You May Shift Gears With Your Fingers If You Wish On the New

McFARLAN SIX

BY MEANS OF THE

Gray Pneumatic Gear Shift

The simplest and easiest method of shifting gears that it is possible to devise. This machine, while built outside of our factory, fits the McFarlan chassis layout as neatly and surely as if it were designed especially for it, and by means of it the McFarlan Six, heretofore a little too big and powerful for the average woman to handle, may now be handled with the greatest ease by the frailest woman.

The selection of the gear is made by means of a hand lever on the steering wheel, as shown in the picture. Then a pressure on the clutch pedal actuates the valve in the shifting mechanism and the gears are shifted quickly and positively. Compressed air does the work. The same medium that is used on the fastest passenger trains to brake and bring them to a stop is used to shift these gears.

The shifting mechanism is so designed that the available air pressure is trebled. Thus with two hundred pounds pressure in the air tank the [illegible] to the gears.

for second or low, as the case might be, then forget about your gears. When the necessity for changing arrives, a simple pressure on the clutch pedal shifts the gears and there is no fumbling with the hand lever with your eyes off the road.

So powerful is this gear shift that if an inexperienced driver should stall his car on a hill and it should back down against the gears and lock them, the gear shifting mechanism will still make the shift. Everyone who has had to get out on a hill and rock the car until the locked gear could be disengaged will appreciate this feature. The shifting mechanism is powerful enough to move the car far enough to release the gears.

The simplicity of the entire shifting mechanism is startling. Even a novice could drive and handle a car equipped with it after one lesson, and any intelligent [illegible] instantly after [illegible]

Digitized by Google

The shifting mechanism is so designed that the available air pressure is trebled. Thus, with two hundred pounds pressure in the air tank, six hundred pounds is exerted to shift the gears. They are positively snapped into action and there is none of the drag and "burring" so common with other types of gear shifting mechanisms.

ANTICIPATE YOUR GEAR

When starting up a hill, if you fear you will not be able to make it on direct, simply set the selector on the steering wheel one lesson, and any intelligent mechanic understands its operation instantly after once having seen it. The whole mechanism follows out the McFarlan principle of installing such simple auxiliary devices such as starting, shifting, etc., that any repair work may be done upon them in any well equipped repair shop.

There is no expense for maintenance, as the same air is used that the McFarlan pneumatic starter uses and the drag on the motor is only intermittent and that very, very slight.

This revolutionary improvement may be had on any McFarlan Six of the new Series at a slight extra charge.

See It At The Shows---- NEW YORK CHICAGO BOSTON

In the McFarlan spaces and in those allotted to the Gray Company, you will see complete McFarlan chassis equipped with this gear shift in actual operation. Tack this on your wall to remind you to look it up.

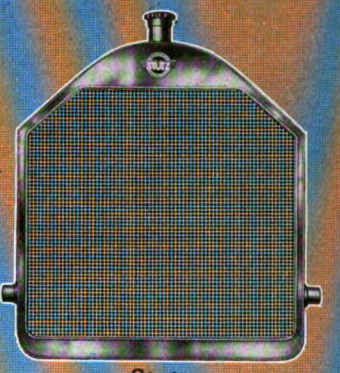
Dealers

The McFarlan Agency is rapidly assuming franchise proportions. Our volume is not large and no national publicity ever will be attempted. The money that this costs goes to you. The McFarlan Six is a thoroughly modern, very beautiful car, so conscientiously and well built that it stays sold, which means a permanent year-after-year money making business for you. Our agency list is not yet complete, do you want this superlative proposition?

This is the third year for the current model of the McFarlan Six. It has been improved from time to time but basically it is the same Series T that has been carrying the McFarlan flag for three years. It is not, therefore, an untried new model rushed out without experimental work to sell at a price. It is thoroughly established in public estimation as worth every dollar we ask for it.

It has our own unequalled 4 x 6 inch bloc motor and the McFarlan special design full floating axle. It is a feature car from the ground up and will do any of the stunts required of an automobile. It is short and light enough to be very easily handled and yet we have, with one or two exceptions, the roomiest bodies on the market. We will back it for easy riding qualities, power and durability against any car on the world's markets, regardless of name or price.

2, 4, 5, 6 and 7 passenger open models	$2590.00
4 passenger coupe	3300.00
7 passenger limousine	4000.00



The newest McFarlan Six. Note the true stream lines, sloping hood and novel windshield mounting.

The big McFarlan catalog and a special booklet on the Gray Gear Shift as applied to the McFarlan car will be sent on request

A Complete Line—a Plug for Every Type of Motor—a Price for Every Purse

This 75-Cent Plug Especially Is the Salvation of All Oily Motors.

It is the *J-D* Petticoat with closed end of improved design, which not only adds stability to the entire plug, but makes it especially desirable and serviceable where an excess of oil is used.

Besides, the porcelain is made in the Jeffery-Dewitt potteries of imported clays blended by a secret process. It will withstand any voltage.

For Ford Cars

this plug is almost a necessity, guaranteed not to foul or crack. It gets all the good out of the motor.

Licensed under Canfield Patent.

JEFFERY-DEWITT CO. DETROIT, MICH.

Registered. U. S. Patent Office.

SOONER or later—every man with a balky motor becomes a *J-D* patron, for *J-D* plugs are the standard cure for over-oiled and dirty engines. There is—in the *J-D* line—a type for every kind of motor, for every ignition defect, for every motorist's preference, for every pocketbook.

75c. to $2.00

Motors are like human beings—they are all different; and nobody ever gets the best out of his motor until he uses the particular plug it needs. It is wonderful what a difference the right type of plug makes—and the *J-D* line has a type for every variety of motor.

The result is that every dealer who handles the *J-D* line becomes an ignition specialist—he gets the pick of trade, and holds it.

J-D plugs include the famous Reliance that "sparks in water"—$1—for motorboats; the "Visible Gap" that instantly locates ignition troubles—$1; the Conical and Petticoat, open or closed end—75 cents; or with sparking points of solid platinum-iridium—$1.25; also the Motorcycle Standard—$1—the finest plug ever manufactured for this purpose; and special Heavy Duty and Double Series types of especial merit.

Write for our popular free illustrated book. "Spark Plug and Ignition Talk. Learn what this complete line offers you in sure profits.

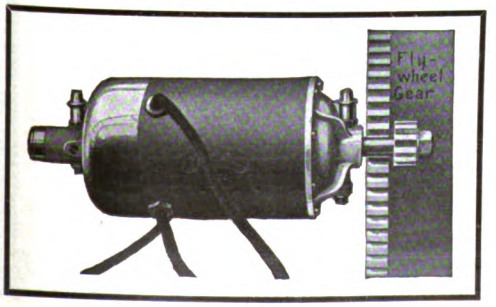
A 400 Pound Man

standing on a 9-inch crank, could not budge a frozen engine that the Rushmore Model C Starter will turn.

Every starter has a stalling point,—a point where it can take no more current and exert no more torque. If it doesn't start a cold engine **then,** its owner goes by train or stays at home!

The Rushmore Starter, Model C, exerts at the point of stalling a torque of 328 inch-lbs., using 580 amperes. Applied to a 21-inch flywheel, using a 1¾-inch pinion, that is equivalent to 435 lbs. at the end of a 9-inch hand crank. With any less resistance, the starter will get the engine under way and warm it up by the heat of compression and of piston friction. At 30 engine r.p.m. or more, the energy converted into heat exceeds 1 horsepower, and this limbers the engine up very rapidly. An engine thus started cannot fail to ignite, because the mere heat of compression, when turning quickly after limbering up, will vaporize the gasoline.

The power actually required by a 50 h.p. engine is far within the stalling limits above named; therefore the Rushmore Starter can never be stalled by any engine within its rated capacity.



One reason for the great stalling torque of the Rushmore Starter is found in the same fact that partly explains its high efficiency at normal speed,—namely, its very low internal resistance. That resistance determines the current taken, and therefore the torque exerted, when the armature is held against rotation. It also largely determines the electrical losses in normal running. In a word, **the starter showing a high efficiency is by the same token NOT easily stalled.** A low efficiency starter is easily stalled.

The Rushmore Starter, Model C, spins any engine up to 6 cylinders 5 x 6 inches 25 to 60 per cent faster than any other electric starter using the same current. It weighs only 30 lbs., and represents a saving of $25 to $50 per car to the manufacturer.

RUSHMORE STARTER MODEL C

Digitized by Google

This shows the Thurber Rotary Starter. Operates by compressed air. Pump and starter built as a unit. Has no belts nor chains. Noiseless, sure, reliable; can't wear out.

This starter can be applied to any car. ***Requires no special lay-out.*** *Goes on front of the car in place of crank. Installed without touching the engine. Is neat, compact, easily understood.*

Here is the Simplest and Surest "Starter" in the World

We expect to get challenged on that statement; but we are ready with our proof. We ask no odds of anyone. We invite you to make your own comparative tests. We are prepared to have the validity of our assertion stand or fall on what the Thurber Rotary Starter actually does when tested on your motor. "Deeds not words" is our motto.

Two years ago we placed the Thurber Rotary Starter on the market. We knew we were right in principle; two years in service under many different conditions showed us many details that could be improved. The Thurber Rotary Starter of today is offered as a finished product. There is not an experimental feature about it. It is right—and it stays right in service.

The Ultimate Starter

There is a growing conviction that compressed air is the ultimate starting energy. This conviction is based upon several well-known facts, viz:

Simplicity, in which it excels.

Efficiency, meaning ample power plus reliability under every condition.

Economy. No cost of operation.

Ease of installation and adaptability to any motor.

Reasonableness of price.

Spins Motor Any Weather

The "Thurber" is easy to operate. Press foot on button which operates the patented double-action valve and this admits air to the starter which instantly **spins** the motor. It doesn't just **turn** it over but **spins** it every time. Why have manufacturers of fire trucks welcomed the Thurber? All of them use large, high compression motors. All demand reliability above everything. Think it over.

THE LONG HORN

"Use It As You Do Your Voice"

Profit On Sale Free and Clear of Any Deduction

THERE is nothing in the Long Horn to get out of order—nothing that requires any attention. Your first profit—a substantial one—is free and clear. No deductions for rewiring. The Long Horn is mechanically operated. No expense for installation. Can be attached in five minutes.

A dependable warning signal that never goes wrong. The Long Horn produces a lusty, sonorous note, modulated at will. You use it as you do your voice—to suit the occasion.

Actuating mechanism is practically wear-proof. All gears are machine cut and points of contact specially hardened. One piece, seamless projector. Simple but sound construction that never fails.

You will sell more Long Horns than any form of motor-driven signal. A demonstration of the Long Horn's warning quality convinces your customer that it is equally if not more effective than the best motor-driven signal. In nine cases out of ten you only need to point out its absolute reliability as opposed to the electric signal, to close the sale.

J-M AUTOMOBILE ACCESSORIES

J-M (MEZ-GER) Soot-Proof Spark-Plug

TO make satisfied customers — the kind that confine their purchases to YOUR STORE, sell them the J-M (Mezger) Soot-Proof Spark Plug.

Millions of J-M (Mezger) Soot-Proof Spark Plugs have been sold since they were put on the market more than twelve years ago. Over 400,000 of the leading cars are now equipped with them.

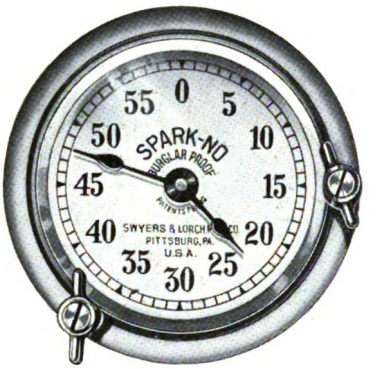
This shows the satisfaction they are giving. And don't forget that back of them is the H. W. Johns-Manville Co., with its established country-wide organization which assures you of prompt deliveries and guarantees satisfaction.

Soot, the root of all plug troubles, will not collect at the end of the J-M Spark Plug because the porcelain insulator or "petticoat" extends to the end of the outer shell, where it is exposed to the full heat of combustion. This prevents carbon collecting because the intense heat burns it up.

The porcelain used in the J-M (Mezger) Soot-Proof Spark Plug will withstand rapid change of temperature. Even when heated red hot and thrown into water it will not crack. This is a severer test than would ever be encountered in actual service.

J-M (Mezger) Soot-Proof Plug is manufactured under the basic patent license concerning this form of construction.

Here's Your Guarantee



We will replace any J-M (Mezger) Spark Plug that may prove defective to your customers, or we will refund purchase price. Here is an iron-clad guarantee issued by a $5,000,000 company that absolutely protects you.

Write for Booklet and Dealers Prices

"Spark-No" Burglar Alarm Combination Automobile Lock

"SPARK-NO" is designed for the purpose of controlling the ignition of automobiles, motorcycles, motor boats, or any vehicles driven by gasoline engines or electric motors.

It operates by a combination which can be set by the owner and can be very easily changed at any time he may desire.

"Spark-No" operates by breaking all connections with the coil, which can be grounded through the lock, thereby cutting out all means of starting with batteries.

When any person not knowing the combination, attempts to start an automobile equipped with this locking device the current, instead of going to the coil, is reversed and goes to a loud alarm bell, which rings continually when the switch is thrown on and the combination broken, notifying you that some unauthorized person is tampering with the car.

The alarm can also be connected to an electric horn with the same results.

There is also a direct high tension ground connection made through this lock which throws out the magneto. This eliminates any possible chance of spinning the motor direct on the magneto.

Another very important feature about "Spark-No" is that the Running Combination is entirely different from the Starting Combination.

Our reason for having the Running Combination different from the Starting Combination is that any person riding with you and seeing your Running Combination would not be able to take your car and start it.

"Spark-No" does not lock the wheels or gears and the car is readily removable in case of fire or any emergency.

The equipment consists of lock, bell and installation wire.

"Spark-No" Motor Cycle Lock

DESIGNED for the security of motorcycle owners. Prevents theft or tampering with machines. Positively grounds the magneto so that the motorcycle cannot be operated by its own power. Made in special casings to fit any motorcycle. Easy to adjust—absolute in action. Sure to be a big seller.

ACCESSORIES

H.W. JOHNS-MANVILLE SERVICE

49 Branch Service Stations
589 Direct Representatives

—insure every owner of a car equipped with Jones Speedometer adequate service in any part of the United States or Canada.

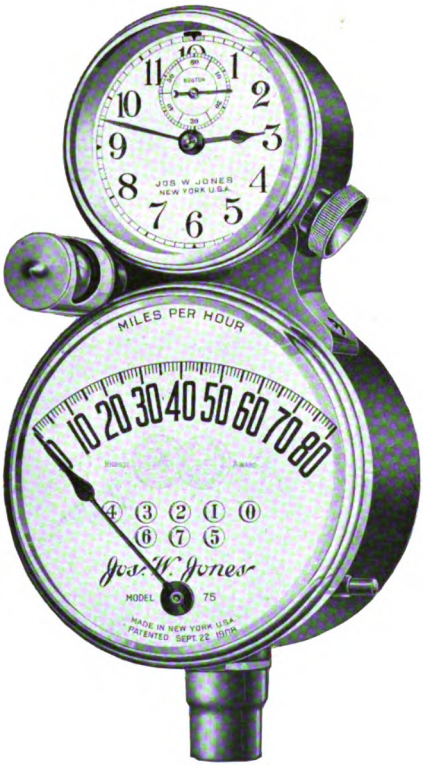
No other speedometer manufacturer can honestly promise such universal service.

Geared to the Truth

CENTRIFUGAL force—a principle as absolute as the law of gravitation—makes the Jones Speedometer the MOST ACCURATE speed recording instrument.

A mile is definite. Your speed is definite when measured by a Jones.

—and a Jones Speedometer is most easily read. Note the large hand, the clock faced dial and the figures unshaded by the rim.



The Jones has fewer parts than speedometers of the magnetic type. It is less likely to get out of order.

Tests made by Columbia University experts, and at the Armour Institute of Technology prove that Jones Speedometers are least affected by temperature.

Vibration, magnetic influences have no effect on the Jones. It is dust and waterproof.

A special feature of the Jones is the instantaneous trip reset on the Odometer, a convenience possessed by no other speedometer.

—and an H.W. Johns-Manville Co. guarantee of mechanical perfection and of national service accompanies every Jones Speedometer.

J-M AUTOMOBILE ACCESSORIES

J-M Mobilite Electric Lamp

YOU can sell J-M Mobilite Electric Lamps to a big percentage of car owners because they offer a desirable alternative between rattling, evil-smelling oil lamps and the installation of an expensive electric lighting system.

J-M Mobilite Electric lamps operate on dry batteries, giving an unusually brilliant light which cannot blow out; while their first cost is only about one-third the price of the cheapest standard electric equipment now obtainable.

A complete car outfit, consisting of two No. 1 J-M Mobilite Set-in Lamps for the dash-board, one No. 1 lamp for inside of dash-board illumination and one No. 2 tail light, with the necessary wire for installation, can be sold at $12.00.

This outfit will operate on six 30 Ampere J-M Dry Batteries and run intermittently from 300 to 420 hours at about one-third the operating cost of standard electric equipment.

J-M Mobilite Electric Lamps are strong and durable. The sockets are made of hard, vulcanized rubber which is practically indestructable. They are fitted with powerful lenses and reflectors and carry special tungsten bulbs. In all lamps, except the No. 2, the switch is self- contained and positively cannot get out of order. Worn out or broken bulbs can be renewed in a few moments.

J-M Mobilite Electric Lamps are easy to install. Their distinctive appearance lends an air of refinement to any car.

The sale of J-M Mobilite Electric Lamps is by no means restricted to the users of automobiles, as a demand for these installations has already been created for use on motorcycles, motor boats, yachts, in garages and camps, and, in fact, for every purpose where the use of oil lamps is attended by inconvenience or danger.

J-M Mobilite Automatic Signal System

THE J-M Mobilite Automatic Signal System is so obviously necessary to all who drive in traffic after dark, especially in cars with fully enclosed Berlin or Limousine bodies, that your customers cannot fail to recognize how greatly their safety will be increased by having the System installed upon their cars.

The J-M Mobilite Automatic Signal System displays an arrow in white light which indicates to the driver of any vehicle behind the car that a turn to right or left is about to be made. These signals appear automatically as they are actuated by a contact device attached to the steering gear. The word "Stop" appears in red whenever the clutch pedal is pushed out, actuated by a contact device attached to same. These contact devices are entirely self-contained and are waterproof. The boxes can be filled with soft grease.

The System complete sells at a good profit for $15.

Shall We Send Booklet and Dealers Prices?

"Noark" Enclosed Fuses

THESE fuses are made up to the high standards maintained for all the H. W. Johns-Manville Company products and provide another accessory that insures satisfied customers.

Special "Noark" Enclosed Fuses with "indicator" to show when fuse has blown, have been designed for the protection of automobile electric lighting circuits.

"Noark" fuses operate with no arc or flash. They are extremely advantageous on automobiles, where an exposed flash might ignite explosive gasoline vapors.

Occupying minimum space, with working parts gauged to a ten thousandth part of an inch, "Noark" Fuses insure absolute reliability of operation under overloaded or short circuits.

J-M AUTOMOBILE ACCESSORIES

The Arnold Electric Vaporizer

WINTER is here and the majority of your customers are already experiencing starting troubles, resulting from low temperature. They will, therefore, be only too eager to buy any device which will relieve them of excessive cranking, whether performed mechanically by self-starters or laboriously by hand.

This circumstance creates for you an unequalled opportunity to sell—and keep on selling—the Arnold Electric Vaporizer.

The Arnold Electric Vaporizer overcomes all trouble in actually starting a cold motor, without first priming it.

The Arnold Electric Vaporizer consists of a case containing a series of resistance coils. It is installed in, and becomes a part of, the hot air pipe connecting the fixed air intake of the carburetor with the exhaust manifold of the motor; the end on which the binding posts are mounted being furthest from the carburetor. The binding posts are then connected through a switch located at some convenient point, with the usual six-volt storage battery carried by the automobile.

By closing this switch, current passes through the coils, and in less than a minute a very high degree of heat is generated within the case. As the motor is turned, this heated air is drawn over the spray nozzle of the carburetor, causing the gasoline to vaporize instantly and the motor starts on the first three or four quarter turns.

The vaporizer consumes about ten amperes at six volts, and as it only remains in action for a few minutes, the current consumption is very small.

The Arnold Electric Vaporizer is of special value on cars equipped with electric self-starters. Any electric starter draws at least 175 amperes, and if this amount of current is drawn from a battery for more than a few seconds at a time, the plates will gradually break down and lose their efficiency.

The Arnold Electric Vaporizer will enable the motor to start at once, preventing excessive consumption so that plate troubles are eliminated. This obviously means an enormous saving in battery repairs.

The Arnold Electric Vaporizer, complete with switch couplings and directions for attaching, sells retail for $10.

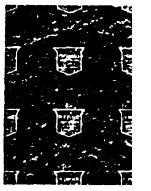
Get Our Introductory Offer to Dealers Today

The Arnold Electric Heating

THE Arnold Electric Heating Plug has so that the advantages of the Arn Vaporizer may be available to users o mobiles and consequently enormously number of consumers to whom such d sold.

In principle the Arnold Electric Heating same as the Vaporizer, except that the vapor itself is heated instead of the incoming air. This works successfully with small motors because much less heating surface is required to cause complete vaporization of their relatively small charge.

The Arnold Electric Heating Plug is placed in the intake manifold and may be operated from five dry cells or from a six-volt storage battery. It consumes only about four amperes of current.



The Arnold Electric Heating Plug complete and directions for attaching retails for $3.50.

J-M AUTOMOBILE ACCESSORIES

J-M Non-Burn Brake-Lining

NINE out of ten of your customers realize that their safety—and the safety of their car—depends upon the brakes. When a car owner tells you that he has brake trouble, induce him to use J-M Non-Burn Brake Lining. Here is a brake lining that adds to the safety and comfort of any car. It grips the drum without shock or jar as soon as pressure is applied and with power sufficient to lock the wheels almost instantly if desired. In fact, its use may well be said to solve the vital problem of car control.

In addition to this it saves the time spent on renewals because one J-M Non-Burn lining will actually outlast several ordinary linings.

The frictional contact between metal and asbestos is acknowledged to produce the most effective braking material known, and J-M Non-Burn Brake Lining is composed of long, tough fibres of pure asbestos, free from all organic substances, reinforced with strong brass wire. This makes it positively proof against the influence of intense frictional heat, oils, water, gasoline, grit, etc.

Don't accept cheap substitutes. Look for the name "J-M Non-Burn" plainly stamped on this lining.

These Facts About the Chalmers Business Tell Why It Pays to Sell Chalmers Cars

HERE are some of the reasons why Chalmers dealers make money, why they have no lean years, why they stay Chalmers dealers year after year. These facts should make clear to every dealer that the company to tie to is one like the Chalmers—a company that has grown through merit.

The business of the Chalmers Motor Company and of its dealers has developed to its present volume simply because this company has built and sold ***good, serviceable*** cars at prices people are ready to pay; because the Chalmers ***business*** has been run as a business and not as a "game."

A "Square Deal" Policy

The policy of the Chalmers Company has been and always will be, to give its customers and its dealers a "square deal," to give full value for the money it receives, always to render reasonable service that will make the buyers of Chalmers cars boosters for future business.

To this policy is due the enthusiasm of some 40,000 owners of Chalmers cars. Seven years of continuous striving to build the finest possible motor car at popular prices, and to ***serve*** the buyers of these cars, have borne fruit. Today no dealers are more loyal than Chalmers dealers —none are more successful or of a higher commercial rating.

And Chalmers owners everywhere are proud to be known as Chalmers owners. For each year Chalmers cars have been up-to-date, have given high quality at a popular price. In actual service they have made good and so have made possible bigger production and greater prestige.

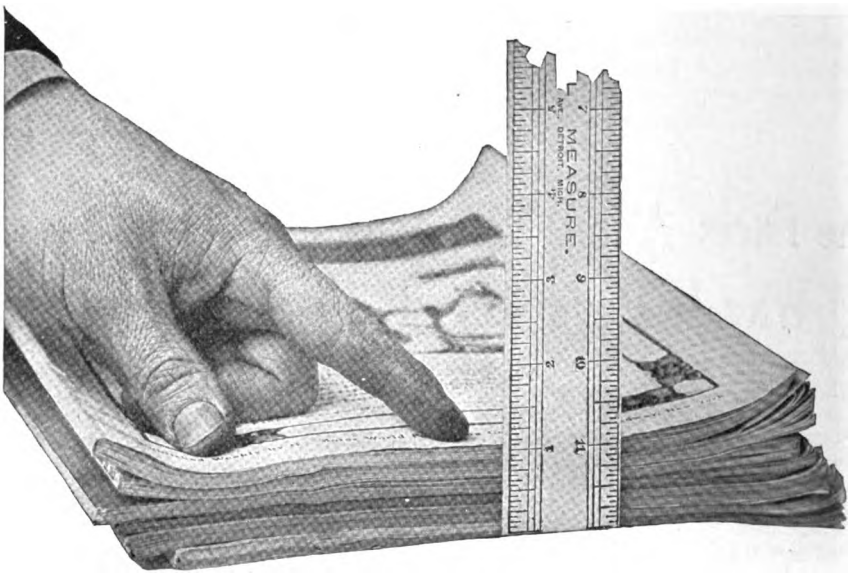
Chalmers Reputation Means Bigger Profits to Dealers Each Year

Chalmers cars sell more readily and in larger quantities each year. This is due to the splendid service they have given in the past and the reputation of the Chalmers Company and Chalmers dealers for thorough reliability.

The prestige of the Chalmers dealer gives him not only quicker, easier and consequently more profitable sales than is the case with those who handle most other cars—it means also better satisfied customers, valuable word-of-mouth advertising, and a permanent and growing business.

The increasing demand for Chalmers cars means the maintenance of Chalmers prices. The dealer makes his full profit on every car, at every season of the year. This year, more than ever before, Chalmers cars sell all the year round.

There is still room for more Chalmers dealers. We have now nearly 800 dealers, but we want wider distribution, through direct representation and more intensive work in some of the territories.



It will be worth money to you to learn about the Chalmers proposition to dealers. The largest part of the 1914 selling season is before you and we urge you to act at once. Send us the coupon below and you will hear from us at once in regard to your territory.

Mr. Percy Owen, Sales Manager,
Chalmers Motor Co.

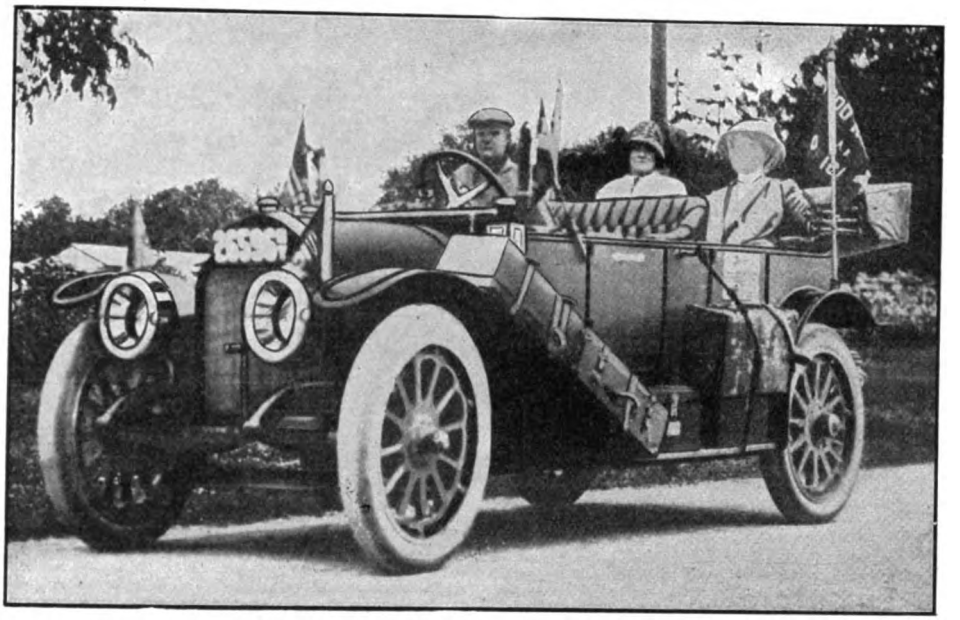
"BOWER SAVES POWER"

One Bower Roller Cannot Differ From Another by 1-20th the Thickness of This Sheet of Paper.

The amazing endurance of Bower Roller Bearings is not accidental. It results from a conscientious attention to even the slightest detail of manufacture.



For instance, the rollers of Bower Bearings are accurate to two ten-thousandths of an inch. Think of what this means. The sheets of paper upon which Motor World is printed run about 250 to the inch. Every Bower Roller is accurate to within 1-20th the thickness of a single sheet.

"Trifles make perfection, but perfection is no trifle"

B OWER ROLLER BEARING COMPANY
DETROIT, MICHIGAN

Digitized by Google

"BOWER SAVES POWER"

Crossing the Continent on Bower Roller Bearings

To cars equipped with Bower Bearings a transcontinental tour is a mere incident. The Pathfinder "40" shown above was driven from coast to coast and return three times in 1912. In the summer of 1913 it surveyed two more transcontinental routes for the A. A. A. and the U. S. Government, and now has just completed its fifth round trip across the Continent.

The Bower Bearings used in the front wheels of this car made these trips across the Continent with neither replacement, adjustment or attention of any kind, except for lubrication.

Bower Roller Bearings never need adjustment

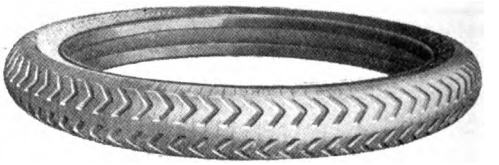
—*and* Now We Are Ready

for More Dealers and Greater Distribution

The First Improvement

Three years ago we began the manufacture of pneumatic automobile tires by the Miller Method. This method embodied the only great improvement made in the process of tire building since the beginning.

The tire using public were quick to recognize the merit of this new method. These tires sprang into instant popularity. From the first our sales increased by leaps and bounds.



200% Increase

The fiscal year ending October 1st, 1913, showed an increase of 200% over the same period of a year ago.

We have been too busy filling orders and increasing facilities to look after the selling end. For 22 years we have manufactured rubber goods. Our product has a globe circling reputation. For instance, last year we made 2,000,000 pairs of rubber gloves. Most of them surgeons' gloves. The best on earth.

The unprecedented increase in our tire business called for a readjustment of our entire plant. New buildings had to be built—our plant today has twice as much floor space as it had three years ago. New equipment bought and installed. In fact a completely new organization had to be wrought on comparatively a moment's notice.

Miller Tires

One Cure Wrapped Tread

Capacity Quadrupled

These new process tires are bound to dominate and revolutionize the industry.

We have doubled our capital, tripled our capacity, reorganized our entire corps, and are ready to begin the march toward the big things that lie before us.

Territory Still Open

There is still some territory open. An exclusive agency proposition. One that protects you against price cutting or unfair competition. You control your own territory, and your own price, and we stand behind you, factory and selling force to help you get your share of the big business that is bound to come. A post card will bring you all particulars. Hold that contract in abeyance, and write now—you cannot afford to do otherwise.

See These Tires at the Show

These super-tires will be exhibited at the New York Show — Space D-1, the third floor of the Palace. There you will be able to see the tire, examine it and secure full information regarding agency proposition.

Send for This Book

There is a book—it is more than a catalogue—it's a Tire Text Book. It contains more inside information on tire building than can be secured from any source. We will send it prepaid on request.

THE THREE HUNDREDTH MOTORIST
AND HIS CAR

LAST year the records showed a production of about 300,000 motor cars. Approximately one car for about every 300 people in the United States.

The Locomobile production was only 4 cars a day, the maximum limit prescribed by our policy.

Only one person in 90,000 bought a Locomobile.

Only one out of every 300 motorists.

This man, the Three Hundredth Motorist, buys the Locomobile because of its quality. Not because of its price, because that is high. And the reason why only one motorist in 300 can buy the Locomobile is because it is made in strictly limited quantities to insure quality.

We adopted the policy of limited production, quality instead of quantity, fourteen years ago, when we set out to make "The Best Built Car in America."

Quantity and quality do not work well together for the attainment of the ideal high-grade motor car. Quantity does not necessarily eliminate quality. It merely fights against it, hinders it, forces it down. As quantity increases beyond a critical figure, quality decreases and the product loses distinction.

Quality instead of quantity is but a part of our policy. The concentration of a rather unusual organization on a limited production is only one of the means to gain an end.

Our plant, for example, was designed and erected for the sole purpose of developing the Locomobile. Its location at Bridgeport, Connecticut, is an important factor. The finest mechanics in the country are in our section of New England. They inherit ability to work on quality products. Our equipment is peculiar, expensive, special, and very, very complete. We could not successfully build any other type of car than the Locomobile. The Locomobile could not be built in any other plant.

Further: each individual car receives intimate attention from company officials, close watching by department heads and factory foremen. Our testing methods are exceedingly expensive, but they enable us to make each Locomobile just the same as every other Locomobile and to *prove* it.

If we were to increase our output the personal attention we give to every car would have to relax and the quality would be lowered. Quality is not a new thing, new born of red tape and rules; it is an old fashioned thing, always born of personality.

Toledo swords and Milanese armour were medieval quality products wrought by personal skill, personal enthusiasm, personal supervision. Eliminate the personal element from a product and you eliminate much of the quality. There can only be just so many responsible officers in any company. Increase the production and the personality of these men is spread out and diluted.

Most Locomobiles are personally addressed when they leave our plant. We know where they are going and to whom they are going. The president, vice-president, factory manager, sales manager and other officials *know* these cars and work over them until they are right.

Every Locomobile official is active in the company. The offices are *in* the factory to be close to the product. There is no separate "Executive Building."

Thus, limited production, peculiar facilities and constant personal attention work for quality in the Locomobile. The organization cherishes ideals, its officers and department heads have worked together, practically intact, for fifteen years. This *esprit de corps* has its stimulating and valuable effect on quality.

The perfect condition for creating quality in a motor car is to produce it in one plant; completing all the operations under one roof, from raw material to finished product. No automobile company strictly does this. In the Locomobile plant ideal conditions are probably more closely approached than in any other. The Locomobile is *our* car. Some of the pains that we take may be unnecessary. However, fifteen years of experience has shown us that the only way to build the highest grade car is to take all possible pains. For example, even the nuts and bolts for the Locomobile are made by its artisans, not purchased. No one questions the method of makers who buy good ready-made nuts and bolts, quite the contrary. The maker who is building a car to fit a price must contrive, must cut corners. The fact that he does so, may not cause trouble for the users of his cars. Though the working out of the Locomobile policy involves extra trouble and greater expense in such details, the result means greater insurance for the Three Hundredth Motorist. Complete relaxation in motoring is only possible in a car in which your confidence is as great as your comfort.

We know the Locomobile has not yet reached the ideal, but our faith is such that we cannot see why anyone who can afford it should buy any other car.

Because of the limited production, the character of the organization, the conditions under which the car is made, the pains given to construction—the Locomobile becomes the logical car for the Three Hundredth Motorist.

The Thomas B. Jeffery Company
Jeffery
Kenosha, Wis. U.S.A.

What the Head Mechanic

THE biggest dealer in a real live town wired the Jeffery Company the other day, asking for consideration as a dealer for his locality. Then he got on the train and came to Kenosha.

Before he left, his head mechanic said to him, "Now look here! Don't you be deceived by advertising. You find out these things about this car before you take it on."

Then he wrote out a list of questions, which the dealer placed in his pocket, and when he reached the factory it was handed to the factory manager. The list as returned, with the answers given, appears below. The dealer closed for the Jeffery line immediately after seeing the factory and the car.

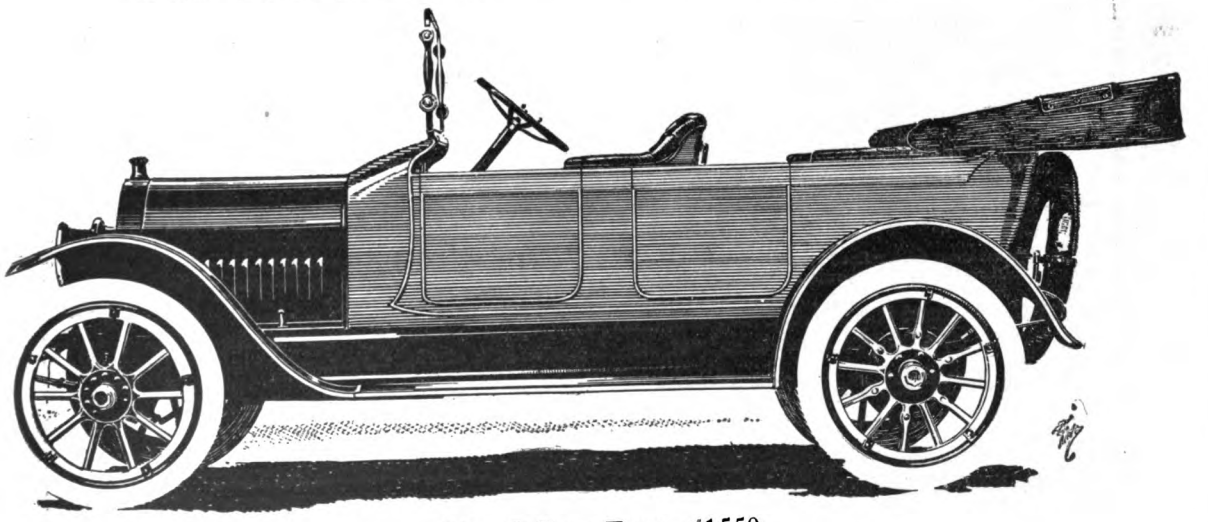
Here Are the Questions and Answers

If you think of any others, just fire them in. They are welcome. There is no question about the Jeffery car that you can ask that we are not proud and even anxious to answer.

Q. Is self starter dirt and water-proof?
A. Yes.
Q. How about cut-out and control of charge?
A. Automatic, easily adjustable to meet conditions.
Q. Is the wiring simple?
A. Yes, simple and carefully protected from oil and grease.
Q. Are dry cells used?
A. Yes, for starting.
Q. Is gasoline tank seamless?
A. Not seamless but of very rigid construction. Seams double lapped throughout.
Q. Is gasoline line carried in the proper manner?
A. Yes, carefully protected by frame side rails.
Q. How are spring hangers mounted on frame?
A. Spring hangers of generous proportions are securely riveted to main frame.
Q. Are spring shackles loose and noisy?
A. No. Spring shackles are fitted with castellated nuts and cotter pins to insure rigidity.

Digitized by Google

old the Boss To Do!



Here Are the Questions and Answers (*Con't.*)

Q. Are springs bushed?
A. Yes.
Q. How are spring bolts lubricated?
A. Zerk compression grease cups. High grade.
Q. How is body fastened to frame?
A. Firmly bolted through heavy oak sills and frame side rail.
Q. How is fan driven?
A. Adjustable V belt, insuring positive drive.
Q. Is magneto accessible?
A. Yes, very easily so by raising left side of hood.
Q. How is pan put on?
A. Securely bolted to frame side rails, crank case flanges and cross girders.
Q. What are the makes of the front and rear axles?
A. Vanadium steel drop forged I beam front, Jeffery manufacture, weight 29 pounds. Salisbury full floating rear on Jeffery Four. American full floating rear on Jeffery Six.
Q. What kind of steering gear?
A. Gemmer, strictly high grade, used generally by manufacturers of the higher priced cars.
Q. How is the steering gear mounted on frame?
A. Securely bolted to reinforced side rail.
Q. Are gears noisy in fourth speed?
A. No. A little more quiet than any we know.
Q. How is leg room in driver's seat?
A. Ample—front vestibule being very roomy.
Q. Are shifting levers in the way?
A. Levers are so located as not to interfere in any way with entering from either side of car.
Q. What kind of demountable rims are used?
A. Funk, straight side, easily removed.
Q. What kind of top and curtains?
A. Top of high grade "Neverleek" material with curtains permanently located, rolling up inside of top.
Q. Is wind shield a good one?
A. Yes, easily adjustable rain vision shield of Jeffery manufacture. Shield is set into cast sockets on cowl, doing away with the necessity of stay rods.
Q. Are radius rods used?
A. No. A single torque rod in center.
Q. How is front end of torque suspended?
A. Spring cushioned ball joint fastened to cross member of frame.
Q. What about fenders?
A. Hand rolled, one piece crowned fenders—spot welded to fillers and fender brace, doing away with visible bolts or rivets.
Q. How long will starter crank motor with one charge of battery?
A. Under normal conditions from six to ten minutes.
Q. What kind of storage battery is used?
A. U. S. L. battery.
Q. Are parts accessible?
A. Yes, very easily so by removing floor boards of the vestibule.
Q. Does car look as good as the picture?
A. Better. The Jeffery body appeared at the Paris show when stream-line was popular. It immediately took the eye of the Parisians and was brought to this country by Rothschild, and first introduced to the American public by Jeffery.

KING

Only Dealers of Proved Ability Need Apply for KING Agencies

We cannot afford to place our car in the hands of an agent who lacks the experience to properly represent it, and thereby risk the KING'S reputation in a community. Reliable dealers are invited to consider the following five points:

I. The KING MOTOR CAR COMPANY sells no stock, and pays cash on all purchases. It reserves for itself only a small fixed profit, returning the balance of its earnings for the betterment of its car.

II. The KING gives greater value in features, power, style, comfort, durability, economy of operation, and equipment, than is elsewhere offered at near price.

III. Our car has a solid, refined appearance, and its vital parts are made by the same specialists who manufacture for the most expensive cars. The KING is distinguished by a cantilever rear suspension of proved superiority, which makes shock-absorbers unnecessary.

IV. Our "one chassis" policy means the concentration of the entire organization upon the production of one perfect unit of valve-running mechanism.

V. Our selling proposition is liberal, we make prompt deliveries, and our advertising is generous and far-reaching.

If you can meet the KING'S requirements, the KING can meet yours—as it will prove to be everything you could desire in a car of its class.

KING MOTOR CAR COMPANY, 1300-1324 JEFFERSON AVE. DETROIT, MICH.

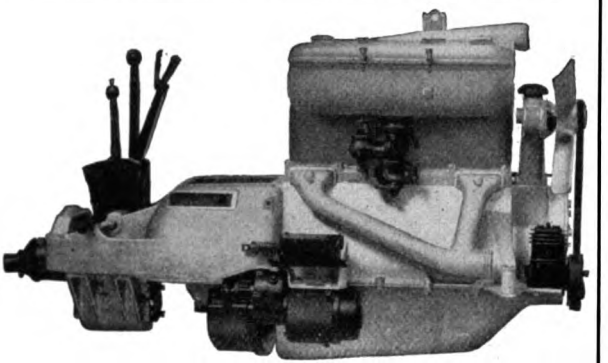
Listen to the Truth About Motors

MOLINE-KNIGHT



$2400

More Power

More Flexibility

More Economy

More Silence

Carburetor side of Moline-Knight motor—"clean as a whistle"—Moline-Wagner Electric Starter, Schebler carburetor, combination breather pipe and fan support, third center control lever for self-starting.

$2400

Four Cylinders

Guaranteed 50 B. H. P.

128 Inch Wheelbase

Five Passenger

The "Four" That Makes the "Six" Unnecessary

When you drive a Moline-Knight The first time you sit behind a Moline - Knight engine you will exclaim—"It feels differently." You will be fascinated by the immediate getaway, because as the gas is fed into the motor the response is instantaneous.

The positive action of the sleeve valves, the smooth even pull—a car with quick, easy acceleration, without laboring, with no racking vibration, no pounding, no rattling of cams, no humming of gears—no noisy valves—just a velvety feeling of steady resistless power will be a new and delightful sensation to any one used to the old poppet valve engine.

No carbon—no valves—no grinding—absolute silence all the time—and the longer the engine remains in use the better it becomes.

Because The superiority of the Moline-Knight motor over any poppet valve design lies in the fact that the efficiency and durability of the Knight system is not effected by high pressures. The explosion does not shock it at any point because the Moline-Knight motor is balanced against lateral pressure.

In the sleeve valve motor is combined silence, endurance and reliability of the small poppet valves and low compression with the high efficiency of the high compression large valves, powerful springs and precipitous cams of the racing poppet valve motor—consequently, the Moline-Knight engine has all the advantages of both types—and is therefore strongest where the poppet valve is weakest.

Write for our "Advance Information Folder." Dealers: wire or write quick. Anchor to a rock-ribbed institution.

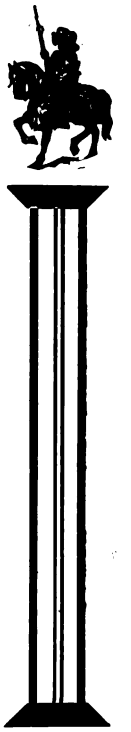
A Uneeda Biscuit Package of

INVADER OIL

The Invader Quart Bullet Eliminates Fire Risk Because It Is Hermetically Sealed.

Quart Can
Exact Size



The INVADER quart bullet is a clean, sealed, small shelf package, convenient to handle and always ready to hand over the counter.

There is no longer any need of going back to the oil tank. It saves time, trouble and money. There is neither waste nor dirt.

Digitized by Google

Something more about---

INVADER OIL

INVADER OIL **will** leave a carbon deposit. So will every other oil.

INVADER OIL **will** smoke when it burns. So will every other oil.

When INVADER OIL is used it **may be** necessary to grind valves. Such certainly would be the case with every other oil.

A motor using INVADER OIL **can** overheat. So it can when any other oil is used.

A machine exclusively lubricated with INVADER OIL **will** eventually wear out. This would also be the case no matter what oil was used.

INVADER OIL is **not** a perfect lubricant, neither is any other oil. There is no such thing.

INVADER OIL, however, is chemically superior to all other oils. It will deposit **less** carbon, make **less** smoke, mean **less** grinding of valves, make a motor **less liable** to overheat, and will cause the machine using it to last **longer** mechanically than would be the case were **any** other oil used.

Remember that the superiority which is indicated by its better tests is a superiority which cannot be contradicted. INVADER OIL is better because its tests are better. There is no way of avoiding this fact.

The Event of the Season

EVERY social function that brings together a representative company of men and women brings also an assemblage of representative motor cars. In a large measure every family is judged by the cars they ride in. Even the bride shares with the automobile which carries her away on her wedding journey the critical or admiring scrutiny of society. If her car is equipped with

THE RUTENBER MOTOR 1914 Six

its social recognition is assured. The new six cylinder Rutenber is the aristocrat among motors—the one motor whose supremacy is universally recognized and whose position is unchallenged. Judged by every standard of motor excellence, this achievement stands without a peer. Its efficiency, its silence, its power, its capacity for speed and endurance command admiration and inspire imitation.

You are cordially invited to view our exhibit at the Chicago Show. Space 26, Coliseum Gallery.

The Rutenber Motor, 1914 Six, costs somewhat more than other six cylinder automobile motors. It could not be what it is if it were cheapened in any way. But this slight increase in motor cost cuts little figure in the price of a high-grade motor car and it is borne by the manufacturer of the car rather than by the buyer.

You who aspire for intrinsic excellence and who know the value of genuine worth will serve yourselves best by selecting a car that is built around a RUTENBER Motor, 1914 Six.

Write for the Rutenber Book.

SAFETY FIRST

Five Bars and a Cross Tie—the Safety First Symbol

Five thick, tough Goodrich rubber fingers—

They dig down through mud, slush and ooze; they clean and grip the road. They stop the skid before it starts. They give you lower-cost mileage because of the extra thickness of rubber at the point of contact.

Goodrich Safety Tread Tires

Best in the Long Run—Best in the Short Stop

Don't experiment. Don't take chances. Look for the five bars and the cross-tie when you choose a non-skid tire.
Read the reduced prices below. Better still, tear out this price list and hand it to your dealer.

Don't pay more than the prices named here for the accepted *standard* non-skid tires:

Size	Smooth Tread Prices	Safety Tread Prices	Size	Smooth Tread Prices	Safety Tread Prices
30 x 3 - -	$11.70	$12.65	34 x 4½ - -	$33.00	$35.00
30 x 3½ - -	15.75	17.00	35 x 4½ - -	34.00	36.05
32 x 3½ - -	16.75	18.10	36 x 4½ - -	35.00	37.10
33 x 4 - -	23.55	25.25	37 x 5 - -	41.95	44.45
34 x 4 - -	24.35	26.05	38 x 5½ - -	54.00	57.30

Quality Mohawk

"THE BEST TIRE—Not big production, not lowest prices."
That is our ambition. That is the policy back of the Quality Mohawk Tire.

"Quality" is Our Hobby

Quality Mohawk Tires

We believe you want a Tire that is proof against blow-outs: One that won't crack, won't fabric-separate, won't tread-separate: One that will give long wear and stand re-treading.

We make that tire. Smooth and Non-Skid. All types.

Quality Mohawk Tubes

We believe, too, that you want a tube that will give service: one that is pure gum: one that won't stretch out in hot weather, won't tear like paper: one that can be patched, and patched again and again: one that will vulcanize and retain its life and strength.

We make that tube. Red and Gray.

Mohawk Specifications

4 inch casings—the size most frequently overloaded.
Fabric: 17¼ ounce Sea Island—the best and strongest made.
Friction: Absolutely pure gum throughout.
Side Strip: Absolutely pure gum—floating stock.
Cushion: Absolutely pure gum—floating stock.
Tread: Straight compound base on finest rubber obtainable—tough and flexible—not an ounce of shoddy reclaimed rubber, or other cheapening materials.
Construction: **6 plies** and a breaker strip. Full molded, under heavy hydraulic pressure into one solid inseparable whole.
Hand Made: Made under the personal supervision of an experienced man—one who has the reputation of making the **best** tire in Akron.

We solicit correspondence from Dealers who want the exclusive sale of this kind of a tire and tube.

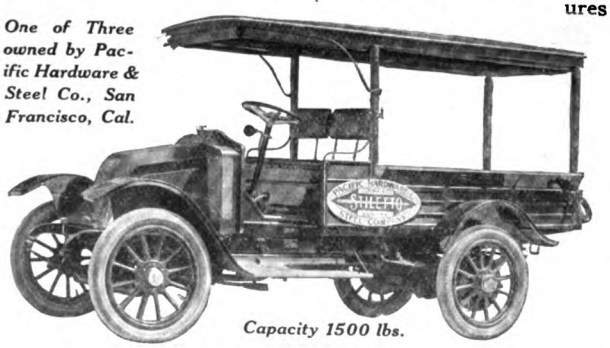
Silent **Lippard-Stewart** Powerful

Trucks That Meet The Demand

"How am I to know why this truck or that is better than another?"

Not long ago this question was a common one, but at that time motor transportation was new and trucks of a diversity of types were untried. Then the purchase of commercial cars was largely a matter of confidence. But times have changed. Owners have been watching truck development. They have found out what amount of work a car can reasonably be expected to do under certain conditions. And, what is more, they now make it their business to know the relation of the type of truck, capacity and mechanism considered, to the service expected of it. In other words, THEY KNOW WHAT THEY WANT.



Capacity 1¼ tons. Operated by Dauler, Close & Johns, Pittsburgh

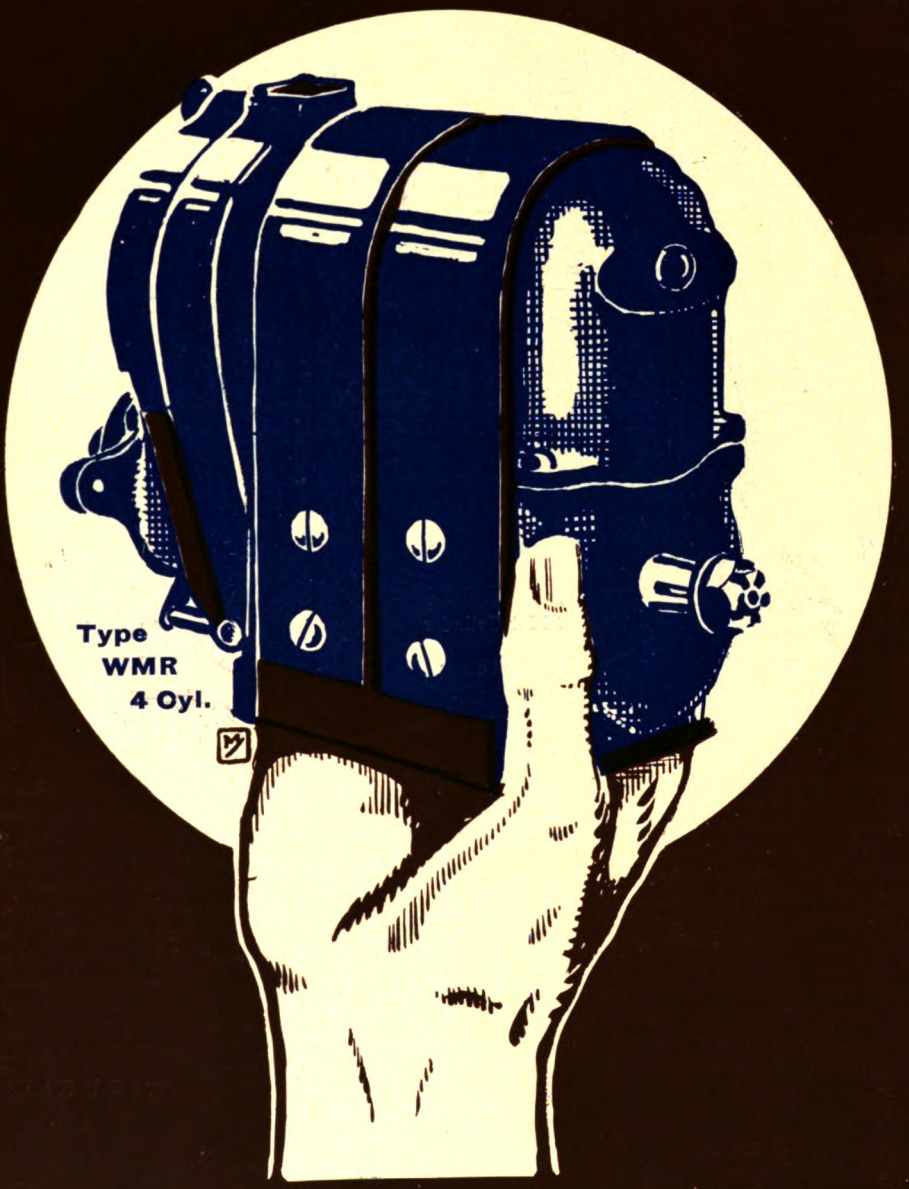
In a Lippard-Stewart truck, this public demand is given the credit it deserves, because its designers have their ears to the ground—quick to heed the trend of the times. For instance, the shortcomings of chain drive, the uncertainty and annoyance which it involved, its excessive wear and waste of power, opened the eyes of users to the advantages of the worm and gear, the success of which has long since been proved in the hardest service—London omnibuses for example. Now, in the Lippard-Stewart, the solution of former drawbacks is offered to American users in a rear axle of the highest quality—Timken-David Brown Worm-Drive.

Then again, years of experience have demonstrated that no longer can a touring car answer for a truck. Commercial vehicles require simplicity, reserve power, and much greater strength. Truck users want the smoothness, pulling power, and the low gasoline consumption of the long-stroke motor, common-sense automatic speed regulation, security and efficiency of the radiator, the choice of solid or pneumatic tires to suit conditions, the utmost safety—and in each essential the Lippard-Stewart measures up to the standard.

One of Three owned by Pacific Hardware & Steel Co., San Francisco, Cal.

Capacity 1500 lbs.

And so we might enumerate instance after instance. But the one point that investigation of Lippard-Stewart trucks makes evident is this: every separate part, every complete unit, every principle of design, embodied in their make-up carries with it the stamp of modern practice—the approval created by the highest type of service and voiced by popular demand.



Lippard-Stewart trucks are furnished in two capacities: 1½ ton chassis, worm-drive, $2300; 1500 lb. chassis bevel-drive (pneumatic tires), $1650, worm-drive (solid tires)—$100 extra. Bodies for various purposes. Write for literature.

EISEMANN AUTOMATIC SPARK CONTROL

Eisemann products will not be exhibited at any of the shows this year. When you are in New York, however, we will be glad to have you communicate with us, for our entire staff will be on hand and will take great pleasure in showing you through the factory or in serving you in any other way possible.

Since moving our general offices from New York City to the plant in the Bush Terminal, Brooklyn, the Eisemann Company has established a new service station in New York City at 123 West 52nd St., in charge of Mr. James Rohde.

The season just closed has been a remarkable one for the Eisemann Company both from a standpoint of business done and general progress and development in the advancements of Eisemann Ignition products and their manufacture. Today Eisemann Magnetos are used as factory equipment on more than seventy-three cars and trucks—with a certain increase of these figures in sight.

The wonderful performance of the Eisemann Magnetos on the Indianapolis to the Pacific Tour—in which eleven out of nineteen cars were Eisemann equipped, all of which came through with a perfect score—has not been underestimated by the manufacturers and dealers of the country. This crowning achievement has done much to increase the popularity of Eisemann Ignition. In this connection it is interesting to note that 45% of all the cars shown at the Olympia Show in London were Eisemann equipped with all the other magneto manufacturers dividing up the remaining 55%.

Remember that Eisemann Ignition is synonymous with efficiency, durability and dependability.

THREE Ergon Motors have become standardized. Standardization comes with the proven efficiency of a unit. It is not a motor manufacturer's term but a term applied by automobile and truck manufacturers to parts or assemblies which measure up to the standard of their requirements.

¶ The Ergon Standard Motors are—

Model C, 3 3-4 x 4 1-2
Model CX, 4 x 4 1-2

Four-cylinder, four-cycle, L-head, water-cooled, unit plant type; four-speed selective transmission with multiple disc clutch in oil, allowing for installation of standard electric starting-lighting system in crank case. Force feed and splash oiling system. All valves enclosed. F. & S. ball bearings. Driggs-Seabury crankshafts and connecting rods.

Model D, 4 3-8 x 6

Supplied either as independent sub-frame motor or in unit plant type with Brown-Lipe dry plate clutch. Otherwise similar to Models C and CX, except Renold silent chain replaces timing gears in driving pump, magneto and valve actuating mechanism.

¶ The standardization of Ergon motors does not mean that the time has arrived to stop further development and progression in favor of a larger production. In our case it means that Ergon motors are making a mark in the industry for efficiency and economy.

¶ Not alone from the engineering side of the question have Ergon motors given satisfaction—but the business end of our activities merit the approval of car and truck builders in such situations as

Rigid Adherence to Delivery Specifications
Prompt and Efficient Service
Intelligent Co-operation In Every Detail

¶ Recently we extended our facilities and equipment so we can take care of increasing business. Our service and our motors are adequate to meet your limits, however close. Correspondence with pleasure car and truck manufacturers solicited.

Velie

America Follows Europe Returns to "Fours"

This Velie Four Will Displace Any Six

(At a Much Lower Cost for Maintenance)

ALREADY the average owner is tired of the excessive fuel and tire cost of the heavy "Six," and Europe, the Dictator of Automobile practice, has come back to the economical "Four." There only the light "Six" survives—the new highly developed "Four" is supreme. In this country the type of car now supreme in Europe (the Velie 4-45) leads the way. Advance orders for this remarkable car are 300 per cent. greater than last year—in the face of the tremendous shout for "Sixes" made by so many manufacturers.

THE THREE GREAT VELIE MODELS

Model 10. (The Light) Velie Six. Cylinders cast in triplets, bore 3¾ inches, stroke 5¼ inches, wheelbase 126 inches. Tires 37 x 4½ inches front and rear. Transmission, four speeds forward and one reverse. Selective sliding. Lubrication, constant level circulating system. Built as 5-passenger touring car, 4-passenger torpedo, 2-passenger roadster. Price..... **$2,350**

Model 9. The famous Velie "4-45." Cylinders cast in pairs, bore 4⅝ inches, stroke 5¼ inches. Wheelbase 121 inches. Tires 36 x 4 inches front and rear. Transmission, four speeds forward and one reverse. Selective sliding. Lubrication, constant level circulating system. Built as a 5-passenger touring car, 4-passenger torpedo, 2-passenger roadster. Price..... **$2,000**

Model 5. "4-35." Cylinders cast en bloc, bore 4 inches, stroke 5½ inches. Wheelbase 113 inches. Tires 34 x 4 inches front and rear. Transmission, three speeds forward and one reverse. Lubrication, constant level circulating system. Built as a 5-passenger touring. Price **$1,500**

THIS REMARKABLE EQUIPMENT STANDARD ON ALL VELIE MODELS

Gray & Davis Electric Starter.
Gray & Davis Electric Lighting.
Goodyear No-Rim-Cut Tires.
Demountable Rims, with extra rim carried at the rear.
Concealed Electric Horn.
Bosch Magneto Dual Ignition.
Stromberg High-Efficiency Carburetor.
Mohair Top and Ventilating Rain Vision Windshield.
Left Steer with Center Control.
Extra Long Springs, 2½ inches wide.
Deep upholstery with best leather used throughout.
Warner Auto-Meter.

Every Velie Dealer
is backed up by our great financial and manufacturing responsibility and his word is the voice of the Velie Motor Vehicle Company.

Velie

Which Truck Is Best of the Famous Big Four?

MERCHANTS who have bought dozens of trucks now narrow their orders down to four great makes of rival motor trucks, each backed by millions of resources. All four of these makers are in the business to stay. Among them competition is keen.

The aggregate resources of these four competing makers is over $25,000,000. Each of these great organizations stands squarely back of every truck it builds and makes good its guarantees to the letter, giving service that cannot be secured from smaller concerns.

Almost daily keenly competitive tests between these four great makes of trucks are establishing which is the best. For the four are in use by the largest corporations who use trucks by the dozen.

In pulling power the Velie Truck, the only one of the big four unadvertised until now, is proving that a more powerful, slower running motor will in competitive tests out-pull and out-wear all high-speed, quick-wear, small-powered motors.

For this reason the Velie One-Ton Truck carries a motor 25% more powerful, possibly, than any other truck made. But this extra horsepower means a much greater service ratio, more miles per gallon of gasoline.

In Frame Construction all four makes have 5 or 6-inch frames—some channel shaped, others I-beam. But the Velie in addition to having a 6-inch I-beam frame has a 4-inch sub-frame that is not found on any other truck. And in heavy hauling this extra sub-frame proves its wonderful worth.

Experienced buyers can tell by comparison of specifications why it is that the Velie is winning the fiercely competitive tests between the four best makes of trucks.

Any Velie agent has these truck contest results on file—they are convincing—ask to see them.

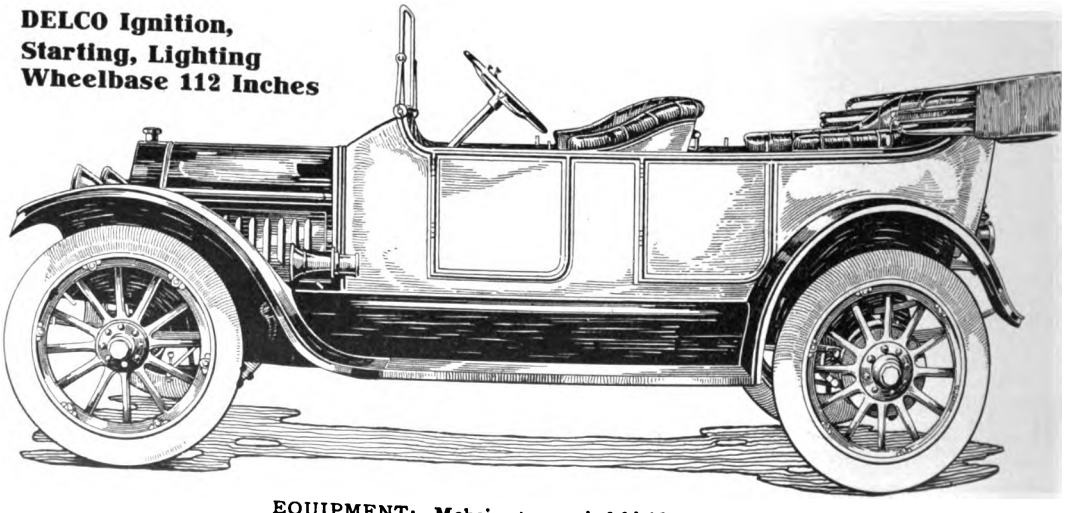
A line that needs no introduction
Forty-five years stability back of it

THE two important factors for you to consider, Mr. Dealer, when signing up your 1914 contract are STABILITY and VALUE.

The factor of STABILITY is becoming more and more a fixed and vital element in the sale of cars. The public wants to know who and what is back of the car. The right answer is important to them; it is important to you.

The dealers who sell the Paterson can point to an unblemished factory record of forty-five years' success.



The factor of VALUE is just as vital. The public is continually asking, "Is the car really worth the money? How does it stand up in a dollar for dollar comparison with other standard cars?"

The dealers who sell the Paterson have only to point to Paterson specifications—Northway motor, Weston-Mott axles, Jacox steering gear, Delco electric lighting and starting system and other salient features—and then let the car talk for itself. There are no better materials used in any car under $2000.00—and the Paterson five passenger touring car is priced at only $1197.00! The roadster at $1147.00!

Here is a car that will stand up under any test; that will meet any questions. It is built to meet popular demand for real value. It nearly sells itself. We want a few more responsible dealers. If you can meet requirements, you can assure yourself a big year by getting in touch with Paterson. Delay means loss. Better write or wire at once.

W. A. PATERSON COMPANY, Flint, Michigan

HAVE YOU INVESTIGATED OUR SPECIAL DEALERS' PROPOSITION YET?

IF you haven't closed up with us for the sale of Ambesco on our special cooperative proposition, you are overlooking one of the best opportunities, from a dealer's standpoint, that has ever been offered to automobile dealers and jobbers. In considering this proposition, remember that we do not ask you to tie up a lot of money and still we offer you the opportunity of carrying a full and complete line of this superior brake lining. And after you have stocked with this line, neither do we ask you to shoulder the full responsibility of selling the goods. By our special plan we cooperate with you both in helping you carry the stock as well as in the sale thereof.

We cannot go into full details in an advertisement, but we certainly will show you either by mail or by a personal call a most interesting as well as a most remunerative proposition if you will apply to us for full details.

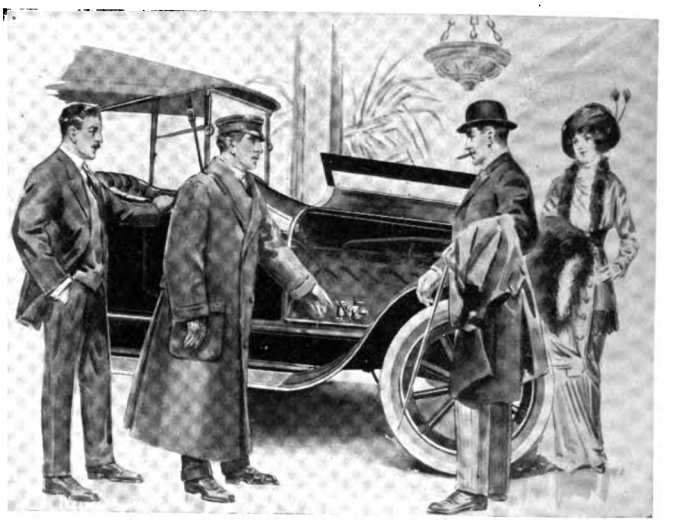
We are illustrating again the new Ambesco Brake Lining rack, which contains a full stock of every size of brake lining made. By carrying your brake lining in this shape not only are you showing your customers a full line which contains all the odd sizes as well as the standard sizes, but you are displaying your wares in an attractive manner as well as in a manner which

enables you to save space and handle the goods in the quickest and easiest way from your standpoint.

All Ambesco is now easily identified both by the trade mark and by the fact that the edges are all gilded. We have applied this gilt to the edges to give our product immediate identity and thus protect you and your customers from substitution of inferior products which look similar from the outside but which are far inferior to the real Ambesco.

Not only are we offering you the opportunity herewith of handling a full line of brake lining on an easy cooperative basis, but we are offering you the opportunity of handling the acknowledged superior of all brake linings—a most staple commodity.

There is an enormous amount of brake lining business in your territory and this plan will enable you to corner a large proportion of the brake linings sold in that territory.



Ambesco is manufactured by us from the raw stock to the finished product and we know that its quality is not only superior but absolutely uniform in every way.

Doesn't this sound interesting? Write us—the details will interest you to a far greater degree.

AMERICAN ASBESTOS COMPANY, Norristown, Pa.

Dealers and Manufacturers both---remember we are manufacturers also of Asbestos Friction Discs for Multiple Disc Clutches---also Asbestos Clutch Facing for Cone Clutches

"The Rayfield is the Point of Difference"

The presence or absence of the Rayfield Carburetor is sufficient reason for choosing or discarding a motor car.

That is, unless you care to go to the added expense of installing a Rayfield after you have bought your car.

A motor car may be a good car and still not have a Rayfield Carburetor; but it would be a ***better*** car if it did show the Rayfield.

A motor car may stand high in every other specification; but if it lacks a Rayfield Carburetor it is still lacking in quality.

RAYFIELD CARBURETOR

If you should choose a car that provides only a poor or ordinary carburetor, you can expect only poor or ordinary service in return.

For the carburetor is the point of difference between the "best" and the "not-so-good."

The Rayfield Carburetor is the final stamp of merit just as any less efficient carburetor is a confession of weakness.

And isn't this reasonable?

Supposing for instance that you see in an automobile the very latest developments in motors, the highest grade of clutch and transmission; the best self starter; and in fact every other specification that stands for motor car supremacy—

Supposing you lift the hood of such a car and note the absence of the Rayfield Carburetor, what are you to think?

You know, the same as thousands of others know, that the Rayfield is the one carburetor that has stood for all that is best in motor car practice.

What are you to think, then when you notice the absence of the Rayfield on the car you thought was "best."

There is only one answer. If motor car service is dependent upon perfect carburetion; and the car before you lacks the test-proven Rayfield; then regardless of the quality it may show in other parts, you cannot expect to receive 100 per cent. service.

And do you think it right for the manufacturer to handicap his car with a second rate foundation?

If the very basis of his motor car is skimped, how can he expect you to obtain the highest efficiency from it?

There is a lot to this carburetor business. It is no small task to lay the corner stone for the perfect running of your automobile.

But Rayfield experience is thorough; Rayfield improvements are well grounded; the Rayfield Carburetor embodies correctness of design and operation that is not duplicated.

For power; speed; economy; and efficiency the Rayfield Carburetor is a synonym.

As a basis upon which to build motor car service, it has no equal.

Look for the Rayfield Service Station in your city

That's why the Rayfield is the point of difference.
The short step between the best and the "not-so-good."

THE Empire Gasoline Economizer is not a fad; it is a scientific aid to better motor car service.

It is not a "knick-nack" to buy because you are an automobile enthusiast; it is a vital help to better efficiency.

The Economizer is built on as scientific a basis as is the carburetor; its work is just as important.

Air is mixed with gasoline to form the vapor which when exploded propels your motor car.

Air is just as necessary to the explosion as is the gas.

You can not explode liquid gasoline with a spark; it will only flame and there is no power in flame.

Because no carburetor has ever been made that controls the air at all speeds of your car, it is plain to see that somewhere the explosion approaches the "flame" point.

The carburetor is adjusted to certain speeds, weather, grade of gasoline, traffic conditions, etc.

There is no limit to the varying conditions that arise in just one mile of driving; and each variation calls for a different gasoline mixture.

Your carburetor is a "mixing pot" and is not intended as a "regulator" of the mixture.

The Empire Gasoline Economizer is an automatic regulator of the gas and air mixture; it acts **with** the throttle; meeting every condition to insure perfect combustion and the greatest power from the charge—

See what that means!

It means that instead of increasing speed or power with added gasoline; it meets the additional task with added gasoline **and air.**

It controls the mixture; it holds back the rich gasoline vapor and mixes with that vapor additional air; to take care of the increased speed or power demand.

In other words it burns air! Absolutely. Here's what you gain.

You get every possible bit of energy from each ounce of gasoline.

The cylinder walls and plugs are kept free from carbon caused by the smoke of too rich a mixture.

You get a hot spark at all times because of clean plugs.

You keep your engine cool—it's flame that heats an engine—and there is no flame.

You get more miles to the gallon of gasoline.

You save money—you get a higher efficiency from your car.

It costs $10.00.

Suppose you use 5 gallons of gasoline a day at 17 cents—that is $5.95 per week.

The Economizer will save you from 20% to 80%.

It will pay for itself in two weeks; in cash —and in ten miles; in satisfaction.

Write at once for our booklet on Motor Car Economy.

We've prepared it for the show, but we will send you an advance copy.

Sold on a Satisfaction Guarantee. Money back if it does not "make good"

BROWN-TAYLOR-GREENE COMPANY

An opportunity to swim with the tide of enthusiasm

AJAX tires are best for the dealer to sell just as they are best for the car owner to buy. Ajax tires are Guaranteed in writing for 5,000 miles. The Ajax guarantee has been made for upwards of nine years, and is the strongest influence possible to exert upon tire buyers! The effect of the Ajax guarantee multiplies in each year.

AJAX TIRES
Guaranteed
(in writing)
5,000 Miles

The Ajax tire business is a success. From the very first Ajax dealers have shared in the company's success.

The Ajax business is bigger this year than last and greater last year than the year before. Ajax is still climbing upward. It hasn't begun to slide down the other side. The Ajax opportunity is a live one!

When the dealer joins the Ajax family he *belongs*. He deals with headquarters. The men who own the Ajax business work for it.

The Ajax product is increased for the new year. We are seeking some new dealers to add to our list. We want some few strong men to come into the Ajax fold, to participate in our further success.

Remember that we have never yet built enough tires to supply the Ajax demand and the product has been increased in each year. We know from the success of our dealers that the Ajax line is the biggest opportunity, the most valuable dealership and the most important connection possible to make in the whole accessory field.

Ajax dealers have all the protection that their efforts entitle. Protection of the dealer is not only our policy; it's our principle, and principle is something else, again.

Don't delay! Act upon your present strong impulse! *Write us today.* Our district traveler may be in your vicinity. You will want to meet him and know the details of the Ajax proposition. Wire or write NOW!

"While others are claiming Quality we are guaranteeing it"

A·R·MOSLER & Co.'s SPARK PLUG PATENT SUSTAINED

WARNING

The United States Circuit Court of Appeals Upholds Our Canfield Basic Patent

This decision covers both the petticoat and the conical type spark plugs having a recess deeper than its diameter around the electrode; which feature is found in all the best-known spark plugs now on the market.

Every party who manufactures such spark plugs without being licensed to do so under this Canfield patent and every party who sells or uses such spark plugs not manufactured by us or by any party licensed to sell them under this Canfield patent will infringe this Canfield patent and be liable to a suit in equity for damages and an injunction.

Since the Circuit Court of Appeals confirmed the validity of this patent, we have given a great deal of thought and consideration to the future spark plug business, as our ownership of this patent may affect it.

The keynote of our policy with respect to the manufacturers and dealers in spark plugs, was fully described in a previous issue of this paper.

It gives us pleasure to state that the following leading manufacturers of spark plugs have been licensed by us under this Canfield Patent:

Auburn Ignition Co., Auburn, N. Y.
Benford Mfg. Co., Mt. Vernon, N. Y.
Belvidere Screw & Mch. Co., Belvidere, Ill.
Champion Ignition Co., Flint, Mich.
Champion Spark Plug Co., Toledo, O.
Frontier Specialty Co., Buffalo, N. Y.
Emil Grossman, Inc., Brooklyn, N. Y.
Hartford Mch. Screw Co., Hartford, Conn.
Jeffery-Dewitt Co., Detroit, Mich.
Lockwood-Ash Motor Co., Jackson, Mich.
C. A. Mezger, Inc., N. Y. C.
N. Y. Mica & Mfg. Co., Auburn, N. Y.
Oakes & Dow, Boston, Mass.
Rajah Auto Supply Co., Bloomfield, N. J.
Reflex Ignition Co., Cleveland, O.
Sharp Spark Plug Co., Cleveland, O.
Silvex Co., N. Y. C.
V-Ray Co., Marshalltown, Ia.
E. Q. Williams, Syracuse, N. Y.

Mosler Spit Fire Plugs

A Special Message to the Trade

We have, upon various occasions, outlined our policy with regard to spark plug manufacturers in so far as our ownership of the Canfield Patent affects them. It is broad and liberal, in no way prohibitive. Even those manufacturers who did not believe in the validity of the Canfield Patent and who refused to recognize our rights under it until the decision of the Court of Appeals left no doubt as to its validity, are licensed. As owners of this patent, we have not assumed any advantage to aid us in merchandizing our plugs.

The market is just as free as ever for fair competition. As in the past we are relying upon the merit of Mosler Spark Plugs to retain our share of the business. We are relying upon our resources and manufacturing facilities to enable us to compete with other licensed manufacturers in the making and selling of our plugs.

Our purchase of the Canfield Patent was not an accident. It was just as much a logical business move as any development we have made in bringing out our various types of plugs, the Spit-Fire, Vesuvius, Triumph, Mosler Junior, Mosler Priming Plug, etc., and developing them to their present high degree of perfection. It is typical of the thought and energy we apply to every department of our business.

Back as far as 1900, some six years before the magneto came into general use, Mosler's Spit-Fire Spark Plugs with the closed end and recessed porcelains had set practically the world's standard for spark plugs which would not foul and short circuit because of carbon deposits on the electrodes.

At the time the magneto took its place in the scheme of automobile ignition, Mosler Plugs again set the standard for plugs which would stand up under the extremely hot spark generated by the magneto.

The magneto had a far reaching effect upon the materials as well as design of spark plugs and in line with other activities we brought out a Mosler Spit-Fire Plug with a genuine platinum point, the design of which has stood the test of use under all conditions for years — necessitating practically no changes and no improvements. True to its design the Spit-Fire with the Platinum Point soon took a leading place among others and its merit soon created such a steady demand that some unscrupulous distributors substituted the original Spit-Fire battery type plugs for the genuine Platinum Pointed Plugs. This began to reflect upon us as manufacturers because, not being built to stand up under the magneto's hot spark, the original Spit-Fires did not

Digitized by Google

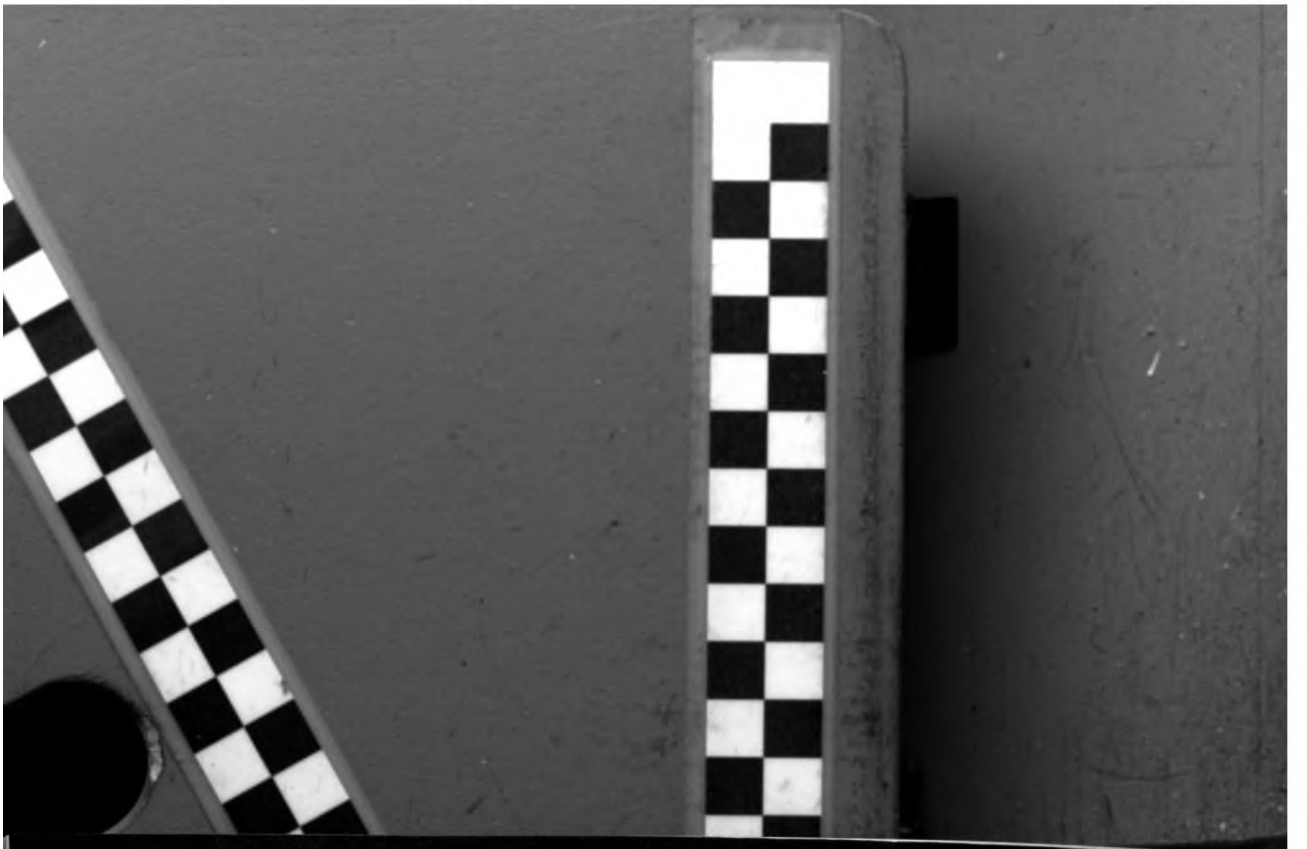
Mosler Spit Fire Plugs

give the same satisfaction people had been accustomed to get with Mosler Plugs. In order to protect ourselves, our dealers and the people who bought the plugs, we put a RED TAG GUARANTEE ON EVERY GENUINE PLATINUM POINTED SPIT-FIRE AND CAUTIONED THE TRADE AND THE PUBLIC AGAINST SUBSTITUTIONS.

Not only to business details have we applied our energies and thought, but the development of our products will show that we had a keen insight into the ignition problems of every type of internal combustion engine and that instead of waiting for others to develop plugs for each particular purpose, we brought out many of the more important ideas that have become standard with the majority of spark plug makers. We are now, and have been for years, making plugs adapted for use on pleasure cars, trucks, motor boats, motorcycles, etc. For the past three years we have published a booklet listing nearly every kind of motor and showing the type plug designed for use on such motors.

It is not surprising that in consequence of all the energy and expense we have devoted to the development of spark plugs that our plant has had to keep pace with an enormously growing demand.

From the original output of 3,000 Spit-Fire Plugs in 1900 the annual output of our Mount Vernon Factory has grown to millions of plugs annually. The production of this number of spark plugs has necessitated an enormous expense in machines and facilities. Many of the machines in our factory are special as well as automatic, built according to our own design to meet the requirements of our business. The methods of inspection are second to none in any factory. The object is to detect any imperfection almost as soon as it occurs and to prevent, in so far as it is humanly possible, a faulty plug getting on the market.



So it is small wonder that when we learned of the Canfield Patent which covered the most vital point of Spark Plug Design, we bought it. It seemed necessary to the undisturbed enjoyment of our work, although for years previous little was thought of this patent and it had changed hands many times without any of its owners regarding it as vital or even valuable. Even this precaution illustrates the thought that is characteristic of every detail of our business. It means that we know what we are doing, that a life-long study of ignition requirements, both from a merchandizing and manufacturing standpoint enables us to understand and to fill the demand for perfection. So confident are we of the intrinsic merit of Mosler Product, Spit-Fire and Vesuvius Spark Plugs, so confident are we of our manufacturing facilities, so confident are we that the Trade as well as the users of Spark Plugs will sooner or later recognize the superiority of our products, that we are taking a broad, fair view of the market, content to abide by whatever the merit of our plugs brings us, without using, in any inequitable manner, any advantage we might exercise by reason of our ownership of this now famous Patent covering the most vital point of spark plug design and construction.

THE PUBLIC DEMANDS THEM—
SHELDON WORM DRIVE AXLES

A Year Ago This Sheldon Worm Gear Axle Was Described in This Publication

It was a new product and looked upon by many as an experiment. ***We emphasize*** the fact it was not an experiment, and hence we offer you the same axle today.

It is a Standardized product. We always follow progressive, but standard practice in our design, material and workmanship.

This axle sells at a higher price than other axles, but the ***quality*** is there, ***they do stand up.***

If you want to know about worm gear axles made with the correct factor of safety, write us, or read what this user says:—

"The first worm drive axle has now been on the road every day (Sundays included) for a little over five months during which time it has been run something over 5,000 miles. The fact the machine itself has been in use every day from the start is evidence enough of its reliability, and so far as the worm is concerned I do not believe the most delicate measuring instrument could detect wear. It is the same today as the day the machine was first put out."

THEY DO STAND UP

SHARRER
ONE HAND TOP

is the *only one hand* or one man *top* that can be raised or lowered either from *within or outside the car with only one hand.* There are other so called one man tops made with braces that have to be broken on both sides to lower the top and in doing so pinch the fingers and tear holes in the material. These braces get stiff and rusty so that two men are often required to lower such a top. *The Sharrer is always a one hand top under all conditions.*

To car manufacturers we offer attractive shop rights, sockets, assembled frames or complete tops.

To top makers we offer you an opportunity to keep in business on a lucrative basis. If you don't investigate the Sharrer Top and proposition—you lose. See us at the New York and Chicago Auto Shows.

We have broad patents and guarantee to protect you.

QUALITY • QUALITY • QUALITY • QUALITY • QUALITY • QUALITY •

Now, you must decide!

The tire selling field has undergone a great change in the past 12 months.

The car owner has become disgusted with tires that demanded constant replacements and adjustments.

More than ever he is looking for real quality, real service—**real mileage.**

For a time he was satisfied with tires made to "sell."

Now he is demanding the tires made to "use."

You must decide which tire you are going to sell

Will you cater to first-time sales with "popular priced" tires—bearing yourself the expense and overhead selling cost of constantly "digging up" new customers, and losing old customers who are dissatisfied with cheaply made tires?

Or will you put your tire business on the right basis with tires made right—that deliver to the motorist the mileage he is entitled to—that always mean a satisfied user and a repeat sale that costs you nothing to make?

We have the quality kind of tire, and are looking for the right kind of dealer in a few selected territories.

If you are interested in ultimate profits as well as present sales—write or wire us at once.

Lozier Light "Four" is Ready and It's Profit Sharing Time for Lozier Dealers

The $2100 Lozier Light "Four," the wonder car, is ready—first deliveries in January.

Take a few days off from business; forget what line of cars you handle—only remember you are in business to get dollars and not for your health—and come see the Lozier Light "Four" at the national show nearest you.

We say, "Come, see this Light 'Four'"—not "Come to see the show," because this Light "Four" **is the show.** A certain number of dealers—it can't exceed 400 or 500—are going to "cash in" this year. They will fatten their bank accounts; line their purses with real money. Fortunes come quickly in this business to the man with the acumen to size up conditions and see ahead clearly.

In the Lozier Light "Four" we have built you a great car to sell—a light weight, strong, powerful, speedy, luxurious mountain-climbing automobile—a real Lozier in every sense of the word.

We have made it a "four," for the Light "Four" is the **car best suited to the owner-driver.** Instead of extra cylinders under the hood we have added on the car a great list of new refinements including a mountain-climbing type Lozier motor; the quietest and simplest four cylinder motor ever built.

We refused to deceive your customers by adding extra cylinders simply for the sake of having extra cylinders when we knew we could give them more for their investment by spending the money in valuable time-saving refinements.

Look at it from your buyer's side of the fence; refinements such as these appeal strongly to the man who drives his own car—and most men who pay around $2000, or under, **do drive their own cars.** Refinements certainly appeal more to these men than added care and big "gas" and repair bills. **These** are what extra cylinders bring to the owner-driver who is trying to stretch a couple of thousand dollars a long way in buying a car.

Take a few days off from business and come see the Lozier Light "Four."

Special Refinements

Special mountain-climbing type Lozier motor
300 to 500 pounds saved in weight
Four speed transmission with direct drive on third speed.
Tungsten steel valves
Gun iron pistons
Chrome-silico manganese springs
Silent floating rear axle
New top—can be operated by a woman
Quick acting side curtains
One-hand operated windshield
Silent chain engine drive
Convex rounded fenders
Tire pump—motor driven
Electric headlight dimmers
Instant locking rear tire carrier
Instrument board within easy reach of driver's hand
Gray & Davis electric starting and lighting system
Cleared running boards
Original Lozier streamline body
Corrugated hard rubber steering wheel
36½ ft. turning radius
Full seven or five passenger body with disappearing extra seats
36 x 4½ inch tires

Astonishing Car Value

Here is a car that sets a new pace for value at a thousand dollars. It has all the earmarks of a distinguished foreign car. It has the lines, the style and the beauty that challenge attention.

It backs this up with mechanical features that instantly disclose sound, conservative, practical engineering practice—ripe experience.

It has the strength, the speed and the lightness that mean satisfaction and ECONOMY.

It has rare individuality; it stands out from the common herd in a manner that defies competition—makes selling easier.

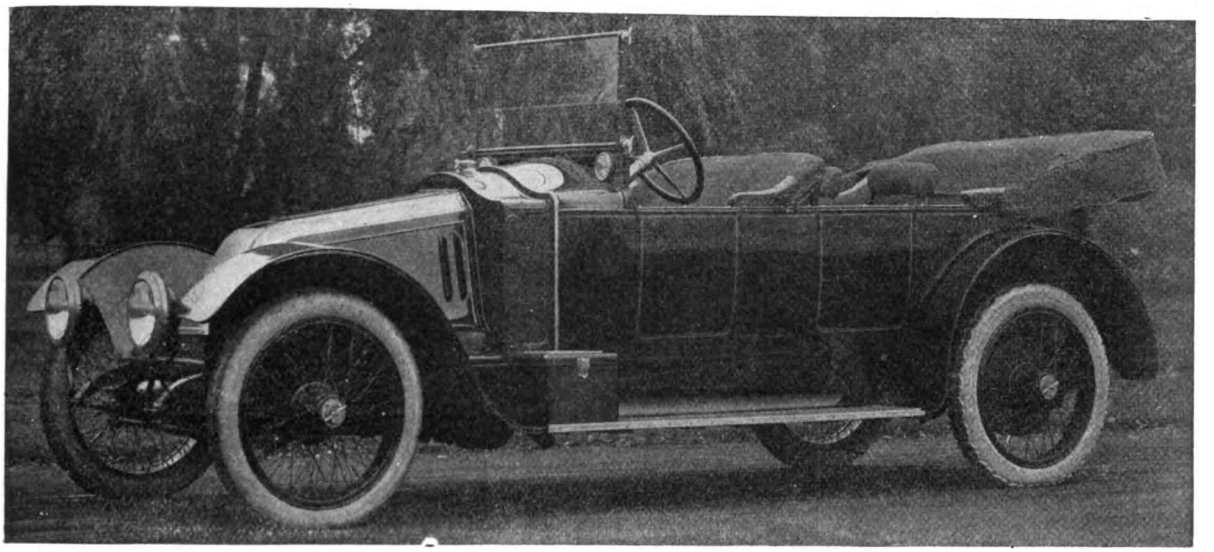
It is the car that spells OPPORTUNITY for the dealer. It gives you something to show, something to talk about. It stirs enthusiasm—and it keeps it up.

It is a full five-passenger car. Body is stream-line, of course. Note how perfectly it harmonizes with the Renault-type hood.

Under that hood, by the way, is concealed a radiator. It can't be seen, yet it is easily filled from the outside.

We use a unit power plant, water cooled, cylinders cast in pairs. Three-bearing crankshaft, force-feed oiling system, multiple disc clutch, sliding gear transmission—three speed, center control, left steer, three-point suspension and a dozen other features that make a hit with the man that buys and the man that sells.

But, we are not going to talk specification here. If you are "on" you will need no leading to this opportunity. You will beat the other fellows to it and WIRE at once for full details of our proposition—and while you are at it you will ask about territory before someone else snaps it up.



Don't Wait—Wire

The NEW "KEETON" and the NEW "CAR-NATION"

Are Now READY—HAVE YOU SEEN THEM?

The new "Six-48" Keeton combines the beauty of line and detail of Europe with the sturdy construction and economical manufacturing methods of America.

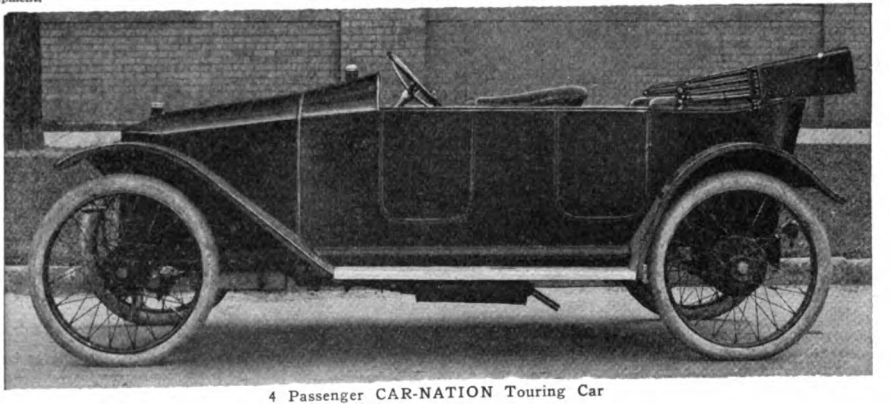
The distinctive lines and appearance of the Keeton attract and hold attention—they interest a possible purchaser at once—your sale is half made when the customer sees the car.

We are looking for first class representation in unoccupied territory, and have an agency agreement that is very fair and profitable. Have we heard from you?

Keeton Specifications

Electric starting.
Full electric light equipment.
Six cylinders cast en bloc, large valves.
Small bore, long stroke.
All moving parts completely enclosed.
Exceptionally powerful and flexible.
Radiator at rear of motor in proper and protected position.
Centrifugal pump and flywheel fan insure ample cooling.
Four speeds forward in transmission.
Direct on 3rd—geared up on 4th.
Left hand drive—right hand control.
Wire wheels—with extra detachable wire wheel.
Long 136-inch wheelbase—long springs, special alloy spring steel, nearly flat under load.
Chrome Vanadium Gears and shafts on imported annular bearings.
Pressure gasoline feed.
Very roomy and comfortable bodies.
Best of foreign practice adapted to American road and touring conditions
Very complete and detailed equipment.

PRICES F. O. B. DETROIT



2 Passenger Roadster, completely equipped.....$3250.00

STUTZ—THE CAR THAT MADE GOOD IN A DAY

Montamarathon Tacoma | Santa Monica | Free for All Corona | Elgin National Trophy | Corona Road Race | Potlatch Trophy Tacoma | Inter-City Trophy Tacoma

STUTZ—THE CAR THAT MADE GOOD IN A DAY

Sturdy Stutz Proclaimed Champion

The year 1913 was a period of splendid achievement for the Sturdy Stutz. It saw the Stutz outclass the most carefully built cars in the world, in the most severe tests ever attempted. Its permanent record stands chiseled in the annals of motor car making in unquestionable terms.

A Year of Triumphs

Since July 5th, 1913, the Stutz has won Seven Consecutive Road Race Victories. In these seven races, totalling 1847.86 miles of service at an average rate of 70 miles an hour, the performance of the Stutz has been the most consistent ever seen on American tracks.

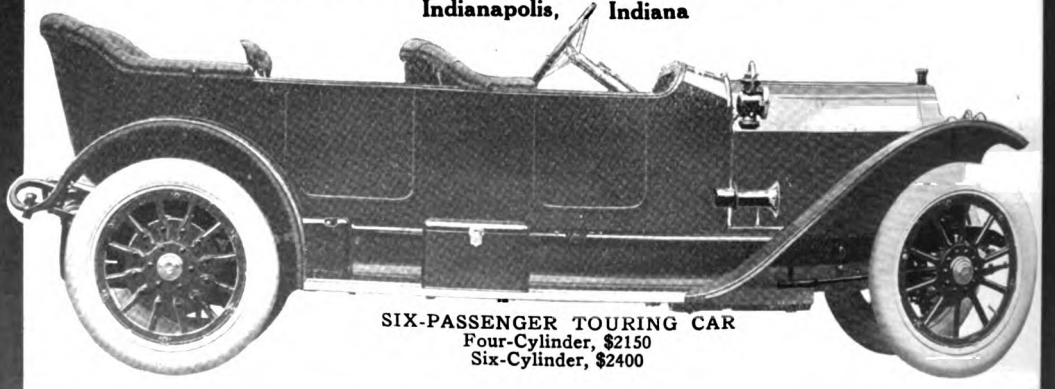
Such a remarkable record is too convincing to be passed by. The triumph of the Stutz comes from building into the car the utmost stamina and endurance, with just the right balance between weight and power.

Built to Endure

The years of gruelling service on the race tracks and in private use, which the Stutz has undergone, have been an education to our designers and mechanics. As a result of these tests, they have learned just what must be put into a car to make it a permanent success, and all these things have been built into the Stutz.

You get perfection of form as well as mechanical perfection when you buy your Stutz. Its stamina, sturdiness, beauty, roominess and comfort will please you always.

See the Stutz at the Shows



The Stutz will be on exhibition at Space B-7, First Regiment Armory, Chicago, and Space B-10, Grand Central Palace, New York. Take the time to look it over carefully. You cannot afford not to know the facts about this truly remarkable car.

Write for our new illustrated catalog No. A-15.

DEALERS: We still have a little desirable territory open and have an interesting proposition to make responsible dealers. Write or wire quickly.

The "Kangaroo"

A Mile a Minute Detroiter $900

Insistent demand from every automobile center—in America and abroad—for a sporty, racy model without trimmings, and with its speed showing in every line leads to the announcement of a new Detroiter model. It is called the "Kangaroo."

¶ On the track this car, with its new and bigger 1914 Detroiter motor, has made more than a mile a minute. It is stripped of every ounce of superfluous weight; has flush lines everywhere; smooth drawn upholstery; concealed lighting apparatus; not an ungainly angle or hook or knob anywhere. Just speed.

¶ The equipment is like that of a track athlete—everything essential but no more.

¶ Tire carrier with tool box enclosing full equipment of tools and repair kit, is at the rear, inclined above fuel and oil tanks of 20 and 3 gallons capacity respectively. Utility box is hidden beneath the seat.

¶ Lighting switch, magneto switch, pedals and speedometer are in the sloping dash. Battery lighting or Prest-O-Lite is optional. Detroiter-Remy self-starting and lighting system is $125 extra.

¶ Colors are fire-chief red or dulled gray, with black fenders.

¶ A car with such lines, with so much speed, with every detail worked down to the finest degree of engineering and artistic exactness, is something new.

¶ And only 150 of these speedsters will be manufactured this season. Also—two weeks must be allowed between receipt of order and delivery.

¶ The safe course is to get in specifications quick.

BRIGGS-DETROITER COMPANY

499 Holbrook Avenue **Detroit, Michigan**

Digitized by Google

IT ISN'T NECESSARY

To Remove a Battery from Car for Recharging on Account of Its Sulphated or Discharged Condition When Used With the

LEECE-NEVILLE
Starting and Lighting System

WHY?

BECAUSE—of the efficiency and capacity of the generator—12 amperes at 13 volts at car speed of 18 miles per hour.

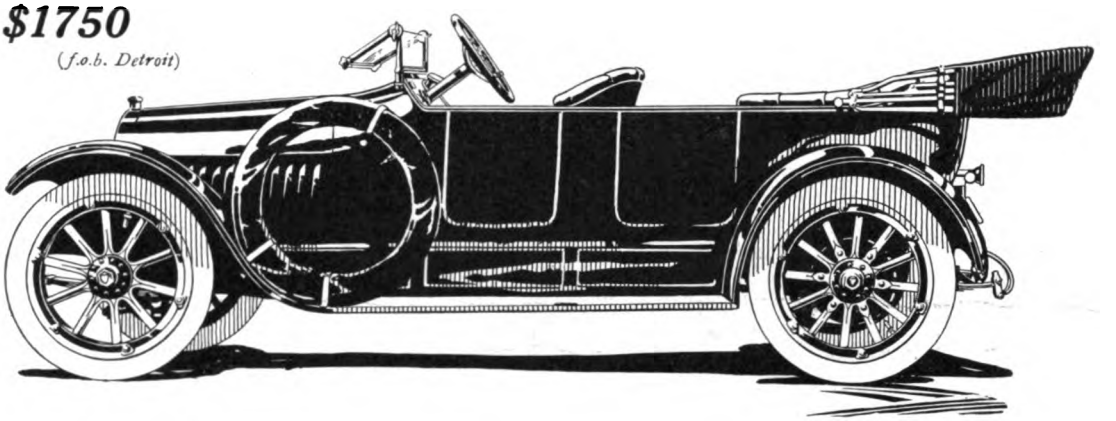
BECAUSE—the generator "cuts-in" and starts to charge the battery at a speed of 7 miles per hour.

BECAUSE—the generator does not "cut-out" until car speed is reduced to 5 miles per hour.

A car rarely runs less than 5 miles per hour — therefore, the Leece-Neville generator charges the battery almost as many hours as the car runs.

This cutting-in at low speed has enabled the Haynes Automobile Co. to use the Vulcan Electric Gear-Shift on thousands of cars without injury to the battery in any respect.

The Leece-Neville Starting and Lighting System was the first double-unit, self-regulating system on the market.



The Leece-Neville System Will Be Displayed and Demonstrated on HAYNES Cars at the New York and Chicago Shows

THE LEECE-NEVILLE COMPANY, Cleveland, O.

HUDSON Six-40
$1750
(f.o.b. Detroit)

How Long Will Men Pay This Price for a Four?

You men who sell cars have something new to consider.

The trend for years has been toward Sixes. Fourteen leading makers now build Sixes exclusively, and 37 of them build Sixes for best.

Four-cylinder cars have long been practically unsalable at a price which would buy a good Six.

This season comes the HUDSON Six-40 to sell at $1750—a price much below any comparable Four. It weighs much less than Fours of equal capacity. It costs much less to operate.

It weighs 400 pounds less than last year's HUDSON "37." It consumes one-fourth less fuel.

The Handsomest Car

The handsomest car on the market this season is the new HUDSON Six-54. And this Six-40 is that same car made smaller. Wheelbase, 123 inches.

It has the same true streamline body, the same perfect equipment. There are two disappearing tonneau seats. The gasoline tank is in the dash. The extra tires are carried ahead of the front door.

The Six-40 has the "One-Man" Pantasote top. It has quick-adjusting side curtains enveloped in the top.

It has dimming headlights, the Delco patented system of electric lighting and starting. No car at any price, up to six months ago, offered so many attractions.

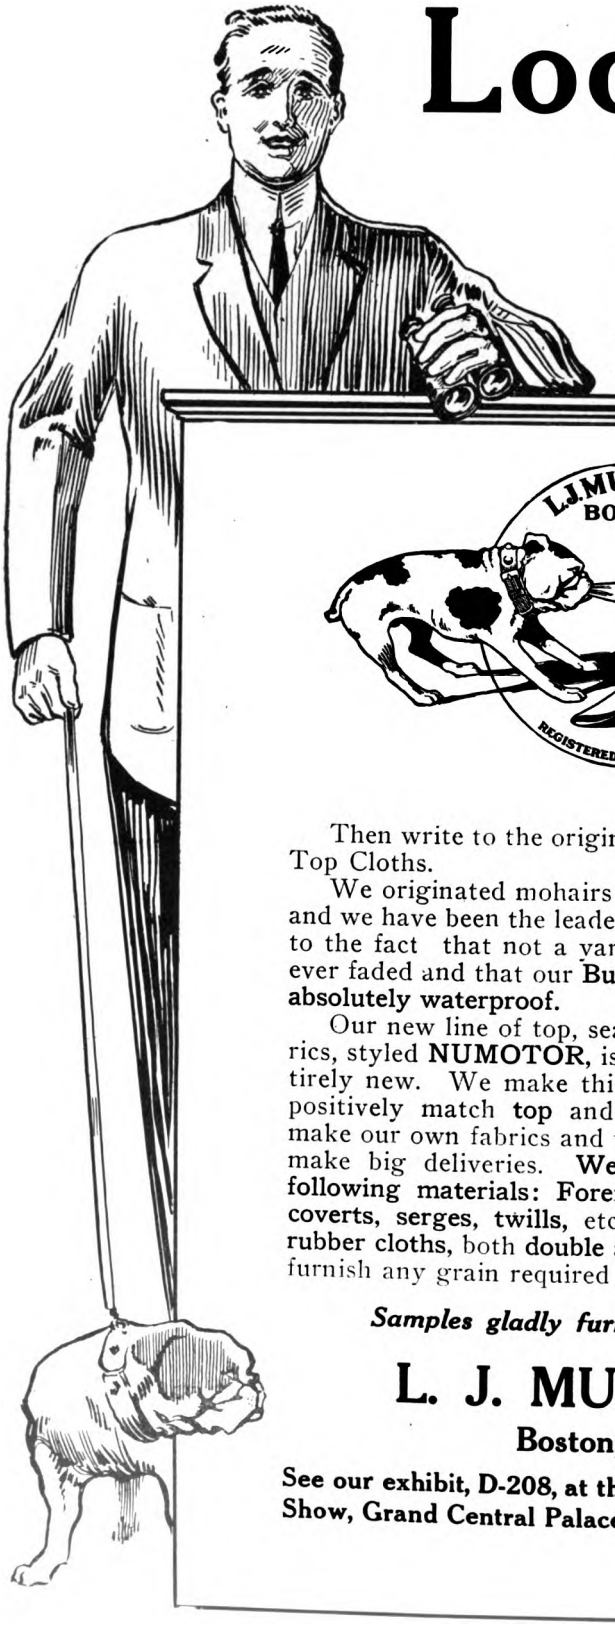
And the car is a HUDSON, designed by Howard E. Coffin, who last year brought out the HUDSON Six-54, the most popular Six of the year.

This Marks a New Era

This HUDSON Six-40 enters a field where tens of thousands of Fours have been sold every year. It undersells those Fours, underweighs them, and shows less operative cost. It outclasses any Four in equipment and appearance.

Beyond any question, it comes to capture that field, as Sixes have captured the whole field above that.

This is the most attractive offer that the HUDSON factory ever put out. It offers to dealers a very rare opportunity.



This Six-40 will be, during the next few months, one of the best-advertised cars in the country. We shall use the National Weeklies, Farm Papers and Magazines in a very large way.

We seek dealers in unoccupied territories.

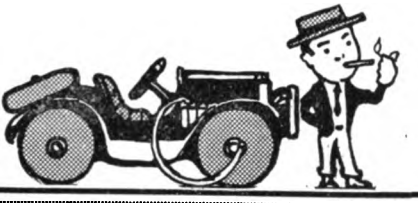
Looking for Mohair?

Then write to the original manufacturers of **Mohair** Top Cloths.

We originated mohairs for automobile tops in 1905 and we have been the leaders in this line ever since, due to the fact that not a yard of our black mohairs has ever faded and that our **Bull Dog** quality is guaranteed **absolutely waterproof.**

Our new line of top, seat cover and upholstery fabrics, styled **NUMOTOR,** is something original and entirely new. We make this in various colors and can positively match **top** and **upholstery material.** We make our own fabrics and we are always in position to make big deliveries. **We are headquarters for the following materials: Foreign** and **domestic mohairs, coverts, serges, twills,** etc. **Auto leathers** and **auto rubber cloths,** both **double** and **single** texture. We can furnish any grain required and we solicit a trial order.



Samples gladly furnished upon request

KELLOGG  TIRE PUMP

NO car is complete in standard equipment without a Kellogg Power Pump—the Standard upon which manufacturers of America's finest cars have depended successfully during the past five years.

Manufacturers and dealers who are trying to sell their product for 1914 without Kellogg equipment are robbing their cars of one of the most essential accessories on the market today. Do not jeopardize a sale through failure to supply this standard pump which thinking purchasers insist upon—nor do not try to substitute something "just as good."

Dealers should bear in mind that we can furnish attachments for equipping practically all motor cars new and old, and that there is a vast field among owners of old cars not so equipped who expect to operate their cars for another year or so.

The same care in selecting materials—the same painstaking workmanship which has accorded the Kellogg four cylinder pump the highest approval by engineers and inspection departments of the leading motor car makers, is in evidence throughout our plant in the manufacture of all Kellogg Products.

In addition to the power air pump we are also producers of the

Kellogg Electric Motor Driven Garage Pump

The solution of the garage pump problem.

Kellogg Self Starting Unit

Simplest, most powerful, and best.

Kellogg Hand Pumps, Pressure Gauges, Valve Grinders, Grease Guns and Primers

We have a complete line and every product excels in its own particular division.

See us at the Shows—and if you are not coming to the Shows, write us for full details.

MERCER

AT THE SHOWS

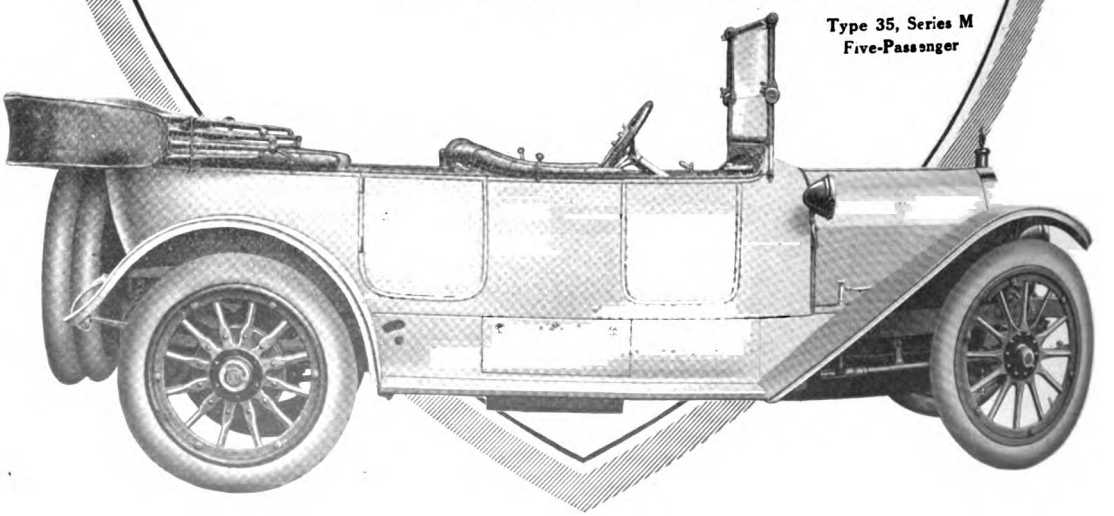
Series H, Close-Coupled Five-Passenger
Series J, Raceabout

Series M, Large Five-Passenger
Series O, Runabout

EXAMINE Mercer cars at the New York, Chicago, Philadelphia or Boston shows, or examine them anywhere you like. A comparison will show you why the Mercer is America's leading medium weight four-cylinder automobile.

Despite the apparent six-cylinder popularity there is a rapidly growing demand for a substantial four-cylinder car possessing power, speed, strength, comfortable riding qualities, graceful appearance, and real honest value. An examination will prove that Mercer cars meet this demand in every way.

Mercer cars are built in limited quantities. The finest materials obtainable are used, the extreme limit of accuracy in workmanship is demanded, and embodied in each car is the best that can be had in the way of testing and inspection. We invite your attention to the following features.



Four speed gear box, with direct drive on fourth.
Service brake operating on main shaft of gearset.
Multiple disc clutch, with forty-four steel to steel plates running in oil.
Two-spark ignition.
Large Tungsten steel valves.
Light reciprocating parts.
Full floating rear axle.
Crankshafts, camshafts, connecting rods, frame and axles from special alloyed steel, heat-treated so as to obtain the greatest degree of strength and durability.
A reliable electric lighting and starting system.

ROFFY GLARELESS HEADLIGHTS

The Roffy Glareless Lamp projects a powerful beam of pure white light which illuminates the roadway for two city squares, and complies with the strict headlight ordinance of New York and other cities.

Takes no more current than an ordinary headlight.

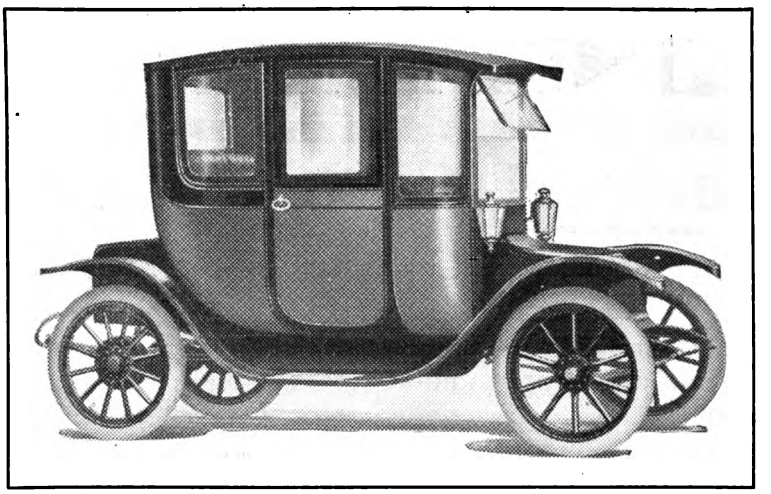
Absolutely no glare to dazzle pedestrians.

By the application of an optical principle in a series of accurately ground lenses the light does not scatter or waste on objects at which it is not focused.

The light rays never rise higher than the top of the radiator and cannot reach the eyes.

A pair of Roffy Lamps act as both head and side lights. A switch provides for reducing the lights to half strength while the car is standing.

Attached to the radiator or other part of the car in a few minutes. For electrically equipped cars only.



Nickel finish, Tungsten bulbs and switch. A splendid opportunity for dealers. Space D-25, New York Show.

Headlight Glare has been prohibited in New York, Philadelphia, Rochester, Syracuse, Chicago, Atlantic City, Brooklyn, Kansas City and Washington. Other cities and towns following rapidly.

WANTED DEALERS JOBBERS

—to Handle Spark Plugs which are unconditionally

Guaranteed for Life

Every plug or set of plugs sold to the user is backed up by an iron-clad legal guarantee signed by the Long Distance Spark Plug Co., which entitles the holder to exchange defective or broken plugs. If any plug goes wrong from any cause whatsoever, whether by accident or otherwise, we will give a new one in exchange.

Improved Long Distance Spark Plugs

are quick sellers. They sell for $1.50 each but are cheapest in the long run. First cost—only cost. Put up in attractive package for counter display. Good margin of profit for both dealer and jobber. Most motorists buy full set of four in order to get one plug free. Dealers and jobbers are requested to write for our special 1914 proposition. Electrotypes for use in your catalogue furnished free.

$5000.00 In Prizes to be Divided Among Retail Dealers.

With every set of improved Long Distance Spark Plugs sold, the dealer is privileged to take in four old plugs and allow 25 cts. for same. To the dealers who take in the greatest number of old plugs, a prize of $1,000 will be given. Smaller prizes totaling $4,000 will be apportioned to other dealers. Every dealer who hustles stands a good show to win big rewards in addition to big profits. Address for full details.

LONG DISTANCE SPARK PLUG CO. 212 South Illinois Street, Indianapolis, Ind.

TO CAR OWNERS—Ask your dealer to show you these Improved Long Distance Spark Plugs. If he cannot supply you, we will send one postpaid on receipt of $1.50 or five for $6.00. If full set of four is ordered, we will take in four old plugs, regardless of condition and allow 25 cts. each for same, making total cost for five plugs $5.00.

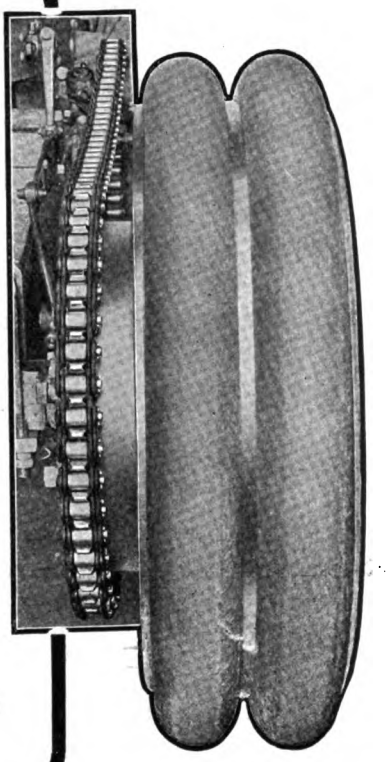
"WHITNEY" Chains

WE call your attention here to "Whitney" Cotter Detachable Chains as the most practical chains ever offered for motor vehicles. They have made a record for themselves which no other Detachable Type has approached.



This Cotter Pin feature is so practical and necessary that it calls for little detailed explanation. The illustrations tell their own story, proving that this form of construction is logical and necessary for chain equipped motor vehicles. This Cotter Detachable Chain can be taken apart at any link and lengthened, shortened or repaired without the use of any special tool, as the Cotter Pin can be removed with pliers, screw driver or any sharp pointed instrument. The use of "Whitney" Cotter Detachable Chains assures the builder, owner and driver of commercial vehicles uninterrupted service on account of the ease of repair.

"Whitney" Chains are made from steel best adapted for the purpose, carefully hardened and calculated to resist the most wear, while in the matters of machining and assembling the utmost care is exercised and thorough inspections and tests characterize each process of manufacture. Their future service, however, depends upon the accuracy of sprockets, care, lubrication, alignment and adjustment, for the best chain in existence cannot withstand the evil influence of improper conditions and give best results.

Write for our illustrated catalog which shows top and side views of each size of all Roller chains manufactured by us.

Practical Engineering Knowledge and Foundry Experience applied to your patterns.

The problem of making a pattern is not simply one of following lines on blue-prints. That is the easiest part.

The real efficiency of a pattern-maker is shown in his ability to see the finished pattern in operation—and to suggest and devise ways and methods by which foundry production can be increased and foundry costs decreased.

It takes experience—brains—and "know-how" to deliver a service that meets modern needs. You can bring your blue-prints here confident that you will get that "extra something" that means real efficiency.

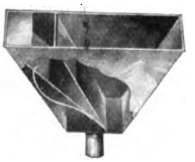
NO-SHAMMY

Agency Appointments



DURING Automobile Show Week we expect to appoint agents for Eastern territory and visit personally New York City dealers.

This information should be of vital interest to accessory salesmen and the trade in general. It means that territory will be apportioned at that time for an exceedingly profitable article; necessary to, and well within the means of every car-owner.

It is the ***No-Shammy Funnel*** (patented), positively guaranteed to remove all water and dirt from gasoline; thereby eliminating fully 99% of carburetor troubles. This funnel has been on the market for several years and thousands are in daily use.

Our intensive advertising and merchandising plans for 1914 cannot help but make the proposition distinctively attractive.

Write us prior to January first, so that a definite appointment can be arranged for a conference with our Mr. O. C. Foster, who will be present at the New York Show.

Applications for territory may be mailed to the Cleveland office at any time, and will be given consideration in the order received.

LEWIS VALVES Toledo

This One Thing—Valves

Lewis Valves are used by the leading and best known builders of Automobile and Marine motors, for only one reason—*Lewis makes better valves*—Lewis Valves last longest, give more power, because they are heat-treated, right.

Our entire plant and organization is devoted to this one thing. We make nothing but valves an make the *best* valves. For prices send blue-prints and ask Lewis about it.

Packard CABLE

PACKARD CABLE goes every other make of cable one better by providing the rubber insulation and braids with a series of flexible enamels, put on by a patented process.

These enamels protect the rubber from the over-vulcanizing effect of heat and the injurious effect of oil, water and dirt to which all cable is subjected.

Demand Packard cable with every starting and lighting system. Don't let the maker save a few cents on each system at the expense of the reputation of your car by substituting cheaper cable. Get the best. Send for sample to test and for our latest price list of 27 kinds of cable for every need.

This Hanger Free To Dealers

A six-color reproduction of the original Packard Girl by Liebscher, 16x20 inches. Makes a handsome decoration for office or garage. Sent free to dealers who write on their own stationery.

Swinehart
Non-Skid Tires

The one type that makes skidding impossible. Both the initial cost and the repair expense of chains and inevitable wear and tear on the fabric of the casing are avoided, representing more than 30% of total tire costs. Swinehart (Keaton) depression type has four times the wearing surface of any other non-skid, and its traction and non-skid properties last until the tire is worn out. Safe and economical.

SHALER Vulcanizers

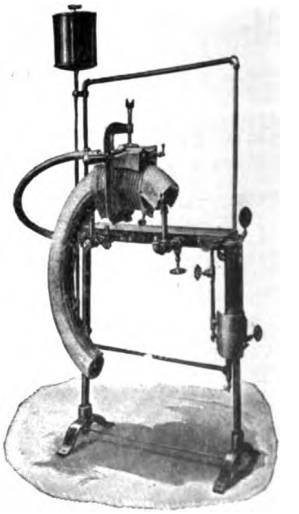
You can repair any puncture, blow-out, tear or hole in any casing or inner tube—anywhere—in a few moments with a Shaler Vulcanizer. It vulcanizes thoroughly and makes the repair the strongest part of the tire. Every Shaler has automatic heat control which makes it impossible to overcure or undercure the tire. The Shaler does not need to be watched. It works automatically. Simply clamp the Shaler Vulcanizer on your tire and it does the rest. A boy can operate it.

Model D-81 $12.50

Save Your Tires — Save Repair Bills

Prevent Blow-Outs—Treble Your Mileage

The Shaler is the Standard Vulcanizer used by the best garages and repair shops everywhere. We make the only complete line of vulcanizers, from the little $2.00 Vul-Kit for mending tube punctures to complete Garage Equipment. We are the largest manufacturers of vulcanizers in the world and our complete line includes vulcanizers of every type—Electric—Gasoline—Alcohol and Steam for every requirement.



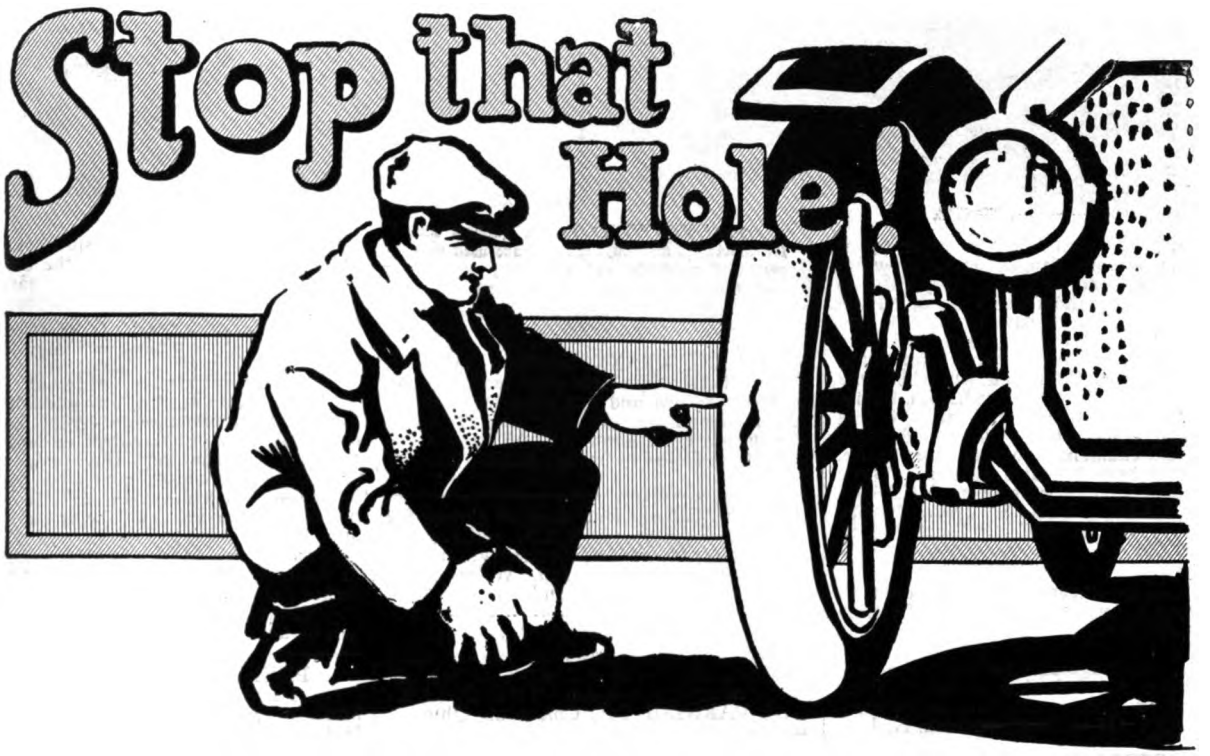
The Shaler Vul-Kit $2.00 is a low priced quick repair vulcanizer that mends tube punctures as perfectly and permanently as the most elaborate outfit. Can be used anywhere as it is so compact that it will fit in a tool-box. All progressive garages and dealers carry it in stock, as it is the best selling motorist's accessory on the market. Will burn gasoline or alcohol which rids it of the flame, soot and smoke attendant upon the use of all other small vulcanizers. The only one with a generator that converts the fuel into gas and produces and maintains temperature high enough to vulcanize a repair clear through instead of on the outside only. When the repair is vulcanized the generator is automatically extinguished. Tubes are mended on a plate inlaid with asbestos to retain the heat and prevent pinching tube. Vulcanizing surface 3½ in. in diameter. Universal clamp gives equal pressure on the tube, insuring smooth repairs. Handle, always cool, permits removal of vulcanizer from the tire while hot. Anybody can use it. Furnished complete with repair material. Fully nickeled—will last a lifetime. Burning fluid cannot spill on tire.

Shaler Model "D" For Motorists $12.50

Operates from city lighting current. When ordering, state voltage of current and whether it is direct or alternating.

The Model "D" is a safe, clean vulcanizer for the motorists own use at home. Any motorist or chauffeur can mend tubes and casings perfectly with it. The exact vulcanizing temperature is maintained by a thermostat which automatically makes and breaks the circuit—giving automatic heat control. There is no possibility of overcuring or undercuring the tire. No watching or regulating necessary. Easily attached to any electric light socket. It vulcanizes two tubes as quickly as one. Repairs Blow-Outs, Cuts, Tears, Punctures, etc. A 3½ by 7 inch repair can be made at one setting, and larger repairs by resetting. Heats in a few minutes and costs but one-half cent an hour to operate. Furnished with ten feet of conducting cord, U. S. Gov't tested heat gauge, Para Rubber, cement, and illustrated book of instructions. Finished in polished nickel. Price complete outfit, $12.50. **Write for complete catalog of SHALER Vulcanizers.**

Shaler Complete Vulcanizing Plant $60.00



Thousands of garages and repair shops use it. Earns Big Profits and does perfect work. Will handle every practicable kind of tube and casing work. Vulcanizes six tubes as quickly as one. Automatic heat control—must vulcanize just right. **Approved wrapped tread process.**

It will pay you to equip your garage or repair shop with a Shaler Vulcanizing plant. Don't delay.

Dealers! Garages! Accessory Dealers!

Can You Sell

A Guaranteed Accessory that Every Motorist Needs?

More Shaler Vulcanizers Are Sold
Than of All Other Makes Combined

It's the only complete line of vulcanizers—the only vulcanizer that has automatic heat control. It's the only accessory never supplied as part of any car's equipment and every motorist needs a Shaler.

Many Dealers Make $15 to $20 a Day Extra Profit

vulcanizing tires with Shaler Vulcanizers. Some make more. One garage wrote us recently that it had 12 of our Type B machines in continuous operation and that vulcanizing was the most profitable work it did.

Have You a Vulcanizer? If not, you're losing money that should be in your pocket. It's easy to vulcanize perfectly with the Shaler Vulcanizer because every Shaler has automatic heat control that makes it impossible to undercure or overcure a tire. The Shaler does not need to be watched. It works automatically. A boy can operate it. We make a complete line of Shaler Vulcanizers in all sizes for every purpose from the $2 Shaler Vul-Kit for mending tube punctures to a complete garage equipment.

Send the coupon today and let us mail you our complete catalog with full information, dealers terms, etc., also special book for dealers only—*"Common Sense About Tire Repairs."*

Every automobile dealer needs a Shaler Vulcanizer for his Repair Shop and can increase his profits by doing vulcanizing for his customers and selling Shaler Vulcanizers to motorists for their own use at home. It will pay you to investigate. Just mail us the coupon.

"We never sold such a satisfactory tire in years"—garage owners say

The thousands of motorists who are using Diamond Vitalized Rubber Tires are unanimous in their claim that they are the *most economical* and *satisfactory* tire money can buy.

Diamond Vitalized Rubber Tires have been put to the most severe tests and have made GOOD on all kinds of motor cars.

This reduction in price is made possible by the decreased cost of crude rubber—the high standard of Diamond quality will be maintained as heretofore.

Look for the Klaxon Nameplate

WHEN the car agent says the car is equipped with a Klaxon—be sure it IS a Klaxon.

YOU can always tell. The Klaxon name plate is never removed. The car maker who Klaxonizes his cars pays from three to eight times as much for the Klaxon as he would have to pay for an unknown "electric horn." He never conceals the Klaxon or the fact that the car is Klaxonized.

If you don't find the Klaxon name-plate the signal isn't a Klaxon. It is probably a "buzzer."

"Buzzers" can be bought by car makers for $1.25. They are the cheapest way in which car makers can say "electric horn." The name plate is often removed; the signal itself is often put under the hood—out of sight. The chance is taken that you don't know warning signals.
